The Genius of Literature presenting her Pupils to Minerva?

ENCYCLOPÆDIA LONDINENSIS;

OR,

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, AND LITERATURE.

COMPREHENDING,

UNDER ONE GENERAL ALPHABETICAL ARRANGEMENT,

ALL THE WORDS AND SUBSTANCE OF

EVERY KIND OF DICTIONARY EXTANT IN THE ENGLISH LANGUAGE.

IN WHICH THE IMPROVED DEPARTMENTS OF

THE MECHANICAL ARTS, THE LIBERAL SCIENCES, THE HIGHER MATHEMATICS, AND THE SEVERAL
BRANCHES OF POLITE LITERATURE,

ARE SELECTED FROM THE

ACTS, MEMOIRS, AND TRANSACTIONS, OF THE MOST EMINENT LITERARY SOCIETIES,
IN EUROPE, ASIA, AND AMERICA.

FORMING A COMPREHENSIVE VIEW OF THE RISE, PROGRESS, AND PRESENT STATE, OF HUMAN
LEARNING IN EVERY PART OF THE WORLD.

EMBELLISHED BY A MOST

MAGNIFICENT SET OF COPPER-PLATE ENGRAVINGS,

ILLUSTRATING, AMONGST OTHER INTERESTING SUBJECTS,

THE MOST CURIOUS, RARE, AND ELEGANT, PRODUCTIONS OF NATURE, IN EVERY PART OF THE UNIVERSE;
AND ENRICHED

WITH PORTRAITS OF EMINENT AND LEARNED PERSONAGES, IN ALL AGES OF THE WORLD.

TOGETHER WITH

A COMPREHENSIVE SYSTEM OF HERALDRY,

FINELY ILLUMINATED, AND ENRICHED WITH THE ARMORIAL BEARINGS OF THE ROYAL FAMILY;
OF THE ENGLISH, SCOTCH, AND IRISH, NOBILITY; OF THE BARONETS OF THE UNITED KINGDOM;
AND OF NUMEROUS DISTINGUISHED FAMILIES, PATRONS OF THIS WORK.

COMPILED, DIGESTED, AND ARRANGED,

By JOHN WILKES, OF MILLAND HOUSE, IN THE COUNTY OF SUSSEX, ESQUIRE;

ASSISTED BY EMINENT SCHOLARS OF THE ENGLISH, SCOTCH, AND IRISH, UNIVERSITIES.

VOLUME I.

London:

PRINTED FOR THE PROPRIETOR, BY J. ADLARD, DUKE-STREET, WEST SMITHFIELD: SOLD AT THE
ENCYCLOPÆDIA OFFICE, AVE-MARIA-LANE, ST. PAUL'S; BY J. WHITE, FLEET-STREET;
AND CHAMPANTE AND WHITROW, JEWRY-STREET, ALDGATE.

Non audiendi sunt homines imperiti, qui humano ingenio majorem, vel inutilem, et rebus gerendis adversam πολυμαθειαν criminantur. Est scilicet quedam Scientiarum cognatio et conciliatio; unde et Εγκυκλοπαιδειαν vocant Græci; ut in unâ perfectus dici nequeat, qui ceteras non attigerit.—Morhofi Polyhistor, l. i. c. i. s. i.

Those inexperienced persons, who make it a charge or accusation against variety and extensive learning, that it exceeds the compass of human ability, or is useless, or that it is an impediment to transacting business, deserve no attention. For there is between the Sciences a degree of natural and close connexion; from which the Greeks use the term "Encyclopædia;" so that no one can be perfect in any one Science, who has not attained to some knowledge of the rest,

---

George B.

We being willing to give all due Encouragement unto this Work, intituled, *Encyclopaedia Londinensis; or, Universal Dictionary of Arts, Sciences, and Literature*, do by these Presents grant unto the Proprietor thereof, Our Royal Licence and Authority for the sole printing, publishing, and vending the said Work; and do hereby strictly forbid all our Subjects, within our Kingdoms or Dominions, to reprint or abridge the same, either in the like, or in any size or manner whatsoever; or to import, buy, vend, utter, or distribute in these Realms any Copies thereof reprinted beyond the Seas, as they will answer for the same at their peril; whereof the Commissioners and other Officers of Our Customs, the Master, Warden, and Company of Stationers, are to take notice, that due Obedience be rendered to Our Pleasure herein declared. Given at Our Court at Saint James's, the Fourth day of May 1795, in the Thirty-fifth Year of Our Reign.

By His Majesty's Command, *Portland*

TO
THE SUBSCRIBERS AND PATRONS
OF THE
ENCYCLOPÆDIA LONDINENSIS.

IT cannot but be a reflection most highly gratifying to every studious mind, that amidst the desolations of war, and the unparalleled proceedings of hostile powers, which have long destroyed the Peace of Europe, the Light of Science and Literature has still shone, and the cultivation of liberal Arts has still continued to diffuse its influence with success and advantage over every part of the United Kingdom. It is also a circumstance, in which the humane and ingenious find peculiar satisfaction, that those learned and eminent persons, who are Members of Literary Societies in the various belligerent Countries, have made political animosity give place to feelings of a more generous nature; and, equally as if they enjoyed profound peace, have reciprocally communicated the result of their researches, experiments, and discoveries, for the general benefit of mankind.

The nations most distinguished in modern times for their literary societies, are Great Britain and Ireland, France, Italy, Sweden, Denmark, Holland, and Germany. Yet to these alone we are not indebted. Our brethren in America, for such we shall ever consider them, and our countrymen and fellow-subjects in the Empire of Hindoostan, have respectively contributed to the general Stock of recent Information. Stimulated by the laudable example of others who have been active in the cause of intellectual Improvement, and impelled as they were by an anxious desire of diffeminating polite Literature and scientific acquirements among the rising generation, I have endeavoured to select from all quarters, however remote, the most interesting communications and discoveries; and, having combined and incorporated them with the valuable store of Learning, which has long adorned and enriched Great Britain and Ireland, I thus have provided materials which may tend to consolidate

consolidate the foundation and raise the superstructure of my laborious work, **THE ENCYCLOPÆDIA LONDINENSIS**. In the prosecution of this work, it has been my studious care so to connect and arrange the various branches of classical and mathematical knowledge, as that propriety and perspicuity should be observed; information and taste be increased; reason and judgment be strengthened. How far my endeavours have been successful, must be pronounced by the sentence of others. That my labours however have not been altogether vain, nor the arrangements and improvements totally devoid of merit, I am induced to hope from the encouragement which has been given to this work by a very considerable part of the nobility as well as by the public in general. With the deepest sentiments of gratitude and respect for their patronage and favourable opinion,

I have the honour to subscribe myself

Their most obliged, obedient, and humble, servant,

Milland House, March 13, 1810.

J. WILKES.

ENCYCLOPÆDIA LONDINENSIS;

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, and LITERATURE.

A.

THE letter A is the first of the alphabet in all the known languages of the world, that of Ethiopia excepted, in which it is the thirteenth. It is placed first, on account of its simplicity, very little more being necessary to its pronunciation than barely opening the mouth. In the English it hath three different sounds, which may be termed the broad, open, and slender.

The broad sound, resembling that of the German *a*, is found in many of our monosyllables, as *all*, *wall*, *malt*, *salt*, in which *a* is pronounced as *au* in *cause*, or *aw* in *law*. Many of these words were anciently written with *au*, as *fault*, *waulk*; which happens to be still retained in *fault*. This was probably the ancient sound of the Saxons, since it is almost uniformly preserved in the rustic pronunciation, and the northern dialects, as *maun* for *man*, *haund* for *hand*.

A, open, not unlike the *a* of the Italians, is found in *father*, *rather*, and more obscurely in *fancy*, *fast*, &c.

A, slender or close, is the peculiar *a* of the English language, resembling the sound of the French *e* masculine, or diphthong *ai* in *païs*, or perhaps a middle sound between them, or between the *a* and *e*; to this the Arabic *a* is said nearly to approach. Of this sound we have examples in the words, *place*, *face*, *waste*, and all those which terminate in *ation*; as *reflation*, *nation*, *generation*.

A is short, as *glass*, *grafs*; or long, as *glaze*, *graze*: it is marked long, generally, by an *e* final, *plane*; or by an *i* added, as *plain*. The short *a* is open, the long *a* close.

A, an article set before nouns of the singular number; *a* man; *a* tree; denoting the number *one*, as, *a* man is coming, that is, *no more than one*. This article has no plural signification. Before a word beginning with a vowel, it is written *an*, as, *an* ox, *an* egg, of which *a* is the contraction.

A, taken materially, or for itself, is a noun; as, *a* great *A*, *a* little *a*.

A is placed before a participle, or participle noun; and is considered by Wallis as a contraction of *at*, when it is put before a word denoting some action not yet finished; as, *I am a* walking. It also seems to be anciently contracted from *at*, when placed before local surnames, as, *Thomas a* Becket. In other cases, it seems to signify *to*, like the French *à*;

A hunting Chloe went.

They go *a* begging to a bankrupt's door.

Prior.

Dryden.

A has a peculiar signification, denoting the proportion of one thing to another. Thus we say, The landlord

VOL. I. No. 1.

hath a hundred *a* year; The ship's crew gained a thousand pounds *a* man.

A is used in burlesque poetry, the same as *o*, to lengthen out a syllable, without adding to the sense;

For cloves and nutmegs to the line-*a*,
And even for oranges to China.

Dryden.

A, in composition, seems to have sometimes the power of the French *a* in these phrases, *a* droit, *a* gauche, &c. and sometimes to be contracted from *at*; as, *afide*, *aslope*, *asfoot*, *asleep*, *athirst*, *aware*, *atrip*;

And now a breeze from shore began to blow,
The sailors ship their oars, and cease to row;
Then hoist their yards *atrip*, and all their sails

Let fall, to court the wind, and catch the gales. Dryden.

A is sometimes redundant; as *arise*, *arouse*, *awake*; the same with *rise*, *rouse*, *wake*.

A, in abbreviations, stands for *artium*, or arts; as, A. B. bachelor of arts, *artium baccalaureus*; A. M. master of arts, *artium magister*; or, *anno*, as, A. D. *anno domini*.

A, in the Julian calendar, is the first of the seven DOMINICAL letters. It had been in use among the Romans long before the establishment of Christianity, as the first of the eight *nundinales litteræ*; in imitation whereof it was that the dominical letters were first introduced.

Among the ancients, *A* was a numerical letter, and signified 500; and, with a stroke over it, it stands for 5000. With logicians, it denotes an universal affirmative proposition. Among merchants, if set alone after a bill of exchange, it signifies *accepted*; and is used by them to distinguish their sets of accounts instead of a figure: thus, A, B, C, are instead of 1, 2, 3. *A*, or *aa*, is used by physicians instead of *ana*, and signifies that the proportions of the ingredients to which it refers are to be equal.

A, in music, is that note which lies between the second and third line in the treble; or upon the top, or fifth, in the bass.

A, in the ancient inscriptions of marbles, &c. occasionally stands for *Augustus*, *ager*, *aiunt*, &c. When double, it denotes *Augusti*; when triple *aurum argentum*, *as*; and sometimes its meaning can only be known by the rest of the inscription. Isidore adds, that when it occurs after the word *miles* (soldier), it denotes him young. On the reverse of ancient medals, it denotes them struck by the city of Argos, sometimes by that of Athens; but on coins of modern date it is the mark of Paris.

B

AAA.

AAA. The chemical abbreviation for Amalgama, or Amalgamation.

AA, rivers of Courland, Germany, Swisserland, Flanders, and France; *Aa* in the Danish language, *Ea* in the Saxon, and *Eau* in the French, signifying water.

AACH, a small town of Nellenburgh in Suabia, near a river of the same name which falls into the lake of Zell. It is subject to Austria, and seated on an eminence between the Danube and the lake of Constance. Lat. 47. 45. N. lon. 9. 0. E.

AAGGII-DOGGII, a mountain of Amasia, over which the caravans pass, in their journey between Constantinople and Isfahan.

AAG-HOLM, a small island of Norway.

AAHUS, a small town, in a county of the same name, in Westphalia, is situated near the source of the AA. Lat. 48. 13. N. lon. 7. 22. E.

AAIN-CHARIN, a village near Jerusalem, said to be the place where Zacharias lived: it is yet frequented by pilgrims; and near it there is a convent, a large elegant building with a handsome cupola, under which is an extraordinary fine mosaic pavement: the altar is a very splendid one, encompassed with marble steps, and is said to be built on the very spot where John the Baptist was born.

AAKIAR, a district of North Jutland, in Denmark.

AAKIRKE, an inland place in Bornholm, is the seat of the civil court and synod, and has the privileges of a town.

AALBERG, or AALBURGH, a bishopric in Jutland, Denmark; has for its capital

AALBORG, (that is, eel-town, from the number of eels taken there) an old, large, and populous, city, and, next to Copenhagen, the richest and best in Denmark. It has an exchange, and a harbour deep and secure, but rather dangerous in the entrance. It carries on a considerable trade in herrings and corn, and a manufactory of saddles and gloves. Lat. 57. 18. N. lon. 29. 16. E.

AALHEIDE, a large heath in Jutland.

AAM, or HAAM, a liquid measure in use among the Dutch, containing 128 *mingles*, each weighing nearly thirty-six ounces averdupoise; whence the Aam contains 288 English, and 148½ pints Paris measure.

AAMA, a province of Barbary, fifteen days journey from Tunis. The entrance to it is very dangerous, being very long and narrow, among quicksands and rivers, so covered with dust, that they appear like one continued plain.

AAN-SIRE, a small island of Norway.

AAR, rivers in Germany and Swisserland, and an island in the Baltic containing several villages but no town.

AARACK, a city of Hira in Persia.

AARASSUS, an ancient city of Asia Minor, mentioned by Strabo, but at present only a village. It is thought to be the Anassus of Ptolemy.

AARAW, a town and bailiwick in Bern, where the diets of the protestant cantons are held. In these assemblies the deputies and their servants being all citizens, dine in the same hall. Their town-house is built of the ruins of the castle, which the inhabitants of Aaraw entirely demolished when the Swiss shook off the yoke of Austria. Lat. 47. 20. N. lon. 8. 10. E.

AARHUUS, in North Jutland, Denmark, the capital of the diocese of the same name, is an open, large, and populous, city, with two market-places, an hospital, university, cathedral, and other public buildings. It lies low, on a beautiful plain, between the sea and an inland lake; from which last the water is conveyed, by means of a pretty broad canal, through the town. The harbour at the mouth of this canal or river is indeed safe and commodious, but hardly of sufficient depth and extent for the trade of the place. Lat. 56. 6. N. lon. 10. 0. E.

AARON, high priest of the Jews, and brother to Moses, was by the father's side great grandson, and by the mother's grandson, of Levi. By God's command he met Moses at the foot of mount Horeb, and they went together into

Egypt to deliver the children of Israel. They went to the court of Pharaoh, and told him that God commanded him to let the Hebrews go to offer sacrifices in the desert of Arabia; but the impious monarch disregarded this command, and caused the labour of the Israelites to be doubled. The messengers of the Almighty again returned to the king, when Aaron wrought a miracle in his sight to move his heart, and induce him to let the people go. Aaron cast down his miraculous rod, and it was immediately converted into a serpent: but the same thing being performed by the king's magicians, his heart was hardened more and more; and his obstinacy at last drew down the just judgments of heaven upon his kingdom, which was afflicted with ten dreadful plagues, in the same order that Aaron stretched forth his rod, at the command of the Almighty. The first was the changing of the waters of the Nile and of all the rivers into blood, so that the Egyptians died of thirst. In consequence of the second plague, the land was covered with innumerable swarms of frogs, which entered even into Pharaoh's palace. By the third plague, the dust was converted into lice, which cruelly tormented both man and beast. The fourth plague was a multitude of destructive flies, which spread throughout Egypt, and infested the whole country. The fifth was a sudden pestilence, which destroyed all the cattle of the Egyptians, without injuring those of the Israelites. The sixth produced numberless ulcers and fiery bites upon man and beast. The seventh was a dreadful storm of hail, accompanied with thunder and lightning, which destroyed every thing that was in the fields, and spared only the land of Goshen, where the children of Israel dwelt. By the eighth plague swarms of locusts were brought into the country, which devoured every green herb, the fruit of the trees, and the produce of the harvest. By the ninth plague thick darkness covered all the land of Egypt, except the dwellings of the children of Israel. The tenth and last plague was the death of the first-born in Egypt, who were all in one night cut off by the destroying angel, from the first-born of the king to the first-born of the slaves and of the cattle. This dreadful calamity moved the heart of the hardened Pharaoh, and he at length consented to allow the children of Israel to depart. That these miracles resulted from the immediate interposition of an offended Deity, is admitted by all authors sacred and profane; but the feats performed on this occasion by Pharaoh's magicians, have, without much reason, opened a wide field for controversy and dispute. We are told, that when Aaron cast down his rod, and it became a serpent, they also did the like with their enchantments; "for they cast down every man his rod, and they became serpents." This was a phenomenon which, it must be confessed, had a very miraculous appearance; and yet there seems to be nothing in it which might not have been effected by flight of hand. The Egyptians, and perhaps the inhabitants of every country where serpents abound, have the art of depriving them of their power to do mischief, so that they may be handled without danger. It was easy for the magicians, who were favoured by the court, to pretend that they changed their rods into serpents, by dexterously substituting one of those animals in place of the rod. In like manner they might pretend to change water into blood, and to produce frogs; for, after the previous information of the nature of the miracles which were to be wrought was given, the magicians might easily provide themselves with a quantity of blood and a number of frogs sufficient to answer their purpose of deceiving the people. Beyond this, however, their power could not go. It stopped where that of all workers in legerdemain must have stopped—at the failure of proper materials to work. Egypt abounds with serpents; blood could be easily procured; and without difficulty they might have frogs from the river. But when Aaron proceeded to the other miracles, and with his rod produced lice from the dust of the ground, the magicians, who had it not in their power to collect a sufficient quantity of these animals, were com-

pelled to own this to be an effect of divine agency. Thus Aaron had a great share in all that Moses did for the deliverance of the Israelites; whence the scriptures call him the prophet of Moses, and he acted in that capacity after the Israelites had passed over the Red Sea. He ascended mount Sinai with two of his sons, Nadab and Abihu, and seventy elders of the people; but neither he nor they went higher than half way, from whence they saw the glory of God; only Moses and Joshua went to the top, where they staid forty days. During their absence, Aaron, overcome by the people's eager intreaties, set up the golden calf, which the Israelites worshipped by his consent. This calf has given rise to various conjectures. Some rabbies maintain that he did not make the golden calf; but only threw the gold into the fire, to get rid of the importunities of the people; and that certain magicians, who mingled with the Israelites at their departure from Egypt, cast this gold into the figure of a calf. According to some authors, the fear of falling a sacrifice to the resentment of the people by giving a refusal, made Aaron comply with their desire: and they allege also, that he hoped to elude their request, by demanding of the women to contribute their ear-rings, imagining they would rather choose to remain without a visible deity, than be deprived of their personal ornaments. This affair of the golden calf happened in the third month after the Israelites came out of Egypt. In the first month of the following year, Aaron was appointed by God high-priest; which office he executed during the time the children of Israel continued in the wilderness. He died in the fortieth year after their departure from Egypt, upon mount Hor, being then 123 years old; A. M. 2522, of the Julian period 3262, before the Christian æra 1452.

AARON and JULIUS (Saints), suffered martyrdom together, during the persecution under the Emperor Dioclesian, in the year 303, about the same time with Saint Alban, the protomartyr of Britain. We are not told what their British names were, it being usual with the Christian Britons, at the time of baptism, to take new names from the Greek, Latin, or Hebrew. Nor have we any other particulars of their death; only that they suffered the most cruel torments. Each had a church erected to his memory; and their festival is placed, in the Roman martyrology, on the first of July.

AARON HARISCHON, a learned rabbi and CARAITE in the fifteenth century, wrote an Hebrew grammar, printed at Constantinople in 1581; probably the same with Aaron the caraites, who wrote a commentary on the five books of Moses, which is in MS. in the royal library of Paris.

AARSENS (Francis), Lord of Someldyck and Spyck, was one of the greatest ministers for negotiation the United Provinces could ever boast of. His father, Cornelius Aarsens, was register to the States; and, being acquainted with Mr. Pleffis Mornay, at the court of William prince of Orange, he prevailed upon him to take his son under him, with whom he continued some years. John Olden Barnevelt, who presided over the affairs of Holland and all the United Provinces, sent him afterwards agent into France, where he learned to negotiate under those profound politicians Henry IV. Villeroy, Silleri, Rossie, Jaonnin, &c. and he acquitted himself in such a manner as to obtain their approbation. Soon after he was invested with the character of ambassador, being the first who was recognised as such by the French court; at which time Henry IV. declared, that he should take precedence next to the Venetian minister. He resided in France fifteen years; during which time he received great marks of esteem from the king, who created him a knight and baron; and for this reason he was received amongst the nobles of the province of Holland. He was the first of three extraordinary ambassadors sent to England in 1620, and the second in 1641, to treat about the marriage of Prince William, son to the Prince of Orange. He was likewise ambassador-extraordinary at the French court in 1624; and the Cardinal de Richlieu having just taken the admi-

nistration of affairs into his hands, and knowing he was an able man, made use of him to serve his own purposes. He died in a very advanced age; and his son, who survived him, was reputed the wealthiest man in Holland.

AARSENS (Peter), a painter, called in Italy Pietro Longo, because of his stature, was born at Amsterdam in 1519. He was eminent for all kinds of subjects; but was particularly famous for altar-pieces, and for representing a kitchen with its furniture: he had the pain to see a fine altar-piece of his painting destroyed by the rabble in the insurrection of 1566, though a lady of Alcmæer offered 200 crowns to redeem it.

AARSEO, a town of Algiers, near the mouth of the river Mina, trades to Guinea, Numidia, and other places. Lat. 36. 50. N. lon. 2. 10. E.

AARTGEN, or AERTGEN, a painter of merit, the son of a woolcomber, born at Leyden in 1498. He worked at his father's trade till the age of eighteen; and then, having discovered a genius for designing, he was placed with Cornelius Engelheitz, under whom he made a considerable progress in painting. He became so distinguished, that the celebrated Francis Floris went to Leyden out of mere curiosity to see him. He found him inhabiting a poor half-ruined hut, and in a very mean condition. He solicited him to go to Antwerp, promising him wealth suitable to his merit; but Aartgen refused, declaring that he found more gratification in his poverty than others did in their riches. It was a custom with this painter never to work on Mondays, but to devote that day to the bottle. He used to stroll about the streets in the night, playing on the german flute, and in one of these frolics he walked into a rivulet and was drowned, in 1564.

AASAR, anciently a town of Palestine, in the tribe of Judah, situated between Azotus and Ascalon. In Jerome's time it was an hamlet.

AASTRUP, a district of Aalberg and North Jutland, to which belong the Herreds of Wenneborg, with twelve parishes, and Jerlef with the like number.

AB, *f.* the eleventh month of the civil year of the Hebrews, and the fifth of their ecclesiastical year, which begins with the month Nisan. It answers to the moon of July; that is, to part of our month of the same name, and to the beginning of August: it consists of thirty days. The Jews fast on the first of this month, in memory of Aaron's death; and on the ninth, because on that day both the temple of Solomon and that erected after the captivity, were burnt; the former by the Chaldeans, and the latter by the Romans. The same day is also remarkable among that people for the publication of Adrian's edict, wherein they were forbid to continue in Judea, or even to look back when at a distance from Jerusalem, in order to lament the desolation of that city. The 18th of the same month is also a fast among the Jews; because the lamp in the sanctuary was that night extinguished in the time of Ahaz.—In the Syriac calendar it is also the name of the last summer-month. The first day of this month they called *Suum Miriam*, the fast of the virgin, because the eastern Christians fasted from that day to the fifteenth, which was therefore called *Father-Miriam*, the cessation of the fast of the virgin.

ABA, or ABAU, HANIFAH or HANFA, surnamed Al-Nooma, was the son of Thabet, and born at Coufah in the eightieth year of the Hegira. This is the most celebrated doctor of the orthodox Mussulmans, and his sect holds the principal esteem among the four which they indifferently follow. Notwithstanding this, he was not very well esteemed during his life, inasmuch that the khaliff Almanzor caused him to be imprisoned at Bagdad, for having refused to subscribe to the opinion of absolute predestination, which the Mussulmans call Cadha. But afterwards Abou Joseph, who was the sovereign judge or chancellor of the empire under the khaliff Hadi, brought his doctrine into such credit, that it became a prevailing opinion, That to be a good Mussulman was to be a Hani-fite. He died in the hundred and fiftieth year of the Hegira,

gira, in the prison of Bagdad aforesaid: and it was not till 335 years after his death, that Melick Schah, a sultan of the Selgiucidan race, built for him a magnificent monument in the same city, whereto he adjoined a college peculiarly appropriated to such as made a profession of this sect. This was in the 485th year of the Hegira, and anno Christi 1092. The most eminent successors of this doctor were Ahmed Benali, Al Giasfas, and Al Razi, who was the master of Nassari; and there is a mosque particularly appropriated to them in the temple of Mecca.

ABA, a lofty mountain of Great Armenia, part of mount Taurus; the rivers Euphrates and Araxes have their rise here; also a city of the ancient kingdom of Phocis in Greece, famous for an oracle of Apollo, and for a rich temple plundered and burnt by the Persians.

ABACA, one of the Philippine Islands.

ABACENA, the ancient name of a town in Media, and another of Cana in the hither Asia.

ABACÆNUM, anciently a town of Sicily, whose ruins are supposed to be those lying near Trippi, a citadel on a high and steep mountain not far from Messina. The inhabitants were called *Abacæni*.

ABACATUAIA, *f.* in ichthyology, a barbarous name of the zeus vomer. See ZEUS.

ABACH, a market town of Germany, in Lower Bavaria, seated on the Danube. It is remarkable for Roman antiquities, and for springs of mineral waters, which are said to be good for various distempers. E. lon. 11. 56. lat. 48. 53.

ABACINARE, or ABBACINARE, *f.* a species of punishment exercised in the middle-ages, consisting in blinding of the criminal, by holding a hot basin or bowl of metal before his eyes.

ABACK, *adv.* a sea-term denoting the situation of the sails when the surfaces are flatted against the masts by the force of the wind. The sails are said to be *taken aback* when they are brought into this situation, either by a sudden change of the wind, or by an alteration in the ship's course. They are *laid aback*, to effect an immediate retreat, without turning to the right or left; or, in the seaphrase, to give the ship *stern-way*, in order to avoid some danger discovered before her in a narrow channel, or when she has advanced beyond her station in the line of battle, or otherwise. The sails are placed in this position by slackening their lee-braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the fore part of their surface, which readily pushes the ship astern, unless she is restrained by some counteracting force. It is also usual to spread some sail aback near the stern, as the mizen-top-sail, when a ship rides with a single anchor in a road, in order to prevent her from approaching it so near as to entangle the flukes with her slackened cable, and thereby loosen it from the ground.

ABACOT, *f.* the name of an ancient cap of state worn by the kings of England, the upper part whereof was in the form of a double crown.

ABACTOR, *f.* [Lat.] One who drives away or steals cattle in herds, or great numbers at once, in distinction from those that steal only a sheep or two.

ABACUS, *f.* [Lat.] in arithmetic, an ancient instrument used by most nations for casting up accounts, or performing arithmetical calculations: it is by some derived from the Greek *αβαξ*, which signifies a cupboard or buffet, perhaps from the similarity of the form of this instrument; and by others it is derived from the Phœnician *abah*, which signifies dust or powder, because it was said that this instrument was sometimes made of a square board or tablet, which was powdered over with fine sand or dust, in which were traced the figures or characters used in making calculations, which could thence be easily defaced, and the abacus refitted for use. But Lucas Pacioli, in the first part of his second distinction, thinks it is a corruption of Arabicus, by which he meant their Algorithm, or the method of numeral computation received from them.

We find this instrument for computation in use, under some variations, with most nations, as the Greeks, Romans, Germans, French, Chinese, &c.

The Grecian abacus was an oblong frame, over which were stretched several brass wires, strung with little ivory balls, like the beads of a necklace; by the various arrangements of which invention all kinds of computations were very easily made. Mahudel, in Hist. Acad. R. Inscr. t. 3. p. 390.

The Roman abacus was a little varied from the Grecian, having pins sliding in grooves, instead of strings or wires and beads. Philos. Transf. No. 180.

The Chinese abacus, or Shwan-pan, like the Grecian, consists of several series of beads strung on brass wires, stretched from the top to the bottom of the instrument, and divided in the middle by a cross piece from side to side. In the upper space every string has two beads, which are each counted for five; and in the lower space every string has five beads, of different values, the first being counted as one, the second as ten, the third as 100, and so on, as with us. See SHWAN-PAN.

The abacus chiefly used in European countries, is nearly upon the same principles, though the use of it is here more limited, because of the arbitrary and unequal divisions of money, weights, and measures, which, in China, are all divided in a tenfold proportion, like our scale of common numbers. This is made by drawing any number of parallel lines, like paper ruled for music, at such a distance as may be at least equal to twice the diameter of a calculus or counter. Then the value of these lines, and of the spaces between them, increases, from the lowest to the highest in a tenfold proportion. Thus, counters placed upon the first line, signify so many units or ones; on the second line 10's, on the third line 100's, on the fourth line 1000's, and so on: in like manner a counter placed in the first space, between the first and second line, denotes 5, in the second space 50, in the third space 500, in the fourth space 5000, and so on. See for example the following figure, where the same number, viz. 1788, is represented in both divisions of the abacus, by different dispositions of the counters:

Besides the above instruments for computation, there have been several others invented by different persons; as *Napier's rods or bones*, described in his *Rabdologia*; also the *Abacus Rhabdologicus*, a variation of Napier's, which is described in the first volume of *Machines et Inventions approuvées par l'Académie Royale des Sciences*. An ingenious and general one was also invented by Mr. Gamaliel Smethurst, and is described in the Philos. Transf. vol. xlvi. where the inventor remarks that computations by it are much quicker and easier than by the pen, are less burthensome to the memory, and can be performed by blind persons, or in the dark as well as in the light. A very comprehensive instrument of this kind was also contrived by the late learned Dr. Nicholas Saunderson, by which he performed very intricate calculations: an account of it is prefixed to the first volume of his *Algebra*, and is there by the editor called *Palpable Arithmetic*.

ABACUS, Pythagorean, so denominated from its inventor, Pythagoras; a table of numbers, contrived for readily learning the principles of arithmetic; and was probably what we now call the multiplication-table.

ABACUS, or ABACISCUS, in architecture, the upper part or member of the capital of a column; serving as a crowning both to the capital and to the whole column. Vitruvius informs us that the abacus was originally intended

tended to represent a square flat tile laid over an urn, or a basket; and the invention is ascribed to Calimachus, an ingenious statuary of Athens, who, it is said, adopted it on observing a small basket, covered with a tile, over the roof of an acanthus plant, which grew on the grave of a young lady; the plant shooting up, encompassed the basket all around, till meeting with the tile, it curled back in the form of scrolls: Calimachus passing by, took the hint, and immediately executed a capital on this plan; representing the tile by the abacus, the leaves of the acanthus by the volutes or scrolls, and the basket by the vase or body of the capital.

Abacus is also used by Scamozzi for a concave moulding in the capital of the Tuscan pedestal. And the word is used by Palladio for other members which he describes. Also, in the ancient architecture, the same term is used to denote certain compartments in the incrustation or lining of the walls of state-rooms, mosaic-pavements, and the like. There were abaci of marble, porphyry, jasper, alabaster, and even glass; variously shaped, as square, triangular, &c.

ABACUS LOGISTICUS is a right-angled triangle, whose sides, about the right angle, contain all the numbers from one to sixty; and its area the products of each two of the opposite numbers. This is also called a *canon of sexagesimals*, and is no other than a multiplication-table carried to sixty both ways.

ABACUS & PALMULÆ, in the ancient music, denote the machinery by which the strings of the polyplectra, or instruments of many strings, were struck, with a plectrum made of quills.

ABACUS HARMONICUS is used by Kircher for the structure and disposition of the keys of a musical instrument, either to be touched with the hands or feet.

ABACUS, in geometry, a table or slate upon which schemes or diagrams are drawn.

ABACUS MAJOR, in metallurgic operations, the name of a trough used in the mines, wherein the ore is washed.

ABADDON, is the name which St. John in the Revelation gives to the king of the locust, the angel of the bottomless pit. The inspired writer says, this word is Hebrew, and in Greek signifies *απολλων*, i. e. a destroyer. That angel-king is thought to be Satan: but M. le Clerc thinks with Dr. Hammond, that by the locust which came out of the abyss, may be understood the zealots and robbers, who miserably afflicted the land of Judea, and laid it in a manner waste, before Jerusalem was taken by the Romans; and that Abaddon, the king of the locust, may be John of Gischala, who having treacherously left that town a little before it was surrendered to Titus, came to Jerusalem, where he soon headed part of the zealots, who acknowledged him as their king, whilst the rest would not submit to him. This subdivision of the zealot party brought a thousand calamities upon the Jews.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed, by the contrivance of his wife Ops, believing it to be his new-born son Jupiter: hence it ridiculously became the object of religious worship.

ABAFEDE, a mountain in Egypt, the residence, in antiquity, of the Egyptian magi; it was much revered by the Romans on their obtaining it, and was afterwards inhabited by Christian devotees who lived in caves dug out of the rock.

ABAPT, *adv.* [*abaftan*, Sax.] afeaterm, signifying the hinder part of a ship, or all those parts both within and without which lie towards the stern, in opposition to *ABORE*.—*Abast*, is also used as a preposition, and signifies *further aft, or nearer the stern*; as, the barricade stands *abast* the main-mast, i. e. behind it, or nearer the stern.

ABAISANCE, *f.* [*abaifer*, Fr.] to depress, to bring down.] An act of reverence, a bow. *Obeysance* is considered by Skinner as a corruption of *abaissance*, but is now universally used.

ABAKA-KHAN, the 18th emperor of the Moguls, a

wife and clement prince. He reigned 17 years, and is by some authors said to have been a Christian. It may be admitted, indeed, that he joined with the Christians in keeping the feast of Easter, in the city Hanadai, some short time before his death. But this is no proof of his Christianity; it having been common, in times of brotherly love, for Christians and Mahometans to join in keeping the same feasts, when each would compliment the other with doing honour to his solemnity.

ABAKAN, a river falling into the Jenesei, near its source in Asiatic Russia, near which stands the town of Abakankoi. Lat. 53. 5. N. lon. 94. 5. E.

ABALA, a city of the tribe of Judah; also a town of the Troglodytes in Africa, near the Red Sea.

ABALASKOI, a town of Siberia. It is yet frequented by pilgrims, on account of a statue, called the image of the Virgin Mary. Lat. 58. 11. N. lon. 68. 20. E.

To ABALIENATE, *v. a.* [*abalieno*, Lat.] To make that another's which was our own before. A term of the civil law, not much used in common speech.

ABALIENATION, *f.* [*abalienatio*, Lat.] The act of giving up one's right to another person; or making over an estate, goods, or chattels, by sale, or due course of law.

To ABANDON, *v. a.* [*abandonner*, Fr. derived, according to Menage, from the Italian *abandonare*, which signifies to forsake his colours; *bandum* [vexillum] *deserere*. Palquier thinks it a coalition of a *ban donner*, to give up to a proscription; in which sense we, at this day, mention the ban of the empire. Ban, in our own old dialect, signifies a curse; and to *abandon*, if considered as compounded between French and Saxon, is exactly equivalent to *divis devovere*.] To give up, resign, or quit; often followed by the particle *to*.—Who is he so *abandoned* to foolish credulity, as to think, that a clod of earth in a sack, may ever, by eternal shaking, receive the fabric of man's body? *Beauley*. To desert; to forsake: in an ill sense. To forsake, to leave.

To ABANDON OVER, *v. a.* [a form of writing not usual, perhaps not exact.] To give up, to resign.

Look on me as a man *abandon'd o'er*

To an eternal lethargy of love;

To pull and pinch, and wound me, cannot cure,

And but disturb the quiet of my death. *Dryden*.

ABANDONED, *participle adj.* Corrupted in the highest degree; as, an *abandoned wretch*. In this sense, it is a contraction of a longer form, *abandoned*, or given up to wickedness.

ABANDONING, [from *abandon*.] Deserting, forsaking.

ABANDONMENT, *f.* [*abandonnement*, Fr.] The act of abandoning; the state of being abandoned.

ABANNITION, *f.* [*abanitio*, Lat.] A banishment for one or two years, for manslaughter. *Obsolete*.

ABANO, a town of Padua in Italy, in the republic of Venice, much frequented on account of its warm baths. Lat. 45. 30. N. lon. 10. 47. E.

ABANTES, a people who came originally from Thrace, and settled in Phocæa, a country of Greece, where they built a town which they called *Abæ*, after the name of Abas their leader. The Abantes were a very warlike people, closing with their enemies, and fighting hand to hand.

ABANTIAS, or ABANTIS, anciently a name of the island Eubœa in the Egean sea, extending along the coast of Greece, from the promontory Sunium of Attica to Thessaly, and separated from Bœotia by a narrow strait called *Euripus*. The island was called *Abantias*, from the Abantes, a people originally of Thrace, called by Homer *οπισθεν Κομωσινες*, from wearing their hair long behind, having in a battle experienced the inconvenience of wearing long hair before. From cutting their hair before, they were called *Curetes*.

ABAPTISTON, *f.* in surgery, [from *α* and *βαπτίζω*, *immergo*, to sink under.] the perforating part of the instrument called a *TREPAN*.

ABARA, a town in the Greater Armenia, under the

dominion of the Turks: it is often the residence of the Archbishop of Nakhivan. Lon. 46. 25. lat. 39. 45.

ABARANER, a city of Turcomania in Asia, said to contain about 300 Christian families. Lat. 39. 0. N. lon. 63. 59. E.

ABARCA, *f.* an ancient kind of shoe used in Spain for passing the mountains with. It was made of raw hides, and bound with cords, which secured the feet of travellers against the snow.

To ABARE, *v. a.* [*abarian*, Sax.] To make bare, to uncover, or disclose.

ABARGALE a country of Abyssinia.

ABARIM, high mountains of steep ascent, separating the country of the Ammonites and Moabites from the land of Canaan where Moses died. Nebah and Pisgah were parts of these mountains.

ABARIS, the Hyperborean; a celebrated sage of antiquity, whose history and travels have been the subject of much learned discussion. Such a number of fabulous stories were told of him, that Herodotus himself seems to scruple to relate them. He tells us only, that this barbarian was said to have travelled with an arrow, and to have taken no sustenance: but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occasion of his leaving his native country, Harpocration tells us, that the whole earth being infested with a deadly plague, Apollo, upon being consulted, gave no other answer than that the Athenians should offer up prayers in behalf of all other nations; upon which, several countries deputed ambassadors to Athens, among whom was Abaris the Hyperborean. In this journey, he renewed the alliance between his countrymen, and the inhabitants of the island of Delos. It appears that he also went to Lacedæmon; since, according to Pausanias, he there built a temple consecrated to Proserpine the Salutary. It is asserted, that he was capable of foretelling earthquakes, driving away plagues, allaying storms, &c. The orator Himerius describes his person accurately, and gives him a very noble character: "They relate (says he) that Abaris the sage was by nation an Hyperborean, appeared a Grecian in speech, and resembled a Scythian in habit and appearance. He came to Athens, holding a bow in his hand, having a quiver hanging on his shoulders, his body wrapt up in a plaid, girt about the loins with a gilded belt, and wearing trowsers reaching from his waist downward." He was affable and pleasant in conversation, in dispatching great affairs secret and industrious, quick-sighted in present exigencies, in preventing future dangers circumspect, a searcher after wisdom, desirous of friendship, trusting little to fortune, and having every thing trusted to him for his prudence. Neither the Academy nor the Lyceum could have furnished a man with fitter qualities to travel so far abroad, and to such wise nations, about affairs no less arduous than important. And if we further attentively consider his moderation in eating, drinking, and the use of all those things which our natural appetites incessantly crave: joining the candour and simplicity of his manners with the solidity and wisdom of his mind; all which we find sufficiently attested; it must be owned, that the world at that time had few to compare with Abaris.

ABARTICULATION, *f.* [*ab*, and *articulus*, a joint, Lat.] A good and apt construction of the bones, by which they move strongly and easily; or that species of articulation that has manifest motion. In anatomy, it signifies a species of articulation, admitting of a manifest motion; called also Diarthrosis, and Dearticulatio, to distinguish it from that sort of articulation, which admits of a very obscure motion, and is called Synarthrosis.

ABAS, *f.* a weight used in Persia for weighing pearls. It is 1-8th less than the European carat.

ABAS, in the heathen mythology, was the son of Hypochoon and Meganira, who entertained Ceres, and offered a sacrifice to that goddess; but Abas ridiculing the cere-

mony, and giving her opprobrious language, she sprinkled him with a certain mixture, and he became a newt or water-lizard.

ABAS (Schah) the Great, was third son of Cötabendi, seventh king of Persia, of the race of the Sôphis. Succeeding to his father at eighteen, in 1585, he found the affairs of Persia at a low ebb, occasioned by the conquests of the Turks and Tartars. By his intrepid conduct and magnanimity, he regained several of the provinces they had seized; but death put a stop to his victories in 1629, after a reign of forty-four years. He was the prince who made Ispahan the metropolis of Persia.

ABAS (Schah) his grandson, ninth king of Persia, of the race of the Sôphis, succeeded his father Sefi at thirteen years of age; he was but eighteen when he made himself master of the city Candahar, which had surrendered in his father's reign to the Great Mögöl, and all the province about it; and he preserved it afterwards against this Indian emperor, though he besieged it more than once with an army of 300,000 men. He was a very merciful prince, and openly protected the Christians: he died at thirty-seven years of age, in 1666.

ABASA, a small town of Romania; it has an elegant mosque and a spacious kahé or inn, and is twelve miles from Adrianople, on the road to Constantinople. Lat. 42. 8. N. lon. 26. 35. E.

ABASCIA, or ABCAS, a country in Asia, tributary to the Turks, situated on the coast of the Black Sea. The people are poor, thievish, and treacherous, inasmuch that there is no trading with them without the utmost caution. Their commodities are furs, buck and tyger skins, linen yarn, boxwood and bees-wax: but their greatest traffic is in selling their own children, and even one another, to the Turks; inasmuch that they live in perpetual distrust. They are destitute of many necessities of life, and have nothing among them that can be called a town; though we find Anacopia, Dandar, and Czekorni, mentioned in the maps. They have the name of Christians; but have nothing left but the name, any more than the Mingrelians their northern neighbours. The men are robust and active, and the women are fair and beautiful; on which account the Turks give a great price for the female slaves, which they purchase very young.

ABASCUS, a river of Asiatic Sarmatio, which, rising from Mount Caucasus, falls into the Euxine, between Pityus to the east, and Nosis to the west.

To ABASE, *v. a.* [*abaïsser*, Fr. from the Lat. *basis*, or *bassus*, a barbarous word, signifying low, base.] To depress, to lower. To cast down, to depress, to bring low; in a figurative and personal sense, which is the common use.—Behold every one that is proud, and *abase* him. *Job*. xl. 11.—If the mind be curbed and humbled too much in children; if their spirits be *abased* and broken much by too strict an hand over them; they lose all their vigour and industry. *Locke*.

ABASED, *adj.* in heraldry, is a term used of the wings of eagles, when the tops look downwards towards the point of the shield; or when the wings are shut; the natural way of bearing them being spread with the top pointing to the chief of the angle.

ABASEMENT, *f.* The state of being brought low; the act of bringing low; depression.—There is an *abasement* because of glory; and there is that lifteth up his head from a low estate. *Eccles*. xx. 11.

To ABASH, *v. a.* [*abaïsser*, Fr.] To put into confusion; to make ashamed. It generally implies a sudden impression of shame.—They heard, and were *abashed*. *Milton*.—The passive admits the particle *at*, sometimes *of*, before the casual noun.—In no wise speak against the truth, but be *abashed* of the error of thy ignorance. *Ecclesi*. iv. 25.

The little Cupids hovering round,
(As pictures prove) with garlands crown'd,
Abash'd at what they saw and heard,
Flew off, nor ever more appear'd.

Swift.
ABASSI.

ABASSI, or **ABASSIS**, *f.* a silver coin current in Persia, equivalent in value to a French livre, or ten-pence half-penny sterling. It took its name from Schah Abas II. king of Persia, under whom it was struck.

To **ABATE**, *v. a.* [*abbatre*, Fr. to beat down.] To lessen, to diminish; to deject, or depress the mind. In commerce, to let down the price in selling, sometimes to beat down the price in buying.

To **ABATE**, *v. n.* To grow less; as, his passion *abates*; the storm *abates*. It is used sometimes with the particle *of* before the thing lessened.—In process of time some diseases have *abated* of their virulence. *Dryden*.—In horsemanship, a horse is said to abate or take down his curvets, when, working upon curvets, he puts his two hind legs to the ground both at once, and observes the same exactness in all the times.

ABATEMENT, *f.* [*abatement*, Fr.] The act of abating or lessening. The state of being abated.—Coffee has an oil strongly combined and entangled with earthy particles; the most noxious part of the oil exhales in roasting, to the *abatement* of near one quarter of its weight. *Arbuthnot*.—The sum or quantity taken away by the act of abating.—The law of works is that law, which requires perfect obedience, without remission or *abatement*. *Locke*.—The cause of abating; extenuation.—We cannot plead in *abatement* of our guilt, that we were ignorant of our duty, under the prepossession of ill habits, and the bias of a wrong education. *Atterbury*.

ABATEMENT in law, is used in three senses: The first is that of removing or beating down a nuisance. In which respect, the person aggrieved by the nuisance may *abate* or remove the same without the formality of an action, so as he commit no riot in the doing of it. If a house or wall is erected so near to mine, that it stops my ancient lights (which is a private nuisance), I may enter my neighbour's land and peaceably pull it down. Or if a new gate be erected across the king's highway (which is a public nuisance), any of the king's subjects passing that way may cut it down and destroy it. And the reason why the law allows this summary method of doing one's self justice is, because injuries of this kind require an immediate remedy, and cannot wait for the slow progress of the ordinary forms of justice. 3 *Blackst.* 5.

The second signification of abatement is, the defeating or overthrowing of an action, by some defect in the proceedings; as where exception is taken to the insufficiency of the matter; to the uncertainty of the allegation, by misnaming either of the parties, or the place; to the variance between the writ and the specialty or record; to the uncertainty of the writ or declaration; or to the death of either of the parties before judgment had. For these and many other causes, the defendant oftentimes prays, that the suit of the plaintiff may for that time cease. And in case of abatement in these respects, all writs and process must begin *de novo*. In the case of an indictment, on a criminal process, the defendant may plead in abatement, that his name is not as in the indictment specified, or that they have given him a wrong addition, as yeoman instead of gentleman; and if the jury find it so, the indictment shall abate. But in the end, there is little advantage accruing to the defendant by means of this kind of dilatory plea; because, if the exception be allowed, a new bill of indictment may be framed, according to what the prisoner in his plea avers to be the true name and addition. For it is a rule, upon all pleas in abatement, that he, who takes advantage of a flaw, must at the same time shew how it may be amended. 4 *Blackst.* 335.

The third species of abatement is, where the rightful possession or freehold of the heir or devisee is defeated or overthrown by the intervention of a stranger. And herein it differs from intrusion, which is the entry of a stranger after a particular estate of freehold is determined, before him in remainder or reversion. An abatement is always to the prejudice of the heir or immediate devisee; an intrusion is always to the prejudice of the remainder-man or

reversioner. For example: If a man dieth seized of lands in fee simple, and before the entry of his heir, a stranger enters thereon, this is an abatement; but if a man be tenant for life, with remainder to another in fee, and after the death of the tenant for life a stranger enters, this is an intrusion. The remedy in abatement or intrusion may be by entry, without the parties being put about to bring their action: for as the original entry of the wrong-doer was unlawful, this may therefore be remedied by the mere entry of him who hath right; unless a descent hath been cast, which gives the heir of the abator or intruder a colourable title, and therefore he shall not be ousted but by another making out a better claim. 3 *Blackst.* 175.

ABATEMENT, in heraldry, an accidental mark, which being added to a coat of arms, the dignity of it is abased, by reason of some stain or dishonourable quality of the bearer.

ABATEMENT, in the customs, an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and land-waiter.

ABATION, an erection at Rhodes, as a fence to the trophy of Artemisia, queen of Halicarnassus, Coos, &c. raised in memory of her victory over the Rhodians; or rather as a screen to conceal the disgrace of the Rhodians from the eyes of the world, the effacing or destroying the trophy being with them a point of religion.

ABATIS, or **ABATTIS**, *f.* [*abbatre*, Fr.] To throw down or beat down. In the military art, it denotes a kind of retrenchment made by a quantity of whole trees cut down, and laid lengthways beside each other, the closer the better, having all their branches pointed towards the enemy, which prevents his approach, at the same time that the trunks serve as a breast-work before the men. The abatis is a very useful work on most occasions, especially on sudden emergencies, when trees are near at hand; and has always been practised, with considerable success, by the ablest commanders in all ages and nations.

ABATIS, an ancient term for an officer of the stables.

ABATER, *f.* The agent or cause by which an abatement is procured; that by which any thing is lessened.

ABATOR, *f.* A law term. One who intrudes into houses or land, void by the death of the former possessor, and yet not entered upon or taken up by his heir, as described above.

ABATUDE, *f.* In old records, any thing diminished.

ABATURE, *f.* [*abatre*, Fr.] Those sprigs of grass which are thrown down by a stag in his passing by.

ABATOS, an island of Egypt, in the Lake Mæris. It was famous for being the sepulchre of Osiris, and for producing the papyrus plant, of which the ancients made their paper.

ABAVO, *f.* in botany, a synonyme of the **ADANSONIA**.

ABB, *f.* a term among clothiers, applied to the yarn of a weaver's warp. They say also *abb-wool* in the same sense.

ABBA, in the Syriac and Chaldee languages, signifies father; and figuratively, a superior, reputed as a father in respect of age, dignity, or affection. It is more particularly used in the Syriac, Coptic, and Ethiopic churches, as a title given to the bishops. The bishops themselves bestow the title *Abba* more eminently on the bishop of Alexandria; which occasioned the people to give him the title of *Baba* or *Papa*, that is, *Grandfather*; a title which he bore before the bishop of Rome. It is a Jewish title of honour given to certain rabbins called *Tanaites*; and it is also used, by some writers of the middle age, for the superior of a monastery, usually called **ABBOT**.

ABBACY, *f.* [*abbatia*, Lat.] The rights or privileges of an abbot.—According to Felinus, an abbacy is the dignity itself, since an abbot is a term or word of dignity and not of office; and, therefore, even a secular person, who has the care of souls, is sometimes, in the canon law, also styled an abbot.

ABBADIE (James), an eminent protestant divine, born at Nay in Bern, in 1654; first educated under the famous John

John la Placette, and afterwards at the university of Sedan. From thence he went into Holland and Germany, and was minister in the French church of Berlin. He left that place in 1690; came into England; and was some time minister in the French church in the Savoy, London; and was made dean of Killaloe in Ireland. He died in London, in 1727, aged 73. He was strongly attached to the cause of King William, as appears in his elaborate defence of the revolution, and his history of the assassination-plot. He had great natural abilities, which he improved by true and useful learning. He was a most zealous defender of the primitive doctrine of the protestants, as appears by his writings; and that strong nervous eloquence for which he was so remarkable; enabled him to enforce the doctrines of his profession from the pulpit with great spirit and energy. He published several works in French, that were much esteemed.

ABBAS, son of Abdalthothleb, and Mahomet's uncle, opposed his nephew with all his power, esteeming him an impostor and infidel; but, in the second year of the Hégira, being overcome and made a prisoner at the battle of Bendir in 623, and a great ransom being demanded for him, he represented to Mahomet, that his paying it would reduce him to poverty, which would redound to the dishonour of the family. But Mahomet having been informed of Abbas's having secreted large sums of money, asked him after the purses of gold he had left in his mother's custody at Mecca. Abbas, upon this, conceiving him to be really a prophet, embraced his new religion; became one of his principal captains; and saved his life when in imminent danger at the battle of Hainin, against the Thakefites, soon after the reduction of Mecca. But besides being a great commander, Abbas was also a famous doctor of the Mussulman law, inasmuch that he read lectures upon every chapter of the Koran, as his nephew pretended to receive them one by one from heaven. He died in 652, and his memory is held in the highest veneration among the Mussulmans to this day.

ABBAS (Abul), surnamed Sassah, was proclaimed khalif; and in him began the dynasty of the

ABBASIDES, who possessed the khalifate for 524 years; and there were thirty-seven khalifs of this race who succeeded one another without interruption.

ABBE, *f.* in a modern sense, the name of a curious popular character in France, of late very much mentioned, but very little known, in Britain. The term is not to be rendered in our language, as the existence of the class it denominates is posterior to the reformation, and no such character was known among the Romanists till about a century and a half ago.

Abbés, according to the strictest definition, are persons who have never obtained any precise or fixed settlement in church or state, yet possessed, till very lately, the most ready access to all tables, and to all communities in France. Their dress was rather that of an academic, or of a professed scholar, than of an ecclesiastic; and, by never varying in colour, was no incumbrance on the pocket. We are told these abbés were very numerous, and no less insinuating. They were, in colleges, the instructors of youth; in private families, the tutors of young gentlemen; and many procured a decent livelihood by their literary and witty compositions of all kinds, from the profoundest philosophy, to the most airy romances. They were in short, a body of men who possessed a fund of universal talents and learning, and were incessantly employed in the publication of the most witty sarcasms, and impressive truths. No subject escaped them; serious or gay, solid or ludicrous, sacred or profane, all were subservient to their researches; and, as they were conversant in the lowest as well as the highest political topics, their fame was equally great in the learned, and in the scribbling world. A distinguishing part of their character too was their devotion to the fair-sex: whose favourites, in return, they had the honour of being in the most enviable degree; the wit and smartness for which they were remarkable, being just the very thing

that suited the French ladies. In fine, these abbés were sought after by most people, on various accounts; as they were equally men of business and pleasure, not less expert in the most serious transactions, than fond of enjoying their share in whatever occupied the gay world. Hence they diligently frequented all public spectacles, which were thought incomplete without them; and they composed the most intelligent part of the company, as they were the most weighty approvers or condemnors of what passed in all places. And it is now said, that by the wit and subtlety of their writings,—by the poignancy of their satire, and the freedom of their speech, they were, in a great measure, the instruments of stirring up the public mind, and of bringing about that astonishing revolution, which will ever make the most prominent feature in the civil and political history of France.

ABBE, in a monastic sense, the same with ABBOT.

ABBEFIORD, a sea-port of Norway.

ABBERLOUGH, a beautiful lake in Argyleshire.

ABBERTON, near Loxden, Essex.—ABBERTON, near Pershore, seven miles from Worcester, famous for its mineral water.—ABBERWICK, near Alnwick, Northumberland.—ABBENHALL, twelve miles from Gloucester, three from Newnham, noted for a spring of water very efficacious in the cure of cutaneous eruptions.

ABBESS, *f.* the superior of an abbey or convent of nuns. The abbess has the same rights and authority over her nuns that the abbots regular have over their monks. The sex indeed does not allow her to perform the spiritual functions annexed to the priesthood, wherewith the abbot is usually invested; but there are instances of some abbesses who have a right or rather a privilege, to commission a priest to act for them. They have even a kind of episcopal jurisdiction, as well as some abbots who are exempted from the visitation of their diocessans. Martene, in his Treatise on the Rites of the Church, observes, that some abbesses have formerly consecrated their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it. However, St. Basil, in his rule, allows the abbess to be present with the priest at the confession of her nuns.

ABBEVILLE, a considerable city of France in Picardy, and the capital of Ponthieu; the river Somme runs through the middle of it, and divides it into two parts. It has a collegiate-church, and twelve parish-churches; the most considerable of which are St. George's and St. Giles's, besides a great number of monasteries and nunneries, a bailiwick, and a presidial court. It is a fortified town; the walls are flanked with bastions, and surrounded by large ditches. The country about it is low, marshy, and dirty. It is pretty well peopled, and is famous for its manufactory of soaps, and linen and woollen cloths. It is about fifteen miles east of the British channel, and ships may come by the river Somme to the middle of the town. This city is 52 miles S. of Calais, and 80 N. by W. of Paris. E. lon. 2. 6. lat. 50. 7.

ABBEY, or ABBY, *f.* [abbatia, Lat.] A monastery of religious persons, whether men or women; distinguished from religious houses of other denominations by larger privileges.

Abbeys differ from priories, in that the former are under the direction of an abbot, and the others of a prior; but abbot and prior (we mean a prior conventual) are much the same thing, differing in little but the name. These abbeys were at first nothing more than religious houses, whither persons retired from the bustle of the world to spend their time in solitude and devotion. But they soon degenerated from their original institution, and procured large privileges, exemptions, and riches. They prevailed greatly in England: and, as they increased in riches, so the state became poor; for the lands which these regulars possessed were in *mortua manu*, i. e. could never revert to the lords who gave them. This inconvenience gave rise to the statutes against gifts in *mortmain*, which prohibited donations to these religious houses: and Lord Coke

Coke tells us, that several lords, at their creation, had a clause in their grant, that the donor might give or sell his land to whom he would (*exceptis viris religiosis & Judæis*), excepting monks and Jews.

These places were wholly abolished in England at the time of the reformation; Henry VIII. having first appointed visitors to inspect into the lives of the monks and nuns, which were found in some places very disorderly: upon which, the abbots, perceiving their dissolution unavoidable, were induced to resign their houses to the king, who by that means became invested with the abbey-lands: these were afterwards granted to different persons, whose descendants enjoy them at this day: they were then valued at 2,853,000*l.* per annum,—an immense sum in those days.

Though the suppression of religious houses, even considered in a political light only, was of a very great national benefit, it must be owned that, at the time they flourished, they were not entirely useless. Abbeys or monasteries were then the repositories, as well as the seminaries of learning; many valuable books and national records, as well as private evidences, have been preserved in their libraries; the only places wherein they could have been safely lodged in those turbulent times. Many of those which had escaped the ravages of the Danes, were destroyed with more than Gothic barbarity at the dissolution of the abbeys. These ravages are pathetically lamented by John Bale, in his declaration upon Leland's Journal, 1549. "Covetousness (says he) was at that time so busy about private commodity, that public wealth, in that most necessary and of respect, was not any where regarded. A number of them which purchased these superstitious mansions, reserved of the library-books, some to serve their jacks, some to scour the candlesticks, and some to rub their boots; some they sold to the grocer and soap-feller; and some they sent over the sea to the book-binders, not in small numbers, but in whole ships full; yea, the universities of this realm are not clear of so detestable a fact. I know a merchant that bought the contents of two noble libraries for forty shillings price; a shame it is to be spoken! This stuff hath he occupied instead of grey paper, by the space of more than these ten years, and yet he hath store enough for as many years to come. I shall judge this to be true, and utter it with heaviness, that neither the Britons under the Romans and Saxons, nor yet the English people under the Danes and Normans, had ever such damage of their learned monuments as we have seen in our time."

In those days every abbey had at least one person whose office it was to instruct youth; and the historians of this country are chiefly beholden to the monks for the knowledge they have of former national events. In these houses also the arts of painting, architecture, and printing, were cultivated. The religious houses also were hospitals for the sick and poor; affording likewise entertainment to travellers at a time when there were no inns. In them the nobility and gentry who were heirs to their founders could provide for a certain number of ancient and faithful servants, by procuring them corodies, or stated allowances of meat, drink, and clothes. They were likewise an asylum for aged and indigent persons of good family. The neighbouring places were also greatly benefited by the fairs procured for them, and by their exemption from forest-laws; add to which, that the monastic estates were generally let at very easy rents, the fines given at renewals included.

The abbots who presided over these monasteries, were many of them called to parliament, and had seats and votes in the house of lords. Of abbots and priors who statedly and constantly enjoyed this privilege, there were twenty-nine in all, viz. the Abbot of Tewkesbury, the Prior of Coventry, the Abbots of Waltham, Cirencester, St. John's at Colchester, Croyland, Shrewsbury, Selby, Bardney, St. Bennet's of Hulme, Thorney, Hyde at Winchester, Winchester, Battel, Reading, St. Mary's in York, Ramsey, Peterborough, St. Peter's in Gloucester,

Glastonbury, St. Edmundsbury, St. Austin in Canterbury, St. Alban's, Westminster, Abingdon, Evesham, Malmesbury, and Tavistock, and the prior of St. John's of Jerusalem, who was styled the first baron of England, but it was in respect to the lay barons only, for he was the last of the spiritual barons.

The abbey-lands, before the dissolution of the monasteries, were many of them discharged from the payment of tithes; either by the pope's bulls; or by real composition with the parson, patron, and ordinary; or by their order, as Cistercians, Templars, Hospitalars, and Premonstratenses. But this was only so long as the lands remained in the hands of the several religious societies, and were cultivated by them, and not in the hands of their tenants or lessees. These exemptions by the dissolution had been abolished, if they had not been continued by the act of parliament 31 Henry VIII. c. 13. with respect to such of the monasteries as were dissolved by that act; which enacts, that they who shall have any lands belonging to the said religious houses, shall enjoy them discharged of the payment of tythes, in like manner as the abbots and others enjoyed the same at the time of their dissolution. Which act also created a new discharge, which was not before at the common law, that is, *unity of the possession* of the parsonage and land tithable in the same hand; for if the monastery, at the time of the dissolution, was seized of the lands and rectory, and had paid no tithes within the memory of man for the lands; those lands shall now be exempted from payment of tythe, by a supposed perpetual unity of possession; because the same persons that had the lands, having also the parsonage, could not pay tithes to themselves. And now, though the titles of discharge under 31 Henry VIII. are many of them lost, and cannot be made out at this day; yet if the lands of a religious house have been held since the dissolution freed from the payment of tythes, it shall be intended that they were held so before. Wood, b. 2. c. 2.

ABBEYBOYLE, a town of Ireland, in the county of Roscommon, and province of Connaught, situate on the river Buelle, over which there are two stone bridges. It is eighty-four miles from Dublin, and is remarkable for an old abbey. W. long. 8. 32. lat. 56. 54.

ABBEYHOLM, a town in Cumberland, so called from an abbey built there by David king of Scots. It stands on an arm of the sea, 16 miles from Carlisle. W. long. 2. 38. Lat. 54. 45.

ABBEY-LUBBER, *f.* A slothful loiterer in a religious house, under pretence of retirement and austerity.

ABBOT, *f.* [in the lower Latin *abbas*, from *ab* father, which sense was still implied; so that the abbots were called *patres*, and abbesses *matres monasterii*.] The chief of a convent, or fellowship of canons. Of these, some in England were mitred, some not: those that were mitred, were exempted from the jurisdiction of the diocesan, having in themselves episcopal authority within their precincts, and being also lords of parliament. The other sort were subject to the diocesan in all spiritual government. Some were called *croziered abbots*, from their bearing the crozier or pastoral staff. Others were styled *acumenical* or universal abbots, in imitation of the patriarch of Constantinople: while others were termed *cardinal abbots*, from their superiority over all other abbots. At present, in the Roman-catholic countries, the principal distinctions observed between abbots are those of *regular* and *commendatory*. The former take the vow and wear the habit of their order; whereas the latter are seculars, though they are obliged by their bulls to take orders when of proper age. Anciently, the ceremony of creating an abbot consisted in clothing him with the habit called *cuculus*, or cowl; putting the pastoral staff into his hand, and the shoes called *pedales* on his feet; but at present, it is only a simple benediction, improperly called, by some, consecration.

ABBOT (George), archbishop of Canterbury, was born Oct. 29, 1562, at Guildford in Surrey. He went through his

his studies at Oxford, and in 1597 was chosen principal of University College. In 1599, he was installed dean of Winchester: the year following, he was chosen vice-chancellor of the university of Oxford, and a second time in 1603. In 1604, that translation of the bible now in use was begun by the direction of king James; and Dr. Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the epistles) was committed. The year following, he was a third time vice-chancellor. In 1608, he went to Scotland with George Hume earl of Dunbar, to assist in establishing an union betwixt the kirk of Scotland and the church of England; and in this affair he behaved with so much address and moderation, that it laid the foundation of all his future preferment. For king James ever after paid great deference to his advice and counsel; and upon the death of Dr. Overton bishop of Litchfield and Coventry, he named Dr. Abbot for his successor, who was accordingly constituted bishop of those two united sees in Dec. 1609. About a month afterwards he was translated to the see of London, and on the second of November following was raised to the archiepiscopal see.

His great zeal for the protestant religion made him a strenuous promoter of the match between the Elector Palatine and the princess Elizabeth; which was accordingly concluded and solemnized on the 14th of February, 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. In the following year happened the famous case of divorce betwixt the lady Francis Howard, daughter of the earl of Suffolk, and Robert earl of Essex: an affair which has been by many considered as one of the greatest blemishes of king James's reign: but the part acted therein by the archbishop added much to the reputation he had already acquired for incorruptible integrity. He prepared a speech, which he intended to have spoken against the nullity of the marriage, in the court of Lambeth; but he did not make use of it, because the king ordered the opinions to be given in few words. He continued, however, inflexible in his opinion against the divorce; and drew up his reasons, which the king thought fit to answer himself. It need scarcely be added, that sentence was given in the lady's favour. In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's day: this gave great uneasiness to the archbishop; who, happening to be at Croydon when it came thither, had the courage to forbid its being read.

Being now in a declining state of health, the archbishop used in the summer to go to Hampshire for the sake of recreation; and being invited by Lord Zouch to hunt in his park at Bramshill, he met there with the greatest misfortune that ever befel him; for he accidentally killed the game-keeper by an arrow from a cross-bow which he shot at one of the deer. The accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which this mischance happened, and he settled an annuity of 20l. on the widow. There were several persons who took an advantage of this misfortune, to lessen him in the king's favour; but his majesty said, "An angel might have miscarried in this fort." His enemies alleging that he had incurred an irregularity, and was thereby rendered unfit for performing the offices of a primate; the king directed a commission to ten persons to inquire into this matter.

The result, however, was not satisfactory to his grace's enemies; it being declared, that, as the murder was involuntary, he had not forfeited his archiepiscopal character. The archbishop thenceforward seldom assisted at the council, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and attended with great constancy till his majesty expired on the 27th of March 1625. He performed the ceremony of the coronation of King Charles I. though very infirm and much troubled with the gout. At length being worn out with cares and infirmities, he died at Croydon, the 5th of Aug.

1633, aged 71 years; and was buried at Guildford, the place of his nativity, where he had endowed an hospital with lands, to the amount of 300l. per annum. A stately monument is erected over the grave, with the effigy of the archbishop in his robes.

He showed himself, in most circumstances of his life, a man of great moderation to all parties; and was desirous that the clergy should attract the esteem of the laity by the sanctity of their manners, rather than claim it as due to their function.

ABBOT (Robert), elder brother to the former, born at Guildford in 1560, went through his studies in Baliol college, Oxford. In 1582, he took his degree of master of arts, and soon became a celebrated preacher; and to this talent he chiefly owed his preferment. Upon his first sermon at Worcester, he was chosen lecturer in that city, and soon after rector of All Saints in the same place. John Stanhope, Esq. happening to hear him preach at Paul's-cross, was so pleased with him, that he immediately presented him to the rich living of Bingham in Nottinghamshire. In 1597, he took his degree of doctor in divinity; and, in the beginning of king James's reign, was appointed chaplain in ordinary to his majesty; who had such an opinion of him as a writer, that he ordered the doctor's book *De Antichristo* to be printed with his own commentary upon part of the Apocalypse. In 1609, he was elected master of Baliol college; which trust he discharged with the utmost care and assiduity, by his frequent lectures to the scholars, by his continual presence at public exercises, and by promoting temperance in the society. In Nov. 1610, he was made prebendary of Normanton in the church of Southwell; and, in 1612, the king appointed him regius professor of divinity at Oxford. The fame of his lectures became very great; and those which he gave upon the supreme power of kings against Bellarmine and Suarez, so much pleased his majesty, that when the see of Salisbury became vacant, he named him to that bishopric, and he was consecrated by his own brother at Lambeth, Dec. 3, 1615. When he came to Salisbury, he found the cathedral in a state of decay, owing to the covetousness of the clergy belonging to it; however, he found means to draw five hundred pounds from the prebendaries, which he applied to the reparation of the church. He then gave himself up to the duties of his function with great diligence and assiduity, visiting his whole diocese in person, and preaching every Sunday whilst health would permit. But this was not long: for his sedentary life, and close application to study, brought upon him the gravel and stone; of which he died on the 2d of March 1618, in the fifty-eighth year of his age; having not filled the see quite two years and three months, and being one of the five bishops which Salisbury had in six years. He was buried opposite to the bishop's seat in the cathedral. Dr. Fuller, speaking of the two brothers, says, "that George was the more plausible preacher, Robert the greater scholar; George the abler statesman, Robert the deeper divine; gravity did frown in George, and smile in Robert." He published several pieces: he also left behind him sundry manuscripts, which Dr. Corbet made a present of to the Bodleian library.

ABBOTS, or APEWOOD-CASTLE, in Staffordshire, situated on a lofty round promontory, and a steep ridge of hills extending a mile in length, supposed to have been one continued fortification of the ancient Britons. It is in the parish of Seisdon, seven miles from Wolverhampton. —ABBOT'S-ANNE, near Andover, Hampshire. —ABBOT'S-BECKINGTON, on the river Towridge, Devonshire.

ABBOTS-BROMLEY, a market-town in Staffordshire. After the dissolution of the monasteries, it was given to the Lord Paget; and has since been called Paget's Bromley, and is so denominated in the county map. But it retains its old name in the king's books, and is a discharged vicarage of 30l. clear yearly value. W. long. 1. 53. lat. 52. 50.—The place consists chiefly of one street, about

the middle of which is the town-hall, wherein are annually held the court-leet and court-baron of the Right Hon. the Earl of Uxbridge, lord of the manor, and patron of the church; here is also a market-place, which is spacious and very clean. The houses are neat, and built in general of brick.

Bromley stands in a fine open fertile country, distant from Litchfield 11 miles; Rugely, Uttoxeter, and Wolfelley-bridge, 6; from Stafford 13; and from London 128. It has a free grammar-school, founded in 1603, by Mr. Richard Clarke. Also an alms-house well endowed, by Lambert Bagot, Esq. in 1703, for six poor old men; and several other charities, to a considerable amount. The market-day is on Tuesday; and there are three fairs held annually, for horses, cows, pigs, sheep, &c. viz. on the Tuesday after Midlent Sunday, the 22d of May, and the 4th of September.

ABBOTSBURY, a small town in Dorsetshire, 10 miles from Dorchester, 8 from Weymouth, 7 from Bridport, and 127 from London. The abbey, from which this town took its name, was founded by a Norman lady, about the year 1026; and Edward the Confessor, and William the Conqueror, were considerable benefactors to it. The church is a large and handsome structure, dedicated to St. Nicholas, and supposed to have been built not very long before the reformation; it is situated on the fourth side of the town, and the whole length is forty-eight feet. St. Catherine's chapel stands on an high round hill, half a mile S. W. of the town: it has two porches, a turret at the west end, and windows all round it. It is a strong handsome building, with a compass roof arched with stone, and is esteemed a great curiosity, and one of the most venerable pieces of antiquity this kingdom has to boast. By the stile of building, it seems to have been erected in the reign of Edward IV. It serves, by its high situation, both for a sea and land mark. This town formerly had a market on Fridays, afterwards changed to Thursdays, and two fairs; but the market and one of the fairs are, of late years, quite decayed. Here is still one fair yearly on St. Peter's day, the tutelar saint of the abbey. In 1706, the west part of the town was burnt down. The principal part of the inhabitants (which are not numerous) depend chiefly on fishing, or on the cultivation of small farms; and others are employed in spinning of cotton, which is here manufactured into stockings, the excellency of which has long acquired great reputation. There is a free-school for teaching twenty poor boys reading, writing, and arithmetic; at first endowed with 12l. per ann. since augmented to 20l. by the late Mrs. Horner. The town lies near the shore, where vast quantities of fine mackarel are caught from the middle of March till Midsummer; they have sometimes caught 30 or 40,000 at a draught, and 100 have been sold for a penny: there are many curious stones on the beach, and stone is dug in the quarries near the shore, very serviceable for flating or paving. About a quarter of a mile S. W. of Abbotbury is a large decoy, well covered with wood, where plenty of wild fowl resort, and are taken. A little west of the town is a noble swannery, much visited by strangers: in the open part of the fleet are kept 6 or 700, formerly 1500, swans: the royalty belonged anciently to the abbot; since to the family of the Strangers; now to the countess dowager of Ilchester, who has a small house upon the margin of the beach, where she usually resides some time in the summer months. About a mile and an half west of the town is an old fortification. The vicinity of this town to Weymouth, being a pleasant ride, occasions, in the bathing-season, frequent excursions of company from that place, particularly of such as are curious in monastic antiquities; or have a taste for romantic prospects; none of whom ever visit this place without expressions of the utmost satisfaction and pleasure. Lat. 50. 38. W. lon. 2. 42.

ABBOTSBURY, near Barley, Hertf. ABBOT'S-CARESWELL, Devon.—ABBOT'S-CROME, Worc.—ABBOT'S-FEE-TYTHING, near Sherborne, Dorset.—ABBOTSHAM,

near Biddeford, Devon.—ABBOT'S-LANGLEY, near Barkway, Hertf.—ABBOT'S-LEIGH, or ISLE, near Ilminster, Somerset.—ABBOTSLEY, near St. Neot's, Hunt. ABBOT'S-MORETON, Worcest.—ABBOTSTOCK, Devon.—ABBOTSTOKE, near Benifist, Dorset.—ABBOTSTONE, near Kingswood, Glou. called also WYKE, from a winding brook that runs by it.—ABBOTSTONE, near Sytton, Glou.—ABBOTSTONE, Wilts.—ABBOTSTONE, near Alresford, Hants.—ABBOTSTOOTH, Dorset. near Wimborne.—ABBOTSWOOD, Worcest. 4 miles N. W. of Pershore.—ABBOT'S WORTHY, near Winchester, Hants.—ABBOT'S-COURT, in Walton, Surrey.

ABBOTSHIP, *f.* The state or privilege of an abbot.

To ABBREVIATE, *v. a.* [*abbreviare*, Lat.] To shorten by contraction of parts without loss of the main substance; to abridge.—The only invention of late years, which hath contributed towards politeness in discourse, is that of *abbreviating* or reducing words of many syllables into one, by lopping off the rest. *Swift*.—To shorten, to cut short.

ABBREVIATION, *f.* The act of abbreviating. The means used to abbreviate, as characters signifying whole words; words contracted.—By statute 4 G. 2. c. 26. all law proceedings shall be in the English tongue, and written in a common legible hand and character, and in words at length and not *abbreviated*: but by 6 G. 2. c. 14. this is somewhat mitigated, which allows, that they may be written in the like manner of expressing numbers by figures as hath been commonly used, and with such *abbreviations* as are now commonly used in the English language.

ABBREVIATOR, *f.* [*abbreviator*, Fr.] One who abbreviates, or abridges.

ABBREVIATORS, a college of seventy-two persons in the chancery of Rome, who draw up the pope's briefs, and reduce petitions, when granted by him, into proper form for being converted into bulls.

ABBREVIATURE, *f.* [*abbreviatura*, Lat.] A mark used for the sake of shortening. A compendium or abridgement.—He who prays for him that wrongs him, forgiving all his faults; who sooner shews mercy than anger; who offers violence to his appetite, in all things endeavouring to subdue the flesh to the spirit: this is an excellent *abbreviature* of the whole duty of a Christian. *Taylor*.

ABBREUVOIR, *f.* [a watering-place. Ital. *abbeverato*, dal verbo *bevere*. Lat. *bibere*. This word is derived by Menage, not much acquainted with the Teutonic dialects, from *adbibere* for *adhibere*; but more probably it comes from the same root with *brew*.] Among masons, the joint or juncture of two stones, or the interstice between two stones to be filled up with mortar.

ABBS-HEAD, St. a promontory or head-land in Perwickshire, Scotland, in the division of Lamber Muir. It is the midway between Coldingham and Lumsden. This head-land is the southern extremity of the frith of Forth. Lat. 55. 55. lon. 1. 56. W.

ABBTENAU, a market town, in the archbishopric of Saltzburgh, in the circle of Bavaria, Germany, about ten miles N. W. of Radstadt, on a branch of the river Salzach.

ABCEDARY, or ABCEDARIAN, *adj.* an epithet given to compositions, the part of which are disposed in the order of the letters of the alphabet: thus we say, Abcedarian psalms, lamentations, hymns, &c.

ABCOUDE, a village, about nine miles from Amsterdam, on the road to Utrecht.

ABCOURT, a town near St. Germain's, four leagues from Paris. Here is a brisk chalybeate water impregnated with fixed air and the fossil alkali; and resembling the water of Spa and Ilmington.

ABDALLA, the son of Abdalmothleb, was the father of the prophet Mahomet. Several other Arabians of eminence bore the same name.

ABDALMALEK, the son of Mirvan, and the fifth khalif of the race of the Ommiades, surnamed *Rafsch al Hegianat*, i. e. the skinner of a stone, because of his extreme

treme avarice; as also *Aboulzebah*, because his breath was said to be so poisonous as to kill all the flies which rested on his face. Yet he surpassed all his predecessors in power and dominion; for in his reign the Indies were conquered in the east, and his armies penetrated Spain in the west: he likewise extended his empire toward the south, by making himself master of Medina and Mecca. He began his reign in the sixty-fifth year of the Hegira, A. D. 648; reigned fifteen years; and four of his sons enjoyed the khalifate one after another.

ABDALMOTHLEB, or **ABDAL MATELEB**, the son of Hassem, the father of Abdalla, and grandfather of Mahomet the prophet of the Mussulmans, was, it is said, of such wonderful comeliness and beauty, that all women who saw him became enamoured; which may have given occasion to that prophetic light which, according to the Arabians, shone on the forehead of him, his ancestors, and descendants; it being certain that they were very handsome and graceful men. He died when Mahomet, of whom he had taken particular care, was only eight or nine years old; aged, according to some, 110, and according to other writers 120.

ABDALONYMUS, or **ABDOLONYMUS** (in classic history), of the royal family of Sidon, and descended from king Cinyras, was contented to live in obscurity, and obtain his subsistence by cultivating a garden, while Strato was in possession of the crown of Sidon. Alexander the Great having deposed Strato, enquired whether any of the race of Cinyras was living, that he might set him on the throne. It was generally thought that the whole race was extinct: but at last Abdalonymus was thought of, and mentioned to Alexander; who immediately ordered some of his soldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a stranger to the noise of arms, with which all Asia was at that time disturbed; and they could scarcely persuade him they were in earnest. Abdalonymus at first thought it an insult offered to his poverty. He requested them not to trouble him with their impertinent jests, and to find some other way of amusing themselves, which might leave him in the peaceable enjoyment of his obscure habitation. At length, however, they convinced him that they were serious in their proposal, and prevailed upon him to accept the regal office, and accompany them to the palace. No sooner was he in possession of the government, than pride and envy created him enemies, who whispered their murmurs in every place, till at last they reached the ear of Alexander; who, commanding the new-elected prince to be sent for, required of him, with what temper of mind he had borne his poverty. "Would to heaven," replied Abdalonymus, "that I may be able to bear my crown with equal moderation: for when I possessed little, I wanted nothing: these hands supplied me with whatever I desired." From this answer Alexander formed so high an idea of his wisdom, that he confirmed the choice he had before made, and annexed a neighbouring province to the government of Sidon.

ABDALS, in the eastern countries, a kind of saints supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic *Abdallah*, the servant of God. They are often carried by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion; of which travellers furnish many instances. The English call this *running a muk*, from the name of the instrument, a sort of poniard, which they employ on those desperate occasions. If they are killed, as it commonly happens, before they have done much mischief, they reckon it highly meritorious; and are esteemed, by the vulgar, martyrs for their faith.

ABDARA, or **ABDERA**, anciently a town of Bœotia in Spain, a Phœnician colony; now Adra, to the west of Almeira in the kingdom of Granada.

ABDERA, was formerly a maritime town of Thrace, not far from the mouth of the river Nessus, on the east side. The foundation, according to Herodotus, was at-

tempted to be laid by Timefius the Clazomenian; but he was forced by the Thracians to quit the design. The Teians undertook it, and succeeded; settling there, in order to avoid the insults of the Persians. Several singularities are told of Abdera. The grass of the country round it was so strong, that such horses as ate of it ran mad. In the reign of Cassander king of Macedon, this city was so pestered with frogs and rats, that the inhabitants were forced to quit it for a time. The Abderites, or Abderitani, were very much derided for their want of wit and judgment: yet their city has given birth to several eminent persons; as Protagoras, Democritus, Anaxarchus, Hecateus the historian, Nicenæus the poet, and many others, who were mentioned among the illustrious men.

ABDERAHMA, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the same name.

ABDEST, a Persian word, properly signifying the water placed in a basin for washing the hands; but is used to imply the legal purifications practised by the Mahometans before they enter on their religious ceremonies.

ABDIAS OF BABYLON, one of the boldest legend-writers, who boasted he had seen our Saviour, that he was one of the seventy-two disciples, had been eye-witness of the actions and prayers at the deaths of several of the apostles, and had followed into Persia St. Simon and St. Jude, who, he said, made him the first bishop of Babylon. His book intitled *Historia certaminis apostolici*, was published by Wolfgang Lazius, at Basil, 1551; and it has since borne several impressions in different places.

To **ABDICATE**, *v. a.* [*abdicō*, Lat.] To give up one's right; to resign; to lay down an office.

Old Saturn here, with upcast eyes,
Beheld his *abdicated* skies.

Addison.

ABDICATION, *f.* [*abdicatio*, Lat.] The act of abdicating; resignation; quitting an office by one's own proper act before the usual or stated expiration.

ABDICATION, in law, is where a magistrate or person in office renounces and gives it up. So on king James the Second's leaving the kingdom, the commons voted that he had *abdicated* the government, and thereby the throne was become vacant. The lords would have had the word *deserted* to be made use of, but the commons thought it was not comprehensive enough, for then the king might have liberty of returning.

ABDICATIVE, *adj.* [from *abdo*, Lat. to hide.] That which has the power or quality of hiding.

ABDOMEN, *f.* [from *abdo*, Lat. to hide.] A cavity commonly called the lower venter or belly. It contains the stomach, guts, liver, spleen, bladder, and is within lined with a membrane called the peritonæum. See **ANATOMY**.

ABDOMINALES, or **ABDOMINAL FISHES**, constitute the IVth Order of the Fourth Class of Animals, in the Linnæan system. See **ZOOLOGY**.

To **ABDUCE**, *v. a.* [*abduco*, Lat.] To draw to a different part; to withdraw one part from another. A word chiefly used in physic or science.

ABDUCENT, *adj.* Muscles abducent are those which serve to open or pull back divers parts of the body; their opposites being called adducent.

ABDUCTION, *f.* [*abductio*, Lat.] The art of drawing apart, or withdrawing one part from another.—In logic, a particular form of argument, by the Greeks called *apagogē*, wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the less extreme as not to require some farther medium or proof, to make it appear.—In surgery, a species of fracture, wherein the broken parts of the bone recede from each other.

ABDUCTOR, *f.* [*abductor*, Lat.] The name given by anatomists to those muscles which serve to lead, or draw back, the several members of the body.

ABECEDARIAN,

ABECEDARIAN, *f.* [from the names of *a, b, c*, the three first letters of the alphabet.] He that teaches or learns the alphabet, or first rudiments of literature.

ABEL, second son of Adam and Eve, was a shepherd. He offered to God some of the firstlings of his flock, at the same time that his brother Cain offered the fruits of the earth. God was pleased with Abel's oblation, but displeased with Cain's; which so exasperated the latter, that he rose up against his brother and killed him. These are the only circumstances Moses relates of him; though, were we to take notice of the several particulars to which curiosity has given birth on this occasion, they would run to a very great length. But this will not be expected. It is remarkable, that the Greek churches, who celebrate the feasts of every other patriarch and prophet, have not done the same honour to Abel. His name is not to be found in any catalogue of saints or martyrs till the tenth century; nor even in the new Romish martyrology. However he is prayed to, with some other saints, in several Romish litanies said for persons at the point of death.

ABEL KERAMIM, or **VINCARUM**, beyond Jordan, in the country of the Ammonites, where Jephthah defeated them, seven miles distant from Philadelphia, abounding in vines, and hence the name. It was also called Abela.

ABEL-MEHOLAH, the country of the prophet Elisha, situate on this side Jordan, between the valley of Jezreel and the village of Bethmaela in the plains of Jordan, where the Midianites were defeated by Gideon. Judges, vii. 22.

ABEL-MIZRAIM, called also the Threshing-floor of Atad; signifying the lamentation of the Egyptians; in allusion to the mourning for Jacob. Gen. i. 3, 10, 11. Supposed to be near Hebron.

ABEL-MOSCHUS, or **ABELMUSH**, *f.* in botany, the trivial name of a species of the **HIBISCUS**.

ABEL-SATTIM, or **SITTIM**, a town in the plains of Moab, to the north-east of the Dead Sea, not far from Jordan, where the Israelites committed fornication with the daughters of Moab. So called, probably, from the great number of sittim-trees there.

ABELARD (Peter), one of the most famous doctors of the twelfth century, was born at Palais near Nantz, in Brittany: he was well learned in divinity, philosophy, and the languages; but was particularly distinguished by his skill in logic, and his fondness for disputations, which led him to travel into several provinces in order to give public proof of his acuteness in that science.

After having baffled many antagonists, he read lectures in divinity with great applause at Paris, where he boarded with a canon whose name was Fulbert, and who had a very beautiful niece named Heloise. The canon ardently wished to see this young lady make a figure among the learned, and Abelard was made her preceptor; but, instead of instructing her in the sciences, he taught her to love. Abelard now performed his public functions very coldly, and wrote nothing but amorous verses. Heloise proving with child, Abelard sent her to a sister of his in Brittany, where she was delivered of a son. To soften the canon's anger, he offered to marry Heloise privately; and the old man was better pleased with the proposal than the niece; who, from a singular excess of passion, chose to be Abelard's mistress rather than his wife. She married, however; but used often to protest upon oath that she was single, which provoked the canon to use her ill. Upon this, Abelard sent her to the monastery of Argenteuil; where she put on a religious habit, but did not take the veil. Heloise's relations considering this as a second treachery, hired ruffians, who, forcing into his chamber in the dead of night, emasculated him. This infamous treatment made him fly to the gloom of a cloister. He assumed the monastic habit in the abbey of St. Dennis; but the disorders of that house soon drove him from thence. He was afterwards charged with heresy; but after several persecutions for his religious sentiments, he settled in a solitude in the diocese of Troies, where he

VOL. I. No. 1.

built an oratory, to which he gave the name of the Paraclet. He was afterwards chosen superior of the abbey of Ruis, in the diocese of Vannes; when the nuns being expelled from the nunnery in which Heloise had been placed, he gave her his oratory, where she settled with some of her sister nuns, and became their prioress.—Abelard died in the priory of Marcellus at Chalons, April 21, 1142, aged sixty-three. His corpse was sent to Heloise, who buried it in the Paraclet. He left several works: the most celebrated of which are those tender letters that passed between him and Heloise, with an account of their misfortunes prefixed; which have been translated into English, and immortalized by the harmony of Mr. Pope's numbers.

ABEL-TREE, *f.* or **ABELE-TREE**, an obsolete name for a species of the poplar. See **POPULUS**.

ABELLIANS, **ABEOLITES**, or **ABELONIANS**, *f.* in church-history, a sect of heretics mentioned by St. Austin, which arose in the diocese of Hippo in Africa, and is supposed to have begun in the reign of Arcadius, and ended in that of Theodosius. Indeed it was not calculated for being of any long continuance. Those of this sect regulated marriage after the example of Abel; who, they pretended, was married, but died without ever having known his wife. They therefore allowed each man to marry one woman, but enjoined them to live in continence; and, to keep up the sect, when a man and woman entered into this society, they adopted a boy and a girl, who were to inherit their goods, and to marry upon the same terms of not begetting children, but of adopting two of different sexes.

ABELLA, anciently a town of Campania, near the river Clanius. The inhabitants were called Abellani, and said to have been a colony of Chalcidians. The nux Avellana, called also Prænestina, or the hazel-nut, takes its name from this town, according to Macrobius. Now Avella.

ABELLINUM, anciently a town of the Hirpini, a people of Apulia; distant about a mile from the rivulet Sabbato, between Beneventum and Salernum. Pliny calls the inhabitants Abellinates, with the epithet Protopi, to distinguish them from the Abellinates Marsi. Now Avellino.—E. lon. 15. 20. lat. 21.

ABEN EZRA (Abraham), a celebrated rabbi, born at Toledo, in Spain, called by the Jews, The wise, great, and admirable, Doctor, was a very able interpreter of the Holy Scriptures; and was well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is, Commentaries on the Old Testament, which is much esteemed: these are printed in Bomberg's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Holy Scriptures: he almost always adheres to the literal sense, and every where gives proofs of his genius and good sense: he, however, advances some erroneous sentiments. The scarcest of all his books is intitled Jesud Mora; which is a theological work, intended as an exhortation to the study of the Talmud. He died in 1174, aged 75.

ABEN MELLER, a learned rabbi, who wrote a commentary on the Old Testament in Hebrew, intitled, The Perfection of Beauty.

ABENAS, a town of France, in Languedoc and in the Lower Vivarais, seated on the river Ardesch, at the foot of the Cevennes. E. lon. 4. 43. lat. 44. 40.

ABENEL GAUBY, a fixed star of the second or third magnitude, on the south scale of the constellation **LIBRA**.

ABENOW, a mountain of Suabia, in Germany, twenty-three miles from Friburg. It is the source of the Danube, and gives name to a chain of mountains, extending from the Rhine to the Neckar, and from the Forest-Towns to the city of Thorheim.

ABENRADE, a mountainous district of Slewick; it has for its capital

ABENRADE, or **APENRADE**, a flourishing town, on a spacious

spacious bay, with a good harbour, where they build large ships. Lat. 55. 6. N. lon. 9. 14. E.

ABENSBURG, a small town of Germany, in the circle and duchy of Bavaria, and in the government of Munich. It is seated on the river Abentz, near the Danube. E. lon. 11. 38. lat. 48. 45.

ABERAVON, a borough-town of Glamorganshire, in Wales, governed by a portreeve. It had a market, which is now discontinued. The vicarage is discharged, and is worth 45*l.* clear yearly value. It is seated at the mouth of the river Avon, 194 miles west of London. W. lon. 3. 21. lat. 51. 40.

ABERBROTHWICK, or ABERBROATH, one of the royal boroughs of Scotland, situated in the county of Angus, about forty miles N. N. E. of Edinburgh; its W. lon. being 2. 29. and N. lat. 56. 36. It is seated on the discharge of the little river Brothie into the sea, as the name imports, *Aber* in the British implying such a situation. It is a small but flourishing place, well built, and still increasing.—The glory of this place was the abbey, whose very ruins give some idea of its former magnificence. It was founded by William the Lion in 1173, and dedicated to our celebrated primate Thomas à Becket.

ABERCONWAY, or CONWAY, Caernarvonshire, North Wales; so called from its situation at the mouth of the river Conway. It is a handsome town, pleasantly situated on the side of a hill, and has many conveniences for trade; notwithstanding which it is the poorest town in the county. It was built by Edward I. and had not only walls, but a strong castle which is now in ruins. Here is an inscription on the tomb of one Nicholas Hooker, importing that he was the one-and-fortieth child of his father, and had twenty-seven children himself. It is 235 miles from London. W. lon. 3. 47. N. lat. 53. 20.

ABERCORN, a town of West Lothian, near the Edinburgh Frith; here began the Roman wall, said to have been built by Severus, which ran west across the country to the Frith of Clyde.

ABERCORN, a small town of Georgia, North America, thirteen miles north-west of Savannah.

ABERDEEN, the name of two cities in Scotland, called the Old and New Town, situated on the German ocean, in W. lon. 1. 40. and N. lat. 57. 19.—Aberdeen is a place of great antiquity. According to tradition, it was of note in the reign of Gregory, who conferred on it some privileges about the year 893. In 1004, Malcolm II. founded a bishopric at a place called Mortlich in Banffshire, in memory of a signal victory which he there gained over the Danes: which bishopric was translated to Old Aberdeen by David I. and in 1163, the then bishop of Aberdeen obtained a new charter from Malcolm IV. There is extant a charter of Alexander II. by which, in 1217, the king grants to Aberdeen the same privileges he had granted to his town of Perth.

The Old Town lies about a mile to the north of the New, at the mouth of the river Don, over which is a fine Gothic bridge, of a single arch, greatly admired, which rests at both sides on two rocks. The Old Town was formerly the seat of the bishop, and had a large cathedral commonly called St. Machar's. Two very antique spires, and one aisle, which is used as a church, are now the only remains of it. The bishopric was founded in the time of David I. as above-mentioned. The cathedral had anciently two rows of stone pillars across the church, and three turrets; the steeple, which was the largest of these turrets, rested upon an arch, supported by four pillars. In this cathedral there was a fine library; but, about the year 1560, it was almost totally destroyed. But the capital building is the King's College on the south side of the town, which is a large and stately fabric. It is built round a square, with cloisters on the south side. The chapel is very ruinous within; but there still remains some wood-work of exquisite workmanship, which was preserved by the spirit of the principal at the time of the reformation, who armed his people and checked the blind

zeal of the barons of the Mearns; who, after stripping the cathedral of its roof, and robbing it of the bells, were going to violate this feat of learning. They shipped their sacrilegious booty, with an intention of exposing it to sale in Holland: but the vessel had scarcely gone out of port, when it perished in a storm with all its ill-gained lading. The steeple is vaulted with a double cross arch; above which is an imperial crown, supported by eight stone pillars, and closed with a globe and two gilded crosses. In the year 1631 this steeple was thrown down by a storm, but was soon after rebuilt in a more stately form. This college was founded in 1494, by William Elphinston bishop of this place, lord chancellor of Scotland in the reign of James III. and lord privy seal in that of James IV. But James V. claimed the patronage of it, and it has since been called the King's College. This college, and the Marischal-college in the New Town, form one university, called the University of King Charles. The library is large, but not remarkable for many curiosities. Hector Boethius was the first principal of the college; and sent for from Paris for that purpose, on an annual salary of forty merks Scots, at thirteen-pence each. The square tower on the side of the college was built by contributions from General Monk and the officers under him then quartered at Aberdeen, for the reception of students; of which there are about a hundred belonging to the college, who lie in it.

The New Town is the capital of the shire of Aberdeen. For largeness, trade, and beauty, it greatly exceeds any town in the north of Scotland. It is built on a rising ground, and lies on a small bay formed by the Dee, deep enough for a ship of 200 tons, and above two miles in circumference. The buildings (which are of granite from the neighbouring quarries) are generally four stories high; and have, for the most part, gardens behind them, which gives it a beautiful appearance. In the High-street is a large church which formerly belonged to the Franciscans. This church was begun by Bishop William Elphinston; and finished by Gavinus Dunbar, bishop of Aberdeen, about the year 1500. Bishop Dunbar is said likewise to have built the bridge over the Dee, which consists of seven arches. In the middle of Castle-street is an octagon building, with neat bas-reliefs of the kings of Scotland from James I. to James VII. The town-house makes a good figure, and has a handsome spire in the centre. The grammar-school is a low, but neat building. Gordon's hospital is handsome; in front is a good statue of the founder, and it maintains forty boys, who are apprenticed at proper ages. The infirmary is a large plain building, and sends out between eight and nine hundred cured patients annually. But the chief public building in the New Town is the Marischal-college, founded by George Keith earl of Marischal, in the year 1593, but since greatly augmented by additional buildings, which has about 140 students belonging to it. In both the Marischal and King's colleges, the languages, mathematics, natural philosophy, divinity, &c. are taught by very able professors. The convents in Aberdeen were: One of Mathurines, or of the order of the Trinity, founded by William the Lion, who died in 1214; another of Dominicans, by Alexander II. a third of Observantines, a building of great length in the middle of the city, founded by the citizens and Mr. Richard Vans, &c. and a fourth of Carmelites, or White Friars, founded by Philip de Arbuthnot in 1350.—Aberdeen, including the Old Town, is supposed to contain 25,000 people. Its trade is considerable, but might be greatly extended by an attention to the white fisheries.

The harbour was long a great detriment to its trade, and occasioned the loss of many lives and much property. A stranger could never depend upon finding it as he left it; while vessels lay at anchor in the road till the tide should make, they have often been wrecked by storms which suddenly arose. It was very narrow at the mouth, having the easterly rocky point of the Grampian mountains on the

the fourth, and a flat blowing sand on the north, extending along the coast for many miles. By the easterly and northeasterly storms the sand was driven in a long ridge across the harbour's mouth, and formed what was called the bar. Upon this bar the depth of water at low tide was sometimes not above three feet. Clearing away the sand, though but a partial and temporary remedy, was a matter of great expence to the community. If it was cleared one week so as to have five or six feet of water at ebb, a fresh storm the next week undid all that had been done. The town at last came to the resolution of erecting a strong pier on the north side of the harbour. This pier is 1200 feet in length, and gradually increases in thickness and height as it approaches to the sea, where the head or rounding is sixty feet in diameter at the base, and the perpendicular elevation is thirty-eight feet. The whole is built of granite, the most durable stone known; many of the outside stones are above three tons weight, with hewn beds. It was built under the direction of Mr. Smeaton; and the expence, amounting to above 17,000*l.* is defrayed by doubling the harbour-dues, which are chiefly paid by the inhabitants.—A little to the south of the bar, they have now a depth of seventeen fathoms at low water; and at the harbour's mouth, from eight to nine fathoms, where they had formerly but a few feet.

Aberdeen once enjoyed a good share of the tobacco trade. At present its imports are from the Baltic, and a few merchants trade to the West Indies and North America. Its exports are stockings, thread, salmon, and oatmeal. The first is a most important article, as appears by the following state of it: for, for this manufacture, 20,800 pounds worth of wool is annually imported, and 1600 pounds worth of oil. Of this wool are annually made 69,333 dozen pairs of stockings; worth, at an average, 1*l.* 10*s.* per dozen. These are the work of the country-people in almost all parts of this great county, who get 4*s.* per dozen for spinning, and 14*s.* per dozen for knitting; so that there is annually paid them 62,329*l.* 14*s.* There is, besides, about 2000*l.* value of stockings manufactured from the wool of the county.—The thread manufacture is another considerable article, though trifling in comparison of the woollen.—The salmon-fisheries on the Dee and the Don are a good branch of trade. About forty-six boats and 130 men are employed on the first; and, in some years, 167,000*lb.* of fish have been sent pickled to London, and about 930 barrels of salted fish exported to France, Italy, &c.—The fishery on the Don is far less considerable. The fish of this river are taken in cruises above the bridge; a practice contrary to the ancient laws of the kingdom, unless where the nature of the water rendered the net-fishery impracticable. The inhabitants likewise export considerable quantities of pickled pork, which they sell to the Dutch for victualling their East-India ships and men of war; the Aberdeen pork having the reputation of being the best cured of any in Europe for keeping on long voyages.—“It is however remarkable, (Mr. Knox observes,) that there is not a single decked vessel fitted out from Aberdeen for the herring or white fisheries. Here is now an excellent harbour: an active people, conversant in trade, and possessed of capital; seated within six hours sailing of the Long Portys, and two days sailing of the Shetland Isles. This inattention is the more extraordinary, as the exports of Aberdeen, though very considerable, do not balance the imports in value. The herring and white fisheries, therefore, if prosecuted with vigour, and cured and dried with judgment, would not only extend the scale of exports, but also furnish the outward-bound vessels with freights, and better affortments for the foreign markets. The salmon of the Dee and Don are taken in great abundance, cured in the highest perfection, and greatly valued at the European markets. If the merchants, in addition to these, should also export the cargoes of fifty or sixty vessels constantly employed in the herring and white fisheries, the port of Aberdeen would in a few years become the most celebrated mart of fish now existing.”

From a round hill at the west of the city, flow two springs, one of pure water, and the other of a quality resembling German Spa. Aberdeen, with Aberbrothwick, Brechin, Montrose, and Inverberrie, returns one member to parliament.

ABERDEENSHIRE, comprehends the districts of Mar, Gariech, Strathbogie, and the greater part of Burchan; and sends one member to parliament. It is washed on the east and north by the ocean, and abounds in sea-ports; from whence there is a safe and ready passage to the Orkneys and Shetland Isles, the Greenland fisheries, Norway, and the regions round the Baltic; the German coast, Holland, Flanders, and France. It is watered by numerous streams, all of them the resort of salmon, and whose banks display very extensive plantations of natural woods.

ABERDOUR, a small town in Fifeshire, Scotland, on the frith of Forth, about ten miles N. W. of Edinburgh. In old times it belonged to the Viponts; but in 1126 it was transferred to the Mortimers by marriage, and afterwards to the Douglasses. William lord of Liddefdale, surnamed the *Flower of Chivalry*, in the reign of David II. by charter conveyed it to James Douglas, ancestor to the present noble owner the Earl of Morton.

ABERFORD, a market-town in the West Riding of Yorkshire, 188 miles from London. It stands on the great Roman causeway, which, all the way to Cattleford-bridge, appears as entire as when first made, though it is upwards of seventeen hundred years old. Under the town runs the river Cock; and near it may be seen the foundation of an old fort, called Castle-cary. Here was formerly a priory of Franciscan friars.—This town has been many years noted for its manufactory of pins; but otherwise it is a place of no trade. It has a market on Wednesday, and five annual fairs, viz. the last Monday in April, the last Monday in May, the first Monday in October, the first Monday after St. Luke, and the first Monday after All Souls. W. lon. 2. 45. lat. 53. 52.

ABERFRAW, a small town in Anglesea, North Wales, twenty miles from Holyhead. It derives its name from the river Aber, on the banks of which it is situated. On one side it is surrounded by sand-banks; and, on the opposite, by fine fertile land, producing, in particular, remarkable fine barley. Though Aberfraw is now an inconsiderable place, it was formerly the residence of the famous prince Llewellyn, the remains of whose house are yet to be seen. The river is navigable, in the summer season, for vessels from thirty to forty tons burthen, up to its quay. The living is in the king's gift, and worth 300*l.* per annum.

ABERGAVENNY, a large, populous, and flourishing, town, in Monmouthshire, seated at the confluence of the rivers Usk and Gavenny. It has a fine bridge over the Usk, consisting of fifteen arches; and being a great thoroughfare from the west part of Wales to Bath, Bristol, Gloucester, and other places, is well furnished with accommodation for travellers. It is surrounded with a wall, and had once a castle. It carries on a considerable trade in flannels, which are brought hither for sale from the other parts of the county. It is governed by a bailiff, recorder, and twenty-seven burgesses.—The environs of Abergavenny are rich and beautiful, and, like the rest of the vale from Brecknock, abound with the most charming variety of landscape. The prospects are terminated at proper distances with mountains, among which, at the opposite side of the town, Skirid-vawr and Blorench raise their conspicuous heads. The mountains in this neighbourhood abound with iron-ore, coal, and lime; and thereon have been lately erected several capital iron-works. Abergavenny is 16 miles from Monmouth, and 144 from London. W. lon. 2. 45. lat. 5. 50. Abergavenny appears to have been the *Gibbanium* of Antoninus, and the town of Usk his *Burrium*.

ABERGELY, a village of Denbighshire.—ABERGUILLY, or ABERGERLECH, a town of Carmarthenshire.

ABERLADY,

ABERLADY, a village in East Lothian.—ABERLEMON, in the shire of Angus.—ABERLEY, ABURLEY, or ABBOTSLEY, Worcestershire.—ABERLOUR, in the shire of Elgin.

ABERNETHY (John), an eminent dissenting minister, born at Colrairie on the 19th of October, 1680. He studied at the university of Glasgow, till he took the degree of master of arts; and, in 1708, he was chosen minister of a dissenting congregation at Antrim, where he continued above twenty years. About the time of the Bangorian controversy, a dissent arose among his brethren in the ministry at Belfast, on the subject of subscription to the Westminster confession; in which he became a leader on the negative side, and incurred the censure of a general synod. Being in consequence deserted by the greatest part of his congregation, he accepted an invitation to settle in Dublin, where his preaching was much admired. He was distinguished by his candid, free, and generous, sentiments; and died of the gout, December 1740, in the 60th year of his age. He published a volume of Sermons on the Divine Attributes; after his death a second volume was published by his friends; and these were succeeded by four other volumes on different subjects: all of which have been greatly admired.

ABERNETHY, a town on the river Spey, in Murrayshire, near which was erected a famous monument, called Macduff's cross; where if any, within the ninth degree to Macduff, fled, for manslaughter, he was pardoned on paying a few heads of cattle, by way of fine.

ABERNETHY, a town in Strathern, a district of Perthshire, in Scotland. It is seated on the river Tay, a little above the mouth of the Erne. It is said to have been the seat of the Pictish kings; and was afterwards the see of an archbishop, since transferred to St. Andrew's. It is now greatly decayed.

ABERRANCE, or ABERRANCY, *f.* [from *aberro*, Lat. to wander from the right way.] A deviation from the right way; an error; a mistake; a false opinion.—Could a man be composed to such an advantage of constitution, that it should not at all adulterate the images of his mind; yet this second nature would alter the crasis of his understanding, and render it as obnoxious to *aberrances* as now. *Glanville.*

ABERRANT, *adj.* [from *aberrans*, Lat.] Deviating, wandering from the right or known way.

ABERRATION, *f.* [*aberratio*, Lat.] The act of deviating from the common or accustomed track.

ABERRATION, in astronomy, an apparent motion of the celestial bodies, observed in the last century by M. Picard, Dr. Hook, Flamsteed, and others; but explained only of late years, by the ingenious Dr. Bradley, who, for the purpose of discovering the true causes of this remarkable phenomenon, erected an apparatus for the zenith of Kew, and another for that of Wanstead, in order to observe more accurately such stars as he judged likely to throw some light upon the subject.

On the 3d of December 1725, the bright star in the head of Draco, marked γ by Bayer, was for the first time observed, as it passed near the zenith, and its situation carefully taken with the instrument; and, about the beginning of March following, the star was found to be $20''$ more southerly than at the time of the first observation. It now seemed to have arrived at its utmost limit southward; for in several trials, made by Dr. Bradley about this time, no sensible difference was observed in its situation. By the middle of April, however, it appeared to be returning back again towards the north; and, about the beginning of June, it passed at the same distance from the zenith as it had done in December, when it was first observed.

From the quick alteration in the declination of the star at this time, increasing about one second in three days, it was conjectured that it would now proceed northward, as it had before gone southward, of its present situation; and it happened accordingly; for the star continued to move northward till September following, when it became

stationary again; being then near $20''$ more northerly than in June, and upwards of $39''$ more northerly than it had been in March. From September the star again returned towards the south, till, in December, it arrived at the same situation in which it had been observed twelve months before, allowing for the difference of declination on account of the precession of the equinox.

After continuing these observations a few months longer, Dr. Bradley discovered what he then apprehended to be a general law observed by all the stars, namely, that each of them became stationary, or was farthest north or south, when it passed over his zenith at six of the clock, either in the evening or morning. He perceived also that whatever situation the stars were in, with respect to the cardinal points of the ecliptic, the apparent motion of every one of them tended the same way, when they passed his instrument about the same hour of the day or night; for they all moved southward when they passed in the day, and northward when in the night; so that each of them was farthest north, when it came in the evening about six of the clock, and farthest south when it came about six in the morning.

After two years had been employed in these observations, he at last discovered, through an amazing sagacity, that this apparent motion of the stars was only a deception on the optic nerve, occasioned by the progressive motion of light, and the earth's annual motion in her orbit: for he perceived; that if light were propagated in time, the apparent place of a fixed object would not be the same when the eye is at rest, as when it is moving in any other direction but that of the line passing through the object and the eye; and that, when the eye is moving in different directions, the apparent place of the object would be different.

M. de Maupertuis, in his Elements of Geography, gives a familiar and ingenious idea of the aberration, in this manner: "It is just the same, (says he,) concerning the direction in which a gun must be pointed to strike a bird in its flight; instead of pointing it straight to the bird, the fowler will point a little before it, in the path of its flight, and that so much the more as the flight of the bird is more rapid, with respect to the flight of the shot." In this way of considering the matter, the flight of the bird represents the motion of the earth, and the flight of the shot represents the motion of the rays of light.

M. Clairaut too, in his Memoires of the Academy of Sciences for the year 1746, illustrates this effect in a familiar way, by supposing drops of rain to fall rapidly and quickly after each other from a cloud, under which a person moves with a very narrow tube; in which case it is evident that the tube must have a certain *inclination*, in order that a drop which enters at the top may fall freely through the axis of the tube, without touching the sides of it; which inclination must be more or less, according to the velocity of the drops in respect to that of the tube: then the angle made by the direction of the tube and of the falling drops, is the aberration arising from the combination of those two motions.—This discovery is certainly one of the brightest of the present age.

ABERRATION of the Planets, is equal to the geocentric motion of the planet, the space it appears to move as seen from the earth, during the time that light employs in passing from the planet to the earth. Thus in the sun, the aberration in longitude is constantly 20 sec. that being the space moved by the sun, or, which is the same thing, by the earth, in the time of 8 min. 7 sec. which is the time in which light passes from the sun to the earth. In like manner, knowing the distance of any planet from the earth, by proportion it will be, as the distance of the sun is to the distance of the planet, so is 8 min. 7 sec. to the time of light passing from the planet to the earth: then computing the planet's geocentric motion in this time, that will be the aberration of the planet, whether it be in longitude, latitude, right ascension, or declination.

ABERRATION, in optics, the deviation or dispersion of the rays of light when reflected by a speculum, or refracted

fracted by a lens, by which they are prevented from meeting or uniting in the same point, called the geometrical focus, but are spread over a small space, and produce a confusion of images. Aberration is either lateral or longitudinal: the lateral aberration is measured by a perpendicular to the axis of the speculum or lens, drawn from the focus to meet the refracted or reflected ray: the longitudinal aberration is the distance, on the axis, between the focus and the point where the ray meets the axis.—There are two species of aberration, distinguished according to their different causes: the one arises from the figure of the speculum or lens, producing a geometrical dispersion of the rays, when these are perfectly equal in all respects; the other arises from the unequal refrangibility of the rays of light themselves; a discovery that was made by Sir Isaac Newton, and for this reason it is often called the Newtonian aberration. As to the former species of aberration, or that arising from the figure, it is very small, and easily remedied, in comparison with the other, arising from the unequal refrangibility of the rays of light, which is very great; and, hence it may seem strange that objects appear through telescopes so distinct as they do, considering that the error arising from the different refrangibility is almost incomparably larger than that of the figure.

In consequence of the discovery of the unequal refrangibility of light, and the apprehension that equal refractions must produce equal divergencies in every sort of medium, it was supposed that all spherical object-glasses of telescopes would be equally affected by the different refrangibility of light, in proportion to their aperture, of whatever materials they might be constructed: and therefore that the only improvement that could be made in refracting telescopes, was that of increasing their length. So that Sir Isaac Newton, and other persons after him, despairing of success in the use and fabric of lenses, directed their chief attention to the construction of reflecting telescopes. However, about the year 1747, M. Euler applied himself to the subject of refraction; and pursued a hint suggested by Newton, for the design of making object-glasses with two lenses of glass inclosing water between them; hoping that, by constructing them of different materials, the refractions would balance one another, and so the usual aberration be prevented. Mr. John Dollond, an ingenious optician in London, minutely examined this scheme, and found that M. Euler's principles were not satisfactory. M. Clairaut likewise, whose attention had been excited to the same subject, concurred in opinion that Euler's speculations were more ingenious than useful. This controversy, which seemed to be of great importance in the science of optics, engaged also the attention of M. Klingenstierna of Sweden, who was led to make a careful examination of the eighth experiment in the second part of Newton's Optics, with the conclusions there drawn from it. The consequence was, that he found that the rays of light, in the circumstances there mentioned, did not lose their colour, as Sir Isaac had imagined. This hint of the Swedish philosopher led Mr. Dollond to re-examine the same experiment; and after several trials it appeared, that different substances caused the light to diverge very differently, in proportion to their general refractive powers. In the year 1757, therefore, he procured wedges of different kinds of glass, and applied them together so that the refractions might be made in contrary directions, that he might discover whether the refraction and divergency of colour would vanish together. The result of his first trials encouraged him to persevere; for he discovered a difference far beyond his hopes in the qualities of different kinds of glass, with respect to their divergency of colours. The Venice glass and English crown glass were found to be nearly allied in this respect: the common English plate glass made the rays diverge more; and the English flint glass most of all. But without enquiring into the cause of this difference, he proceeded to adapt wedges of crown glass, and of white flint glass, ground to different angles, to each other, so as to refract in different directions; till

the refracted light was entirely free from colours. Having measured the refractions of each wedge, he found that the refraction of the white glass was to that of the crown glass, nearly as 2 to 3: and he hence concluded in general, that any two wedges made in this proportion, and applied together so as to refract in contrary directions, would refract the light without any aberration of the rays.

Mr. Dollond's next object was to make similar trials with spherical glasses of different materials, with the view of applying his discovery to the improvement of telescopes: and here he perceived that, to obtain a refraction of light in contrary directions, the one glass must be concave, and the other convex; and the latter, which was to refract the most, that the rays might converge to a real focus, he made of crown glass, the other of white flint glass. And as the refractions of spherical glasses are inversely as their focal distances, it was necessary that the focal distances of the two glasses should be inversely as the ratios of the refractions of the wedges; because that, being thus proportioned, every ray of light that passes through this compound glass, at any distance from its axis, will constantly be refracted, by the difference between two contrary refractions, in the proportion required; and therefore the different refrangibility of the light will be entirely removed. But in the applications of this ingenious discovery to practice, Mr. Dollond met with many and great difficulties. At length, however, after many repeated trials, by a resolute perseverance, he succeeded so far as to construct refracting telescopes much superior to any that had hitherto been made; representing objects with great distinctness, and in their true colours.

M. Clairaut, who had interested himself from the beginning in this discovery, now endeavoured to ascertain the principles of Mr. Dollond's theory, and to lay down rules to facilitate the construction of these new telescopes. With this view he made several experiments, to determine the refractive power of different kinds of glass, and the proportions in which they separated the rays of light: and from these experiments he deduced several theorems of general use. M. d'Alembert made likewise a great variety of calculations to the same purpose; and he shewed how to correct the errors to which these telescopes are subject, sometimes by placing the object-glasses at a small distance from each other, and sometimes by using eye-glasses of different refractive powers. But though foreigners were hereby supplied with the most accurate calculations, they were very defective in practice. And the English telescopes, made, as they imagined, without any precise rule, were greatly superior to the best of their construction.

M. Euler, whose speculations had first given occasion to this important and useful enquiry, was very reluctant in admitting Mr. Dollond's improvements, because they militated against a pre-conceived theory of his own. At last however, after several altercations, being convinced of their reality and importance by M. Clairaut, he assented; and he soon after received farther satisfaction from the experiments of M. Zeiher, of Petersburg.—M. Zeiher shewed by experiments that it is the lead, in the composition of glass, which gives it this remarkable property, namely, that while the refraction of the mean rays is nearly the same, that of the extreme rays considerably differs. And, by increasing the lead, he produced a kind of glass, which occasioned a much greater separation of the extreme rays than that of the flint glass used by Mr. Dollond, and at the same time considerably increased the mean refraction. M. Zeiher, in the course of his experiments, made glass of minium and lead, with a mixture also of alkaline salts; and he found that this mixture greatly diminished the mean refraction, and yet made hardly any change in the dispersion: and he at length obtained a kind of glass greatly superior to the flint glass of Mr. Dollond for the construction of telescopes; as it occasioned three times as great a dispersion of the rays as the common glass, whilst the mean refraction was only as

1.61 to 1.—Other improvements have since been made on the new or achromatic telescopes by the inventor Mr. John Dollond, and by his son Peter Dollond; which see at large under the article OPTICS.

ABERRATION, (Crown of,) is a luminous circle surrounding the real disk of the sun, and depending on the aberration of the solar rays, whereby his apparent diameter is enlarged.

To **ABERUNCATE**, *v. a.* [*averunco*, Lat.] To pull up by the roots; to extirpate utterly.

ABERYSTWITH, a market-town of Cardiganshire, in Wales, seated on the Ridal, near its confluence with the Iſtwith, where it falls into the sea. It is a populous and rich town, and has a great trade in lead, and a considerable fishery of whiting, cod, and herrings. It was formerly surrounded with walls, and fortified with a castle; but both are now in ruins. It is 30 miles distant from Cardigan, and 203 south-west of London. Lat 52. 30. lon. 4. 0. W.

ABESTA, *f.* the name of one of the sacred books of the Persian magi, which they ascribe to their great founder Zoroaster. The abesta is a commentary on two others of their religious books called Zend and Pazend; the three together including the whole system of the Ignicold or worshippers of fire.

To **ABET**, *v. a.* [from *betan*, Sax. signifying to enkindle or animate.] To push forward another, to support him in his designs by connivance, encouragement, or help. It was once indifferent, but is almost always taken by modern writers in an ill sense.

ABETMENT, *f.* The act of abetting.

ABETTER, or **ABETTOR**, *f.* He that abets; the supporter or encourager of another.—In law, it implies one who encourages another to the performance of some criminal action. Abettors of murder, are such as command, procure, or counsel, others to commit a murder; and, in case they are present when the murder is committed, they shall be taken as principals, but if absent at the time of committing the fact, they shall be considered as accessaries only. Treason is the only crime in which abettors are excluded by law, every individual concerned being considered as a principal.

ABEX, a country in Africa, bordering on the Red Sea. It is subject to the Turks, and has the name of the Beglerbeg of Habeleth. It is about five hundred miles in length and one hundred in breadth, and is a wretched barren country. The heat here is almost insupportable, and the air is so unhealthy, that an European cannot stay long in it without the utmost hazard of his life. It is very mountainous, and there are many more wild beasts than men. Here are forests, in which grow a great number of ebony-trees.

ABEYANCE, *f.* [law-term, from *bayer*, Fr. to expect,] is that which is in expectation, remembrance, and intentment, of the law. By a principle of law, in every land there is a fee-simple in somebody, or else it is in *abeyance*; that is, though for the present it be in no man, yet it is in expectancy belonging to him that is next to enjoy the land. Thus if a man be patron of a church, and presenteth a clerk to the same, the fee of the lands and teneaments pertaining to the rectory is in the parson: but if the parson dies, and the church becometh void, then is the fee in *abeyance*, until there be a new parson presented, instituted, and inducted. 1 *Inſt.* 342. And though where no person is seen or known in whom the inheritance can vest, it may be in *abeyance*, as in a limitation to several persons, and the survivor, and the heirs of such survivor, because it is uncertain who will be survivor: yet the freehold cannot, because there must be a tenant to the præcipe always. 1 *Vezy*, 174.

ABGAR, or **ABGARUS**, a name given to several of the kings of Edeſſa in Syria. The most celebrated of them is one who, it is said, was cotemporary with our Saviour; and who having a distemper in his feet, and hearing of Christ's miraculous cures, requested him by letter to come

and cure him. Eusebius, who believed that this letter was genuine, and also an answer our Saviour is said to have returned to it, has translated them both from the Syriac, and asserts that they were taken out of the archives of the city of Edeſſa. The first is as follows:—"Abgarus, prince of Edeſſa, to Jesus the holy Saviour, who hath appeared in the flesh in the confines of Jerusalem, greeting. I have heard of thee, and of the cures thou hast wrought without medicines or herbs. For it is reported thou makest the blind to see, the lame to walk, lepers to be clean, devils and unclean spirits to be expelled, such as have long been diseased to be healed, and the dead to be raised; all which when I heard concerning thee, I concluded with myself, That either thou wast a god come down from heaven, or the Son of God sent to do these things. I have therefore written to thee, beseeching thee to vouchsafe to come unto me, and cure my disease. For I have also heard that the Jews use thee ill, 'and lay snares to destroy thee. I have here a little city, pleasantly situated, and sufficient for us both. **ABGARUS**." To this letter, Jesus, it is said, returned an answer by Annanias, Abgarus's courier; which was as follows: "Blessed art thou, O Abgarus: who hast believed in me whom thou hast not seen; for the scriptures say of me, They who have seen me have not believed in me, that they who have not seen, may, by believing, have life. But whereas thou writest to have me come to thee, it is of necessity that I fulfill all things here for which I am sent; and having finished them, to return to him that sent me: but when I am returned to him, I will then send one of my disciples to thee, who shall cure thy malady, and give life to thee and thine. **JESUS**." After Christ's ascension, Judas, who is also named Thomas, sent Thaddeus, one of the seventy, to Abgarus; who preached the gospel to him and his people, cured him of his disorder, and wrought many other miracles: which was done, says Eusebius, A. D. 43.—Though the above letters are acknowledged to be spurious by the candid writers of the church of Rome; several Protestant authors, as Dr. Parker, Dr. Cave, and Dr. Grabe, have maintained that they are genuine, and ought not to be rejected.

ABGILLUS (John), surnamed Preſter-John, was son to a king of the Frisicii; and, from the austerity of his life, obtained the name of *Preſter*, or Priest. He attended Charlemagne in his expedition to the Holy Land; but, instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abyssines, called, from his name, the empire of Preſter-John.

ABGREGATION, *f.* [*abgregatio*, Lat.] A separation from the flock.

ABHEL, *f.* in botany, a name given to the shrub called SAVIN.

ABHER, **HABAR**, or **EBHER**, a city of Persian-irak, or ancient Parthia, with a small river of the same name running through the middle of it, which makes it very pleasant. Its mosques, bazars, inns, &c. are elegant, and their gardens are of immense extent. It contains 2500 houses, and is governed by a deroga. Lat. 36. 14. N. lon. 50. 59. E.

To **ABHOR**, *v. a.* [*abhorreo*, Lat.] To hate with acrimony; to detest to extremity; to loath; to abominate. A church-of-England man *abhors* the humour of the age, in delighting to sling scandals upon the clergy in general; which, besides the disgrace to the reformation, and to religion itself, casts an ignominy upon the kingdom. *Swift*.

ABHORRENCE, or **ABHORRENCY**, *f.* The act of abhorring, detestation; the disposition to abhor, hatred. The first tendency to any injustice that appears, must be suppressed with a show of wonder and *abhorrency* in parents and governors. *Locke*.

ABHORRENT, *adj.* Struck with abhorrence; loathing; contrary to; foreign; inconsistent with. It is used with the particles *from* or *to*, but more properly with *from*.—This I conceive to be an hypothesis, well worthy a rational

tional belief; and yet it is so *abhorrent* from the vulgar, that they would as soon believe Anaxagoras, that snow is black, as him that should affirm it is not white. *Glanville.*

ABHORRER, *f.* The person that abhors; a hater, a detester.

ABHORRING, the object of abhorrence. This seems not to be the proper use of the participial noun.—They shall go forth, and look upon the carcases of the men that have transgressed against me: for their worm shall not die, neither shall their fire be quenched, and they shall be an *abhorring* unto all flesh. *Isaiah*, lvi. 44.

ABIAD, a town on the coast of Abex, seated on a high mountain, remarkable for its trade in ebony and aromatic plants.

ABIANS, anciently a people of Thrace, or (according to some authors) of Scythia. They had no fixed habitations; they led a wandering life. Their houses were wagons, which carried all their possessions. They lived on the flesh of their herds and flocks, on milk, and cheese, chiefly on that of mare's milk. They were unacquainted with commerce, and only exchanged commodities with their neighbours. They possessed lands, but they did not cultivate them; for they assigned their agriculture to any who would undertake it, reserving only to themselves a tribute; which they exacted, not with a view to live in affluence, but merely to enjoy the necessities of life. They never took arms but to oblige those to make good a promise to them by whom it had been broken. They paid tribute to none of the neighbouring states. They deemed themselves exempt from such an imposition; for they relied on their strength and courage, and consequently thought themselves able to repel any invasion. The Abians, we are told, were a people of great integrity. This honourable eulogium is given them by Homer. *Strabo.*

ABIATHAR, high-priest of the Jews, son to Abimelech, who had borne the same office, and received David into his house. This so enraged Saul, who hated David, that he put Abimelech to death, and eighty-one priests; Abiathar alone escaped the massacre. He afterwards was high-priest; and often gave king David testimonies of his fidelity, particularly during Absalom's conspiracy, at which time Abiathar followed David, and bore away the ark. But after this he conspired with Adonijah, in order to raise him to the throne of David his father; this so exasperated Solomon, that he afterwards divested him of the priesthood, and banished him, A. M. 3021, before Christ 1014.

ABIB, *f.* signifying an ear of corn, a name given by the Jews to the first month of their ecclesiastical year, afterwards called Nisan. It commenced at the vernal equinox; and according to the course of the moon, by which their months were regulated, answered to the latter part of our March and beginning of April.

To **ABIDE**, *v. n.* I abode or abid, [from *bidian*, or *abidian*, Sax.] To stay in a place; not to remove.—Those who apply themselves to learning, are forced to acknowledge one God, incorruptible and unbegotten; who is the only true being, and *abides* for ever above the highest heavens, from whence he beholds all the things that are done in heaven and earth. *Stillingfleet.*—To remain; not cease or fail; to be immovable. To continue in the same state. To endure without offence, anger, or contradiction. It is used with the particle *with* before a person, and *at* or *in* before a place.—It is better that I give her to thee, than I give her to another man: *abide with me.* *Gen.* xxix. 19.—For thy servant vowed a vow, while I *abode at* Gethur in Syria, saying, if the Lord shall bring me again indeed to Jerusalem, then I will serve the Lord. *2 Sam.* xv. 8.—It is used with *by* before a thing; as, to *abide by* his testimony; to *abide by* his own skill; that is, to rely upon them. To *abide by* an opinion, to maintain it; to *abide by* a man, is also to defend or support him. But these forms are something low.—Of the participle *abid*, I have found only the example in Woodward, and should rather determine that

abide in the active sense has no passive participle, or compounded preterite. *Johnson.*

To **ABIDE**, *v. a.* To wait for, expect, attend, wait upon, await: used of things prepared for persons, as well as of persons expecting things. To bear or support the consequences of a thing. To bear or support, without being conquered or destroyed.—But the Lord he is the true God, he is the living God, and an everlasting king: at his wrath the earth shall tremble, and the nations shall not be able to *abide* his indignation. *Jer.* x. 10.—To bear without aversion; in which sense it is commonly used with a negative. To bear or suffer:

—Girt with circumfluous tides,
He still calamitous constraint *abides*.

Pope.

ABIDER, *f.* The person that abides or dwells in a place; perhaps that lives or endures. A word little in use.

ABIDING, *f.* Continuance; stay; fixed state.—We are strangers before thee and sojourners, as were all our fathers: our days on the earth are as a shadow, and there is none *abiding*. *1 Chron.* xxix. 15.

ABJECT, *adj.* [*abjectus*, Lat. thrown away as of no value.] Mean; worthless; base; groveling: spoken of persons, or their qualities.—Honest men, who tell their sovereigns what they expect from them, and what obedience they shall be always ready to pay them, are not upon an equal foot with base and *abject* flatterers. *Addison.*—Being of no hope or regard: used of condition.—We see man and woman in the highest innocence and perfection, and in the most *abject* state of guilt and infirmity. *Addison.*—Mean and despicable: used of actions:

To what base ends, and by what *abject* ways,
Are mortals urg'd, through sacred lust of praise? *Pope.*

ABJECT, *f.* A man without hope; a man whose miseries are irretrievable; one of the lowest condition.—Yea, the *abjects* gathered themselves together against me. *Psalms* xxxv. 15.

ABJECTEDNESS, *f.* The state of an abject.

ABJECTION, *f.* Meanness of mind; want of spirit; servility; baseness.—That this should be termed baseness, *abjection* of mind, or servility, is it credible? *Hooker.*

ABJECTLY, *adv.* In an abject manner, meanly, basely, servilely, contemptibly.

ABJECTNESS, *f.* Abjection, servility, meanness.—Servility and *abjectness* of humour is implicitly involved in the charge of lying.

ABIES, *f.* the fir-tree. See **PINUS**.

ABIGEAT, *f.* an old law-term, denoting the crime of stealing cattle by droves or herds. This crime was severely punished; the delinquent being often condemned to the mines, banishment, or something capital.

ABIHU, brother to Nadab, and son to Aaron. The two former had the happiness to ascend mount Sinai with their father, and there to behold the glory of God; but afterward putting strange fire into their censers, instead of the sacred fire commanded by God, fire rushed upon them, and killed them. Though all the people bewailed this terrible catastrophe, Moses forbid Aaron and his two sons Eleazar and Ithamar to join in the lamentation.

ABIH SCYTHÆ, taken by Strabo to denote the European Sarmatæ, bordering on the Thracians and Bastianæ: they were commended by Curtius for their love of justice, and by Ammiesius for their contempt of earthly things.

ABILITY, *f.* [*habileté*, Fr.] The power to do any thing, whether depending upon skill, or riches, or strength, or any other quality. Capacity of mind; force of understanding; mental power. When it has the plural number, *abilities*, it frequently signifies the faculties or powers of the mind, and sometimes the force of understanding given by nature, as distinguished from acquired qualifications.

ABIMELECH, king of Gerar, a country of the Philistines, was cotemporary with Abraham. This patriarch and his family being there, his wife Sarah, though ninety years

years of age, was not safe in it; for Abimelech carried her off, and was so enamoured of her, that he resolved to marry her. Abraham did not declare himself Sarah's husband; but gave out she was his sister. But the king being warned in a dream, that she was married to a prophet, and that he should die if he did not restore her to Abraham, the king obeyed, at the same time reproving Abraham for his dissimulation; who, thereupon, among other excuses, said she was really his sister, being born of the same father, though of a different mother. Abimelech afterwards gave considerable presents to Abraham; and a covenant was entered into between them.—After the death of Abraham, there being a famine in the neighbouring countries, Isaac his son also withdrew into Gerar, which was then likewise governed by a king called

ABIMELECH, probably the successor of the former. Here Rebecca's beauty forced her husband to employ Abraham's artifice. Abimelech discovering that they were nearly related, chid Isaac for calling his wife his sister; and at the same time forbade all his subjects, upon pain of death, to do the least injury to Isaac or Rebecca.—Isaac's prosperity lost him the king's friendship, and he was desired to go away from among them. He obeyed; but Abimelech afterwards entered into a covenant with him.

ABIMELECH, the natural son of Gideon, by Drumahis concubine. His violent acts and death are recorded in Judges, chap. ix.

ABINGDON, the county-town of Berkshire, seated on a branch of the Thames, is of great antiquity. It had its name and principal glory from the abbey, founded by the father of King Ina, about the year of Christ 675, which was one of the finest and richest in England. Henry I. furnished Beauderk, was educated in this monastery. Kenulphus, King of the West Saxons, gave to the monastery of Abingdon fifteen mansions, called Oulnam, with all profits to the same belonging, as an inheritance for ever, and that it should be for ever free from all episcopal jurisdiction; and that all discussions of causes should be subject to the decree of the abbot of that monastery only. From this charter Sir Edward Coke inferred, that the ecclesiastical jurisdiction was always invested in the imperial crown of England; and, therefore, the statute made under Henry VIII. concerning the king's spiritual authority, was not introductory of a new law, but declaratory only of an old one.

The town, (which has two churches and three meeting-houses for dissenters,) consists of several streets, which centre in a spacious area, where the market is kept on Monday and Friday, toll-free, and is very considerable for barley, as there are great quantities of malt made here, and sent down the Thames in barges to London. The market-house is a stately edifice, of most curious workmanship, and claims the preference of most others in the kingdom; over which there is a noble hall, where the summer assize is held; the Lent assize being held at Reading. The county-court is kept here once a month, at which the members for the county are elected; as also the coroners, and verdurers of Windsor forest. It had formerly an elegant cross, but it was quite demolished in the civil wars. It is a free borough, and sends one member to parliament; the first of which it sent to parliament in the 4th year of the reign of Philip and Mary. The right of election is in the inhabitants paying scot and lot, and not receiving alms, or any charity, by a resolution of the house of commons the 18th of January, 1708. The supposed number of voters is 600. It is a town-corporate, consisting of a mayor, recorder, two bailiffs, twelve principal burgesses, sixteen secondary burgesses, two sergeants, and a beadle.

Here is a good free-school, founded in 1563, by Mr. John Roys; also several alms-houses well endowed; and about 900l. per ann. left for charitable uses. Also a large manufactory, which employs a great number of hands in the packing, bagging, and floor and sail cloths, which are principally sent to London. Here are seven fairs annually, viz. on the first Monday in Lent, May the 6th, June 20,

August 5, September 19; Monday before Old Michaelmas-day, for servants, &c. and on December 11.

Abingdon is distant from Oxford six miles, from Wantage ten, Farringdon fourteen, Wallingford ten, Newbury twenty-one, Reading twenty-six, and fifty-six from London. This town is supposed by Bishop Gibson to be the place called, in the Saxon annals, *Clovesho*, where two synods are said to have been held, one in 742, and the other in 822. Lat. 51. 42. lon. 1. 20.

ABINGDON, a pretty town of Philadelphia county, in Pennsylvania; also a small town in Ireland, seven miles east of Limerick, and ninety miles from Dublin.

ABINTESTATE, *adj.* [of *ab*, from, and *intestatus*, Lat.] A term of law, implying him that inherits from a man, who, though he had the power to make a will, yet did not make it.

ABIPONIANS, a tribe of American Indians, who formerly inhabited the districts of *Chaks*, in Paraguay; but the hostilities of the Spaniards have now obliged them to remove southward into the territory lying between Santa Fe and St. Jago. The only account we have of them is that published by M. Dobrizhoffer in 1785. This gentleman, who lived seven years in their country, informs us, that they are not numerous, the whole nation not much exceeding 5000; for which he assigns as a reason an unnatural custom among their women of sometimes destroying their own children from motives of jealousy, lest their husbands should take other mates during the long time they give suck, which is not less than two years. They are naturally white, but, by exposure to the air and smoke, become of a brown colour. They are a strong and hardy race of people; which our author attributes to their marrying so late, an Abiponian seldom or never thinking of marriage till thirty years of age. They are greatly celebrated on account of their chastity and other virtues; though they seem to have no knowledge of a Deity. They make frequent incursions into the territories of the Spaniards, mounted on the horses which run wild in those parts. They have a kind of order of chivalry for their warriors; and are so formidable, that a hundred of their enemies will fly before ten of these horsemen. The hatred which these savages, whose manners, though rude and uncultivated, are in many respects pure and virtuous, bear to the Spaniards, is invincible. "These pretended Christians, (says our author,) who are the scum of the Spanish nation, practise every kind of fraud and villany among these poor barbarians; and their corrupt and vicious morals are so adapted to prejudice the Abiponians against the Christian religion, that the Jesuit missionaries have, by a severe law, prohibited any Spaniard from coming, without a formal permission, into any of their colonies."—From this account of the success of the Jesuits in converting them to Christianity, it does not appear that they have been able to make any impression on their minds; so that in general they are quite ignorant and uncivilized: a most striking instance of which is, that in counting they can go no farther than three; and all the art of the Jesuits to teach them the simplest use and expression of numbers, has proved unsuccessful.

ABIRAM, a seditious Levite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, in order to share with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven, and consumed 250 of their followers. Numb. xvi.

ABISHAI, son of Zeruah, and brother to Job, was one of the celebrated warriors who flourished in the reign of David. He killed with his own hand 300 men, with no other weapon but his lance; and slew a Philistine giant, the iron of whose spear weighed 300 shekels. 1 Samuel, xxvi. 2 Samuel, xxiii.

To ABJUGATE, *v. a.* [*abjugo*, Lat.] To unyoke, to uncouple.

ABIUL,

ABIUL, a town of Baira, containing 1300 inhabitants. Lat. 40. 20. lon. 7. 10. W.

To ABJURE, *v. a.* [*abjuro*, Lat.] To cast off upon oath, to swear not to do or not to have something. To retract, recant, or abnegate a position upon oath.

ABJURATION, *f.* The act of abjuring. The oath taken for that end in law; by which it was anciently the custom, that if a person had committed a felony, and could fly to a church or church-yard before he was apprehended, he could not be taken from thence to be tried for his crime; but on confession thereof before the coroner, he was admitted to his oath to *abjure* the realm. But by the 21 J. c. 28. all privilege of sanctuary, and abjuration consequent thereupon, is utterly abolished. 2 *Infl.* 628.

But there is one kind of abjuring the realm which yet remains, as not depending on any privilege of sanctuary; and that is, with respect to popish recusants convicted, removing from the place of their habitation without licence, and not conforming in three months after notice: in which case, they are required by statute 35 Eliz. c. 2. to abjure the realm before two justices of the peace or the coroner; the form of which abjuration, according to the old books, is this: "This hear you, Sir Coroner, that I, A. B. am a popish recusant, and, in contempt of the laws and statutes of England, I have and do refuse to come to their church. I do therefore, according to the intent and meaning of the statute made in the 35th year of queen Elizabeth late queen of this realm of England, abjure the realm of England. And I shall haste me towards the port of C. which you have given and assigned to me, and that I shall not go out of the highway leading thither, nor return back again; and if I do, I will that I be taken as a felon of the king. And that at C. I will diligently seek for passage, and will tarry there but one flood and ebb, if I can have passage; and unless I can have it in such place, I will go every day into the sea up to my knees, affaying to pass over. So help me God and his doom." *Stamf.* 116. *Offic. Cor.* 49.

There is also an oath of abjuration, whereby every person in any office, trust, or employment, *abjures* the pretender, and recognises the right of his majesty under the act of settlement, engaging to support him, and promising to disclose all treasons and traitorous conspiracies against him.

ABKAS, one of the seven nations, in the countries comprehended between the Black Sea and the Caspian. Its capital is Anakopir, tributary to the Turks.

To ABLACTATE, *v. a.* [*ablacto*, Lat.] To wean from the breast.

ABLACTATION, *f.* in medicine, the taking a child from the milk of the breast; also called *apogalactismus*. When the mother wants health, or strength; hath too small nipples, or ill formed ones; when the infant will not take the breast; the mother's milk is bad or in too small a quantity; when the mother hath weak nerves, is apt easily to be surprised; these defects spoil the milk, and render it advisable to wean the child. It can never be useful to continue the breast more than eight or nine months; but generally, if a child is favoured with a good supply by suckling, during its first three or four months, and is in a tolerably healthful state, it will rarely be the worse for weaning at this early period; so that if difficulties attend its being suckled, there need not be any hesitation about taking it from the breast. If it feeds tolerably with the spoon, and is free from disorders in its bowels, a tendency to convulsions, &c. weaning may be attempted at any time. But, if feeding with the spoon is difficult; if the child is much subject to the gripes, &c. another nurse should be sought for, and weaning must be deferred until more favourable circumstances attend. In general, the sooner a child is weaned, the more easy it parts with the breast. Prudence directs to accustom infants to early feeding with the spoon, and to continue the same until the breast may be wholly omitted. They should only be fed once in six hours, at the most, during the first two months; and should be entirely weaned from the breast, and from all feeding in the night; for

night-feeding bloats them, and if they are not used to it in the first week, they will never want it: if they are not disturbed from their birth, in a week or two, they will be formed to a habit of sleeping most of the night very quietly.

The food should be simple and light; not spoiled with sugar, wine, and such-like additions, for they produce the diseases with which children are most troubled, acidities in the *prima via*. Unfermented flour makes a viscid food that turns sour before it digests, and well fermented bread soon turns sour; but if this latter is made into fresh panada every night and morning, or, in cool weather, every morning, the inconvenience of souring is prevented. To avoid acidity in the child's stomach by a daily use of vegetable food, give now and then a little fresh broth, made from either veal, mutton, or beef, once or twice in the day; suppose, for example, a mixture of equal parts of the gravy which is discharged in cutting a joint that is brought hot on the table, and warm water, to which may be added a little salt, and thus an excellent broth is readily made. This fills children with humours, only of the most nourishing kind. Cows milk, a little diluted with water, is an excellent substitute for the mother's; yet, as it is apt to turn sour, add to it a little Lisbon sugar. Rice is not so apt to turn sour as wheat bread is; it therefore would be a more convenient food for children, and deserves to be attended to. Toasted bread boiled in water till it is almost dry, then mixed with fresh milk, not boiled, is an agreeable change. As the teeth advance, the diet may increase in its solidity. As to the quantity, let the appetite be the measure of it; observing to satisfy hunger, but no more, which may be thus managed; feed the child no longer than he eats with a degree of eagerness. In feeding, let the child be held in a sitting posture, and thus continue it until the stomach has nearly digested its contents. The practice of violently dancing and shaking the child should be avoided, though moderate exercise is essentially necessary.—Keep the child awake until it breaks wind after each time it is fed; divert it during the day as much as you can, and thus it will soon lie quiet all the night. Never awaken a child when it is asleep, for thus sickness and peevishness are often produced. As soon as teeth appear, give the child now and then a piece of flesh meat in its hand to chew; but never give it any confectionaries.

ABLACTATION, *f.* One of the methods of grafting; and, according to the signification of the word, as it were a weaning of a scion by degrees from its mother stock; not cutting it off wholly from the stock, till it is firmly united to that on which it is grafted.

ABLAÏ, a country of Great Tartary, the inhabitants of which, called *Buchars* or *Buchares*, are subject to Russia, but that only for protection. It is governed by a Calmuc prince, and lies eastward of the river Irty, extending five hundred leagues along the southern frontiers of Siberia.

ABLANIA, *f.* in botany. See *TRICHOCARPUS*.

ABLAQUEATION, *f.* [*ablaqueatio*, Lat.] The art or practice of opening the ground about the roots of trees, to let the air and water operate upon them.

ABLATION, *f.* [*ablatio*, Lat.] The act of taking away.

ABLATIVE, *adj.* in grammar, [*ablatus*, Lat.] That which takes away. It is the sixth case of Latin nouns. Priscian also calls it the *comparative case*; as serving among the Latins for comparing as well as for taking away. The ablative is opposite to the DATIVE; the first expressing the action of taking away, and the latter that of giving. In English, French, &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, *the magnitude of the city*, and *to speak much of the city*; we say, that of the city in the first is *genitive*, and in the latter *ablative*; because it would be so, if the two phrases were expressed in Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischlin and Crusius; the former of whom maintained, and the latter opposed, the reality of it. The dis-

pute still subsists among their respective followers. The chief reason alleged by the former is, that the Roman writers often joined Greek words with the Latin prepositions, which govern ablative cases, as well as with nouns of the same case. To which their opponents answer, that the Latins anciently had no ablative themselves; but instead thereof, made use, like the Greeks, of the dative case: till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances: but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative.

ABLE, *adj.* [*habile*, Fr. *habilis*, Lat. skilful, ready.] Having strong faculties, or great strength or knowledge, riches or any other power of mind, body, or fortune. Having power sufficient; enabled.—Before a verb, with the particle *to*, it signifies generally having the power. Wrath is cruel, and anger is outrageous; but who is *able* to stand before envy? *Prov.* xxvii. 4.—With *for* it is not often nor very properly used.

ABLE, or **ABEL** (Thomas), chaplain to queen Catharine consort to Henry VIII. distinguished himself by his zeal in opposing the proceedings against that unfortunate princess for a divorce. He took the degree of bachelor of arts at Oxford on the 4th of July, 1513, and that of master of arts on the 27th of July, 1516. In 1534 he fell under a prosecution for being concerned in the affair of Elizabeth Barton, called the *Holy Maid of Kent*. This was an infamous impostor, suborned by the monks to use some strange gesticulations, and to pretend to inspiration by the spirit of prophecy; and so well did she act her part, that some people of consequence gave credit to her; but being at last detected, she was condemned and executed, after discovering the names of her principal accomplices and instigators. On her account Able was accused of misprision of treason, by stat. 25 Henry VIII. and, being also one of those who denied the king's supremacy over the church, he was apprehended and imprisoned; during which time his confinement was so rigorous, that the keeper of Newgate was committed to the Marshalsea prison for suffering him to go out upon bail. He was afterwards hanged, drawn, and quartered, at Smithfield, in 1540.

To **ABLE**, *v. a.* To make able; to enable, which is the word commonly used.

ABLE-BODIED, *adj.* Strong of body.—It lies in the power of every fine woman, to secure at least half a dozen *able-bodied* men to his majesty's service. *Addison*.

ABLECTI, in Roman antiquity, a select body of soldiers chosen from among those called *EXTRAORDINARIII*.

To **ABLEGATE**, *v. a.* [*ablego*, Lat.] To send abroad upon some employment; to send out of the way.

ABLEGATION, *f.* The act of sending abroad.

ABLEGMINA, *f.* in Roman antiquity, those choice parts of the entrails of victims which were offered in sacrifice to the gods. They were sprinkled with flour, and burnt upon the altar; the priests pouring some wine on them.

ABLENESS, *f.* Ability of body or mind, vigour, force.

ABLEPSY, *f.* [*αβληψια*, Gr.] Want of sight, blindness; unadvisedness.

ABLIGURITION, *f.* [*abliguritiio*, Lat.] Prodigal expence on meat and drink.

ABLIGATE, *v. a.* [from *abligo*, Lat.] To tie up from.

To **ABLOCATE**, *v. a.* [*abloco*, Lat.] To let out to hire.—Perhaps properly by him who has hired it from another.

ABLOCATION, *f.* A letting out to hire.

ABLOE, a town of Little Tartary, between the river Dnieper and the Black Sea. Lat. 46. 20. N. lon. 33. 15. E.

To **ABLUDE**, *v. n.* [*abludo*, Lat.] To be unlike.

ABLUENT, *adj.* [*abluens*, Lat. from *abluo*, to wash

away.] That which washes clean; that which has the power of cleansing.

ABLUTION, *f.* [*ablutio*, Lat.] The act of cleansing, or washing clean. The water used in washing:

Wash'd by the briny wave, the pious train
Are cleans'd, and cast th' *ablutions* in the main. *Pope*.

The rinsing of chemical preparations in water, to dissolve and wash away any acrimonious particles.

ABLUTION, in a religious sense, a ceremony in use among the ancients, and still practised in several parts of the world: it consisted in washing the body, which was always done before sacrificing, or even entering their houses.—Ablutions appear to be as old as any ceremonies, and external worship itself. Moses enjoined them; the heathens adopted them; and Mahomet and his followers have continued them: thus they have got footing among most nations, and make a considerable part of many established religions. The Egyptian priests had their diurnal and nocturnal ablutions; the Grecians their sprinklings; the Romans their lustrations and lavations; the Jews their washing of hands and feet, beside their baptisms. The ancient Christians had their ablutions before communion; which the Romish church still retain before their mass, sometimes after: the Syrians, Cophts, &c. have their solemn washings on Good-Friday: the Turks their greater and lesser ablutions; their Ghast and Wodou, their Aman, Taharat, &c.—The Indians practise ablution, and have a high veneration for the waters of the Ganges. But as they cannot at all times be near enough to wash themselves in its sacred waters, the bramins tell them that all other waters will have the same virtue, if, whilst they are bathing, they pronounce these words, "O Ganges, purify me."

No doubt ablutions might be designed to represent inward purity; but they were at the same time calculated for the preservation of health. However whimsical these washings may appear to some, few things would tend more to prevent diseases than a proper attention to many of them. Were every person, for example, after visiting the sick, handling a dead body, or touching any thing that might convey infection, to wash before he went into company, or sat down to meat, he would run less hazard of catching the infection himself, or of communicating it to others.

ABNAKIS, a tribe of Indians between Canada and New England, who dislike labour, and prefer hunting and fishing to tillage.

To **ABNEGATE**, *v. a.* [*abnego*, Lat.] To deny.

ABNEGATION, *f.* [*abnegatio*, Lat. denial, from *abnegare*, to deny.] Denial, renunciation.

ABNER, the son of Ner, father-in-law to Saul, and general of all his forces, who served him on all occasions with fidelity and courage. After the death of that prince, Abner set Ishbosheth, Saul's son, on the throne. A war breaking out between the tribe of Judah who had elected David king, and Israel, Abner marched against that prince with the flower of his troops, but was defeated. Abner afterward, being disguised, went over to David, and disposed the chiefs of the army and the elders of Israel to declare for him; and was received by David with such testimonies of affection, as gave umbrage to Joab, who killed him traitorously.

ABNODATION, *f.* [*abnodatio*, Lat.] The act of cutting away knots from trees: a term of gardening.

ABNORMOUS, *adj.* [*abnormis*, Lat. out of rule.] Irregular, misshapen.

ABO, a maritime town in Sweden: it is the capital of the province of Finland, and lies upon the point where the gulphs of Bothnia and Finland unite. It is a good port; and is the see of a bishop, suffragan of Upsal. It has an university; founded by queen Christina in 1640, and endowed with the same privileges as that of Upsal. There is also a school here, which was founded by Gustavus Adolphus, for 300 scholars. This town is tolerably well built, and contains several brick buildings; but the generality are of wood painted red. The inhabitants export linen,

linen, corn, and planks. It lies 140 miles north-east from Stockholm. Lat. 60. 27. lon. 22. 18. E.

ABOARD, *adv.* a sea-term, but adopted into common language; [derived immediately from the French *à bord*, as *aller à bord*, *envoyer à bord*.] *Bord* is itself a word of very doubtful original, and perhaps, in its different acceptations, deducible from different roots. *Bord*, in the ancient Saxon, signified a *house*; in which sense to *go aboard*, is to take up residence in a ship. Hence any person who enters a ship is said to *go aboard*; but when an enemy enters in the time of battle, he is said to *board*; a phrase which always implies hostility.—To *fall aboard of*, is to strike or encounter another ship when one or both are in motion, or to be driven upon a ship by the force of the wind or current.—*Aboard main-tack*, the order to draw the main-tack, i. e. the lower corner of the main-sail, down to the CHESS-TREE.

ABODE, *f.* Habitation, dwelling, place of residence:

Others may use the ocean as their road,
Only the English make it their *abode*;
Whose ready sails with every wind can fly,
And make a cov'nant with th' inconstant sky. *Waller.*
Stay, continuance in a place:

The woodcocks early visit, and *abode*
Of long continuance in our temperate clime,
Foretell a liberal harvest. *Phillips.*

To *make abode*. To dwell, to reside, to inhabit.

To **ABODE**, *v. a.* [See **BODE**.] To foretoken or foreshow; to be a prognostic, to be ominous. It is taken, with its derivatives, in the sense either of good or ill.

ABODEMENT, *f.* A secret anticipation of something future; an impression upon the mind of some event to come; prognostication; omen:

I like not this.

For many men that fumble at the threshold;
Are well foretold that danger lurks within.—
—Tush! man, *abodelements* must not now affright us.

Shakespeare.

To **ABOLISH**, *v. a.* [*aboleo*, Lat.] To annul; to make void: applied to laws or institutions. To put an end to, to destroy.—Fermented spirits contract, harden, and consolidate, many fibres together, *abolishing* many canals; especially where the fibres are the tenderest, as in the brain. *Arbuthnot.*

ABOLISHABLE, *adj.* That which may be abolished.

ABOLISHER, *f.* He that abolishes.

ABOLISHMENT, *f.* The act of abolishing.

ABOLITION, *f.* The act of abolishing. This is now more frequently used than *abolishment*.—An apoplexy is a sudden *abolition* of all the senses, and of all voluntary motion, by the stoppage of the flux and reflux of the animal spirits through the nerves destined for those motions. *Arbuthnot.*

ABOLLA, *f.* a kind of garment worn by the Greeks and Romans, chiefly out of the city, in following the camp.—Critics and antiquaries are greatly divided as to the form, use, kinds, &c. of this garment. Papias makes it a species of the toga, or gown; but Nonius, and the generality, a species of the pallium, or cloak. The *abolla* seems rather to have stood opposed to the toga, which was a garment of peace, as the *abolla* was of war; at least Varro and Martial place them in this opposite light. There seem to have been different kinds of *abollas*, fitted to different occasions. Even kings appear to have used the *abolla*: Caligula was affronted at king Ptolemy for appearing at the shows in a purple *abolla*, and by the éclat thereof turning the eyes of the spectators from the emperor upon himself.

ABOMASUS, **ABOMASUM**, **ABOMASIUS**, *f.* names of the fourth stomach of ruminating animals. It is in the *abomasus* of calves and lambs that the runnet is formed wherewith milk is curdled.

ABOMINABLE, *adj.* [*abominabilis*, Lat.] Hateful, detestable; to be loathed. Unclean. In low and ludicrous language, it is a word of loose and indeterminate censure.

ABOMINABLENESS, *f.* The quality of being abominable; hatefulness, odiousness.—Till we have proved, in its proper place, the eternal and essential difference between virtue and vice, we must forbear to urge atheists with the corruption and *abominableness* of their principles. *Bentley.*

ABOMINABLY, *adv.* A word of low or familiar language, signifying excessively, extremely, exceedingly; in an ill sense. It is not often seriously used.

To **ABOMINATE**, *v. a.* [*abominor*, Lat.] To abhor, detest, hate utterly.—Pride goes hated, cursed, and *abominated* by all. *Hammond.*

ABOMINATION, *f.* Hatred, detestation. The object of hatred. Pollution, defilement. Wickedness; hateful or shameful vice. The cause of pollution.

It is used in scripture with regard to the Hebrews, who, being shepherds, are said to have been an *abomination* to the Egyptians, because they sacrificed the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as abominations, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, because the worship of idols is in itself an abominable thing, and at the same time ceremonies observed by idolaters were always attended with licentiousness and other odious and abominable actions. The *abomination of desolation*, foretold by the prophet Daniel, is supposed to imply the statue of Jupiter Olympius, which Antiochus Epiphanes caused to be placed in the temple of Jerusalem. And the *abomination of desolation*, mentioned by the Evangelists, signifies the ensigns of the Romans, during the last siege of Jerusalem by Titus, on whom the figures of their gods and emperors were embroidered, and placed upon the temple after it was taken.

ABORAM, a small island on the coast of Morocco, whose inhabitants live chiefly by fishing.

ABORIGINES, *f.* [Lat.] The earliest inhabitants of a country; those of whom no original is to be traced; as, the Welsh in Britain. Dionysius Halicarnassus, Livy, and Virgil, gave this name to a certain people in Italy, who inhabited the ancient Latium, or country now called *Campagna di Roma*. Whence this people came by the appellation, is much disputed. St. Jerom says they were so called, as being *absque origine*, the primitive planters of the country after the flood: Dion of Halicarnassus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them so called, as being originally Arcadians, who claimed to be earth-born, and not descended from any people. Aurelius Victor suggests another opinion, viz. that they were called *Aborigines*, q. d. *Aberrigines*, from *ab* "from," and *errare* "to wander:" as having been before a wandering people. Pausanias rather thinks they were thus called *απο ορεσι*, from "mountains;" which opinion seems confirmed by Virgil, who, speaking of Saturn, the legislator of this people, says,

*Is genus indocile ac dispensum montibus altis
Composuit, legesque dedit.*

The Aborigines were either the original inhabitants of the country, settled there by Janus, as some imagine; or by Saturn, or Cham, as others; not long after the dispersion, or even, as some think, before it: or they were a colony sent from some other nation; who, expelling the ancient inhabitants the Siculi, settled in their place. The term Aborigines, though so famous in antiquity, is used in modern geography only occasionally as an appellative. It is given to the primitive inhabitants of any country, in contradistinction to colonies, or new races of people.

To **ABORT**, *v. n.* [*aborto*, Lat.] To bring forth before the time; to miscarry.

ABORTION, *f.* [*abortio*, Lat.] The act of bringing forth untimely; the produce of an untimely birth; in which sense it is used for the unseasonable exclusion of an imperfect human foetus, either alive or dead, before the natural time of delivery.

If abortion happens before the second month of pregnancy, it is called a *false conception*. Abortions are seldom dangerous.

dangerous in the first three months; but a frequent habit of miscarriage debilitates the system, flattens the constitution, and lays the foundation of chronic diseases of the most obstinate and dangerous nature. In the advanced months, the prognosis will be more or less favourable, according to the patient's former state of health. The proximate cause of abortion is the same with that of real travail, namely, a contracting effort of the uterus, and abdominal muscles, assisted by the other expulsive powers. The remote causes cannot be explained with precision, as many circumstances, with regard to the nature of impregnation and connection of the fœtus with the placenta and uterus, are subjects involved in many difficulties; so that the general maxims which follow, are the heads that require particular attention. 1. Whatever interrupts the regular circulation between the uterus and placenta. 2. Every thing that excites the spasmodic contraction of the uterus, or other assisting powers. 3. All accidents, or occasions, that deprive the fœtus of life.

In consequence of the great abridgment of the human race by abortion, and of the ill health it induces to those unfortunate females who become subject to it, the late Dr. Hunter bestowed infinite pains to investigate its cause, and to check its progress. He dissected three abortions, which happened at the most usual time women are subject to this misfortune, namely, toward the end of the third month; whence it appeared that there is an extinction of life in the fœtus for some time before any symptoms of abortion occur. For instance, if the miscarriage happens about the end of the third month, the age of the fœtus is generally no more than eight or nine weeks; or if it perishes in the fifth, sixth, or seventh, month, it will still be retained in the uterus, and the expulsion will rarely happen until near the completion of its full time.

Previous to opening these abortions, Dr. Hunter had made several useful discoveries relative to the human pregnant uterus, which see under ANATOMY. His brother, Mr. John Hunter, had likewise, by a number of surgical operations, manifested, that "the blood is the life of the body;" which see under BLOOD. Hence Dr. Hunter concluded, that a careful investigation of the minuter vessels of the uterine system, with their ramifications, would be the likeliest means of obtaining satisfactory information on this delicate subject. This also led him to the discovery of the *Decidua*, which is a membrane of a very peculiar nature, the knowledge of which throws great light upon the contents of the pregnant womb, and upon the connection between the mother and child. It appears to be an efflorescence of the internal coat of the uterus; and is therefore shed, as often as a woman bears a child, or suffers a miscarriage. It consists of two parts, called *decidua vera*, and *decidua reflexa*. In separating it from the chorion, and from the muscular fibres of the uterus, an infinite number of small veins and arteries are discovered full of blood, which ramify from its outer surface inwards through its whole substance, blending itself inseparably with the umbilical portion of the placenta. Its principal arteries run in winding convolutions, like the coils of a snake; forming an appearance much resembling that of lace; and considering the number and size of the vessels, which are necessarily broken upon the expulsion of the fœtus, we cannot longer wonder at those frequent fatal bleedings, which accompany miscarriages in an advanced state of pregnancy. The subjects of these curious and masterly dissections are represented on the annexed plate, of which the following is an explanation.

Fig. 1. An abortion of about nine weeks old, seen on that side which is membranous. The decidua is torn, and turned somewhat aside, to shew the smooth and opaque decidua reflexa. A, the rough external surface of the decidua, which exfoliated from the womb. B, the outside of a small portion of the placenta, the rest of which was situated on the back part of this object. CC, the internal cribriform surface of the decidua, which, in the first months of pregnancy, does not adhere to the membranes which it

encloses. DD, the lacerated edge of the decidua which had been continued into the edge EE of the same membrane. F, the decidua reflexa spread over the outside of the chorion. GG, the angle of reflection at the edge of the placenta, where the inner layer of the decidua is turned over the chorion; much in the same manner as the inner lamella of the pericardium is reflected, to cover the outer surface of the heart. H, the termination of the decidua at the cervix uteri.

Fig. 2. shews a vertical section of the same subject. AA, the section of the placenta; which, we must suppose, had adhered to the upper and back part of the womb. B, the section of the anterior portion of the decidua. C, the section of the posterior portion of the decidua. D, the termination of the decidua at the cervix uteri. E, the cavity of the amnion, in which the embryo hangs by a slender navel-string, from the inside of the placenta. F, the section of the three membranes, which are not only contiguous, but adhere to one another, viz. the amnion, the chorion, and the decidua reflexa. GG, the angle at the edge of the placenta where the inner layer of the decidua is reflected over the outside of the chorion. H, here those three membranes are a little separated, to shew their course at the placenta.

Fig. 3. represents an abortion of about eight weeks old. A small strap of the decidua is cut out, and turned up, to shew the cavity between it and the other membranes. A, the cut slip of the decidua. B, the part of the conception where there is no decidua, viz. opposite to the passage through the cervix uteri. CC, the external surface of the decidua. D, the decidua reflexa covering the chorion and amnion, which project and fill up the cavity of the decidua. E, the outside of the upper part of the placenta.

Fig. 4. represents the same subject, when the decidua had been opened by a crucial incision, and the four angles had been turned off, and then a round piece of the decidua reflexa dissected off, and turned to one side, to shew the loose vessels on the outside of the chorion. AA, the inside of the four angles or flaps into which the decidua was reduced by a crucial incision. BB, the decidua reflexa covering the other membranes. C, the angle at the edge of the placenta where the interior lamella of the decidua is continued over the outside of the chorion, forming the decidua reflexa. D, a round portion of the decidua reflexa dissected from the outside of the chorion and turned aside. E, the chorion, with its shaggy vessels, laid bare. These vessels adhered firmly to the decidua reflexa, and parts of them were cut off with that membrane.

Fig. 5. shews an abortion of the same age, consisting of the chorion only, with its vessels and contents; that is, without the decidua, or uterine part of the secundines. A, the larger and more crowded branches of the shaggy vessels which shoot from the external surface of one part of the chorion, to mix with the decidua, or uterine part, to form the placenta. B, that portion of the chorion which afterwards becomes the uniform transparent membrane. It is covered with fewer and more delicate floating vessels, which lose themselves in the decidua reflexa. The embryo is seen through it. C, the vesicula umbilicalis on the outside of the amnion, seen through the chorion; with a whitish thread, (the remains of an artery and vein,) leading from it, towards the navel of the embryo.

Fig. 6. represents the same abortion opened. The membranes, which were at the fore-part, being cut from the placenta, and turned up, the embryo is distinctly seen. A, the vesicula umbilicalis, from which B, the remains of an artery and vein, in the form of a white thread, pass to C, the navel of the embryo, with some turns of the intestines lodged in the beginning of the navel-string.

The common causes of abortion are, the death of the child; weakness or relaxation of the mother; or too great evacuations. It however proceeds oftener from a violent distention, or rupture, of the minuter vessels of the uterine system, occasioned by too strong exercise; raising great weights;

and without tricks. *L'Étrange*.—Without disguise or concealment.

ABOVE-CITED, *adv.* Cited before. A figurative expression, taken from the ancient manner of writing books on scrolls; where whatever is cited or mentioned before in the same page, must be *above*.

ABOVE-GROUND, *adv.* An expression used to signify alive; not in the grave.

ABOVE-MENTIONED, *adv.* The same as above-cited.—I do not remember, that Homer any where falls into the faults *above-mentioned*, which were indeed the false refinements of latter ages. *Addison*.

ABOUKIR, a small town of Egypt, situate in the desert between Alexandria and Rosetta. It is the ancient Canopus, and is situated, according to Mr. Savary, six leagues from Pharos. The town is built upon a rock, which forms a handsome road for shipping, and is out of the reach of inundations. See **CANOPUS**.

To ABOUND, *v. n.* [*abundo*, Lat. *abonder*, Fr.] To have in great plenty; to be copiously stored. It is used sometimes with the particle *in*, and sometimes the particle *with*. To be in great plenty:

Words are like leaves, and where they most *abound*,
Much fruit of sense beneath is rarely found. *Pope*.

ABOUT, *prep.* [*abutan*, or *abuton*, Sax. which seems to signify encircling on the outside.] Round, surrounding, encircling.—Let not mercy and truth forsake thee. Bind them *about* thy neck; write them upon the table of thy heart. *Proverbs*, iii. 3.—Near to. Concerning; with regard to, relating to.—The painter is not to take so much pains *about* the drapery as *about* the face, where the principal resemblance lies. *Dryden*.—In a state of being engaged in, or employed upon.—Our armies ought to be provided with secretaries, to tell their story in plain English, and to let us know, in our mother tongue, what it is our countrymen are *about*. *Addison*.—Appendant to the person, as clothes. Relating to the person, as a servant or dependant. Relating to person, as an act or office.—Good corporal, for my old dame's sake, stand my friend: she hath nobody to do any thing *about* her when I am gone, and she is old and cannot help herself. *Shakespeare*.

ABOUT, *adv.* Circularly, in a round; *circum*. In circuit, in compass. Nearly; *circiter*. Here and there; every way; *circa*.—A wolf that was past labour, in his old age, borrows a habit, and so *about* he goes, begging charity from door to door, under the disguise of a pilgrim. *L'Étrange*.—With *to* before a verb; as *about to fly*, upon the point, within a small distance of:

These dying lovers, and their floating sons,
Suspend the fight, and silence all our guns:
Beauty and youth, *about to perish*, finds
Such noble pity in brave English minds. *Waller*.

Round; the longest way, in opposition to the short straight way. *To bring about*; to bring to the point or state desired; as, *he has brought about his purposes*. *To come about*; to come to some certain state or point. It has commonly the idea of revolution, or gyration.—Wherefore it came to pass, when the time was *come about*, after Hannah had conceived, that she bare a son. 1 *Sam.* i. 20.

One evening it befel, that looking out,
The wind they long had wish'd was *come about*;
Well pleas'd they went to rest; and if the gale
Till morn continu'd, both resolv'd to fail. *Dryden*.

To go about; to prepare to do it. In common language, they say, *to come about* a man, *to circumvent* him. Some of these phrases seem to derive their original from the French *à bout*; *venir à bout d'une chose*; *venir à bout de quelqu'un*.

ABOUT, *adv.* in sea-language, the situation of a ship immediately after she has tacked, or changed her course by going about and standing on the other tack.—*About ship!* the order to the ship's crew for tacking.

ABOUTIGE, a town in Upper Egypt, in Africa, near the Nile, where they make the best opium in all the Le-

vant. It was formerly a large, but now is a mean place. *N. Lat.* 26. 50.

ABRA, a silver coin struck in Poland, worth about one shilling sterling. It is current in several parts of Germany, Constantinople, Astracan, Smyrna, and Grand Cairo.

ABRABANEL, **ABARBANEL**, or **AVRAVANEL**, (*I-faac*), a celebrated rabbi, descended from King David, and born at Lisbon A. D. 1437. He became counsellor to Alphonso V. king of Portugal, and afterwards to Ferdinand the catholic; but in 1492 was obliged to leave Spain with the other Jews. And, after residing at Naples, Corsou, and several other cities, he died at Venice in 1508, aged 71. Among other works he wrote a Treatise on the World; in which he refutes Aristotle, who imagined that the world was eternal. Though Abrabanel discovers his implacable aversion to Christianity in all his writings, yet he treated Christians with politeness and good manners in all the common affairs of life.

ABRACADABRA, a magic word, recommended by Serenius Sammonicus, supposed to have the virtue of a charm, or amulet, in curing agues, and preventing other diseases, particularly the fever called by the physicians *hemitratatus*. To have this effect, the word must be wrote on paper, and repeated, omitting each time the last letter in the former, so that the whole may form a kind of inverted cone: in which there was this property, that which way soever the letters be taken, beginning from the *apex* and ascending from the left to the right, they make the same word, or, as some would have it, the same sentiment, as is found in the first whole line. According to Julius Africanus, another ancient writer, the pronouncing of the word in the same manner, will do as well.

To ABRADE, *v. a.* [*abrado*, Lat.] To rub off; to wear away from the other parts; to waste by degrees.

ABRAHAM, the father and stock from whence the faithful sprung, was the son of Terah. He was descended from Noah by Shem, from whom he was nine degrees removed. Some fix his birth in the 130th year of Terah's age, but others place it in his father's 70th year. It is highly probable he was born in the city of Ur, in Chaldaea, which he and his father left when they went to Canaan, where they remained till the death of Terah; after which Abraham resumed his first design of going to Palestine. The Scriptures mention the several places he stopped at in Canaan; his journey into Egypt, where his wife was carried off from him; his going into Gerar, where Sarah was again taken from him; but restored as before; the victory he obtained over the four kings who had plundered Sodom; his compliance with his wife, who insisted that he should make use of their maid Hagar in order to raise up children; the covenant God made with him, sealed with the ceremony of circumcision; his obedience to the command of God, who ordered him to offer up his only son as a sacrifice, and how this was prevented; his marriage with Keturah; his death at the age of 175 years; and his interment at the cave of Macpelah, near the body of Sarah his first wife. It would be of little use to dwell long upon these particulars, since they are so well known. But tradition has supplied numberless others, the mention of one or two of which may not be unacceptable.

Many extraordinary particulars have been told relating to his conversion from idolatry. It is a pretty general opinion, that he sucked in the poison with his milk; that his father made statues, and taught that they were to be worshipped as gods. Some Jewish authors relate, that Abraham followed the same trade with Terah for a considerable time. Maimonides says, that he was bred up in the religion of the Sabæans, who acknowledged no deity but the stars; that his reflections on the nature of the planets, his admiration of their motions, beauty, and order, made him conclude there must be a Being superior to the machine of the universe, a Being who created and governed it; however, according to an old tradition, he did not renounce Paganism till the fiftieth year of his age. It is related, that his father, being gone a journey, left him to sell the statues

statues in his absence; and that a man, who pretended to be a purchaser, asked him how old he was: Abraham answered, "Fifty."—"Wretch that thou art (said the other), for adoring at such an age a being which is but a day old!" These words greatly confounded Abraham. Some time afterwards, a woman brought him some flour, that he might give it as an offering to the idols; but Abraham, instead of doing so, took up a hatchet and broke them all to pieces, excepting the largest, into the hand of which he put the weapon. Terah, at his return, asked whence came all this havoc? Abraham made answer, that the statues had had a great contest which should eat first of the oblation; "Upon which (said he) the god you see there, being the stoutest, hewed the others to pieces, with that hatchet." Terah told him this was bantering; for those idols had not the sense to act in this manner. Abraham retorted these words upon his father against the worshipping of such gods. Terah, stung with this raillery, delivered up his son to the cognizance of Nimrod, the sovereign of the country: who exhorted Abraham to worship the fire; and, upon his refusal, commanded him to be thrown into the midst of the flames: "Now let your God (said he) come and deliver you." But (adds the tradition) Abraham came safe and found out of the flames.—This tradition is not of modern date, since it is told by St. Jerome; who seems to credit it in general, but disbelieves that part of it which makes Terah so cruel as to be the informer against his own son. Perhaps the word *Ur* might have given rise to the fiction altogether. Such as lay stress on the following words which God says to Abraham (Gen. xv. 7.), *I am the Lord that brought thee out of Ur of the Chaldees*, imagine that he saved him from a great persecution, since he employed the very same words in the beginning of the decalogue to denote the deliverance from Egypt.

Abraham is said to have been well skilled in many sciences, and to have written several books. Josephus tells us that he taught the Egyptians arithmetic and geometry; and, according to Eupolemus and Artapan, he instructed the Phœnicians, as well as the Egyptians, in astronomy. A work which treats of the creation has been long ascribed to him: it is mentioned in the Talmud, and the Rabbis Chanina and Hofchia used to read it on the eve before the sabbath. In the first ages of Christianity, according to St. Epiphanius, an heretical sect, called *Sethinians*, dispersed a piece which had the title of *Abraham's Revelation*. Origen mentions also a treatise supposed to be wrote by this patriarch. All the several works which Abraham composed in the plains of Mamre, are said to be contained in the library of the monastery of the Holy Cross on Mount Amara in Ethiopia. The book on the creation was printed at Paris in 1552, and translated into Latin by Postel: Rittangel, a converted Jew, and professor at Königsberg, gave also a Latin translation of it, with remarks, in 1642.

ABRAHAM USQUE, a Portuguese Jew, who translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1553, and reprinted in Holland in 1630. This Bible, especially the first edition, which is most valuable, marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

ABRAHAM (Nicholas), a learned Jesuit, born in the diocese of Toul, in Lorraine, in 1589. He obtained the rank of divinity professor in the university of Pont-a-Mousson, which he enjoyed seventeen years, and died September 7, 1655. He wrote Notes on Virgil and on Nonnius; A Commentary on some of Cicero's Orations, in two vols. folio; an excellent collection of theological pieces in folio, intitled *Pharus Veteris Testamenti*; and some other works.

ABRAHAMITES, an order of monks exterminated for idolatry by Theophilus in the ninth century. Also the name of another sect of heretics who had adopted the errors of Paulus.

ABRAHAM'S BALM. The name of an herb.

ABRANTES, a town of Portugal, in Estremadura, seated on the river Tajo, belongs to a marquis of the same

name. It stands high, is surrounded with gardens and olive-trees, and contains thirty-five thousand inhabitants. It has four convents, an alms-house, and an hospital. Lat. 39. 13. W. lon. 7. 13.

ABRASION, *f.* The act of abrading or rubbing off. In medicine, the wearing away of the natural mucus, which covers the membranes, particularly those of the stomach and bowels, by corrosive or sharp medicines, or humours. The matter worn off by the attrition of bodies.

ABRAUM, *f.* in natural history, a name given by some writers to a species of red clay, used in England by the cabinet-makers, &c. to give a red colour to new mahogany wood. We have it from the Isle of Wight; but it is also found in Germany and Italy.

ABRAXAS, *f.* or ABRASAX, the supreme god of the Basilidian heretics. It is a mystical word, composed of the Greek numerals $\alpha, \beta, \gamma, \delta, \epsilon, \zeta, \eta, \theta$, which together make up the number CCCLXV. For Basilides taught, that there were 365 heavens between the earth and the empyrean; each of which heavens had its angel or intelligence, which created it; each of which angels likewise was created by the angel next above it; thus ascending by a scale to the Supreme Being, or first Creator. The Basilidians used the word *Abrahas* by way of charm or amulet.

ABRAXAS, *f.* an antique stone with the word *abraxas* engraved on it. They are of various sizes, and most of them as old as the third century. They are frequent in the cabinets of the curious; and a collection of them, as complete as possible, has been desired by several. There is a fine one in the abbey of St. Genévieve, which has occasioned much speculation. Most of them seem to have come from Egypt; whence they are of some use for explaining the antiquities of that country. Sometimes they have no other inscription besides the word: but others have the names of saints, angels, or Jehovah himself, annexed; though most usually the name of the Basilidian god. Sometimes there is a representation of Isis sitting on a lobe, or apsis, surrounded with stars; sometimes monstrous compositions of animals, obscene images, Phalli, and Ithyfalli. The graving is rarely good, but the word on the reverse is sometimes said to be in a more modern taste than the other. The characters are usually Greek, Hebrew, Coptic, or Heterian, and sometimes of a mongrel kind, invented, as it would seem, to render their meaning the more inscrutable. It is disputed whether the Veronica of Montreuil, or the granite obelisk mentioned by Gori, be *Abrahas*.

ABREAST, *adv.* Side by side; in such a position that the breasts may bear against the same line. In sea language it denotes a situation in which two or more ships lie, with their sides parallel to each other, and their heads equally advanced. This term more particularly regards the line of battle at sea, where, on the different occasions of attack, retreat, or pursuit, the several squadrons or divisions of a fleet are obliged to vary their dispositions, and yet maintain a proper regularity by sailing in right or curved lines. When the line is formed abreast, the whole squadron advances uniformly, the ships being equally distant from and parallel to each other, so that the length of each ship forms a right angle with the extent of the squadron or line abreast. The commander in chief is always stationed in the centre, and the second and third in command in the centres of their respective squadrons.—*Abreast*, within the ship, implies on a line with the beam, or by the side of any object aboard; as, the frigate sprung a leak abreast of the main hatch-way, *i. e.* on the same line with the main hatch-way, crossing the ship's length at right angles, in opposition to AFORE or ABAFT the hatch-way.—We discovered a fleet abreast of Beachy-head; *i. e.* off, directly opposite to it.

To ABRIDGE, *v. a.* [*abreger*, Fr. *abbrevio*, Lat.] To make shorter in words, keeping still the same substance. To contract, to diminish, to cut short. To deprive of; to cut off from. In which sense it is followed by the particle *from*, or *of*, preceding the thing taken away.

ABRIDGED OF, *part.* Deprived of, debarred from, cut short.

ABRIDGER,

ABRIDGER, *f.* He that abridges; a shortener. A writer of compendiums or abridgments.

ABRIDGMENT, *f.* [*abregement*, Fr.] The epitome of a larger work contracted into a small compass; a compend; a summary. A diminution in general. Contraction; reduction. Restraint from any thing pleasing; contraction of any thing enjoyed.

ABRIDGMENT, in literature, is the art of conveying much sentiment in few words, and the happiest talent an author can be possessed of. This talent is peculiarly necessary in the present state of literature; for many writers have acquired the dexterity of spreading a few trite thoughts over several hundred pages. When an author hits upon a thought that pleases him, he is apt to dwell upon it, to view it in different lights, to force it in improperly, or upon the slightest relations. Though this may be pleasant to the writer, it tires and vexes the reader. There is another great source of diffusion in composition. It is a capital object with an author, whatever be the subject, to give vent to all his best thoughts. When he finds a proper place for any of them he is peculiarly happy. But rather than sacrifice a thought he is fond of, he forces it in by way of digression, or superfluous illustration. If none of these expedients answer his purpose, he has recourse to the margin, a very convenient apartment for all manner of pedantry and impertinence. There is not an author, however correct, but is more or less faulty in this respect.—An abridger, however, is not subject to these temptations. The thoughts are not his own; he views them in a cooler and less affectionate manner; he discovers an impropriety in some, a vanity in others, and a want of utility in many. His business, therefore, is to retrench superfluities, digressions, quotations, pedantry, &c. and to lay before the public only what is really useful.

Abridging is peculiarly useful in taking the substance of what is delivered by professors, &c. It is impossible, even with the assistance of short-hand, to take down *verbatim*, what is said by a public speaker. Besides, although it were practicable, such a talent would be of little use. Every public speaker has circumlocutions, redundancies, lumber, which deserve not to be copied. All that is really useful may be comprehended in a short compass. If the plan of the discourse, and arguments employed in support of the different branches, be taken down, you have the whole. These you may afterwards extend in the form of a discourse dressed in your own language. This would not only be a more rational employment, but would likewise be an excellent method of improving young men in composition; an object too little attended to in all our universities.

ABROACH, *adv.* In a posture to run out, or yield the liquor contained; properly spoken of vessels. In a figurative sense: in a state to be diffused or extended, in a state of such beginning, as promises a progress:

That man, that sits within a monarch's heart,
And ripens in the sunshine of his favour,
Would he abuse the countenance of the king,
Alack! what mischiefs might be set *abroach*,
In shadow of such greatness! *Shakespeare.*

ABROAD, *adv.* Without confinement; widely; at large:

Again, the lonely fox roams far *abroad*,
On secret rapine bent, and midnight fraud;
Now haunts the cliff, now traverses the lawn,
And flies the hated neighbourhood of man.

Prior.

In another country. Out of the house. In all directions, this way and that; with wide expansion. Without, not within.—Bodies politic, being subject, as much as natural, to dissolution by divers means, there are undoubtedly more states overthrown through diseases bred within themselves, than through violence from *abroad*. *Hooker.*

To **ABROGATE**, *v. a.* [*abrogo*, Lat.] To take away from a law its force; to repeal; to annul.

ABROGATION, *f.* [*abrogatio*, Lat.] The act of abrogating; the repeal of a law.—*Abrogation* stands opposed to

rogation: it is distinguished from *derogation*, which implies the taking away only some part of a law; from *subrogation*, which denotes the adding a clause to it; from *obrogation*, which implies the limiting or restraining it; from *dispensation*, which only sets it aside in a particular instance; and from *antiquation*, which is the refusing to pass a law.

ABROHANI, or **MALLEMOLLI**, a kind of muslin, or clear white cotton cloth, brought from the East Indies, particularly from Bengal; being in length 16 and $\frac{3}{4}$ French ells, and in breadth five-eighths.

ABROLKOS, the name of certain shelves, or banks of sand, about twenty leagues from the coast of Brazil.

ABROMA, [*a* and *βρωμα*, no food, not fit for food; in opposition to *Theobroma*, with which it ranks in the system.] In botany, a genus of the polyadelphia dodecandria class, and of the natural order of columniferae. The generic characters are—Calyx: perianth five-leaved; leaflet lanceolate, acute, spreading, permanent. Corolla: petals five, larger than the calyx; claws obovate, arched, concave, obtuse, hairy at the end, erect, inserted at the base into the nectary; borders oval, obtuse, spreading, ciliate, contracted at the base into very short, ciliate, recurved, little claws, on which the principal claws are placed. Nectary, short, small, pitcher-shaped, divided into five segments, which are obcordate, hairy, erect, recurved and arched, alternate with the claws of the petals. Stamina: filaments five, membranaceous, very small, growing on the nectary between the segments, emarginate-trifid. Antheræ on each filament three, twin, kidney-form. Pistillum: germ subcylindrical. Styles five, subulate, approximating. Stigmas acute. Pericarpium: capsule ovate, membranaceous, veined, five-winged, five-beaked, five-celled, gaping at top into five parts between the beaks; partitions folded. Seeds: very many, subovate, within an oblique membranaceous aril, fixed in a double row to the central edge of the partitions, which is thickened and longitudinally bearded. Receptacle of the seeds, none.—*Essential Character.* Pistils five; capsule five-celled, one-valved, gaping at top; seeds subovate, incompletely arilled.

Species. 1. *Abroma augusta*, or maple-leaved *abroma*: leaves cordate or angular, sharply serrulate. This is a tree, with a straight trunk, yielding a gum when cut, and filled with a white pith, like the elder. Some of the leaves are heart-shaped and acuminate; others, especially almost all of the first year, are angular, and have five or seven lobes, which are acute, and the anterior ones most produced; they are all veined, alternate, green on both sides, but paler underneath, and the petioles are round. The whole plant is covered with stiff, whitish, shining, decumbent, bristles, scarcely visible to the naked eye, easily separating, and sticking to the hands, but harmless. The peduncles are generally bifid, and bear two flowers. There is one stipule on each side to every petiole; but four at the division of the peduncles, lanceolate and acute. The flower nods, is elegant, but has little smell. The corolla is of a dark purple. The time of flowering is from June to October. In September and October the fruit ripens, and the peduncle is erect. It is a native of New South-Wales, and the Philippine islands; and was brought into England about the year 1770.

2. *Abroma Wheleri*, or *Wheeler's abroma*: leaves ovate-lanceolate acuminate slightly toothed. This is a shrub with a brown bark; the extreme branches tomentose. Leaves alternate, some having a few teeth about the edge, others entire; the nerves are tomentose. Peduncles opposite to the leaves, having one joint curved back and woody when bearing fruit: they have an involucre consisting of several lanceolate deciduous leaflets. The flowers are of a dusky purple colour. Nectary bearded on each side with parallel hairs; the inner one consisting of obcordate scales. Antheræ in threes, sitting in the sinuses between the divisions or scales of the inner nectary. Capsule large, with five membranaceous valves. Receptacle five-parted, bearded, fastened to the sutures of the valves. Seeds ovate, dark-coloured, scabrous with raised points.

Native of the East Indies, where it was observed by Koenig, who gave it the trivial name in compliment to Edw. Wheeler, Esq. member of the supreme council in Bengal.

Propagation and Culture. The first sort requires the protection of a hot-house; and is propagated here by cuttings; the seeds will not easily ripen with us, and seldom arrive in a state fit for vegetation, unless great care be taken of them; the plant requires a strong heat and abundance of water. The second is not known in Europe.

ABROTANOIDES, *f.* in botany. See **ARTEMISIA**, **PROTEA**, and **SERIPHIMUM**.

ABROTANUM, *f.* in botany. See **ARTEMISIA**, **ERIOCEPHALUS**, **SANTOLINA**, and **TANACETUM**.

ABROTANUM, anciently a town and harbour on the Mediterranean, in the district of Syrtis Parva, in Africa, one of the three cities that went to form Tripoli.

ABRUG-BANYA, a well-inhabited town of Transylvania, on the river Ompay; near which there are mines of gold and silver, and the mine-court is held there. Lat. 46. 50. N. lon. 23. 24. E.

ABRUPT, *adj.* [*abruptus*, Lat. broken off.] Broken, craggy. Divided, without any thing intervening. Sudden, without the customary or proper preparatives:

Resiffling, roaring, dreadful, down it comes
From the rude mountain, and the mossy wild,
Tumbling through rocks *abrupt*. *Thomson.*

ABRUPTED, *adj.* [*abruptus*, Lat. a word little in use.] Broken off suddenly.

ABRUPTION, *f.* [*abruptio*, Lat.] Breaking off, violent and sudden separation.

ABRUPTLY, *adv.* Hastily, without the due forms of preparation.—They punctually observed the time agreed upon, and in whatever company or business they were engaged, they left it *abruptly*, as soon as the clock warned them to retire. *Addison.*

ABRUPTNESS, *f.* An abrupt manner, haste, suddenness, untimely vehemence. The state of an abrupt or broken thing; roughness, craggy; as of a fragment violently disjoined.

ABRUS, *f.* [*αβρος*, soft, delicate; from the extreme tenderness of the leaves.] In botany, a genus of the diadelphia decandria class, and of the natural order of leguminosae. The generic characters are—Calyx: perianthone-leaved, bell-shaped, obscurely four-lobed; teeth blunt, the upper one broader than the rest. Corolla: papilionaceous. Banner roundish, entire, ascending, flattened at the sides, longer than the wings and keel. Wings oblong, blunt. Keel oblong, sickle-shaped, gibbous, longer than the wings. Stamina: Filaments nine, united into a sheath, cloven above, free at the end, unequal, rising. Antherae oblong, erect. Pistillum: germ cylindrical, hairy. Style subulate, rising shorter than the stamina. Stigma in form of a head, and small. Pericarpium: legume like a rhomb, compressed, coriaceous, bivalved, four or five celled, acuminate, with a little subulate deflex claw. Seeds: solitary subglobose.—*Essential Character.* Calyx: obscurely four lobed; the upper lobe broadest. Filaments nine, united into a sheath at bottom, gaping at the back. Stigma blunt. Seeds subglobose.

There is only one species which grows naturally in both Indies, Guinea, and Egypt. It was also found by the late circumnavigators in the Society islands, about the year 1769. This is a perennial plant, with slender, shrubby, twining, branching, stalks, by which it will rise to the height of eight or ten feet. The leaves are pinnate, ending abruptly, and have from twelve to sixteen pairs of small, smooth, oblong, blunt, leaflets, set close together; these have the taste of liquorice, whence the inhabitants of the West Indies have given it the name of wild liquorice, and they use the herb for the same purpose as we do the liquorice in Europe. The flowers are produced from the side of the stalks in short spikes or bunches; they are of a pale purple colour, and shaped like those of the kidney-bean; these are succeeded by short smooth pods, each containing

three or four hard seeds, very smooth, of a glowing scarlet colour, with a black spot or eye on that side which is fastened to the pod. The legume or pod is sometimes of an oblong form, and contains six seeds, scarce apparently divided by a membrane, which indeed frequently disappears as the pods ripen. There are two varieties, one with a white, and the other with a yellow seed; but these do not differ from the former in leaf or stalk. The seeds of this plant are commonly strung, and worn as ornaments by the natives of those countries where the plant grows wild; they are frequently brought to Europe from Guinea, and the East and West Indies, and wrought into various forms with other hard seeds, and shells. A few years since an attempt was made, both at London and Paris, to introduce them into ear-rings and other female ornaments, but without much success. This, like most others, was only the revival of a fashion which prevailed for a short time in Holland, at the latter end of the last century. In their native countries they are commonly used for weighing precious commodities; they are also strung as beads for rosaries; whence the trivial name of *precatorius*. They are frequently thrown, with other West-Indian seeds, on the north west coast of Scotland. Linnaeus affirms that they are extremely deleterious. Abrus was accounted a species of glycine, until Linnaeus made it a separate genus in the twelfth edition of his *Systema Vegetabilium*, on account of a difference in its stature and appearance from the other species. The abrus was cultivated before 1680, by Bishop Compton, at Fulham.

Propagation and Culture. This plant is propagated by seeds, which must be sown upon a good hot-bed in the spring; but, as the seeds are very hard, unless they are soaked in water twelve or fourteen hours before they are sown, they frequently lie in the ground a whole year before they vegetate; but when soaked, the plants will appear in a fortnight, if the seeds be good, and the bed in a proper temperature of heat. When the plants are two inches high, they should be transplanted each into a separate pot, filled with light earth, and plunged into a hot-bed of tanner's bark, where they should be shaded from the sun until they have taken new root; after which they must be treated in the same manner as other tender plants from the same countries, always keeping them in the bark stove. They will flower the second year, and sometimes ripen their seeds in England.

ABRUZZO, a province in Naples. The river Pescara divides it into two parts; one of which is called Ulterior, whereof Aquila is the capital; and the other Citerior, whose capital is Solomona. Besides the Appenines, there are two considerable mountains, the one called Monte Cavallo, and the other Monte Majello; the top of which last is always covered with snow. Abruzzo is a cold country; but the rigour of the climate is not so great as to prevent the country from producing in abundance every thing requisite for the support of life. Vegetables, fruits, animals, and numberless other articles of sustenance, not only furnish ample provision for the use of the natives, but also allow of exportation. There is so large a quantity of wheat reaped, that many thousands of quarters are annually shipped off. Much Turkey wheat is sent out, and the province Teramo sells a great deal of rice little inferior in goodness to that of Lombardy. Oil is a plentiful commodity, and wines are made for exportation on many parts of the coast; but wool has always been, and still is, their staple commodity: the flocks, after passing the summer in the fine pastures of the mountains, are driven for the winter into the warm plains of Puglia, and a few spots near their own coast, where the snow does not lie; there are no manufactures of woollens in the province, except two small ones of coarse cloth, and the greatest part of the wool is sent out unwrought. No silk is made here, though mulberry-trees would grow well on the low grounds.

The antiquary and the naturalist may travel here with exquisite pleasure and profit; the former will find treasures of inscriptions, and inedited monuments appertaining to the

the warlike nations that once covered the face of the country: the natural philosopher will have a noble field for observation in the stupendous monuments that rise on all sides. Monte-corno and Majella are among the most interesting; the first is like an aged monument of nature, bald, and horribly broken on every aspect: from various appearances, it is evident that its bowels contain many valuable veins of metallic ore; but the great difficulty of access renders the search of them almost impracticable. Majella has other merits, and of a gayer kind:—nature has clothed its declivities and elevated fields with an infinite variety of her most precious plants; vulnerary herbs grow there in as great perfection as on the Alps of Swisserland, and are applied by the natives to wounds with equal success.

ABSALOM, the son of David by Maacah, was brother to Thamar, David's daughter, who was ravished by Amnon their eldest brother by another mother. Absalom waited two years for an opportunity of revenging the injury done to his sister; and at last procured the assassination of Amnon at a feast which he had prepared for the king's sons. He took refuge with Talmai king of Geshur; and, was no sooner restored to favour, but he engaged the Israelites to revolt from his father. Absalom was defeated in the wood of Ephraim: as he was flying, his hair caught hold of an oak, where he hung till Joab came and thrust him through with three darts. David had expressly ordered his life to be spared; and he lamented his death extremely.

ABSCISS, *f.* [*abscissus*, Lat.] in surgery, a cavity containing pus; or, a gathering of matter in a part; so called, because the parts which were joined are now separated; one part recedes from another, to make way for the collected matter. For the cure, see **SURGERY**.

To ABSCOND, *v. a.* To cut off, either in a natural or figurative sense.

ABSCISSA, [*Lat.*] Part of the diameter of a conic section, intercepted between the vertex and a semi-ordinate.

ABSCISSION, *f.* [*abscisso*, Lat.] The act of cutting off. The state of being cut off.

To ABSCOND, *v. n.* [*abscondo*, Lat.] To hide one's self; to retire from the public view: generally used of persons in debt, or criminals eluding the law.—The marmotte or mus alpinus, which *absconds* all winter, lives on its own fat: for in autumn, when it shuts itself up in its hole, it is very fat; but, in the spring-time, when it comes forth again, very lean. *Ray*.

ABSCONDER, *f.* The person that absconds.

ABSCONSA, *f.* a dark lantern used by the monks at the ceremony of burying their dead.

ABSENCE, *f.* [*absentia*, Lat.] The state of being absent, opposed to presence. Inattention, heedlessness, neglect of the present object. Want of appearance in a legal sense.—*Absence* is of a fourfold kind or species. The first is a necessary *absence*, as in banished persons; this is entirely necessary. A second, necessary and voluntary; as, upon the account of the commonwealth; or in the service of the church. The third kind the civilians call a probable *absence*; as, that of students on the score of study. And the fourth, an *absence* entirely voluntary; as, on the account of trade, merchandize, and the like. Some add a fifth kind of *absence*, which is committed *cum dolo & culpa*, by a man's non-appearance on a citation; as, in a contumacious person, who, in hatred to his contumacy, is, by the law, in some respects, reputed as a person present. *Ayliffe*.

ABSENT, *adj.* [*absens*, Lat.] Not present. Absent in mind, inattentive; regardless of the present object. It is used with the particle *from*:

In spring the fields, in autumn hills I love;
At morn the plains, at noon the shady grove;
But Delia always: *absent from* her sight,
Nor plains at morn, nor groves at noon delight. *Pope*.

To ABSENT, *v. a.* To withdraw, to forbear to come in to presence:

Go—for thy stay, not free, *absents* thee more. *Milton*.

ABSENTANEOUS, *adj.* Relating to absence; absent.

ABSENTEE, *f.* He that is absent from his station or employment, or country. A word used commonly with regard to Irishmen living out of their country.—Then was the first statute made against *absentees*, commanding all such as had land in Ireland, to return and reside thereupon.

Davies.—A great part of estates in Ireland are owned by *absentees*, and such as draw over the profits raised out of Ireland, refunding nothing. *Child*.

ABSINTHIATED, *part.* [from *absinthium*, Lat. wormwood.] Imbittered; impregnated with wormwood. Bartholin mentions a woman whose milk was become absinthiated, and rendered as bitter as gall, by the too liberal use of wormwood.

Vinum absinthites, or *poculum absinthiatum*, “wormwood wine,” is much spoke of among the ancients as a wholesome drink, and even an antidote against drunkenness. Ray makes it a preventative of venery. It is made by infusing the leaves of the plant in wine; but, according to Fehr, it ought to be prepared by fermentation, in order to correct the crudities, and call forth a volatile salt; which last, however, does not exist in wormwood. Some prefer the distilled water; but whatever virtues wormwood possesses reside entirely in its essential oil.

ABSINTHIUM, *f.* in botany. See **ARTEMISIA**, **ACHILLEA**, **ANTHEMIS**, **PARTHENIUM**, **SENECIO**, **TANACENTUM**.

ABSIS, *f.* in astronomy, the same with **APSIS**.

To ABSIST, *v. n.* [*absisto*, Lat.] To stand off, to leave off.

To ABSOLVE, *v. a.* [*absolvo*, Lat.] To clear, to acquit of a crime in a judicial sense. To set free from an engagement or promise. To pronounce sin remitted, in the ecclesiastical sense:

But all is calm in this eternal sleep;
Here grief forgets to groan, and love to weep;
E'en superstition loses every fear;
For God, not man, *absolves* our frailties here. *Pope*.

ABSOLUTE, *adj.* [*absolutus*, Lat.] Complete; applied as well to persons as things. Unconditional; as, an *absolute* promise. Not relative; as, *absolute* space.—An *absolute* mode is that which belongs to its subject, without respect to any other beings whatsoever; but a relative mode is derived from the regard that one being has to others. *Watts*.—In this sense we speak of the ablative case *absolute* in grammar. Not limited; as, *absolute* power. Positive; certain; without any hesitation. In this sense it rarely occurs.

ABSOLUTE, in metaphysics, is more particularly understood of a being or thing which does not proceed from any cause, or does not subsist by virtue of any other being, considered as its cause; in which sense, God alone is *absolute*. Absolute, in this sense, is synonymous with *independent*, and stands opposed to *dependent*.

ABSOLUTE also denotes a thing's being free from conditions or limitations; in which sense, the word is synonymous with *unconditional*. We say, an *absolute* decree, *absolute* promise, *absolute* obedience.

ABSOLUTE GOVERNMENT, *adj.* that wherein the prince is left solely to his own will, not being limited to the observance of any laws except those of his own discretion.

ABSOLUTE EQUATION, in astronomy, is the aggregate of the optic and eccentric equations. The apparent inequality of a planet's motion arising from its not being equally distant from the earth at all times, is called its optic equation, and would subsist even if the planet's real motion were uniform. The eccentric inequality is caused by the planet's motion being uniform. To illustrate which, conceive the sun to move, or to appear to move, in the circumference

circumference of a circle, in whose centre the earth is placed. It is manifest, that if the sun moves uniformly in this circle, it must appear to move uniformly to a spectator on the earth, and in this case there will be no optic nor eccentric equation; but suppose the earth to be placed out of the centre of the circle, and then, though the sun's motion should be really uniform, it would not appear to be so, being seen from the earth; and in this case there would be an optic equation, without an eccentric one. Imagine farther, the sun's orbit to be not circular, but elliptic, and the earth in its focus; it will be as evident that the sun cannot appear to have a uniform motion in such ellipse: so that his motion will then be subject to two equations, the optic and the eccentric.

ABSOLUTE NUMBER, in algebra, is any pure number standing in any equation without the conjunction of literal characters; as $2x + 36 = 48$; where 36 and 48 are *absolute numbers*, but x is not, as being joined by the letter x .

ABSOLUTELY, *adv.* Completely, without restriction. Without relation: in a state unconnected. Without limits or dependance. Without condition. Peremptorily, positively:

Being as I am, why didst not thou
Command me *absolutely* not to go,
Going into such danger, as thou said'st?

Milton.

ABSOLUTENESS, *f.* Completeness. Freedom from dependance, or limits.—There is nothing that can raise a man to that generous *absoluteness* of condition, as neither to cringe, to fawn, or to depend meanly; but that which gives him that happiness within himself, for which men depend upon others. *South.*—Despoticism.—He kept a strait hand upon his nobility, and chose rather to advance clergymen and lawyers, which were more obsequious to him, but had less interest in the people; which made for his *absoluteness*, but not for his safety. *Bacon.*

ABSOLUTION, *f.* [*absolutio*, Lat.] Acquittal.—*Ab-solution*, in the civil law, imports a full acquittal of a person by some final sentence of law; also, a temporary discharge of his farther attendance upon a mesne process, through a failure or defect in pleading; as it does likewise in the canon law, where, and among divines, it likewise signifies a relaxation of him from the obligation of some sentence pronounced either in a court of law, or else in *foro penitentiali*. Thus there is, in this kind of law, one kind of *absolution*, termed judicial, and another, styled a declaratory or extrajudicial *absolution*. *Ayliffe.*—The remission of sins, or penance, declared by ecclesiastical authority.—The Romanists hold absolution a part of the sacrament of penance: the council of Trent, sess. xiv. cap. iii. and that of Florence, in the decree *ad Armenos*, declare the form or essence of the sacrament to lie in the words of *absolution*, "I absolve thee of thy sins." The formula of absolution in the Romish church, is absolute: in the Greek church, it is deprecatory; and, in the churches of the reformed, declarative.

ABSOLUTORY, *adj.* [*absolutorius*, Lat.] That which absolves.—Though an *absolutory* sentence should be pronounced in favour of the persons, upon the account of nearness of blood; yet, if adultery shall afterwards be truly proved, he may again be proceeded against as an adulterer. *Ayliffe.*

ABSONANT, *adj.* Contrary to reason, wide from the purpose.

ABSONOUS, *adj.* [*absonus*, Lat. ill-sounding.] Absurd, contrary to reason. It is not much in use, and it may be doubted whether it should be followed by *to* or *from*.—To suppose an union of a middle constitution, that should partake of some of the qualities of both, is unwarranted by any of our faculties; yea, most *absonous* to our reason. *Glanville.*

To **ABSORB**, *v. a.* [*absorbo*, Lat. preter. *absorbed*; part. pret. *absorbed*, or *absorpt*.] To swallow up.—Moses imputed the deluge to the disruption of the abyss; and St. Peter to the particular constitution of that earth, which

made it obnoxious to be *absorpt* in water. *Burnet.*—To suck up.—While we perspire, we *absorb* the outward air. *Arbutnot.*

ABSORBENT, *f.* [*absorbens*, Lat.] In general, any thing possessing the faculty of *absorbing*, or swallowing up another.

ABSORBENT MEDICINES, *adj.* testaceous powders, as chalk, crabs-eyes, &c. which are taken inwardly for drying up or absorbing any acid or redundant humours in the stomach or intestines. They are likewise applied outwardly to ulcers or sores with the same intention.

ABSORBENT VESSELS, a name given promiscuously to the lacteal vessels, lymphatics, and inhalent arteries. See **ANATOMY**.—Naturalists also define similar absorbents in plants, the fibrous or hairy roots of which are as a kind of vasa absorbentia, which attract and imbibe the nutritious juices from the earth. See **PLANTS**.

ABSORBING, *part.* the swallowing up, sucking up, or imbibing, any thing: thus black bodies are said to absorb the rays of light; luxuriant branches, to absorb or waste the nutritious juices which should feed the fruit of trees, &c.

ABSORPT, *part.* Swallowed up; used as well, in a figurative sense, of persons, as, in the primitive, of things.

ABSORPTION, *f.* the act of swallowing up; and, in the animal economy, is the power whereby the absorbent vessels imbibe the juices, &c.

ABSORPTIONS OF THE EARTH, *f.* a term used by Kircher and others for the sinking in of large tracts of land by means of subterranean commotions, and many other accidents. Pliny tells us, that in his time the mountain Cymbotus, with the town of Eurites, which stood on its side, were wholly absorbed into the earth, so that not the least trace of either remained; and he records the like fate of the city Tantalus in Magnesia, and after it of the mountain Sypelus, both thus absorbed by a violent opening of the earth. Galanis and Garnatus, towns once famous in Phœnicia, are recorded to have met the same fate; and the vast promontory, called Phlegium, in Ethiopia, after a violent earthquake in the night-time, was not to be seen in the morning, the whole having disappeared, and the earth closed over it. These and many other histories, attested by authors of the greatest credit among the ancients, abundantly prove the fact in the earlier ages; and there have not been wanting too many instances of more modern date. Kircher's Mund. Subter. p. 77. See **EARTH** and **EARTHQUAKE**.

ABSORUS, **APSORUS**, **ABSYRTIS**, **ABSYRTIDES**, **APSYRTIDES**, **APSYRTIS**, and **ABSYRTIUM**, (Strabo, Mela, Ptolomy;) islands in the Adriatic, in the gulph of Carnero; so called from Absyrtus, Medea's brother, there slain. They are either one island or two, separated by a narrow channel, and joined by a bridge; and are now called *Cherso* and *Osero*.

To **ABSTAIN**, *v. n.* [*abstineo*, Lat.] To forbear, to deny one's self any gratification; with the particle *from*:

If thou judge it hard and difficult,
Conversing, looking, loving, to *abstain*
From love's due rites, nuptial embraces sweet;
And, with desires, to languish without hope. *Milton.*

ABSTEINEN, a district and village of Prussia, in a mountainous and pleasant country, so fertile in corn and cattle, that it is called the storehouse of Lithuania.

ABSTEMII, in church-history, a name given to such persons as could not partake of the cup of the eucharist on account of their natural aversion to wine. Calvinists allow these to communicate in the species or bread only, touching the cup with their lip; which, on the other hand, is by the Lutherans deemed a profanation.

ABSTEMIOUS, *adj.* [*abstemius*, Lat.] Temperate, sober, abstinent, refraining from excess of pleasures. It is used of persons; as, an *abstemious* hermit: and of things, as, an *abstemious* diet. It is spoken likewise of things that cause temperance.—The History of Mr. Wood, in the

Medic.

Medic. Transf. vol. ii. p. 261. art. 18. is a very remarkable exemplification of the very beneficial alterations which may be effected on the human body by a strict course of abstemiousness.—The Roman ladies, in the first ages of the republic, were all enjoined to be abstemious; and that it might appear, by their breath, whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTEMIOUSLY, *adv.* Temperately, soberly, without indulgence.

ABSTEMIOUSNESS, *f.* The quality of being abstemious.

ABSTENTION, *f.* [from *abstineo*, Lat.] The act of holding off, or refraining; restraint.

TO ABSTERGE, *v. a.* [*abtergo*, Lat.] To cleanse by wiping; to wipe.

ABSTERGENT, *adj.* Cleansing; having a cleansing quality.—Abstergent medicines are those employed for resolving obstructions, concretions, &c. such as soap, &c.

TO ABTERSE, *v. a.* To cleanse, to purify; a word very little in use, and less analogical than *abterge*.—Nor will we affirm, that iron receiveth, in the stomach of the ostrich, no alteration; but we suspect this effect rather from corrosion than digestion; not any tendency to chilification by the natural heat, but rather some attrition from an acid and vitriolous humidity in the stomach, which may *abterse* and shave the scorious parts thereof. *Brown.*

ABTERSION, *f.* [*abterfio*, Lat.] The act of cleansing.

ABTERSIVE, *adj.* That has the quality of absterging or cleansing.

ABSTINENCE, *f.* [*abstinentia*, Lat.] Forbearance of anything; with the particle *from*. Fasting, or forbearance of necessary food. It is generally distinguished from temperance, as the greater degree from the less; sometimes as single performances from habits; as, a day of *abstinence*, and a life of temperance.—Among the Jews, various kinds of abstinence were ordained by their law. Among the primitive Christians, some denied themselves the use of such meats as were prohibited by that law, others looked upon this abstinence with contempt; as to which, St. Paul gives his opinion, Rom. xiv. 1—3. The council of Jerusalem, which was held by the Apostles, enjoined the Christian converts to abstain from meats strangled, from blood, from fornication, and from idolatry. Abstinence, as prescribed by the gospel, is intended to mortify and restrain the passions, to humble our vicious natures, and by that means raise our minds to a due sense of devotion. But there is another sort of abstinence, which may be called *ritual*, and consists in abstaining from particular meats at certain times and seasons. It was the spiritual monarchy of the western world which first introduced this ritual abstinence; the rules of which were called *rogations*; but grossly abused from the true nature and design of fasting.—In England, abstinence from flesh has been enjoined by statute even since the reformation, particularly on Fridays and Saturdays, on vigils, and on all commonly called *fish-days*. The like injunctions were renewed under Queen Elizabeth: but at the same time it was declared, that this was done not out of motives of religion, as if there were any difference in meats; but in favour of the consumption of fish, and to multiply the number of fishermen and mariners, as well as spare the stock of sheep. The great fast, says St. Augustin, *is to abstain from sin*.

ABSTINENCE is more particularly used for a spare diet, or a slender parsimonious use of food, below the ordinary standard of nature. The physicians relate wonders of the effects of abstinence in the cure of many disorders, and protracting the term of life. The noble Venetian, Cornaro, after all imaginable means had proved vain, so that his life was despaired of at 40, recovered, and lived to near 100, by mere dint of abstinence; and he himself gives the account. It is indeed surprising to what a great age the primitive Christians of the east, who retired from the persecutions into the deserts of Arabia and Egypt, lived

healthful and cheerful on a very little food. Cassian assures us, that the common rate for twenty-four hours was twelve ounces of bread and mere water: with this St. Anthony lived 105 years; James the Hermit 104; Arsenius, tutor of the Emperor Arcadius, 120; St. Epiphanius, 115; Simeon the Stylite, 112; and Romauld, 120. Indeed, we can match these instances of longevity at home. Buchanan writes, that one Lawrence preserved himself to 140 by force of temperance and labour; and Spottwood mentions one Kentigern, afterwards called St. Mongah or Mungo, who lived to 185 by the same means. Other instances see under the article **LONGEVITY**.—**Abstinence**, however, is to be recommended only as it means a proper regimen; for in general it must have had consequences when observed without a due regard to constitution, age, strength, &c. According to Dr. Cheyne, most of the chronic diseases, the infirmities of old age, and the short lives of Englishmen, are owing to repletion; and may be either cured, prevented, or remedied, by abstinence: but then the kinds of abstinence which ought to obtain, either in sickness or health, are to be deduced from the laws of diet and regimen.

Among the brute creation, we see extraordinary instances of long abstinence. The serpent-kind, in particular, bear abstinence to a wonderful degree. We have seen rattlesnakes that had subsisted many months without any food, yet still retained their vigour and fierceness. Dr. Shaw speaks of a couple of cerastes (a sort of Egyptian serpents), which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand wherein they coiled themselves up in the bottom of the vessel may be reckoned as such: yet when he saw them, they had newly cast their skins, and were as brisk and lively as if just taken. But it is even natural for divers species to pass four, five, or six, months, every year, without either eating or drinking. Accordingly, the tortoise, bear, dormouse, serpent, &c. are observed regularly to retire, at those seasons, to their respective cells, and hide themselves, some in the caverns of rocks or ruins; others dig holes under ground; others get into woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c. And these animals are found as fat and fleshy after some months abstinence as before.—Sir G. Ent weighed his tortoise several years successively, at its going to earth in October, and coming out again in March; and found, that, of four pounds four ounces, it used only to lose about one ounce.—Indeed, we have instances of men passing several months as strictly abstinent as other creatures. In particular, the records of the Tower mention a Scotchman imprisoned for felony, and strictly watched in that fortress for six weeks: in all which time he took not the least sustenance; for which he had his pardon. Numberless instances of extraordinary abstinence, particularly from morbid causes, are to be found in the different periodical Memoirs, Transactions, Ephemerides, &c.—It is to be added, that, in most instances of extraordinary human abstinence related by naturalists, there were said to have been apparent marks of a texture of blood and humours, much like that of the animals above-mentioned. Though it is no improbable opinion, that the air itself may furnish something for nutrition; it is certain, there are substances of all kinds, animal, vegetable, &c. floating in the atmosphere, which must continually be taken in by respiration. And that an animal body may be nourished thereby, is evident in the instance of vipers; which, if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are observed to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone; in like manner as the eggs or spawn of fishes grow and are nourished with the water. And hence, say some, it is that cooks, turnspit-dogs, &c. though they eat but little, yet are usually fat. See **FASTING**.

ABSTINENT, *adj.* [*abstinens*, Lat.] That uses abstinence,

nence, in opposition to covetous, rapacious, or luxurious. It is used chiefly of persons.

ABSTINENTS, or **ABSTINENTES**, a sect of heretics that appeared in France and Spain about the end of the third century. They are supposed to have borrowed part of their opinions from the Gnostics and Manicheans, because they opposed marriage; condemned the use of flesh meat, and placed the Holy Ghost in the class of created beings.

ABSTORTED, *adj.* [*abstortus*, Lat.] Forced away, wrung from another by violence.

To ABSTRACT, *v. a.* [*abstraho*, Lat.] To take one thing from another. To separate by distillation. To separate ideas. To reduce to an epitome.—If we would fix in the memory the discourses we hear, or what we design to speak, let us *abstract* them into brief compends, and review them often. *Watts.*

ABSTRACT, *adj.* [*abstractus*, Lat.] Separated from something else; generally used with relation to mental perceptions; as, *abstract* mathematics, *abstract* terms, in opposition to concrete.

ABSTRACT, *f.* A smaller quantity, containing the virtue or power of a greater. An epitome made by taking out the principal parts. The state of being abstracted or disjoined. In literature, a compendious view of any large work; shorter and more superficial than an abridgment.

ABSTRACT IDEA, *adj.* in metaphysics, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstracting from the rest. Thus, in viewing an object with the eye, or recollecting it in the mind, we can easily abstract from some of its parts and properties, and attach ourselves to others: we can attend to the redness of a cherry, without regard to its figure, taste, or consistence.

ABSTRACT TERMS, words that are used to express abstract ideas. Thus beauty, ugliness, whiteness, roundness, life, death, are abstract terms.

ABSTRACT NUMBERS, are assemblages of units, considered in themselves without denoting any particular and determined particulars. Thus 6 is an abstract number, when not applied to any thing; but, if we say 6 feet, 6 becomes a concrete number. See the article **NUMBER**.

ABSTRACT MATHEMATICS, otherwise called *Pure Mathematics*, is that which treats of magnitude or quantity, absolutely and generally considered, without restriction to any species of particular magnitude; such are Arithmetic and Geometry. In this sense, abstract mathematics is opposed to mixed mathematics; wherein simple and abstract properties, and the relations of quantities primitively considered in pure mathematics, are applied to sensible objects, and by that means become intermixed with physical considerations; such are Hydrostatics, Optics, Navigation, &c.

ABSTRACTED, *part. adj.* Separated; disjoined. Refined, purified. Abstruse; difficult. Absent of mind, inattentive to present objects; as, an *abstracted* scholar.

ABSTRACTEDLY, *adv.* With abstraction, simply, separately from all contingent circumstances.

ABSTRACTION, *f.* [*abstractio*, Lat.] The act of abstracting. The state of being abstracted. Absence of mind; inattention. Disregard to worldly objects.

ABSTRACTION, in metaphysics, the operation of the mind when occupied by abstract ideas. A large oak fixes our attention, and abstracts us from the shrubs that surround it. In the same manner a beautiful woman in a crowd, abstracts our thoughts, and engrosses our attention solely to herself. These are examples of real abstraction: when these, or any others of a similar kind, are recalled to the mind after the objects themselves are removed from our sight, they form what are called *abstract ideas*.

Abstraction is chiefly employed these three ways. First, When the mind considers any one part of a thing, in some respect distinct from the whole; as a man's arm without the consideration of the rest of the body. Secondly, When we consider the *mode* of any substance, omitting the sub-

stance itself; or when we separately consider several modes which subsist together in one subject. This abstraction the geometricians make use of when they consider the length of a body separately, which they call a *line*, omitting the consideration of its breadth and thickness. Thirdly, It is by abstraction that the mind forms general or universal ideas; omitting the modes and relations of the particular objects whence they are formed. Thus, when we would understand a thinking being in general, we gather from our self-consciousness what it is to think; and, omitting those things which have a particular relation to our own minds, or to the human mind, we conceive a thinking being in general. Ideas formed in this manner, which are what we properly call *abstract ideas*, become general representatives of all objects of the same kind; and their names applicable to whatever exists conformable to such ideas. Thus the idea of colour that we receive from chalk, snow, milk, &c. is a representative of all of that kind; and has a name given it, *whiteness*, which signifies the same quality wherever found or imagined.

ABSTRACTIVE, *adj.* Having the power or quality of abstracting.

ABSTRACTLY, *adv.* In an abstract manner, absolutely, without reference to any thing else.

ABSTRACTNESS, *f.* Subtlety; separation from all matter or common notion.—I have taken some pains to make plain and familiar to your thoughts, truths, which established prejudice, or the *abstractness* of the ideas themselves, might render difficult. *Locke.*

ABSTRACTED, *part. adj.* [*abstractus*, Lat.] Unbound.

To ABSTRINGE, *v. a.* To unbind.

To ABSTRUDE, *v. a.* [*abstrudo*, Lat.] To thrust off, or pull away.

ABTRUSE, *adj.* [*abstrusus*, Lat. thrust out of sight.] Hidden. Difficult; remote from conception or apprehension. It is opposed to *obvious* and *easy*:

Th' eternal eye, whose sight discerns
Abstrusely thoughts, from forth his holy mount,
And from within the golden lamps that burn
Nightly before him, saw, without their light,
Rebellion rising.

Milton.

ABSTRUSELY, *adv.* In an abstruse manner; obscurely, not plainly, or obviously.

ABTRUSENESS, *f.* The quality of being abstruse; difficulty, obscurity.—It is not oftentimes so much what the scripture says, as what some men persuade others it says, that makes it seem obscure, and that as to some other passages which are so indeed, since it is the *abtruseness* of what is taught in them, that makes them almost inevitably so; it is little less saucy, upon such a score, to find fault with the style of the scripture, than to do so with the Author for making us but men. *Boyle.*

ABTRUSITY, *f.* Abtruseness. That which is abstruse. A word seldom used.

To ABSUME, *v. a.* [*absumo*, Lat.] To bring to an end by a gradual waste; to eat up. An uncommon word.

ABSURD, *adj.* [*absurdus*, Lat.] Unreasonable; without judgment, as used of men. Inconsistent, contrary to reason, used of sentiments or practices.—Thus, it would be absurd to say that 6 and 6 make only 10, or to deny that twice 6 make 12. When the term *absurd* is applied to actions, it has the same import as *ridiculous*.

ABSURDITY, *f.* The quality of being absurd; want of judgment, applied to men; want of propriety, applied to things. That which is absurd; as, His travels were full of *absurdities*. In which sense it has a plural.—The satisfaction we receive from the opinion of some pre-eminence in ourselves, when we see the absurdities of another, or when we reflect on any past *absurdities* of our own. *Addison.*

ABSURDLY, *adv.* After an absurd manner; improperly; unreasonably.—We may proceed yet further with the atheist, and convince him, that not only his principle is absurd, but his consequences also as *absurdly* deduced from it. *Bentley.*

ABSURDNESS,

ABSURDNESS, *f.* The quality of being absurd; injudiciousness; impropriety. Absurdity is more frequently used.

ABSUS, *f.* in botany. See **CASSIA**.

ABSYRTUS, in the heathen mythology, the son of Æta and Hypsæa, and the brother of Medea. The latter running away with Jason, after her having assisted him in carrying off the golden fleece, was pursued by her father; when, to stop his progress, she tore Absyrtus in pieces, and scattered his limbs in his way.

ABTHANES, a title of honour used by the ancient inhabitants of Scotland, who called their nobles *thanes*, which in the old Saxon signifies *king's ministers*; and of these the higher rank were styled *abthanes*, and those of the lower *under thanes*.

ABUCCO, **ABOCCO**, or **ABOCCHI**, a weight used in the kingdom of Pegu. One abucco contains $12\frac{1}{2}$ teccalis; two abuccos make a giro or agire; two giro, half a piza; and a piza weighs an hundred teccalis; that is, two pounds five ounces the heavy weight, or three pounds nine ounces the light weight of Venice.

ABUKESO, in commerce, the same with **ASLAN**.

ABULFARAGIUS (Gregory,) son to Aaron a physician, born in 1226, in the city of Malatia, near the source of the Euphrates in Armenia. He followed the profession of his father; and practised with great success, numbers of people coming from the most remote parts to ask his advice. However, he would hardly have been known at this time, had his knowledge been confined to physic: but he applied himself to the study of the Greek, Syriac, and Arabic languages, as well as philosophy and divinity; and he wrote a history which does honour to his memory. It is written in Arabic, and divided into dynasties. It consists of ten parts, being an epitome of universal history from the creation of the world to his own time. Dr. Pocock published it with a Latin translation in 1663; and added, by way of supplement, a short continuation relating to the history of the eastern princes.

ABUNA, the title given to the archbishop or metropolitan of Abyssinia.

ABUNDANCE, *f.* [*abondance*, Fr.] Plenty; a sense chiefly poetical. Great numbers. A great quantity. Exuberance, more than enough.

ABUNDANT, *adj.* [*abundans*, Lat.] Plentiful. Exuberant. Fully stored. It is followed sometimes by *in*, commonly by *with*.—The world began but some ages before these were found out, and was *abundant with* all things at first; and men not very numerous; and therefore were not put so much to the use of their wits, to find out ways for living commodiously. *Burnet*.—It is applied generally to things, sometimes to persons.—The Lord, the Lord God, merciful and gracious, long-suffering and *abundant in goodness and truth*. *Exod.* xxxiv. 6.

ABUNDANT NUMBER, in arithmetic, is a number, the sum of whose aliquot parts is greater than the number itself. Thus the aliquot parts of 12, being 1, 2, 3, 4, and 6, they make, when added together, 16. An abundant number is opposed to a *deficient* number, or that which is greater than all its aliquot parts taken together; as 14, whose aliquot parts are, 1, 2, and 7, which make no more than 10: and to a *perfect* number, or one to which its aliquot parts are equal; as 6, whose aliquot parts are 1, 2, and 3.

ABUNDANTLY, *adv.* In plenty.—Let the waters bring forth *abundantly* the moving creature that hath life. *Gen.* i. 20.—Amplly, liberally, more than sufficiently.—Heroic poetry has ever been esteemed the greatest work of human nature. In that rank has Aristotle placed it; and Longinus is so full of the like expressions, that he *abundantly* confirms the other's testimony. *Dryden*.

ABUNDANTIA, a heathen divinity, represented in ancient monuments under the figure of a woman with a pleasing aspect, crowned with garlands of flowers, pouring all sorts of fruit out of a horn which she holds in her right hand, and scattering grain with her left, taken pro-

miscuously from a sheaf of corn. On a medal of Trajan, she is represented with two cornucopieæ.

ABURY, or **AUBERY**, Wilts, near Marlborough-downs, noted for the stupendous remains of a Druidical temple, like Stonehenge, on Salisbury plain.

ABU SAID (Ebn Aljaptu), sultan of the Moguls, succeeded his father anno 717 of the hegira. He was the last monarch of the race of Jenghizkhan; and after his death, which happened the same year that Tamerlane was born, the empire was made a scene of blood and desolation.

ABUS, in ancient geography, a river of Britain, formed by the confluence of the Ure, the Derwent, Trent, &c. falling into the German Sea between Yorkshire and Lincolnshire, and forming the mouth of the Humber.

TO ABUSE, *v. a.* [*abutor*, *abusus*, Lat.] In abuse the verb, *s* has the sound of *z*; in the noun, the common sound. To make an ill use of. To violate; to defile. To deceive; to impose on. To treat with rudeness; to reproach.

Some praise at morning what they blame at night.

But always think the last opinion right.

A muse by these is like a mistress us'd,

This hour she's idoliz'd, the next *abus'd*.

Pope.

ABUSE, *f.* The ill use of any thing. A corrupt practice, bad custom. Seducement. Unjust censure, rude reproach, contumely:

I dark in light expos'd

To daily fraud, contempt, *abuse*, and wrong. *Milton.*

ABUSER, *f.* He that makes an ill use. He that deceives.—Next thou, the *abuser* of thy prince's ear. *Denham*. He that reproaches with rudeness. A ravisher, a violater.

ABUSIVE, *adj.* Practising abuse. Containing abuse; as an abusive lampoon. Deceitful; a sense little used, yet not improper.—It is verified by a number of examples, that whatsoever is gained by an *abusive* treaty, ought to be restored *in integrum*. *Bacon*.

ABUSIVELY, *adv.* Improperly, by a wrong use. Reproachfully.

ABUSIVENESS, *f.* The quality of being abusive; foulness of language.—Pick out of mirth, like stones out of thy ground, profaneness, filthiness, *abusiveness*. *Herbert*.

TO ABUT, *v. n.* obsolete. [*aboutir*, to touch at the end, Fr.] To end at, to border upon; to meet, or approach to, with the particle *upon*.—The Loos are two several corporations, distinguished by the addition of east and west, *abutting upon* a navigable creek, and joined by a fair bridge of many arches. *Carew*.

ABUTILON, in botany. See **HIBISCUS**, **MELOCHIA**, **MALVA**, **NAPÆA**, **SIDA**.

ABUTMENT, *f.* That which abuts, or borders upon another.

ABUTTAL, *f.* The butting or boundaries of any land. A writing declaring on what lands, highways, or other places, it does abut.

ABYDOS, anciently a town built by the Milesians in Asia, on the Hellespont, where it is scarce a mile over, opposite to Sestos on the European side. Now both called the *Dardanelles*. Abydos lay midway between Lampacus and Ilium, famous for Xerxes's bridge; and for the loves of Leander and Hero; celebrated also for its oysters.

ABYDOS was likewise anciently an inland town of Egypt, between Ptolemais and Diospolis Parva, towards Syrene; famous for the palace of Memnon and the temple of Osiris. A colony of Milesians: and the only one in the country into which the singers and dancers were forbid to enter.

This city, reduced to a village under the empire of Augustus, now presents to our view only an heap of ruins without inhabitants; but to the west of these ruins is still found the celebrated tomb of Ismandes. The entrance is under a portico sixty feet high, and supported by two rows of massy columns. The immovable solidity of the edifice, the huge masses which compose it, the hieroglyphics it is loaded with, stamp it a work of the ancient Egyptians. Beyond it is a temple 300 feet long and 145 wide. Upon entering

entering the monument we meet with an immense hall, the roof of which is supported by twenty-eight columns sixty-feet high and nineteen in circumference at the base. They are 12 feet distant from each other. The enormous stones that form the ceiling, perfectly joined and incruited, as it were, one in the other, offer to the eye nothing but one solid platform of marble 126 feet long and twenty-six wide. The walls are covered with hieroglyphics. One sees there a multitude of animals, birds, and human figures with pointed caps on their heads, and a piece of stuff hanging down behind, dressed in loose robes that come down only to the waist. Amongst these we may distinguish some women suckling their children, and men presenting offerings to them. Here also we meet with the divinities of India. Monsieur Chevalier, formerly governor of Chandernagore, who resided twenty years in that country, carefully visited this monument on his return from Bengal. He remarked here the gods *Jagrenet*, *Gonez*, and *Vechnou*, or *Wistnou*, such as they are represented in the temples of Indostan. A great gate opens at the bottom of the first hall, which leads to an apartment forty-six feet long by twenty-two wide. Six square pillars support the roof of it; and at the angles are the doors of four other chambers, but so choked up with rubbish that they cannot now be entered. The last hall, sixty-four feet long by twenty-four wide, has stairs by which one descends into the subterraneous apartments of this grand edifice. The Arabs, in searching after treasure, have piled up heaps of earth and rubbish. In the part we are able to penetrate, sculpture and hieroglyphics are discoverable as in the upper story. The natives say that they correspond exactly with those above ground, and that the columns are as deep in the earth as they are lofty above ground. It would be dangerous to go far into those vaults; for the air of them is so loaded with a mephitic vapour, that a candle can scarce be kept burning in them. Six lions' heads, placed on the two sides of the temple, serve as spouts to carry off the water. You mount to the top by a staircase of a very singular structure. It is built with stones incruited in the wall, and projecting six feet out; so that being supported only at one end, they appear to be suspended in the air. The walls, the roof, and the columns of this edifice, have suffered nothing from the injuries of time; and did not the hieroglyphics, by being corroded in some places, mark its antiquity, it would appear to have been newly built. The solidity is such, that unless people make a point of destroying it, the building must last a great number of ages. To the left of this great building we meet with another much smaller, at the bottom of which is a fort of altar. This was probably the sanctuary of the temple of Osiris.

ABYLA (Ptolemy, Mela), one of Hercules's pillars on the African side, called by the Spaniards *Sierra de las Monas*, over against Calpe in Spain, the other pillar; supposed to have been formerly joined, but separated by Hercules, and thus to have given entrance to the sea now called the Mediterranean: the limits of the labours of Hercules. *Pliny*.

ABYSM, *f.* [*abyssme*, old Fr. now written contractedly *abime*.] A gulf; the same with *abyss*.

My good stars that were my former guides,
Have empty left their orbs, and shot their fires
Into the *abyss* of hell. *Shakespeare*.

ABYSS, *f.* [*abyssus*, Lat. *αβυσσος*, bottomless, Gr.] A depth without bottom.

Thy throne is darkness in th' *abyss* of light,
A blaze of glory that forbids the sight;
O teach me to believe thee thus conceal'd,
And search no farther than thyself reveal'd. *Dryden*.

A great depth, a gulf; hyperbolically.—The yawning earth disclosed the *abyss* of hell. *Dryden*.—In a figurative sense, that in which any thing is lost.—If, discovering how far we have clear and distinct ideas, we confine our thoughts within the contemplation of those things that are within the

reach of our understandings, and launch not out into that *abyss* of darkness, out of a presumption that nothing is beyond our comprehension. *Locke*.—The body of waters supposed at the center of the earth.—We are here to consider what is generally understood by the great *abyss*, in the common explication of the deluge; and it is commonly interpreted either to be the sea, or subterraneous waters hid in the bowels of the earth. *Burnet*.—In the language of divines, hell:

That insatiable *abyss*,
Where flames devour, and serpents hiss. *Roscommon*.

Dr. Woodward, in his Natural History of the Earth, asserts, That there is a mighty collection of waters inclosed in the bowels of the earth, constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the great deep, and what most authors render the great *abyss*. The water of this vast *abyss*, he alleges, does communicate with that of the ocean, by means of certain hiatuses or chafins passing betwixt it and the bottom of the ocean: and this and the *abyss* he supposes to have one common centre, around which the water of both is placed; but so, that the ordinary surface of the *abyss* is not level with that of the ocean, nor at so great a distance from the centre as the other, it being for the most part restrained and depressed by the strata of earth lying upon it: but wherever those strata are broken, or so lax and porous that water can pervade them, there the water of the *abyss* ascends; fills up all the clefts and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone, or other matter, all around the globe, quite up to the level of the ocean.

The existence of an *abyss*, or receptacle of subterraneous waters, is controverted by Camerarius; and defended by Dr. Woodward chiefly by two arguments: the first drawn from the vast quantity of water which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to show are occasioned by the violence of the waters in this *abyss*. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, according to him, that the waters, which were the occasion thereof, were co-extended with that part of the globe. There are even instances of universal earthquakes; which show, that the whole *abyss* must have been agitated; for so general an effect must have been produced by as general a cause, and that cause can be nothing but the subterraneous *abyss*.

To this *abyss* also has been attributed the origin of springs and rivers; the level maintained in the surfaces of different seas; and their not overflowing their banks. To the effluvia emitted from it, some even attribute all the diversities of weather and change in our atmosphere. Ray, and other authors, ancient as well as modern, suppose a communication between the Caspian Sea and the ocean by means of a subterranean *abyss*: and to this they attribute it that the Caspian does not overflow, notwithstanding the great number of large rivers it receives, of which Keimper reckons above fifty in the compass of sixty miles; though, as to this, others suppose that the daily evaporation may suffice to keep the level.

The different arguments concerning this subject may be seen collected and amplified in Cockburn's Inquiry into the Truth and Certainty of the Mosaic Deluge, p. 271, &c. After all, however, this amazing theory of a central *abyss* is far from being demonstrated: it will perhaps in several respects appear inconsistent with sound philosophy, as well as repugnant to the phenomena of nature. In particular, if we believe any thing like elective attraction to have prevailed in the formation of the earth, we must believe that the separation of the chaos proceeded from the union of similar particles. It is certain that rest is favourable to such operations of nature. As, therefore, the central parts of the earth were more immediately quiescent than those remote

remote from the centre, it seems absurd to suppose that the heavier and denser bodies gave place to the more light and fluid; that the central part should consist of water only, and the more superficial part of a crust or shell. Vid. Whitehurst's Inquiry into the original Formation of the Strata, &c. See DELUGE.

ABYSS is more particularly used in antiquity, to denote the temple of Proserpine. It was thus called on account of the immense fund of gold and riches deposited there; some say, hid under ground.

ABYSS is also used in heraldry to denote the centre of an escutcheon. In which sense, a thing is said to be bore in abyfs, *en abyfme*, when placed in the middle of the shield, clear from any other bearing: He bears azure, a fleur-de-lis, in abyfs.

ABYSSINIA, or *Modern Ethiopia*, is a very extensive empire in Africa, called by the Arabians *Al Habash*.—Into this part of the globe the admission of travellers has been supposed extremely difficult, and their return from thence almost impracticable. James Bruce, Esq. of Kinnaird, in Scotland, has, however, lately made the tour of those remote regions: from whence he has returned home in safety, and has since favoured the world with a very interesting and curious description of Abyssinia and the other parts of Ethiopia, through which he travelled to discover the source of the Nile. According to a map of the country published by this gentleman, Abyssinia is bounded on the south by a vast chain of mountains, extending with very little interruption from 34° to 44° E. lon. and between 80° and 90° N. lat. On the east and north-east it has the Red Sea, and on the south-east the kingdom of Adel. On the west and north its boundaries are less distinctly marked; having on both these quarters the barbarous kingdom of Sennaar, whose limits frequently vary according to the fortune of war. From Arkeeko, situated near the foot of the Bafaltes mountains, in about 15° 30' N. lat. it extends to near 7° N. lat. where the mountains of Caffa, the most southerly province of Abyssinia, terminate. Along the coast of the Red Sea lie the territories inhabited by the Hazorta-Shiho, the district of Engana-Shiho, and the kingdom of Dancali, including the territory of Azab. To the westward of these are the province or kingdom of Tigré, including the country of the Dobas, part of the kingdom of Bali, and that of Dawaro. Still farther west are those of Siré, Lafta, Amhara, the greatest part of Bali, and part of Fatigar, which last reaches beyond the mountains. Proceeding still in the same direction, we come to Teherkin, Tchelga, Abargale, Salao, Begemder, Shoa, and Ifat; reckoning always from north to south; Teherkin, for instance, being to the northward of Tchelga, &c. Shoa extends a considerable way to the westward; so that, besides Ifat, it has to the south of it also the kingdoms of Hade and Cambut; the latter extending beyond the southern ridge of mountains. To the westward are Ras-el-Feel, Dembea, Gojam, and Damot; and beyond these are the kingdoms of Dembea, Bizamo, Gooderoo, and Guraque; those of Nare or Enarea and Caffa occupying the south-west corner of the empire.

The principal river is the Nile, which has its source in this country; and the most considerable lake is that of Dembea, which discharges itself into the Nile; it is about 700 miles in length, and ninety in breadth. The air is pretty temperate in the mountains, and therefore their towns and strong holds are generally placed on them; but in the valleys it is hot and suffocating. The torrents in the rainy season wash a great deal of gold from the mountains. This season begins in May, when the sun is vertical, or directly over their heads, and ends in September.—These rains produce the inundation of the NILE; for the particulars of which see that Article.

The Abyssines in general are of an olive complexion, tall, graceful, and well featured. Those who are neither mechanics nor tradesmen (which few of them are), nor tillers of the ground, are enured to bear arms, which are a head-piece, a buckler, a coat of mail, bows and arrows,

darts, pikes capped with iron at both ends, a sling, and a sword: they have very few fire-arms, and those were introduced by the Portuguese. The habit of persons of quality is a fine silken vest, or fine cotton, with a kind of scarf. The citizens have the same habit, only coarser. The common people have nothing but a pair of cotton drawers, and a scarf which covers the rest of their body. The women are of a healthy constitution, active, and moderately handsome, having neither flat noses nor thick lips like the negroes; and nature is so friendly, that they stand in little need of midwives, which is indeed the case of most countries in the torrid zone. They appear in public as in Europe, without being forbid the conversation of the men as among the Mahometans. Princesses of the royal blood are not permitted to marry foreigners: and when they take the air, they go in great state, with 400 or 500 women attendants. Their language bears a great affinity with the Arabic; but particular provinces have a different dialect.

Gold, silver, copper, and iron, are the principal ores with which their mines abound in this extensive part of Africa: but not above one third part is made use of by way of merchandize, or converted into money; of which they have little or no use in Abyssinia. They cut their gold indeed into small pieces for the pay of their troops, and for expences of the court, which is but a modern custom among them; the king's gold, before the end of the 17th century, being laid up in his treasury in ingots, with intent to be never carried out, or never used in any thing but vessels and trinkets for the service of the palace. In the lieu of small money, they make use of rock salt as white as snow and as hard as stone. This is taken out of the mountain of Lafta, and put into the king's warehouses; where it is reduced into tablets of a foot long, and three inches broad, ten of which are worth about a French crown. When they are circulated in trade, they are reduced into still smaller pieces, as occasion requires. This salt is also applied to the same purpose as common sea-salt. With this mineral salt, they purchase pepper, spices, and silk stuffs, which are brought to them by the Indians, in their ports in the Red Sea. Cardamums, ginger, aloes, myrrh, cassia, civet, ebony-wood, ivory, wax, honey, and cotton, are merchandises which may be had from Abyssinia; to which may be added sugar, hemp, flax, &c. It is affirmed there are in this country the finest emeralds that are any where to be found; and, though they are found but in one place, they are there in great quantities, and some so large and so perfect as to be of almost ineffinable value. The greatest part of the merchandises above mentioned, are more for foreign than inland trade. The domestic commerce consists chiefly in salt, honey, buck-wheat, grey peas, citrons, oranges, lemons, and other provisions, with fruits and herbage necessary for the support of life. Those places that the Abyssinian merchants frequent the most, who dare venture to carry their commodities by sea themselves, are Arabia Felix, and the Indies; particularly Goa, Cambaye, Bengal, and Sumatra. With regard to their ports on the Red Sea, to which foreign merchants commonly resort, the most considerable are those of Mette, Azum, Zanjalla, Maga, Dazo, Patea, and Brava. The trade of the Abyssinians by land is inconsiderable. There are, however, bands of them who arrive yearly at Egypt, particularly at Cairo, laden with gold dust, which they bring to barter for the merchandises of that country, or of Europe, for which they have occasion. These caravans or caravans, if we may be allowed thus to call a body of forty or fifty poor wretches who unite together for their mutual assistance in their journey, are commonly three or four months in their route, traversing forests and mountains almost impassable in order to exchange their gold for necessaries for their families, and return immediately with the greatest part of the merchandise on their backs. Frequently the Jews or Egyptians give them large credit; which may seem surprising, as they are beyond recourse if they should fail of payment. But experience has shewn, that they have

never abused the confidence reposed in them; and even in the event of death, their fellow-travellers take care of the effects of the deceased for the benefit of their families, but in the first place for the discharge of those debts contracted at Cairo.—It remains only to be observed, that one of the principal branches of trade of the Abyssines is that of slaves; who are greatly esteemed in the Indies and Arabia for the best, and most faithful, of all that the other kingdoms of Africa furnish. The Indian and Arabian merchants frequently substitute them as their factors; and, on account of their good services and integrity, not only often give them their liberty, but liberally reward them.

There is a great difference of climate in this country, owing to the vast extent and variety of elevation in different parts of the empire, which is very perceptible in its soil and productions. The mountains in many places are not only barren, but altogether inaccessible, except by those who make it their constant practice to climb amongst them; and even by them they cannot be ascended without great difficulty and danger. The shapes of these mountains are very strange and tremendous; exceedingly different from those of Europe; some resembling towers and steeples, while others are like a board or slate set up on end; the base being so narrow, and the whole mountain so high and thin, that it seems wonderful how it can stand. In the valleys, however, and flat parts of the country, the soil is excessively fruitful, though in the warmest places grain cannot be brought to perfection. Wine is also made only in one or two places; but the greatest profusion of fruits of all kinds is to be met with every where, as well as many vegetables not to be found in other countries. There is a vast variety of flowers, which adorn the banks of the rivers in such a manner as to make them resemble fine gardens. Among these a species of roses is met with, which grows upon trees, and is much superior in fragrance to those which grow on bushes. Among the variety of rare plants to be met with in Abyssinia, Mr. Bruce particularly describes the following.

1. The papyrus, the ancient material for paper; which our author supposes to have been a native of Ethiopia, and not of Egypt as has been supposed. 2. Balestan, balm, or balsam plant; a tree growing to the height of fourteen or fifteen feet, and used for fuel along with other trees in the country. It grows on the coast of the Red Sea, among the myrrh trees behind Azab, all the way to Babelmandel. This is the tree producing the balm of Gilead mentioned in Scripture. 3. The fassa, myrrh, and opocalpasum trees. These grow likewise along the coast of the Red Sea. The fassa or opocalpasum is used in manufactures; and, according to our author, resembles gum *adragant*, probably tragacanth. The tree which produces it grows to a great size, and has a beautiful flower, scarce admitting of description without a drawing. 4. The ergett, a species of the mimosa, is of two kinds; one called *ergette y'dimmo*, or the bloody ergett, from the pink colour of its filaments; the other *ergett el krone*, or the horned ergett, with a flower resembling the acacia vera or Egyptian thorn. These were both found on the banks of a river named *Amo*, near the great lake Dambea. 5. Enfete, an herbacious plant, growing in Narea, in swampy places; but it is supposed to grow equally as well in any other part of the empire where there is heat and moisture sufficient. It forms a great part of the vegetable food of the Abyssinians. It produces a kind of figs, but these are not eatable. When used for food, it is to be cut immediately above the small detached roots, or perhaps a foot or two higher, according to the age of the plant. The green is to be stripped from the upper part till it becomes white; and, when soft, it affords an excellent food when eaten with milk or butter. 6. Kolquall, a kind of tree, only the lower part of which is woody, the upper part being herbaceous and succulent. The flowers are of a beautiful golden colour, and the fruit turns to a deep crimson; so that the trees make a very beautiful appearance. The whole plant is full of a very acrid and caustic milk. 7. Rack is a large tree, growing not only in

Abyssinia, but in many places of Arabia Felix. Its wood is so hard and bitter, that no worm will touch it; for which reason it is used by the Arabs for constructing their boats. It grows, like the mangrove, among the salt-water of the sea, or about salt-springs. 8. Gir-gir, or geshe-el-aube; a kind of grafs found about Ras-el-Feel, growing to the height of about three feet four inches. 9. The kantuffa, a very noxious species of thorn, much more troublesome than any with which we are acquainted, and growing to the height of eight or more feet. The flowers have a strong smell like the flower mignonet. 10. The gagnedi, is a short tree only about nine feet high, a native of Lamalmon. The flowers, which are yellow and very beautiful, turn towards the sun like those of the helianthus. 11. The wansey, a tree common throughout all Abyssinia; flowers exactly on the first day the rains cease. It grows to the height of eighteen or twenty feet; having a thick bark and close heavy wood; the first part of which is white, but the rest of a dark colour. The flowers are of a beautiful white colour; but it does not appear to possess any other remarkable property, though it is held in great estimation by the Abyssinians, and is even worshipped by the Galla. 12. The farek, or *Bauhinia acuminata*, grows in the country immediately adjacent to the sources of the Nile: being found by Mr. Bruce scarce 400 yards distant from the fountain. 13. Kuara, is a beautiful tree, growing in the south and south-west parts of Abyssinia. It has a fruit like a bean, of a red colour, which in the early ages was made use of as a weight for gold and diamonds; and hence Mr. Bruce is of opinion that the name of the imaginary weight *carat* is derived. 14. The walkuffa, grows in the hottest parts of Ethiopia. It is a flowering tree, with beautiful white blossoms, which do not appear till towards the middle of January. The flowers have no smell, and are accounted pernicious to bees. The wood is very heavy. 15. The wooginoos, or *Brucea antidyfenterica*, is common throughout the whole empire, but principally on the sides of the valleys. It is a sovereign remedy against the dysentery, a very common and fatal disease in hot countries. Mr. Bruce had experimental proof of its antidyfenteric virtues. 16. Cusso, or *Bankfia anthelmintica*, is a very beautiful and useful tree, being a strong anthelmintic, and used as such by the Abyssinians. Every person there, whether male or female, is troubled with that kind of worm called *ascarides*; a great number of which are evacuated every month, and the evacuation is promoted by an infusion of this plant. While taking this medicine, the patients sequester themselves from all their acquaintance, and keep close at home. It is said, that the want of this medicine in other countries is the reason why the Abyssinians do not go out of their own country; or, if they do, that they are short-lived. 17. Tef, is a kind of grain sown generally throughout Abyssinia; and constituting the bread commonly made use of by the inhabitants. They have indeed plenty of wheat, and are as skilful in forming it into bread as the Europeans; but this is only made use of by people of the first rank: however, the tef is sometimes of such an excellent quality, that the bread made from it is held in equal estimation with the finest wheat. From the bread made of this grain a fourth liquor called *bouza* is prepared, which is used for common drink like our small beer. A liquor of the same kind, but of inferior quality, is made from barley cakes. Some have been of opinion, that the use of tef occasions the worms above mentioned; but this is controverted by Mr. Bruce. Nook, a plant not to be distinguished from our marigold either in shape, size, or foliage, is also sown very generally over the country, and furnishes all Abyssinia with oil for the kitchen and other uses.

Abyssinia abounds with a vast variety of quadrupeds, both wild and tame. Immense numbers of cattle every where present themselves, some of them the most beautiful in the world. Buffaloes are here met with in great numbers, and are very fierce and untractable; but there are no such animals as carnivorous bulls, which have been said to exist in this and other internal parts of Africa. Antelopes

telopes and other wild animals are met with in great numbers in the uncultivated parts; feeding chiefly on the leaves of trees. They abound most of all, however, in those parts which have been once cultivated, but since desolated by the calamities of war; and where wild oats abound in such quantities as to hide them from pursuit. Hyenas, lions, foxes, jackals, wild boars, &c. are also found, as well as the elephant, rhinoceros, caméléopard, and others of the larger and more uncommon kinds. Great havoc is made in the cultivated fields by multitudes of baboons, apes, rats, and mice. There is plenty of hares; but these being reckoned unclean, as well as wild boars, are not used as food. The rivers abound with crocodiles and hippopotami, at least the Nile, and those large streams which flow into it: but a great number have water in them only during the rainy season, and these have neither fish nor any animal that feeds upon them.

The number of birds in this country is immense; nor are those of the carnivorous kind at all deficient. Great numbers of eagles, vultures, hawks, and others of that kind, are met with, and come punctually every year after the tropical rains have ceased. They feed at first upon the shell-fish which are met with in great quantities on the edges of the deserts, where they had lived in the salt springs; but, being forced from their natural habitations when these springs were swelled by the rains, are afterwards left to perish on dry land. When these fail, their next resource is from the carcases of the large animals, such as the elephant and rhinoceros, which are killed in the flat country by the hunters. Their next supply is the multitude of rats and field-mice which infest the country after harvest. The vast slaughter of cattle made by the Abyssinian armies, the multitude of persons killed whose bodies are allowed to rot on the field of battle, &c. furnish them also with another resource. These supplies, however, all fail at the beginning of the rainy season, when the hunters and armies return home, and the vast quantity of water which continually overflows the ground renders it impossible for them to find any other food.

There are other birds, which feed upon insects, and multitudes which live on grain or seeds of various kinds; all of which are amply supplied by the immense quantity of fruits and berries which grow in Abyssinia, and are ripe at all seasons of the year. A very remarkable particular concerning this is, that the trees which bear fruit all the year round do not carry it always in the same place. The west side is that which blossoms first, and where of consequence the fruit first comes to perfection; the south side succeeds, and goes through the same process; after which, the north blossoms in like manner; and last of all is the east side, which produces flowers and fruit towards the beginning of the rainy season. All the trees of Abyssinia are ever-green; and their leaves are of a thick leathery consistence, and highly varnished to enable them to resist the violent rains which fall during a certain season. The granivorous birds have likewise this advantage, that the rains do not fall at the same time all over the country. It is intersected by a chain of mountains that divide the seasons also; so that they have but a short way to fly in order to become birds of passage, and supply themselves with such food as is necessary for them beyond the mountains. All the pigeons, of which there are many species, are birds of passage excepting one kind. The owls are extremely large and beautiful, but few in number. There is a great variety of swallows, several kinds of which are unknown in Europe; but, says Mr. Bruce, "those that are common in Europe appear in passage at the very season when they take their flight from thence. We saw the greatest part of them in the island of Masuah, where they lighted and tarried two days, and then proceeded with moon-light nights to the south-west." The large birds which reside constantly among the mountains of Samen and Taranta have all their feathers tubular, the hollow part being filled with a kind of yellow dust which issues out in great abundance on hunting them. This was par-

ticularly observed by Mr. Bruce in a species of eagle which he calls the golden eagle; and the dust being viewed through a microscope with a very strong magnifying power, appeared like fine feathers. The crows are spotted white and black, almost in equal proportions. The raven has his feathers intermixed with brown; the tip of his beak white, and a figure like a cup or chalice of white feathers upon his head. Mr. Bruce saw no sparrows, magpies, nor bats; neither are there many water-fowl, especially of the web-footed kind; but there are vast numbers of storks, which cover the plains in May, when the rains become constant. There are no geese, excepting one species called the golden goose or goose of the Nile, which is common all over Africa; but there are snipes in all the marshes.

Our author describes very few fishes; though he says that an account of these, and other marine productions of the Red Sea, which he collected, would occupy many large volumes. He mentions a fish named binny, which is good food, and grows to a large size; its whole body is covered with beautiful scales resembling silver spangles.

Of the reptiles in Abyssinia, Mr. Bruce describes a kind of lizard, and of the cerastes, or horned serpent; but denies that serpents are numerous in Abyssinia, as almost all authors have supposed, and as we should be led naturally to suspect. He vouches also for the power that some persons have of enchanting serpents and scorpions, which in some is natural, in others communicated artificially by certain medicines. He prevailed upon those who knew the secret to prepare him by these means as they had done others; but, notwithstanding this assistance, he acknowledges, that when it came to the trial his heart always failed him.

Mr. Bruce gives an ample description of the manners of the Abyssinians, who in some respects are barbarous beyond measure. The continual state of warfare in which they are engaged, no doubt contributes to confirm them in their barbarity. This arises from an error in the regulations concerning the succession. The crown is indeed hereditary, but it depends on the minister to choose the particular person who is to enjoy it; and as it is always his inclination to have the government in his own hands, he never fails to choose an infant, who is seldom suffered to live after he comes to the years of maturity. Thus perpetual wars and commotions take place, inasmuch that the ravenous birds, as has been observed, find one great supply of food in the slaughters made by the Abyssinians of one another. All authors agree, that the devastations committed by their armies are excessive; inasmuch, that after a long encampment is removed, nothing is to be seen all around the place where it was but bare earth. When an army there marches through the country, an inconceivable number of birds and beasts of prey, especially the former, follow it from the first day of its march to its return; increasing always in proportion the more it advances into the country. An army there leaves nothing living behind, nor the vestige of an habitation; but the fire and the sword reduce every thing to a wilderness and solitude. The beasts and birds unmolested have the country to themselves, and increase beyond all possible conception. The slovenly manner of this savage people, who, after a battle, bury neither friends nor enemies; the quantity of beasts of burthen that die perpetually under the load of baggage, and variety of mismanagement; the quantity of offal, and half-eaten carcases of cows, goats, and sheep, which they consume in their march for sustenance; all furnish a stock of carrion sufficient to occasion contagious distempers, were there not such a prodigious number of voracious attendants who consume them almost before putrefaction. There is no giving the reader any idea of their number, unless by comparing them to the sand of the sea. While the army is in motion, they are a black canopy which extends over it for leagues. When encamped, the ground is discoloured with them beyond the sight of the eye; and all the trees are loaded with them.

The

The prodigious number of criminals executed for high treason, whose bodies are cut in pieces and thrown about the streets, invite the hyænas to the capital, in the same manner that the carrion of the camp invites the birds of prey to follow it. The method of keeping off these voracious animals is certainly very curious. "An officer (says Mr. Bruce) called *Serack Maffery*, with a long whip, begins cracking and making a noise worse than twenty French postillions, at the door of the palace before the dawn of day. This chafes away the hyænas and other wild beasts; this too is the signal for the king's rising, who sits in judgment every morning fasting; and after that, about eight o'clock, he goes to breakfast."

With regard to the ferocious manners of the Abyssinians, they are accounted for by Mr. Bruce very naturally. Their continual warfare inures them to blood from their infancy; so that even children would not have the least scruple at killing one another, or grown up persons, if they were able. Many shocking instances of hardness of heart are related of them. Their cruelty displays itself abundantly in the punishments inflicted upon criminals, one of which is fleeing alive. Cutting in pieces with a sabre is another; and this is performed, not by executioners, whose employment is reckoned disgraceful as in this country, but by officers and people of quality. So little is this thought of in Gondar, the capital of Abyssinia, that Mr. Bruce happening to pass by an officer employed in this work, who had three men to dispatch, the officer called to him to stop till he had killed them all, as he wanted to speak to him upon a matter of consequence. Stoning to death is a capital punishment likewise common in this country; and usually inflicted on Roman Catholics if they happen to be found, or upon other heretics in religion as they term them.

It is not to be supposed that people who regard the lives of one another so little, will show much compassion to the brute creation. In this respect however, the Abyssinians are cruel and savage beyond all people on the face of the earth. There are many instances of savages eating raw flesh, and we call them barbarous that do so; but what name shall we give to those who cut off pieces of flesh from animals while still living, and eat it not only raw but still quivering with life! Mr. Bruce also says, that this way of eating not raw, but living, flesh, was customary among the nations of antiquity; and, in Picard, we find a people called Antis, that inhabited the mountains of Peru, who after they had taken an enemy, tied him alive to a tree, and cut off and ate the flesh from his bones, in which state he was left to languish and expire. Mr. Bruce informs us, that when he was at no great distance from Axum, the capital of Tigré, he fell in with three of the natives driving a cow. They halted at a brook, threw down the beast, and one of them cut a pretty large collop of flesh from its buttock; after eating which, they drove the cow gently on as before. In his description of their feasts he says the animal is tied, so that it cannot move: after stripping off the skin, the flesh of the buttocks is cut off in solid square pieces, without bones or much effusion of blood; and the prodigious noise the animal makes is a signal for the company to sit down to table. Every man sits between two women, having a long knife in his hand. With this he cuts the flesh, while the motion of its fibres is yet visible, into pieces like dice. These are laid upon pieces of bread made of the grain called *teff*, being strongly powdered with Cayenne pepper, and fossil salt. They are then rolled up like so many cartridges; the men open their mouths, stooping and gaping like idiots, while the women cram them so full of these cartridges, that they seem every moment in danger of being choked; and in proportion to the quantity their mouths can hold, and the noise they make in chewing, they are held in estimation by the company. All this time the animal bleeds but little: but when the large arteries are cut and it expires, the flesh becomes tough; and the wretches who have the rest to eat, gnaw it from the bones like dogs!

This circumstance, mentioned by Mr. Bruce, of the Abyssinians eating raw flesh from the ox, appears at first view so unnatural and disgusting, that it has induced many persons to doubt his veracity, and even to question whether he had ever really visited the source of the Nile. Yet, we find every nation has its peculiarities with respect to food, many of which would appear inhuman, did not our familiarity with the custom take off the impression. Do not we eat raw oysters within a second of their being separated from the shell? And do we not both roast them and lobsters whilst alive; the barbarity of which practice seems almost to equal that of the Abyssinians? Do not cooks skin eels whilst alive? And do not epicures crimp fish for the gratification of their appetites?

That the Abyssinians eat beef in a raw state, is agreed both by Lobo and Poncet; and the former says, reeking from the beast. Mr. Antes, moreover, was told by a Franciscan monk, who went with the caravan from Abyssinia to Cairo, that he was witness to an ox being killed, and immediately devoured by a band of travellers. For the civil, religious, and political, history of this people, see ETHIOPIA.

ACA, ACE, or ACON, a town of Phœnicia, on the Mediterranean; afterwards called Ptolemais; now Acre. See ACRE.

ACACALOTL, *f.* the Braslian name of a bird called by some *corvus aquaticus*, or water raven: properly, the pelicus carbo, or corvorant. See PELICANUS.

ACACIA, *f.* in botany. See GUILANDINA, GUAIA-CUM, MIMOSA, POINCIANA, SPARTIUM.

The flowers of a species of the acacia are used by the Chinese in making that yellow which we see bears washing in their silks and stuffs, and appears with so much elegance in their painting on paper. The method is this:—They gather the flowers before they are fully open; these they put into a clean earthen vessel over a gentle heat, and stir them continually about, as they do the tea leaves, till they become dryish and of a yellow colour; then to half a pound of the flowers they add three spoonfuls of fair water, and after that a little more, till there is just enough to hold the flowers incorporated together: they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

Mr. Geoffroy attributes the origin of bezoar to the seeds of this plant; which being broused by certain animals, and vellicating the stomach by their great sourness and astringency, cause a condensation of the juices till at length they become coated over with a stony matter, which we call BEZOAR.

ACACIA FALSE, in botany. See ROBINIA.

ACACIA THREE-THORNED, in botany. See GLEDITSIA.

ACACIA, *f.* in the materia medica, the inspissated juice of the unripe fruit of the MIMOSA NILOTICA. This juice is brought to us from Egypt, in roundish masses, wrapt up in thin bladders. It is outwardly of a deep-brown colour, inclining to black; inwardly of a reddish or yellowish brown; of a firm consistence, but not very dry. It soon softens in the mouth, and discovers a rough, but not disagreeable, taste, which is followed by a sweetish relish. This inspissated juice entirely dissolves in watery liquors; but is scarce sensibly acted on by rectified spirit. Acacia is a mild astringent medicine. The Egyptians give it in spitting of blood, in the quantity of a drachm, dissolved in any convenient liquor; they likewise employ it in collyria for strengthening the eyes, and in gargarisms for quinsseys. Among us, it is little otherwise used than as an ingredient in mithridate and theriaca, and is rarely met with in the shops. What is usually sold for the Egyptian acacia, is the inspissated juice of unripe sloes: this is hard-

er, heavier, of a darker colour, and somewhat sharper in taste, than the true fort.

ACACIA GERMAN, the juice of unripe sloes inspissated nearly to driness over a gentle fire, care being taken to prevent its burning. It is moderately astringent, similar to the Egyptian acacia, for which it has been commonly substituted in the shops. It is given in fluxes, and other disorders where styptic medicines are indicated, from a scruple to a drachm.

ACACIA, among antiquaries, something resembling a roll or bag, seen on medals, in the hands of several consuls and emperors. Some take it to represent a handkerchief rolled up, wherewith they made signals at the games; others, a roll of petitions or memorials; and some, a purple bag full of earth, to remind them of their mortality.

ACACIANS, in ecclesiastical history, the name of several sects of heretics; some of which maintained, that the Son was only a similar, not the same, substance with the Father; and others, that he was not only a distinct, but a dissimilar, substance. Two of these sects had their denomination from Acacius bishop of Cæsarea, who lived in the fourth century, and changed his opinions, so as, at different times, to be head of both. Another was named from Acacius patriarch of Constantinople, who lived in the close of the fifth century.

ACACIUS, surnamed **LUSCUS**, because he was blind of one eye, was bishop of Cæsarea in Palestine, and succeeded the famous Eusebius: he had a great share in the banishment of Pope Liberius, and bringing Felix to the see of Rome. He gave name to the above sect, and died about the year 365. He wrote the life of Eusebius, and several other works.

ACACIUS (St.) bishop of Amida, in Mesopotamia, in 420, was distinguished by his piety and charity. He sold the plate belonging to his church, to redeem seven thousand Persian slaves who were ready to die with want and misery; and, giving each of them some money, sent them home. Veranius their king was so affected with this noble instance of benevolence, that he desired to see the bishop; and this interview procured a peace between that prince and Theodosius I.

ACAD, or **ACHAD**, a town in which Nimrod reigned, called Archad by the Seventy; situated in Babylonia to the eastward of the Tigris.

ACADEMIAL, *adj.* Relating to an academy, belonging to an academy.

ACADEMIAN, *f.* A scholar of an academy or university; a member of an university. *Wood*, in his *Athenæ Oxonienses*, mentions a great feast made for the *academians*.

ACADEMICAL, *adj.* [*academicus*, Lat.] Belonging to an university.

ACADEMICIAN, *f.* [*académicien*, Fr.] The member of an academy. It is generally used in speaking of the professors in the academies of France.

ACADEMIC, *f.* A student of an university.

ACADEMIC, *adj.* [*academicus*, Lat.] Relating to an university:

While through poetic scenes the genius roves,
Or wanders wild in *academic* groves.

Pope.

ACADEMICS, or **ACADEMISTS**, a denomination given to the cultivators of a species of philosophy originally derived from Socrates, and afterwards illustrated and enforced by Plato, who taught in a grove near Athens, consecrated to the memory of Academus, an Athenian hero; from which circumstance this philosophy received the name of *academic*. Before the days of Plato, philosophy had in a great measure fallen into contempt. The contradictory systems and hypotheses which had successfully been urged upon the world were become so numerous, that, from a view of this inconsistency and uncertainty of human opinions, many were led to conclude, that truth lay beyond the reach of our comprehension. Absolute and universal scepticism was the natural consequence of this conclusion. In order to remedy this abuse of philosophy and

of the human faculties, Plato laid hold of the principles of the academical philosophy; and, in his *Phædo*, reasons in the following manner:—"If we are unable to discover truth (says he), it must be owing to two circumstances: either there is no truth in the nature of things; or the mind, from a defect in its powers, is not able to apprehend it. Upon the latter supposition, all the uncertainty and fluctuation in the opinions and judgments of mankind admit of an easy solution. Let us therefore be modest, and ascribe our errors to the real weakness of our own minds, and not to the nature of things themselves. Truth is often difficult of access: in order to come at it, we must proceed with caution and diffidence, carefully examining every step; and, after all our labour, we shall frequently find our greatest efforts disappointed, and be obliged to confess our ignorance and weakness."

Labour and caution in their researches, in opposition to rash and hasty decisions, were the distinguishing characteristics of the disciples of the ancient academy. A philosopher, possessed of these principles, will be slow in his progress; but will seldom fall into errors, or have occasion to alter his opinion after it is once formed. Vanity and precipitance are the great sources of scepticism: hurried on by these, instead of attending to the cool and deliberate principles recommended by the academy, several of our modern philosophers have plunged themselves into an absurd and ridiculous kind of scepticism. They pretend to discredit subjects that are plain, simple, and easily comprehended; but give peremptory and decisive judgments upon things that evidently exceed the limits of our capacity. Of these, Berkeley and Hume are the most considerable. Berkeley denied the existence of every thing, excepting his own ideas. Mr. Hume has gone a step further, and questioned even the existence of ideas; but at the same time has not hesitated to give determined opinions with regard to eternity, providence, and a future state, miraculous interpositions of the Deity, &c. subjects far above the reach of our faculties. In his essay on the academical or sceptical philosophy, he has confounded two very opposite species of philosophy. After the days of Plato, indeed, the principles of the first academy were grossly corrupted by Arcesilas, Carneades, &c. This might lead Mr. Hume into the notion that the *academical* and *sceptical* philosophy were synonymous terms. But no principles can be of a more opposite nature than those which were inculcated by the old academy of Socrates and Plato, and the sceptical notions which were propagated by Arcesilas, Carneades, and the other disciples of the succeeding academies.

ACADEMIST, *f.* The member of an academy. This is not often used.—It is observed by the Parisian *academists*, that some amphibious quadrupeds, particularly the sea-calf or seal, hath his epiglottis extraordinary large. *Ray.*

ACADEMY, *f.* [anciently, and properly, with the accent on the first syllable, now frequently on the second. *Academia*, Lat.] An assembly or society of men, uniting for the promotion of some art. The place where sciences are taught. An university. A place of education, in contradistinction to the universities or public schools. The thing, and therefore the name, is modern.

The first academy was a fine villa or pleasure house, in one of the suburbs of Athens, about a mile from the city; where Plato, and the wise men who followed him, held assemblies for disputes and philosophical conference; which gave the name to the sect of academics. The house took its name, *Academy*, from one Academus, or Eademus, a citizen of Athens, to whom it originally belonged: he lived in the time of Theseus; and here he used to have gymnastic sports or exercises.

This academy was farther improved by Cimon, and adorned with fountains, trees, shady walks, &c. for the convenience of the philosophers and men of learning, who here met to confer and dispute for their mutual improvement. It was surrounded with a wall by Hipparchus, the son of Pisistratus; and it was also used as the burying-place for illustrious persons, who had deserved well of the republic.

republic. It was here that Plato taught his philosophy; and hence it was that all public places, destined for the assemblies of the learned and ingenious, have been since called academies. Sylla sacrificed the delicious walks and groves of the academy, which had been planted by Cimon, to the ravages of war; and employed those very trees in constructing machines to batter the walls of the city which they had adorned.—Cicero too had a villa or country retirement, near Puzzuoli, which he called by the same name, *Academia*. Here he used to entertain his philosophical friends; and here it was that he composed his Academical Questions, and his books *De Naturâ Deorum*.

ACADEMY, among the moderns, denotes a regular society or company of learned persons, instituted under the protection of some prince, or other public authority, for the cultivation and improvement of arts or sciences. Some authors confound academy with university; but, though much the same in Latin, they are very different things in English. An university is properly a body composed of graduates in the several faculties; of professors, who teach in the public schools; of regents or tutors, and students who learn under them, and aspire likewise to degrees. Whereas an academy is not intended to teach, or profess any art or science, but to improve it: it is not for novices to be instructed in, but for those that are more knowing; for persons of learning to confer in, and communicate their lights and discoveries to each other, for their mutual benefit and improvement.

The first modern academy we read of, was established by Charlemagne, by the advice of Alcuin, an English monk: it was composed of the chief geniuses of the court, the emperor himself being a member. In their academical conferences, every person was to give some account of the ancient authors he had read; and each one assumed the name of some ancient author, that pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn these particulars, took that of Placcus, the surname of Horace; a young lord named Augilbert, took that of Homer; Adelard bishop of Corbie, was called Augustin; Recluse bishop of Mentz, was Dametas; and the king himself David.

Since the revival of learning in Europe, academies have multiplied greatly, most nations being furnished with several, and from their communications the chief improvements have been made in the arts and sciences, and in cultivating natural knowledge. There are now academies for almost every art, or species of knowledge; in giving an account of which, it seems most proper to arrange them according to their subjects.

I. MEDICAL ACADEMIES, as that of the *Naturæ Curiosos* in Germany; that founded at Palermo in 1645; another at Venice in 1701, which meets weekly in a hall near the grand hospital; another at Geneva in 1715, in the house of M. le Clerc. The colleges of physicians at London and Edinburgh are also, by some, ranked in the number of Academies.

The *Academy of Naturæ Curiosos*, called also the Leopoldine Academy, was founded in 1652 by Jo. Laur. Bauschius, a physician; who, in imitation of the English, published an invitation to all physicians to communicate their extraordinary cases; and, meeting with success, was elected president. Their works were at first published separately; but in 1670 a new scheme was laid for publishing a volume of observations every year. The first volume appeared in 1684, under the title of *Ephemerides*, and the work has been continued with some interruptions and variations of the title, &c. In 1687, the emperor Leopold took the society under his protection, granting the members several privileges, particularly that their presidents should be counts palatine of the holy Roman empire. This academy has no fixed residence, nor regular assemblies: instead of these, there is a kind of bureau, or office, first established at Breslau, and afterwards removed to Nuremberg, where letters, observations, &c. from correspondents or members are taken in. The academy consists of a

president, two adjuncts or secretaries, and colleagues or members without restriction. The colleagues, at their admission, oblige themselves to two things: first, to choose some subject out of the animal, vegetable, or mineral, kingdom, to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the Annual *Ephemerides*. Each member to bear a symbol of the academy, viz. a gold ring; whereon, instead of a stone, is a book open, and on the face thereof, an eye; on the other side the motto of the academy, *Nunquam otiosus*.

II. CHIRURGICAL ACADEMIES; as that instituted some years ago, by public authority, at Paris: the members of which were not only to publish their own and correspondents observations and improvements; but to give an account of all that is published on surgery, and to compose a complete history of the art, by their extracts from all the authors ancient and modern who have wrote on it. A question in surgery is annually proposed by the academy, and a gold medal of 200 livres value given to him who furnishes the most satisfactory answer.

Academy of Surgery at Vienna, was instituted some years ago, by order of the emperor, under the direction of the celebrated Brambilla. In this there were at first only two professors; and to their charge the instruction of 130 young men was committed, 30 of whom had formerly been surgeons in the army. But of late the number both of the teachers and pupils has been considerably increased. Gabrieli was appointed to teach pathology and practice; Boecking, anatomy, physiology, and physics; Streitz, medical and pharmaceutical surgery; Hunczowsky, surgical operations, midwifery, and the *chirurgia forensis*; and Plenk, chemistry and botany. To these also was added, Beindl, as professor and extraordinary professor of surgery and anatomy. A large and splendid edifice is erected in Vienna for this society, which affords habitation both for the teachers, the students, pregnant women, patients for clinical lectures, and servants. The emperor also purchased, for the use of this academy a medical library; a complete set of surgical instruments; an apparatus for experiments in natural philosophy; a collection of natural history; a number of anatomical and pathological preparations; a collection of preparations in wax brought from Florence; and a variety of other useful articles. Adjoining to the building also there is a good botanical garden.

III. ECCLESIASTICAL ACADEMIES; as that of Bologna in Italy, instituted in 1687, employed in the examination of the doctrine, discipline, and history, of each age of the church.

IV. COSMOGRAPHICAL ACADEMIES; as that at Venice, called the *Argonauts*. This was instituted at the solicitation of F. Coronelli, for the improvement of geographical knowledge. Its design was to publish exact maps, both celestial and terrestrial, as well particular as general, together with geographical, historical, and astronomical, descriptions. Each member, in order to defray the expence of such a publication, was to subscribe a proportional sum, for which they were to receive one or more copies of each piece published. For this end three societies are settled; one under F. Moro, provincial of the Minorities in Hungary; another under the Abbot Laurance au Ruy Payenne au Marais; the third under F. Baldigiani, Jesuit, professor of mathematics in the Roman college. The device of this academy is the terraqueous globe, with the motto *Plus ultra*; and at its expence all the globes, maps, and geographical writings, of F. Coronelli have been published.

V. ACADEMIES OF SCIENCES. These comprehend such as are erected for improving natural and mathematical knowledge. They are otherwise called *Philosophical* and *Physical* academies. The first of these was instituted at Naples about the year 1560, in the house of Baptista Porta. It was called the *Academy Secretorum Naturæ*; and was succeeded by the *Academy of Lyncei*, founded at Rome by Prince Frederic Cesi, towards the end of that century. Several

Several of the members of this academy rendered it famous by their discoveries; among these was the celebrated Galileo. Several other academies were instituted about that time, which contributed greatly to the advancement of the sciences; but none of them comparable to that of the Lyncei.

Some years after the death of Toricelli, the *Academy del Cimento* made its appearance, under the protection of Prince Leopold, afterwards Cardinal de Medicis. Redi was one of its chief members; and the studies pursued by the rest may be collected from those curious experiments published in 1667, by their secretary Count Laurence Magulotti, under the title of *Saggi di Naturali Esperienze*; a copy of which was presented to the Royal Society, translated into English by Mr. Waller, and published at London in 4to.

The *Academy degli Inquieti*, afterwards incorporated into that of Della Tracia in the same city, followed the example of that of Del Cimento. Some excellent discourses on physical and mathematical subjects, by Geminiano Montanari, one of the chief members, were published in 1667, under the title of *Perfieri Fisco Matematici*.

The *Academy of Rossano*, in the kingdom of Naples, was originally an academy of Belles Lettres, founded in 1540, and transformed into an Academy of Sciences in 1695 at the solicitation of the learned abbot Don Giacinto Gimma; who, being made president, under the title of promoter general thereof, gave them a new set of regulations. He divided the academists into the following classes:—Grammarians, Rhetoricians, Poets, Historians, Philosophers, Physicians, Mathematicians, Lawyers, and Divines, with a class apart for cardinals, and persons of quality. To be admitted a member, a man must have some degrees in the faculty. The members are not allowed to take the title of academists in the beginning of their books, without a written permission from their president, which is not granted till the work has been examined by the censors of the academy; and the permission is the greatest honour the academy can confer, as they thereby adopt the work, and are answerable for it against all criticisms that may be made upon it. To this law the president or promoter himself is subject; and no academist is allowed to publish any thing against the writings of another without leave from the society.

Several other Academies of Sciences have been founded in Italy; but, for want of being patronized, did not continue long. The loss of them, however, was abundantly repaired by the institution of others still subsisting; such as, the *Academy of Filarmonici* at Verona; of *Ricovatri* at Padua, where a learned discourse on the origin of springs was delivered by Sig. Vallisnieri, first professor of physic in the university of that city, and which was afterwards printed. To the *Academy of the Mute of Reggio*, at Modena, the same Sig. Vallisnieri presented an excellent discourse on the scale of created beings, since inserted in his History of the Generation of Man and Animals, printed at Venice in the year 1721.

F. Merfenne is said to have given the first idea of a philosophical academy in France, towards the beginning of the 17th century, by the conferences of naturalists and mathematicians occasionally held at his lodgings; at which Gassendi, Des Cartes, Hobbes, Roberval, Pascal, Blondel, and others, assisted. F. Merfenne proposed to each certain problems to examine, or certain experiments to be made. These private assemblies were succeeded by more public ones, formed by Mr. Montmort and Mr. Thevenot, the celebrated traveller. The French example animated several Englishmen of distinction and learning to erect a kind of philosophical academy at Oxford, towards the close of Oliver Cromwell's administration; which, after the restoration, was erected into a Royal Society. See SOCIETY. The English example, in its turn, animated the French. Louis XIV. in 1666, assisted by the counsels of M. Colbert, founded an academy of sciences at Paris, with a sufficient revenue to defray the charge of experiments, and salaries to the members.

Royal Academy of Sciences. After the peace of the Pyrenees, Louis XIV. being desirous of establishing the ARTS, SCIENCES, and LITERATURE, upon a solid foundation, directed M. Colbert to form a society of men of known abilities and experience in the different branches, who should meet together under the king's protection, and communicate their respective discoveries. Accordingly M. Colbert formed a society of such persons as were conversant in natural philosophy and mathematics, joined to them other persons skilled in history, and other branches of erudition, with those who were entirely engaged in what are called the *Belles Lettres*, grammar, eloquence, and poetry. All the different classes were ordered to meet together upon the first Thursday of every month; and, by their respective secretaries, make a report of the proceedings of the foregoing month. In a short time, however, the classes of history, belles lettres, &c. were united to the French Academy, which was originally instituted for the improvement and refining the French language; so that the Royal Academy contained only two classes, viz. that of natural philosophy and mathematics.

In the year 1696, the king, by a proclamation dated the 26th of January, gave this academy a new form, and put it upon a more respectable footing.—It was now to be composed of four kinds of members, viz. *honorary, pensionary, associates, and elves*. These last were a kind of pupils, or scholars, each of whom was attached to one of the pensionaries. The first class to contain ten persons, and each of the rest twenty. The honorary academists to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to be foreigners; and the elves all to live at Paris. The officers to be, a president named by the king, out of the class of honorary academists; and a secretary and treasurer to be perpetual. Of the pensionaries, three to be geometers, three astronomers, three mechanics, three anatomists, three chemists, three botanists, and the remaining two to be secretary and treasurer. Of the twelve associates, two to apply themselves to geometry, two to botany, and two to chemistry. The elves to apply themselves to the same kind of science with the pensionaries they were attached to; and not to speak, except when called by the president. No regular or religious to be admitted, except into the class of honorary academists; nor any person to be admitted either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. To encourage the members to pursue their labours, the king engaged not only to pay the ordinary pensions, but even to give extraordinary gratifications, according to the merit of their respective performances; furnishing withal the expence of the experiments and other inquiries necessary to be made. If any member gave in a bill of charges of experiments he had made, the money was immediately paid by the king, upon the president's allowing and signing the said bill. So, if an anatomist, for instance, required live tortoises, for making experiments on the heart, &c. as many as he pleased were brought him at the king's charge.

Finally in the year 1783 the king confirmed, by letters patent, dated April 23, the establishment of the academy of sciences, making the following alterations, and adding classes of agriculture, natural history, mineralogy, and physics; incorporating the associates and adjuncts, and limiting to six the members of each class, namely, three pensioners and three associates; by which the former receive an increase of salary, and the latter approach nearer to becoming pensioners.

By the articles of this instrument it is ordained, that the academy shall consist of eight classes, namely, that of geometry, 2d astronomy, 3d mechanics, 4th general physics, 5th anatomy, 6th chemistry and metallurgy, 7th botany and agriculture, 8th natural history and mineralogy. That each class shall remain irrevocably fixed at six members; namely, three pensioners and three associates, independent however of a perpetual secretary and treasurer, of twelve free associates, and of eight associate strangers or foreigners,

ers, the same as before, except that the adjunct-geographer for the future be called the associate-geographer.

The late M. Rouille de Meslay, counsellor of the parliament of Paris, founded two prizes, the one of 2500 livres, the other of 2000 livres, which the academy distributed alternately every year: the subjects of the former prize respecting physical astronomy, and of the latter, navigation and commerce. And the world is highly indebted to this academy for the many valuable works they have executed, or published, both individually and as a body collectively, especially by their memoirs, making upwards of a hundred volumes in 4to, with the machines, indexes, &c. in which may be found most excellent compositions in every branch of science.

The French have also considerable academies in most of their great cities; as, at Montpellier, a Royal Academy of Sciences on the like footing as that at Paris, being as it were a counter part thereof; at Thoulouse, an academy under the denomination of Lanternists; others at Nîmes, Arles, Lyons, Dijon, Bourdeaux, &c. And we have the best authority for asserting, that, notwithstanding the late unparalleled acts of violence, which shook the Gallic empire to its very foundations, the progress of literature was but for a short time impeded, and the public academies are now encouraged and protected.

The Royal Academy of Sciences at Berlin, was founded in 1700, by Frederic I. king of Prussia, on the model of that of England; excepting that, besides natural knowledge, it likewise comprehends the Belles Lettres. In 1718, it was ordained that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes; the first for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third for the German language, and the history of the country; the fourth for oriental learning, particularly as it may concern the propagation of the gospel among infidels. The great promoter of this institution was the celebrated M. Leibnitz, who was made director. The first volume of their transactions was published in 1710, under the title of *Miscellanea Berolinensia*; and, though they received but few marks of the royal favour for some time, they continued to publish new volumes in 1723, 1727, 1734, and 1740. At last, Frederic II. the renowned king of Prussia, gave new vigour to this academy, by inviting to Berlin such foreigners as were most distinguished for their merit in literature, and encouraged his subjects to prosecute the study and cultivation of the liberal sciences by giving ample rewards; and thinking that the academy, instead of having some opulent nobleman for its president, would find an advantage in having a man of letters at its head, he conferred that honour on M. Maupertuis. At the same time he gave a new regulation to the academy, and took upon himself the title of its protector. The academists hold two public assemblies annually, at the last of which is given a gold medal of 50 ducats value: the subject for this prize is successively, natural philosophy, mathematics, metaphysics, and erudition.

The Imperial Academy of Sciences at Petersburg, was projected by Czar Peter the Great. That monarch having, during his travels, observed the advantage of public societies for the encouragement and promotion of literature, formed the design of founding an academy of sciences at Petersburg. By the advice of Wolf and Leibnitz, whom he consulted on this occasion, the society was regulated, and several learned foreigners were invited to become members. The emperor himself drew the plan, and signed it on the 10th of February, 1724; but was prevented by the suddenness of his death, from carrying it into execution. His decease, however, did not prevent its completion: for, on the 21st of December, 1725, the empress Catharine I. established it on the original plan; and on the 27th of the same month the society was first assembled. The empress settled a fund of 4982l. per annum for the support of the academy; and fifteen members, all emi-

nent for their learning and talents, were admitted and pensioned, under the title of professors in the various branches of literature and science. The most distinguished of these professors were Nicholas and Daniel Bernoulli, the two De Lîles, Bulfinger, and Wolf.

During the short reign of Peter II. the salaries of the members were discontinued, and the academy was utterly neglected by the court; but it was again patronized by the empress Anne, who even added a seminary for the education of youth, under the superintendence of the professors. Both institutions flourished for some time under the direction of baron Korf; but upon his death, towards the latter end of Anne's reign, an ignorant person being appointed president, many of the most able members quitted Russia. At the accession of Elizabeth; new life and vigour were again restored to the academy: the original plan was enlarged and improved; some of the most learned foreigners were again drawn to Petersburg; and, what was considered as a good omen for the literature of Russia, two natives, Lomonosof and Rumovsky, men of genius and abilities, who had prosecuted their studies in foreign universities, were enrolled among its members. The annual income was now increased to 10,659l. and soon afterwards the new institution took place.

The present empress Catharine II. with her usual zeal for promoting the diffusion of knowledge, has taken this useful society under her more immediate protection. She has altered the court of directors greatly to the advantage of the whole body; she has corrected many abuses, and has infused a new spirit into their researches. By her majesty's particular recommendation, the most ingenious professors have visited the various provinces of her vast dominions; and, as the fund of the academy was not sufficient to supply the whole expence of these several expeditions, the empress bestowed a largess of 2000l. which she still renews as often as occasion requires. In these travels, they were ordered to pursue their inquiries upon the different sorts of earths and waters; upon the best methods of cultivating the barren and desert spots; upon the local disorders incident to men and animals, and the most efficacious means of relieving them; upon the breeding of cattle, and particularly of sheep; on the rearing of bees and silk-worms; on the different places and objects for fishing and hunting; on minerals; on the arts and trades; and on forming a Flora Russica, or collection of indigenous plants: they were particularly instructed to rectify the longitude and latitude of the principal towns: to make astronomical, geographical, and meteorological, observations; to trace the course of the rivers; to take the most exact charts; and to be very distinct and accurate in remarking and describing the manners and customs of the different people, their dresses, languages, antiquities, traditions, history, religion; and, in a word, to gain every information which might tend to illustrate the real state of the whole Russian empire. In consequence of these expeditions, perhaps no country can boast, within the space of so few years, such a number of excellent publications on its internal state, on its natural productions, on its topography, geography, and history; on the manners, customs, and languages, of the different people, as have issued from the press of this academy.

The first transactions of this society were published in 1728, and intitled, *Commentarii Academiae Scientiarum Imperialis Petropolitanae ad anno 1726*, with a dedication to Peter II. The publication was continued under this form until the year 1747, when its transactions were called *Novi Commentarii Academiae*, &c. In 1777 the academy again changed the title into *Acta Academiae Scientiarum Imperialis Petropolitanae*, and likewise made some alteration in the arrangement and plan of the work. Under the new title of *Acta Academiae*, several volumes have been given to the public, and two are printed every year. These transactions abound with ingenious and elaborate disquisitions upon various parts of science and natural history, and which reflect the greatest honour upon their authors; and

it may not be an exaggeration to assert, that no society in Europe has more distinguished itself for the excellence of its publications, and particularly in the more abstruse parts of the pure and mixed mathematics.

The academy is still composed, as at first, of fifteen professors, besides the president and director. Each of these professors has a house and an annual stipend from 200l. to 600l. Beside the professors, there are four adjuncts, who are pensioned, and who are present at the sittings of the society, and succeed to the first vacancies.

The building and apparatus of this academy are extraordinary. There is a fine library, consisting of 40,000 curious books and manuscripts.—There is an extensive museum, in which the various branches of natural history, &c. are distributed in different apartments: it is extremely rich in native productions, having been considerably augmented with a variety of specimens collected by Pallas, Gmelin, Guldenstaedt, and other learned professors, during their late expeditions through the Russian empire. The stuffed animals and birds occupy one apartment. The chamber of rarities, the cabinet of coins, &c. contain innumerable articles of the highest curiosity and value, not to mention Cox's Museum and other valuable curiosities purchased from this country. The society has this modest motto, *Paulatim*.

The Academy of Sciences at Bologna, called the *Institute of Bologna*, was founded by Count Marigli in 1712, for the cultivating of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself.

The Academy of Sciences at Stockholm, or *Royal Swedish Academy*, owes its institution to six persons of distinguished learning, amongst whom was the celebrated Linnæus; they originally met on the 2d of June, 1739, formed a private society, in which some dissertations were read; and in the latter end of the same year their first publication made its appearance. As the meetings continued and the members increased, the society attracted the notice of the king, and was, on the 31st of March, 1741, incorporated under the name of the Royal Swedish Academy. Not receiving any pension from the crown, it is only under the protection of the king, being directed, like our Royal Society, by its own members. It has now a large fund, which has chiefly arisen from legacies and other donations; but a professor of experimental philosophy, and two secretaries, are still the only persons who receive any salaries. The dissertations read at each meeting are collected and published four times in the year; they are written in the Swedish language, and printed in octavo, and the annual publications make a volume. The first forty volumes, which were finished in 1779, are called the *Old Transactions*; for in the following year the title was changed into that of *New Transactions*. The king is sometimes present at the ordinary meetings, and particularly at the annual assembly in April for the election of members. Any person who sends a treatise which is thought worthy of being printed, receives the transactions for that quarter *gratis*, and a silver medal, which is not esteemed for its value, being worth only three shillings, but for its rarity and the honour conveyed by it. All the papers relating to agriculture are put forth separately under the title of *Oeconomica acta*. Annual premiums, in money and gold medals, principally for the encouragement of agriculture and inland trade, are also distributed by the academy.

The Royal Academy of Sciences at Copenhagen, owes its institution to the zeal of six literati, whom Christian VI. in 1742, ordered to arrange his cabinet of medals. The count of Holstein was the first president; and the six persons who first formed the design, were John Gram, Joachim Frederic Ramus, Christian Louis Scheid, Mark Woldickey, Eric Pontopidan, and Bernard Moelman. These persons, occasionally meeting for that purpose, extended their designs; associated with them others who were eminent in several branches of science; and forming a kind of literary society, employed themselves in searching into, and explain-

ing the history and antiquities of their country. The count of Holstein warmly patronized this society, and recommended it so strongly to Christian VI. that, in 1743, his Danish majesty took it under his protection, called it the Royal Academy of Sciences, endowed it with a fund, and ordered the members to join to their former pursuits, natural history, physics, and mathematics. In consequence of the royal favour, the members engaged with fresh zeal in their pursuits; and the academy has published twenty volumes in the Danish language, some whereof have been translated into Latin.

The American Academy of Sciences, was established in 1780 by the council and house of representatives in the province of Massachusetts Bay, for promoting the knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries and experiments, astronomical, meteorological, and geographical, observations, and improvements in agriculture, manufactures, and commerce; and, in short, for cultivating every art and science which may tend to advance the interest, honour, dignity, and happiness, of a free, independent, and virtuous, people. The members of this academy are never to be more than 200, nor less than 40.

VI. ACADEMIES OR SCHOOLS OF ARTS; as that at Petersburg, which was established by the empress Elizabeth, at the suggestion of count Shuvalof, and annexed to the academy of sciences: the fund was 4000l. per annum, and the foundation for 40 scholars. The present empress has formed it into a separate institution, enlarged the annual revenue to 12,000l. and augmented the number of scholars to 300; she has also constructed, for the use and accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of six, and continue until they have attained that of 18: they are clothed, fed, and lodged, at the expence of the crown. They are all instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14 they are at liberty to choose any of the following arts, divided into four classes. 1. Painting in all its branches of history, portraits, battles, and landscapes; architecture; mosaic; enamelling, &c. 2. Engraving on copper-plates, seal-cutting, &c. 3. Carving in wood, ivory, and amber. 4. Watch-making, turning, instrument-making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing. Prizes are annually distributed to those who excel in any particular art; and from those who have obtained four prizes, twelve are selected, who are sent abroad at the charge of the empress. A certain sum is paid to defray their travelling expences; and when they are settled in any town, they receive an annual salary of 60l. which is continued during four years. There is a small assortment of paintings for the use of the scholars; and those who have made great progress are permitted to copy the pictures in the empress's collection. For the purpose of design, there are models in plaster of the best antique statues in Italy, all done at Rome, of the same size with the originals, which the artists of the academy were employed to cast in bronze.

The Royal Academy of Arts in London, was instituted for the encouragement of *Designing, Painting, Sculpture*, &c. &c. in the year 1768. This academy is provided with a noble set of apartments in the front of Somerset-place, under the immediate patronage of the king, and under the direction of forty artists of the first rank in their several professions. It furnishes, in winter, living models of different characters to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians are annually elected out of the forty, whose business is to attend by rotation, to set the figures, to examine the performance of the students, and to give them necessary instructions. There are likewise four professors, of *Paint-*
ing,

ing, of *Architecture*, of *Anatomy*, and of *Perspective*, who annually read public lectures on the subjects of their several departments; besides a president, a council, and other officers. The admission to this academy is free to all students properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit, the elegance and utility of which does infinite honour to the kingdom.

The Academy of Painting and Sculpture at Paris. This took its rise from the disputes that happened between the master painters and sculptors in that capital; in consequence of which, M. Le Brun, Sarazin, Corneille, and others of the king's painters, formed a design of instituting a particular academy; and, having presented a petition to the king, obtained an arret dated Jan. 20, 1648. In the beginning of 1655, they obtained from cardinal Mazarin a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal for their protector, and the chancellor for their vice-protector. In 1663, by means of M. Colbert, they obtained a pension of 4000 livres. The academy consists of a protector; a vice-protector; a director; a chancellor; four rectors; adjuncts to the rectors; a treasurer; four professors, one of which is professor of anatomy, and another of geometry; several adjuncts and counsellors, an historiographer, a secretary, and two ushers.

There is also an Academy of Painting, Sculpture, &c. at Rome, established by Lewis XIV. wherein those who have gained the annual prize at Paris are intitled to be three years entertained at the king's expence, for their further improvement.

The Academy of Architecture, established by M. Colbert in 1671, consisting of a company of skilful architects, under the direction of the superintendant of the buildings.

VII. ACADEMIES OF LAW; as that famous one at Beryta, and that of the Sitientes at Bologna.

VIII. ACADEMIES OF HISTORY; as the *Royal Academy of Portuguese History at Lisbon*. This academy was instituted by king John V. in 1720. It consists of a director, four censors, a secretary, and fifty members; to each of whom is assigned some part of the ecclesiastical or civil history of the nation, which he is to treat either in Latin or Portuguese. In the church history of each diocese, the prelates, synods, councils, churches, monasteries, academies, persons illustrious for sanctity or learning, places famous for miracles or relics, must be distinctly related in twelve chapters. The civil history comprises the transactions of the kingdom from the government of the Romans down to the present time. The members who reside in the country are obliged to make collections and extracts out of all the registers, &c. where they live. A medal was struck by this academy in honour of their prince; the front of which was his effigy, with the inscription *Johannes V. Lusitanorum Rex*; and, on the reverse, the same prince is represented standing, and raising History almost prostrate before him, with the legend *Historia Resurgens*.

Academy of Suabian History at Tubingen, was lately established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs, on the several points and periods thereof.

IX. ACADEMIES OF ANTIQUITIES; as that at Cortona in Italy, and at Upsal in Sweden. The first is designed for the study of Etrurian antiquities: the other for illustrating the northern languages, and the antiquities of Sweden, in which notable discoveries have been made by it. The head of the Etrurian academy is called *Lucomon*, by which the ancient governors of the country were distinguished. One of their laws is to give audience to poets only one day in the year; another is to fix their sessions, and impose a tax of a dissertation on each member in his turn.

The Academy of Medals and Inscriptions at Paris was set on foot by M. Colbert, under the patronage of Lewis XIV.

in 1663, for the study and explanation of ancient monuments, and perpetuating great and memorable events, by coins, relievos, inscriptions, &c.—One of the first undertakings of this academy, was to compose, by means of medals, a connected history of the principal events of Lewis XIV's reign; but in this design they met with great difficulties, and of consequence it was interrupted for many years; but at length it was completed down to the advancement of the duke of Anjou to the crown of Spain.—In this celebrated work, the establishment of the academy itself was not forgot. The medal on this subject represents Mercury sitting, and writing with an antique stylus on a table of brass; he leans with his left hand upon an urn full of medals, and at his feet are several others placed upon a card: the legend, *Rerum gestarum fides*; and on the exergue, *Academia regia inscriptionum et numismatum, instituta M.DC.LXIII.* signifying that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testimony of all great actions. Besides this work, we have several volumes of their memoirs; and their history, written and continued by their secretaries.

X. ACADEMIES OF BELLES LETTRES, are those wherein eloquence and poetry are chiefly cultivated. These are very numerous in Italy, and not uncommon in France.

The Academy of Umidi at Florence has contributed greatly to the progress of the sciences by the excellent Italian translations given, by some of its members, of the ancient Greek and Latin historians. Their chief attention is to the Italian poetry, at the same time that they have applied themselves to the polishing of their language, which produced the *Academy della Crusca*.

The Academy of Humorists, Umoristi, had its origin at Rome from the marriage of Lorenzo Marcini, a Roman gentleman; at which several persons of rank were guests; and, it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, first extempore, and afterwards premeditatedly; which gave them the denomination of *Belli Humori*. After some experience, coming more and more into the taste of these exercises, they resolved to form an Academy of Belles Lettres; and changed the title of *Belli Humori* for that of *Humoristi*: choosing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, *Redit agmine dulci*.

In 1690, the *Academy of Arcadi* was established at Rome, for reviving the study of Poetry and of the Belles Lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehends many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appear masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of *academists* amounted to six hundred. They hold assemblies seven times a year in a mead or grove, or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems and verses of the Arcadi residing at Rome; who read their own compositions; except ladies and cardinals, who are allowed to employ others. The seventh meeting is set apart for the compositions of foreign or absent members. This academy is governed by a custos, who represents the whole society, and is chosen every four years, with a power of electing twelve others yearly for his assistance. Under these are two sub-custodes, one vicar, or pro-custos, and four deputies or superintendants, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model.

XI. ACADEMIES OF LANGUAGES; called, by some, *Grammatical Academies*: as,

The Academy della Crusca at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors confound this with the Florentine academy. The

discourses

discourses which Toricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, and the wind, the power of percussion, mathematics, and military architecture, are a proof that these academists applied themselves to things as well as words.

The *Academy of Fruits* had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of 900. It was prior in time to the French Academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue by George Neumark.

The *French Academy*, which had its rise from a meeting of men of letters in the house of M. Conrat, in 1629. In 1635, it was erected into an academy, by Cardinal Richelieu, for refining and ascertaining the French language and style.—The number of its members are limited to forty; out of whom a director, chancellor, and secretary, are to be chosen: the two former hold their posts for two months, the latter is perpetual. They meet three times a week in the Louvre; and, at breaking up, forty silver medals are distributed among them. By this distribution, the attendance of the academists is secured, those who are present receiving the surplus otherwise intended for the absent. To elect or expel a member, at least eighteen are required; nor can any be chosen unless he petition for it: by this expedient, the affront of refusals from persons elected is avoided. Religious are not admitted; nor can any person be admitted on another footing than as a man of letters. The design of this academy was to give not only rules, but examples, of good writing. They began with making speeches on subjects taken at pleasure, about twenty of which were printed. They have been severely satirized, and their style has been ridiculed as enervating instead of refining the French language. The most remarkable work of this academy is a dictionary of the French tongue; which, after fifty years spent in settling the words and phrases to be used in writing, was at last published in the year 1694.

An *Academy* similar to the above has been set on foot at Petersburg, by the learned princefs Dashkof: it consists of sixty members. The plan has also been approved by the empress, who has given a fund for its support and establishment.

The *Royal Spanish Academy at Madrid*, held its first meeting in July 1713, in the palace of its founder, the Duke d'Escalona. It consisted at first of eight academists, including the duke; to which number fourteen others were afterwards added, the founder being chosen president or director. In 1714, the king granted them his confirmation and protection. Their device is a crucible in the middle of the fire, with this motto, *Lympha, fya, y da esplendor*; "It purifies, fixes, and gives brightness." The number of members is limited to twenty-four; the Duke d'Escalona to be director for life, but his successors chosen yearly, and the secretary to be perpetual. Their object, as marked out by the royal declaration, was to cultivate and improve the national language: they were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous, or obsolete, ones; and composing a dictionary wherein these may be distinguished from the former.—For a further account of similar establishments, see the article SOCIETY.

ACADEMY is also a term for schools and other seminaries of learning among the Jews, where their rabbins and doctors instructed their youth in the Hebrew language, and explained to them the Talmud and the secrets of the Cabbala. Those of Tiberias and Babylon have been most noted.

The Romans had a kind of military academies, established in all the cities of Italy, under the name of *Campi*

Martis. Here the youth were admitted to be trained for war at the public expence. The Greeks, besides academies of this kind, had military professors called *Tactici*, who taught all the higher offices of war, &c. &c.

We have two royal academies of this kind in England, the expences of which are defrayed by the government; the one at Woolwich, for the artillery and military engineers; and the other at Portsmouth, for the navy. The former was established by his late majesty king George II. in 1741, for instructing persons belonging to the military part of the ordnance, in the several branches of the mathematics, fortification, &c. proper to qualify them for the service of artillery, and the office of engineers. This institution is under the direction of the master-general and board of ordnance for the time being; and at first the lectures of the masters in the academy were attended by the practitioner-engineers, with the officers, serjeants, corporals, and private men of the artillery, besides the cadets. At present, however, none are educated there but the gentlemen cadets, to the number of 90 or 100, where they receive an education perhaps not to be obtained or purchased for money in any part of the world. The master-general of the ordnance is always captain of the cadets' company, and governor of the academy; under him are a lieutenant-governor, and an inspector of studies. The masters have been gradually increased, from two or three at first, now to the number of twelve, namely, a professor of mathematics, and two other mathematical masters, a professor of fortification and an assistant, two drawing-masters, two French masters, with masters for fencing, dancing, and chemistry. This institution is of the greatest consequence to the state, and it is hardly credible that so important an object should be accomplished at so trifling an expence. It is to be lamented, however, that the academy is fixed in so unhealthy a situation; that the lecture-rooms and cadets' barracks are so small as to be insufficient for the purposes of the institution; and that the salaries of the professors and masters should be so inadequate to their labours, and the benefit of their services.

The Royal Naval Academy at Portsmouth was founded by George I. in 1722, for instructing young gentlemen in the sciences useful for navigation, to breed officers for the royal navy. The establishment is under the direction of the board of admiralty, who give salaries to two masters, by one of whom the students are boarded and lodged, the expence of which is defrayed by their own friends, nothing being supplied by the government but their education.

ACADEMY is likewise a name given to a riding-school, where young gentlemen are taught to ride the great horse, &c. and the ground allotted is usually called the *Manege*.

ACADEMY FIGURE, a drawing of a naked man or woman, taken from the life; which is usually done on paper with red or black chalk, and sometimes with pastils or CRAYONS.

ACADIE, or ACADY, in geography, a name formerly given to Nova Scotia, or New Scotland, in America. See NOVA SCOTIA.

ACÆNA, *f.* in antiquity, a Grecian measure of length, being a ten-feet rod, used in measuring their lands.

ACÆNA, *f.* [*axana*, Gr. a thorn.] In botany, a plant of the tetrandria monogynia class. The generic characters are.—Calyx: perianthium four-leaved; leaflets ovate, concave, equal, permanent. Corolla: none, unless the calyx be termed as such. Stamina: filaments equal, of middle length, opposite to the calyx. Antheræ quadrangular, twin, erect. Pistillum: germ inferior, obovate, hispid. Style very small, bent in on one side. Stigma a small, many-cleft, thickish, coloured, membrane. Pericarpium: a dry, obovate, one-celled, berry, beset with spines bent backwards. Seed: single.—*Essential Character*. Calyx: four-leaved. Corolla: four-petalled. Berry dry, inferior, one-seeded, with spines bent backwards.—This is a Mexican plant. Perennial, woody, very-branched; the branches very long. Stems many, shrubby, rather erect,

two feet high. Leaves pinnate, scattered, sheathing; leaflets sessile, approximating, pubescent underneath: the first pairs very small, linear, acute, quite entire; from four to eight large pairs, oblong, serrate; the serratures bearded at the end. Spikes axillary, ancipital, erect, a little rigid, six or seven inches long. Bractes ovate-oblong, concave, so near the calyx as easily to be taken for a part of it. Flowers subsessile, alternate.

ACAJOU, and ACAJUBA, *f.* in botany. See ANACARDIUM.

ACALANDRUS, a river falling into the bay of Tarentum, not far from the Metapontum (Pliny, Strabo); now Fiume de Rosetto.

ACALEPTIC, *f.* in ancient prosody, a complete verse.

ACALYPHA, *f.* [ακαληφη, παρα το μη εχειν καλην αφην, Gr. not being pleasant to handle.] In botany, a genus of the monoeia monadelphia class, ranking in the natural order of tricoceæ. The generic characters are—(male flowers crowded above the females) Calyx: perianthium three or four leaved; leaflets roundish, concave, equal. Corolla: none. Stamina: filaments eight to sixteen, short, crowded, connected at the base. Antheræ roundish.—Female flowers fewer, below the others, received into a large divided involucre. Calyx: perianthium three leaved; leaflets subovate, concave, converging, small, permanent. Corolla: none. Pistillum: germ roundish. Styles three; branching, usually three-parted, long. Stigmas simple. Pericarpium: capsule roundish, three-furrowed, three-celled; the valves gaping two ways. Seeds: solitary, roundish, very large.—*Essential Character.* Male. Calyx, three or four leaved. Corolla, none. Stamina, eight to sixteen.—Female. Calyx, three-leaved. Corolla, none. Styles, three. Capsule three-grained, three-celled. Seed, one.

Species. 1. *Acalypha Virginica*, or Virginian acalypha. Female involucre heart-shaped gashed: leaves ovate-lanceolate longer than the petiole. This sort grows naturally in Virginia, and several other parts of North America; also in Ceylon. It is an annual plant, seldom more than a foot high, sending out several side-branches towards the bottom: the leaves are very like those of broad-leaved pellitory of the wall: the flowers are produced in small clusters in July and August: these make but a poor appearance, and resemble those of pellitory so much, that they may easily be mistaken for them at a little distance.

2. *Acalypha virgata*, or Jamaica acalypha. Female spikes with involucre heart-shaped, serrate; male ones distinct, naked; leaves lanceolate-ovate. This is a native of the warmest countries, and grows plentifully in Jamaica. This is also an annual plant, which in England seldom exceeds the former in stature. The leaves greatly resemble those of the annual nettle, and sting full as much when touched.

3. *Acalypha Indica*, or Indian acalypha. Female involucre heart-shaped slightly notched: leaves ovate shorter than the petiole. This species was discovered in great plenty by Dr. Housloun, at La Vera Cruz. It is an inhabitant of marshy places, and grows about three feet high, with an herbaceous stalk: leaves alternate, differing much in their figure; some plants having them long and narrow, others broad like those of the chestnut-tree, and deeply veined. These varieties arise from the seed of the same plant. It is found also in the East Indies upon dunghills, whence it has the name of *Kupamenija*, i. e. dung-loving. It is annual, and flowers in July. The stems are round, striated, branching, a foot high: at the joints are roundish smooth leaves, which are slightly notched, and resemble those of mercury; whence, and from the tricocous capsule, these plants are called by some *Three-seeded Mercury*. A spike comes out from the axils with six, seven, or eight, female flowers. The involucre is stem-clasping, each having one female flower, with male flowers terminating the spike.

4. *Acalypha villosa*, or villous acalypha. Female involucre very small, toothed, and extremely villous; spikes

elongate; leaves ovate pointed serrate, longer than the petiole.—It was found by Mutis in the woods about Carthage, where it flowers from May to August. It is an erect branching shrub, often fifteen feet high. The flowers are very small, in axillary spikes, those of different sexes on distinct branches: the male spike close, cylindric, erect: the female very loose; calyx five-leaved; three styles, each bifid to the base.

5. *Acalypha Australis*, or South American acalypha. Female involucre quite entire; leaves lanceolate obtuse.—Is a native of South America.

6. *Acalypha hernandifolia*. Female spikes very long, involucre cordate serrate; males distinct naked; leaves subcordate serrate, on very long petioles. 7. *Acalypha corensis*. Female flowers terminating distinct, involucre three-leaved; male spikes axillary involucre; leaves ovate serrate. 8. *Acalypha levigata*. Female spikes with many-parted involucre; male spikes lax naked; leaves wedge-ovate acuminate serrulate very smooth. 9. *Acalypha elliptica*. Female spikes with involucre shorter than the germs, ovate toothed hirsute; males naked lax; leaves elliptic acuminate toothed. 10. *Acalypha reptans*. Spikes terminating erect, flowers mixed, females lower; involucre cordate serrate; males leafless; leaves ovate serrate; stem creeping. 11. *Acalypha tomentosa*. Female spikes terminating solitary, involucre many-parted; males erect; leaves ovate-lanceolate serrate scabrous villous-tomentose underneath. 12. *Acalypha angustifolia*. Female flowers subsessile terminating, involucre serrate; males in spikes; leaves linear serrate. 13. *Acalypha scabrofolia*. Female spikes with cordate gashed involucre; leaves oblong-lanceolate serrate scabrous.—These are all natives of the West Indies. The seventh is a shrub six feet in height, upright, smooth, and having runners; and is a native of Domingo and Martinico, but most frequent on the confines of woods in Venezuela. The eleventh and twelfth are found in Hispaniola. The tenth is found both there and in Jamaica. The rest are inhabitants of the island of Jamaica.

14. *Acalypha betulæfolia*. Female flowers axillary sessile, involucre cordate crenate; males in spikes; leaves roundish crenate smooth.—This is a shrub that has very much the appearance of *Betula mana*. The leaves are about half an inch in length, and some of them almost as broad.

Propagation and Culture. These plants have no beauty to recommend them, and are preserved only in some botanic gardens for the sake of variety. If the seeds of the first sort are permitted to scatter, the plants will come up in the spring, better than if sown by hand; and, if they are not put into the ground in autumn, they rarely grow the first year. All the culture this plant requires, is to keep it clear from weeds, and to let it remain where it was sown, for it does not bear removing well. It flowers in August, and the seeds ripen in October. The second sort is too tender to thrive in the open air in England, therefore the seeds should be sown in pots, plunged into a hot-bed; and, if the plants do not come up the first year, which often happens, the pots should be put under shelter in winter, and the following spring plunged again into a hot-bed, which will bring up the plants: these must be transplanted into other pots, and brought forward in hot-beds, otherwise they will not produce ripe seeds at all. The third species may be treated like the second: in a stove it will flower, and in September perfect the seeds. The other sorts have not yet been introduced, but will require the same treatment with the second and third.

ACAMANTIS, the ancient name of the island of Cyprus, taken from one of its promontories situated to the west, and called Acamas. Teos in Ionia was also called thus from Acamus the founder.

ACAMAS, or ACAMANTIS, the west promontory of the island of Cyprus, from whence it took this ancient name; now Cape Pifanio, or Epifanio, where formerly was a town of the same name, now a village called Crufocco.

ACAMAS,

ACAMAS, son of Theseus, followed the rest of the Grecian princes to the siege of Troy; and was deputed with Diomedes, to the Trojans, in order to get Helen restored. Laodice, Priam's daughter, falling in love with this prince, stole a night with him, and had a son by him called Munitus. He was one of the heroes who concealed themselves in the wooden horse. One of the tribes of Athens was called *Acamantides* from him, by the appointment of the oracle; and he founded a city in Phrygia Major, called *Acamantium*. Homer mentions two other heroes of this name; one a Thracian prince who came to succour Priam, another a son of Antenor.

ACANACEOUS PLANTS, *f.* such as are armed with prickles.

ACANGA, *f.* in botany. See **BROMELIA**.

ACANGIS, that is, *Ravagers* or *Adventurers*; a name which the Turks give their hussars or light-troops, who are generally sent out in detachments to procure intelligence, harrafs the enemy, or ravage the country.

ACANNY, a country of Guinea, long famous for producing and trading in very fine gold; also a town or village of Guinea. Lat. 8. 30. N. lon. 0. 30. E.

ACANOS, or **ACANTHIUM**, *f.* in botany. See **ONOPORDUM**.

ACANTHA, *f.* in botany, the prickle of any plant; in zoology, a term for the spine or prickly fins of fishes.

ACANTHABOLUS, *f.* in surgery, an instrument for pulling thorns, or the like, out of the skin.

ACANTHINE, *f.* any thing resembling or belonging to the herb acanthus. Acanthine garments, among the ancients, are said to be made of the down of thistles; others think they were garments embroidered in imitation of the acanthus.

ACANTHOIDES, *f.* in botany. See **CARLINA**.

ACANTHOPTERYGIUS FISHES, *f.* a term used by Linnæus and others for those fishes whose back-fins are hard, ossæous, and prickly.

ACANTHOS, a town of Egypt, near Memphis, now Bifalta. Also a maritime town of Macedonia, to the west of mount Athos, a colony of Andrians, now Erisso; near which was shown Xerxes' ditch, of seven stadia, in order to separate mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic bay. Acanthos is also a town of Epirus.

ACANTHUS, *f.* [*ἄκανθα*, Gr. a thorn.] In botany, a genus of the didynamia angiospermia class, ranking in the natural order of perfonate. The generic characters are—Calyx: perianthium with leaflets in three alternate pairs, unequal, permanent. Corolla: one-petalled unequal; tube very short, closed with a beard; upper lip none; under lip very large, flat, straight, very broad, three-lobed, obtuse, the length of the upper lip of the calyx. Stamina: filaments four, subulate, shorter than the corolla, the two upper rather longer, recurved, incurved at the top. Antheræ oblong, compressed, obtuse, the lateral ones parallel, villous before. Pistillum: germ conical. Style filiform, length of the stamens. Stigmas two, acute, lateral. Pericarpium: capsulæ subovate with a point, two-celled, two-valved, with a contrary partition; claws alternate, curved, fastened to the partition. Seed: ovate, gibbous, single; sometimes two.—*Essential Character*. Calyx: two-leaved, bifid. Corolla: one-lipped, bent down, trifid. Capsule two-celled.

Description. The plants of this genus are generally large, with a single herbaceous stalk, and great pinnatifid leaves. The flowers are produced in terminating spikes. Some of the species are shrubby and thorny; with undivided leaves, toothed, and having a thorn at the end of the teeth.

Species. 1. *Acanthus mollis*, or smooth acanthus; the leaves sinuate unarmed.—This has a stem from two to three feet in height. The leaves oblong, smooth on both sides, and shining; from a span to a foot in length, divided deeply into opposite ovate lobes, which are bluntly toothed and finely ciliate about the edges: they are placed on roundish

petioles, with a flat channel running along the upper surface. Though the leaves are said to be smooth, yet they are not without white bristles on both sides, especially along the nerves. The flowers are white, and come out from about the middle to the top of the stalk. This is the species which is used in medicine, under the name of *branca urfina*. The roots and leaves abound with a mucilage, which is readily extracted by boiling or infusion. The roots are the most mucilaginous. Where this plant is common, they employ it for the same purposes to which the *althæa* or marsh-mallow, and other vegetables possessing similar qualities, are applied among us.

2. *Acanthus cardusfolius*, or thistle-leaved acanthus. The leaves sinuous-toothed thorny, spike of flowers radical.—The stem is extremely short. Many leaves proceed almost immediately from the root, resembling those of the thistle; whence it derives the trivial name: the divisions terminate in a tomentose or naked spine. The spike of flowers is oblong, of the same length with the leaves, or longer; and furnished with imbricate, nerved, stiff, six-spined, bractes. The calyxes are thornless and membranaceous. Sparrmann found this plant at the Cape of Good Hope.

3. *Acanthus spinosus*, or prickly acanthus, the leaves pinnatifid thorny, deeply jagged in very regular order, and each segment is terminated with a sharp spine; as are also the petioles, and the calyx of the flowers; so that this plant is troublesome to handle. It grows wild in Italy and Provence; and flowers from July to September. In 1629 it was cultivated in England. These plants were formerly called *brank-urfine*, and also by the vulgar appellation of *beard's-breech*, from the roughness of this species. But these have now become obsolete; and the softer, more classical, name of *acanthus* is generally adopted in English.

4. *Acanthus Dioscoridis*, or acanthus of Dioscorides; the leaves lanceolate quite entire and thorny on the margin.—This, which Linnæus supposes to be the genuine species of Dioscorides, grows naturally in the east, on Lebanon, &c.

5. *Acanthus ilicifolius*, or holly-leaved acanthus; the leaves repand tooth-thorny, stem shrubby prickly; it is an ever-green shrub, rising about four feet high, and dividing into many branches; with leaves very like those of the common holly, both in size and shape; and armed with spines in the same manner. The flowers come out singly in an upright raceme at the end of the stalk; they are white, and shaped like those of the common acanthus, but smaller. The calyx consists of six imbricate leaflets, according to Linnæus. Loureiro describes it as having an upright border, divided into four parts; the segments acute, and the two outer ones larger than the others. The corolla has the tube truncate in front, and extending backwards into an ovate, upright, segment, which is slightly trifid. The stigma is simple, and there are two seeds. He observed it near Canton in China, differing from that of Cochinchina, in having two small concave leaflets at the base of the calyx; and the truncate part of the corolla emarginate. Native of the East and West Indies, and some of the islands in the South Seas.

6. *Acanthus integrifolius*, or entire-leaved acanthus; the leaves oblong entire, stem herbaceous procumbent. 7. *Acanthus procumbens*, or procumbent acanthus. Leaves oblong serrate and ciliate, stem procumbent shrubby. 8. *Acanthus furcatus*, or forked acanthus; the leaves oblong tooth-thorny, stem shrubby, bractes terminated by a three-forked thorn. 9. *Acanthus Capensis*, or Cape acanthus; the leaves oblong toothed thorny, stem shrubby erect, bractes terminated by a simple thorn.—These species are natives of the Cape of Good Hope. The last has round, opposite, ash-coloured, branches; opposite, subanceolate, sessile, stiff, leaves, with two spines on each side, and one at the end; the axillary leaves are petioled, longer, softer, but thorny as well as the others. Spikes of flowers terminal, solitary, and sessile: the bractes resemble the leaves, but are mostly without spines. The calyx is bivalve and

smooth, the upper valve longest: the corolla has one trifid lip.

10. *Acanthus Maderaspatensis*, or *Madras acanthus*; the leaves fourfold, flowers axillary, calyxes ciliate, with an herbaceous dichotomous stem: elliptic thornless leaves: the outer calyx imbricated, with four pairs of obovate leaflets inclining to wedge-shaped, and ciliate: the inner four-leaved, the two outer leaflets of which are lanceolate and longer than the others; the two inner less and linear. Capsule red. It is a native of the East Indies.

Propagation and Culture. The smooth and prickly acanthus are lasting plants, which may be propagated either by seeds, or parting of their roots; if by the former method, the seeds should be sown in a light dry soil, towards the end of March: when the season proves favourable, the plants will appear in May, and all the culture they require is to keep them clean from weeds, and, where the plants are too close to thin them, so as to leave them about six inches asunder, which will be room enough for them to grow till autumn, when they should be transplanted where they are designed to remain. The first sort, and especially the Portuguese variety, being more tender, ought to be planted in a warm border near a wall; and, as these do not multiply so fast by their roots, they do not require more room than three feet; but the third spreads its roots to a great distance, therefore must have more than twice that room. This, being hardy, may be planted between shrubs, to fill up vacant spaces, where it will thrive fast enough, provided the ground be light, and not over wet; and, when it is in flower, will make an agreeable variety. If this sort be propagated by its roots, the operation may be performed either in spring or autumn; but the others must only be removed in the spring; for, if they are transplanted in the autumn, and the following winter should prove cold, they will run the hazard of being lost. These plants take root very deep, so that when they are planted in wet grounds, their roots will rot in winter. When they are once established in a garden, they are with difficulty eradicated.

The holly-leaved and *Madras acanthus* are too tender to thrive out of a stove in England, and can only be propagated by seeds, which do not ripen in Europe.—The other sorts must be placed among Cape plants, and treated in the same manner as they are.

ACANTHUS, *f.* in architecture, an ornament representing the leaves of the acanthus, used in the capitals of the Corinthian and Composite orders.

ACAPULCO, a considerable town and port in Mexico, in the South Sea. It has a fine harbour, from whence a ship annually sails to Manilla in the Philippine islands, near the coast of China in Asia; and another returns annually from thence with all the treasures of the East Indies, such as diamonds, rubies, sapphires, and other precious stones; the rich carpets of Persia; the camphire of Borneo; the benjamin and ivory of Pegu and Cambodia; the silks, muslins, and calicoes, of the Mogul's country; the gold-dust, tea, china-ware, silk, and cabinets, of China and Japan; inasmuch that this single ship contains more riches than many whole fleets.

It was one of these Acapulco ships or galleons, that commodore Anson captured in 1743, which retrieved all the misfortunes of that celebrated voyage, for which see *ANSON*; and the *St. Jago* register-ship was also one of this description, which in 1793 was taken by the French privateer *le Dumouris*, and afterwards captured by Sir Andrew Snape Douglas in the *Phaeton* frigate, detached from admiral Gell's squadron, and brought into Portsmouth. The rich cargo of this ship, consisting of 33 chests of gold, jewels, and plate, 680 chests of dollars, and a prodigious quantity of the choicest merchandize, loaded twenty-one waggons, which conveyed the property in cavalcade, under a strong detachment of dragoons, from Portsmouth to the Tower of London, where it was safely deposited. The ship and cargo, after being two years in

litigation, produced, it is said, upwards of 900,000*l.* which was divided amongst the captors in 1795.

The goods brought by these ships to Acapulco are carried to the city of Mexico by mules and pack-horses; and from thence to Vera Cruz on the North Sea, in order to be shipped for Europe. Acapulco itself is a small place, consisting only of about 200 or 300 thatched houses. Ships arrive at the port by two inlets, separated from each other by a small island; the entrance into them in the day-time is by means of a sea-breeze, as the sailing out in the night-time is effected by a land-breeze. A wretched fort, 42 pieces of cannon, and a garrison of 60 men, defend it. It is equally extensive, safe, and commodious. The basin which constitutes this harbour is surrounded by lofty mountains, which are so dry, that they are even destitute of water. The air here is hot, heavy, and unwholesome; to which none can habituate themselves, except certain negroes that are born under a similar climate, or some mulattoes. This feeble and miserable colony is crowded with a vast accession to its numbers upon the arrival of the galleons, and the Spanish register-ships; when a fair is held, which continues about 30 days, to which traders flock from all the provinces of Mexico, who come to exchange European toys, their own cochineal, and about ten millions of silver (437,500*l.* sterling), for spices, muslins, printed linens, silk, perfumes, and the gold works of Asia. N. Lat. 17. 30. W. lon. 102. 29.

ACARADY, a country on the south coast of Guinea, remarkable for fine pure gold.

ACARAI, a town of Paraguay, in South America, built by the Jesuits in 1624. S. Lat. 26. 0. lon. 51. 5. W.

ACARAUNA, *f.* a small American fish, called by our sailors the *old wife*. See *LABRUS*.

ACARNA, *f.* in botany.—See *ATRACTYLIS*, *CARDUUS*, *CARLINA*, *CNICUS*.

ACARNANIA, the first county of Free Greece, or Greece Proper, bounded on the west by the Sinus Ambracius, and separated from Ætolia by the river Achelous on the east, and by the Sinus Ambracius from Epirus. The people were called *Acarnanes*, denoting persons unshorn; other Ætolians, to the east of the Achelous, being called *Curetes*, from being shorn. According to Lucian, they were noted for effeminacy and incontinence; hence the proverb, *Porcellus Acarnanius*. This country was famous for an excellent breed of horses; so that *Ἀκαρννός κτην* is a proverbial saying for a thing excellent in its kind. It is now called *la Carnia* and *il Despotato*.

ACARON, or **ACCARON**, a town of Palestine, called *Echron* in Scripture. It was the boundary of the Philistines to the north; stood at some distance from the sea, near Bethshemesh, and was famous for the idol Baalzebub.

ACARUS, *f.* the *TICK* or *MITE*, a genus of insects belonging to the order of aptera, or such as have no wings. The acarus has eight legs; two eyes, one on each side of the head; and two jointed tentacula. The female is oviparous. Linnaeus enumerates thirty-five species; of which some are inhabitants of the earth, some of waters; some live on trees, others among stones, and others on the bodies of other animals, and even under the skin. We shall give a description of a few of the most remarkable.

1. The fire, or cheese-mite, is a very minute species. To the naked eye, these mites appear like moving particles of dust; but the microscope discovers them to be perfect animals, having as regular a figure, and performing all the functions of life as perfectly, as creatures that exceed them many times in bulk. The head is small in proportion to the body; and has a sharp snout, and a mouth that opens and shuts like a mole's. They have two small eyes, and are extremely quicksighted; and when they have been once touched with a pin, you will easily perceive how cunningly they avoid a second touch. Their legs are each furnished at the extremity with two little claws, with which the animal very nicely takes hold of anything. The hinder part of the body is plump and bulky; and ends in

1. The Achras Sapota Plant. 2. The Cheese mite. 3. The Harvest Tick. 4. The Tick Insect.
5. The longicornis, or, horned Tick; all greatly Magnified.

London, Published as the Act directs, Jan. 30. 1808, by J. Wilkes.

an oval form, from which there issue out a few exceeding long hairs. Other parts of the body are also beset with thin and long hairs. The males and females are easily distinguished in these little animals. The females are oviparous, as the louse and spider; and from their eggs the young ones are hatched in their proper form, without having any change to undergo afterwards. They are, however, when first hatched, extremely minute; and, in their growing to their full size, they cast their skins several times. These little creatures may be kept alive many months between two concave glasses, and applied to the microscope at pleasure. They are thus often seen *in coitu*, conjoined tail to tail; and this is performed by an incredibly swift motion. Their eggs, in warm weather, hatch in twelve or fourteen days; but in winter they are much longer. Their eggs are so small, that a regular computation shows, that ninety millions of them are not so large as a common pigeon's egg. They are very voracious animals, and have often been seen to eat one another. Their manner of eating is by thrusting alternately one jaw forward and the other backward, and in this manner grinding their food; and after they have done feeding, they seem to chew the cud.—There are several varieties of this species found in different substances besides cheese; as in malt-dust, flour, oatmeal, &c. Those in malt-dust and oatmeal are much nimbler than the cheese-mites, and have more and longer hairs. There are also a sort of wandering mites, which range wherever there is any thing they can feed on: they are often seen in the form of a white dust, and are not suspected to be living creatures.—The mite is called by authors simply, *acarus*. It is an animal very tenacious of life, and will live months without food. Mr. Lewenhock had one which lived eleven weeks on the point of a pin, on which he had fixed it for examining by his microscope.

2. The *fanguifugus*. The hinder part of the abdomen is crenated, the scutellum is oval and yellowish, and the beak trifid. It is a native of America, and sticks so fast on the legs of travellers, sucking their blood, that they can hardly be extracted.

3. The *telarius* is of a greenish yellow colour. It has a small sting or weapon, with which it wounds the leaves of plants, and occasions them to fold backward. They are very frequently to be met with in the autumn, inclosed in the folded leaves of the lime-tree.

4. The *exulcerans*, or itch-*acarus*, is a very small species: its body is of a figure approaching to oval, and lobated; the head is small and pointed; its colour is whitish, but it has two dusky semicircular lines on the back. It has long setaceous legs, but the two first are short. It is found in pustules of the itch: authors in general have supposed that it causes that disease: but others observe, that if this were so, it would be found more universally in those pustules. It is more probable that these only make a proper nidus for it. See the article *ITCH*.

5. The *batatas* is of a blood-colour, and a little rough; the fore pair of legs are as long as the body. It inhabits the potatoes of Surinam.

6. The *ovinus*, or sheep-tick, has a flat body of a roundish figure, but somewhat approaching to oval, and of a yellowish white colour, and has a single large round spot on the back: the anus is visible in the lower part of the body; the thorax is scarcely conspicuous; the head is very small and black; the mouth is bifid: the antennæ are of a clavated figure, and of the length of the snout; the legs are short and black. It is common on sheep, and its excrements stain the wool green: it will live in the wool many months after it is shorn from the animal.

7. The *coleopratorum*, or *acarus* of insects, is extremely minute: its body is round, reddish, and covered with a firm and hard skin; the head is very small, the neck scarcely visible; the legs are moderately long, the anterior pair longer than the others; it has a whiteness about the anus. It is frequent on the bodies of many insects, which it infests, as the louse does others; it runs very

swiftly: the humble-bee and many other of the larger insects, are continually infested with it; but none so much as the common black beetle, which has thence been called the lousy beetle.

8. The *baccarum*, or scarlet tree-mite, is a small species: its body is roundish, and the back not at all flattened, as it is in many others; the skin is smooth, shining, and glossy; and the whole animal seems distended, and ready to burst; the colour is a bright red, but a little dusky on the sides than elsewhere: the head is very small, and the legs short; there is on each side a small dusky spot near the thorax, and a few hairs grow from different parts of the body. It is very common on trees, particularly on the currant, on the fruit of which we frequently see it running.

ACASTUS, in classic history, the son of Pelias king of Thessaly, and one of the most famous hunters of his time, married Hippolyta, who falling desperately in love with Peleus her son-in-law, and he refusing to gratify her wishes, she accused him to her husband of a rape; on which he slew them both.

ACATALECTIC, *f.* [ἀκαταληκτικός, Gr.] A verse which has the complete number of syllables, without defect or superfluity.

ACATERY, or **ACATRY**, *f.* anciently an officer of the king's household, designed for a check betwixt the clerks of the kitchen and the purveyors.

ACATHARSIA, *f.* in medicine, an impurity of the blood or humours.

ACATHISTUS, *f.* the name of a solemn hymn anciently sung in the Greek church on the Saturday of the fifth week in Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of the barbarous nations.

ACATIUM, *f.* in the ancient navigation, a kind of boat or pinnace used for military purposes. Strabo describes it as a privateer or pirate sloop.

ACAULIS, *f.* in botany, a term applied to certain plants, the flowers of which have no pedicle or stalk to support them, but rest immediately on the ground, such as the carline thistle, &c.

ACCA (St.) bishop of Hagustaldt, or Hexam, in Northumberland, succeeded Wilfrid in that see in 709. He ornamented his cathedral in a most magnificent manner: he furnished it also with plate and holy vestments; and erected a noble library, consisting chiefly of ecclesiastical learning, and a large collection of the lives of the saints, which he was at great pains to procure. He was accounted a very able divine, and was famous for his skill in church-music. He died in 740, having enjoyed the see of Hexam thirty-one years, under Egbert king of the Northumbrians.

ACCALIA, *f.* in Roman antiquity, solemn festivals held in honour of Acca Laurentia, Romulus's nurse: they were otherwise called **LAURENTALIA**.

ACCANY. See **ACANNY**.

ACCAPITARE, *v. n.* in law, the act of becoming vassal of a lord, or of yielding him homage and obedience. Hence,

ACCAPITUM, *f.* signifies the money paid by a vassal upon his admission to a feud. It likewise, in our ancient law, was used to express the relief due to the chief lord.

ACCEDAS AD CURIAM, *f.* in the English law, a writ lying, where a man has received, or fears, false judgment in an inferior court. It lies also for justice delayed, and is a species of the writ **RECORDARE**.

To **ACCEDE**, *v. n.* [*accedo*, Lat.] To be added to, to come to; generally used in political accounts; as, another power has *acceded* to the treaty; that is, has become a party.

To **ACCELERATE**, *v. a.* [*accelero*, Lat.] To make quick, to hasten, to quicken motion; to give a continual impulse to motion, so as perpetually to increase:

Lo! from the dread immensity of space
Returning, with *accelerated* course,
The rushing comet to the sun descends.

Thomson.

Spices

Spices quicken the pulse, and *accelerate* the motion of the blood, and dissipate the fluids; from whence leanness, pains in the stomach, loathings, and fevers. *Arbuthnot*.—It is generally applied to matter, and used chiefly in philosophical language; but it is sometimes used on other occasions.—It may point out to a student now and then, what may employ the most useful labours of his thoughts, and *accelerate* his diligence in the most momentous enquiries. *Watts*.

ACCELERATION, *f.* [*acceleratio*, Lat.] The act of quickening motion. The state of the body accelerated or quickened in its motion. The act of hastening.—Considering the languor ensuing that action in some, and the visible *acceleration* it maketh of age in most, we cannot but think venery very much abridgeth our days. *Brown*.

ACCELERATION, in mechanics, the increase of velocity in a moving body. Accelerated motion is that which continually receives fresh accessions of velocity. Acceleration stands directly opposed to *retardation*, which denotes a diminution of velocity. It is chiefly used in physics, in respect of falling bodies, i. e. of heavy bodies tending towards the centre of the earth by the force of gravity. That natural bodies are accelerated in their descent, is evident from various considerations, both *a priori* and *posteriori*. Thus, we actually find, that the greater height a body falls from, the greater impression it makes, and the more vehemently does it strike the subject plane, or other obstacle.

Various were the systems and opinions which philosophers produced to account for this acceleration. But the immediate cause of acceleration is now sufficiently obvious; the principle of gravitation, which determines the body to descend, determining it to be accelerated by a necessary consequence.

Suppose a body let fall from on high: the primary cause of its beginning to descend is doubtless the power of gravity; but when once the descent is commenced, that state becomes in some measure natural to the body; so that, if left to itself, it would persevere in it for ever, even though the first cause should cease: as we see in a stone cast with the hand, which continues to move after it is left by the cause that gave it motion. But, beside the propensity to descend impressed by the first cause, and which of itself were sufficient to continue the same degree of motion, once begun, *in infinitum*; there is a constant accession of subsequent efforts of the same principle, gravity, which continues to act on the body already in motion, in the same manner as if it were at rest. Here, then, being a double cause of motion; and both acting in the same direction, viz. directly towards the centre of the earth; the motion they jointly produce must necessarily be greater than that of any one of them.—And the velocity thus increased having the same cause of increase still persisting, the descent must necessarily be continually accelerated.

ACCELERATION of BODIES on inclined Planes. The same general law obtains here as in bodies falling perpendicularly: the effect of the plane is to make the motion slower; but the inclination being every where equal, the retardation arising therefrom will proceed equally in all parts, at the beginning and the ending of the motion. See **MECHANICS**.

ACCELERATION of the MOTION of PENDULUMS. The motion of pendulous bodies is accelerated in their descent; but in a less ratio than that of bodies falling perpendicularly. See **MECHANICS** and **PENDULUM**.

ACCELERATION of the MOTION of PROJECTILES. See **PROJECTILE**.

ACCELERATION is also applied in the ancient astronomy, in respect of the fixed stars. This acceleration was the difference between the revolution of the *primum mobile* and the solar revolution; which was computed at three minutes and fifty-six seconds.

ACCELERATION of a PLANET. A planet is said to be accelerated in its motion, when its real diurnal motion exceeds its mean diurnal motion. And, on the other hand,

the planet is said to be retarded in its motion, when the mean exceeds the real diurnal motion. This inequality arises from the change in the distance of the planet from the sun, which is continually varying; the planet moving always quicker in its orbit when nearer the sun, and slower when farther off.

ACCELERATION of the MOON, a term used to express the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth; so that it is now a little swifter than it was formerly. Dr. Halley was the first who made this discovery: and he was led to it by comparing the ancient eclipses observed at Babylon with those observed by Albatennius in the ninth century, and some of his own time. He was not able to ascertain the quantity of this acceleration, because the longitudes of Bagdad, Alexandria, and Aleppo, where the observations were made, had not been accurately determined. But since his time the longitude of Alexandria has been ascertained by Chazelles; and Babylon, according to Ptolemy's account, lies 50' east from Alexandria. From these data, Mr. Dunthorne compared several ancient and modern eclipses, with the calculations of them, by his own tables, and hereby verified Dr. Halley's opinion; for he found that the same tables represent the moon's place more backward than her true place in ancient eclipses, and more forward than her true place in later eclipses; and thence justly inferred, that her motion in ancient times was slower; in later times quicker, than the tables give it. But he did not content himself with merely ascertaining the fact; he proceeded to determine the quantity of the acceleration; and by means of the most ancient eclipse of which any authentic account remains, observed at Babylon in the year before Christ 721, he concluded, that the observed beginning of this eclipse was not above an hour and three-quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 50' of a degree at that time. Admitting the acceleration to be uniform, and the aggregate of it as the square of the time, it will be at the rate of about 10" in 100 years.

Dr. Long attributes the acceleration above described to one or more of these causes:—either, 1. The annual and diurnal motion of the earth continuing the same, the moon is really carried round the earth with a greater velocity than heretofore: or, 2. The diurnal motion of the earth, and the periodical revolution of the moon, continuing the same, the annual motion of the earth round the sun is a little retarded; which makes the sun's apparent motion in the ecliptic a little slower than formerly; and, consequently, the moon, in passing from any conjunction with the sun, spends less time before she again overtakes the sun, and forms a subsequent conjunction: in both these cases, the motion of the moon from the sun is really accelerated, and the synodical month actually shortened. Or, 3. The annual motion of the earth, and the periodical revolution of the moon continuing the same, the rotation of the earth round its axis is a little retarded: in this case, days, hours, minutes, seconds, &c. by which all periods of time must be measured, are of a longer duration; and consequently the synodical month will appear to be shortened, though it really contains the same quantity of absolute time as it always did. If the quantity of matter in the body of the sun be lessened by the particles of light continually streaming from it, the motion of the earth round the sun may become slower: if the earth encreases in bulk, the motion of the moon round the earth may be quickened thereby. See **ASTRONOMY**.

ACCELERATOR, *f.* in anatomy, the name of two muscles of the penis, which serve for ejecting the urine or semen. See **ANATOMY**.

To ACCEND, *v. a.* [*accendo*, Lat.] To kindle, to set on fire; a word very rarely used.

ACCENDENTES, a lower order of ministers in the Romish church, whose office is to light and trim the candles.

ACCENDONES,

ACCENDONES, in Roman antiquity, a kind of gladiators, whose office was to excite and animate the combatants during the engagement. The orthography of the word is contested: the first edition of Tertullian, by Rhemanus, has it *accedones*; an ancient manuscript, *accendones*. Aquinas adheres to the former, Pitiscus to the latter. The origin of the word, supposing it *accendones*, is from *accendo*, I kindle; supposing it *accedones*, from *accedo*, I accede, am added to. The former places their distinguishing character in enlivening the combat by their exhortations and suggestions; the latter thinks them to be much the same with what among us are called *seconds*, among the Italians *patroni*; excepting that these latter only stand by to see the laws of the sword duly observed, without intermeddling to give advice or instruction.

ACCENSI, in the Roman armies, certain supernumerary soldiers, designed to supply the places of those who should be killed or disabled. The *accensi*, Livy observes, were placed at the rear of the army, because no great exertions were expected from them: they were taken out of the fifth class of citizens.

ACCENSI, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants, or tipstaves, among us. They were thus called from *accire*, to send for; one part of their office being to call assemblies of the people, summon parties to appear and answer before the judges, &c.

ACCENSI was also an appellation given to a kind of adjutants, appointed by the tribune to assist each centurion and decurion. In which sense, *accensus* is synonymous with *optio*. In an ancient inscription, given by a Torre, we meet **ACCENSUS EQUITUM ROMANORUM**; an office no where else heard of. That author suspects it to be a corruption; and instead thereof reads, *A censibus*.

ACCENSION, *f.* [*accensio*, Lat.] The act of kindling, or the state of being kindled.—The fulminating damp will take fire at a candle, or other flame, and, upon its *accension*, gives a report like the discharge of a gun, and makes an explosion so forcible as sometimes to kill the miners, shake the earth, and force bodies of great weight and bulk from the bottom of the pit or mine. *Woodward.*

ACCENT, *f.* [*accentus*, Lat.] The manner of speaking or pronouncing, with regard either to force or elegance. The sound given to the syllable pronounced. In grammar, the marks made upon syllables, to regulate their pronunciation. Poetically, language or words. A modification of the voice, expressive of the passions or sentiments.

The tender *accent* of a woman's cry
Will pass unheard, will unregarded die;
When the rough seaman's louder shouts prevail,
When fair occasion shews the springing gale. *Prior.*

To **ACCENT**, *v. a.* [*accentus*, Lat.] formerly elevated at the second syllable, now at the first. To pronounce, to speak words with particular regard to the grammatical marks or rules. In poetry; to pronounce or utter in general. To write or note the accents. We generally reckon three grammatical accents in ordinary use, all borrowed from the Greeks, viz. the *acute accent* (´), which shews when the tone of the voice is to be raised. The *grave accent* (`), when the note or tone of the voice is to be depressed. The *circumflex accent* (^ or ˆ), is composed of both the acute and the grave, and points out a kind of undulation of the voice. The Latins have made the same use of these three accents.

The Hebrews have a grammatical, a rhetorical, and musical, accent; though the first and last seem, in effect, to be the same; both being comprised under the general name of *tonic accents*, because they give the proper tone to syllables; as the rhetorical accents are said to be euphonic, because they tend to make the pronunciation more sweet and agreeable. There are four euphonic accents, and twenty-five tonic: of which some are placed above,

and others below, the syllables; the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish the sections, periods, and numbers of periods, in a discourse; and to answer the same purposes with the points in other languages. Their accents are divided into *emperors*, *kings*, *dukes*, &c. each bearing a title answerable to the importance of the distinction it makes. Their emperor rules over a whole phrase, and terminates the sense completely; answering to our full-point. Their king answers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short.

As to the Greek accents, now seen both in manuscripts and printed books, there has been no less dispute about their antiquity and use than about those of the Hebrews. Isaac Vossius endeavours to prove them of modern invention; asserting, that anciently they had nothing of this kind, but only a few notes in their poetry, which were invented by Aristophanes the grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than grammatical, use, serving as aids in the singing of their poems, and very different from those introduced afterwards. He also shews from several ancient grammarians, that the manner of writing the Greek accents in these days was quite different from that which appears in our books.

The use of accents, to prevent ambiguities, is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. Among the people of China, every word, or (which is the same thing) syllable, admits of five accents, as spoken more acutely or remissly; and thus stands for many different things. The same sound *ya*, according to the accent affixed to it, signifies *God*, a *wall*, *excellent*, *stupidity*, and a *goose*. The Chinese have but 330 spoken words in their language; but these being multiplied by the different accents or tones, which affect the vowels, furnish a language tolerably copious. By means hereof, their 330 simple sounds come to denote 1650 things; but, this being hardly sufficient, they are increased further by aspirates added to each word to double the number. The Chinese only reckon four accents; for which the missionaries use the following marks, *aa*, *à*, *á*, *ä*; to which they have added a fifth, thus, *z*. They make a kind of modulation; wherein, prolonging the duration of the sound of the vowel, they vary the tone, raising and sinking it by a certain pitch of voice: so that their talking is a sort of music or singing. Attempts have been made to determine the quantity of the rise or fall in each accent by means of musical notes; but this is hard to effect, as being different in different persons. Hence the great difficulty of the language to foreigners; they are forced to sing most scrupulously: if they deviate ever so little from the accent, they say quite a different thing from what was intended. Thus, meaning to compliment the person you are speaking to with the title *Sir*, you call him a beast with the same word, only a little varied in the tone.

ACCENT, in music, is a certain enforcement of particular sounds, whether by the voice or instruments, generally used at the beginning of bars.

To **ACCENTUATE**, *v. a.* [*accentuer*, Fr.] To place the proper accents over the vowels.

ACCENTUATION, *f.* The act of placing the accent in pronunciation. Marking the accent in writing.

To **ACCEPT**, *v. a.* [*accipio*, Lat. *accepter*, Fr.] To take with pleasure; to receive kindly; to admit with approbation. It is distinguished from *receive*, as *specific* from *general*; noting a particular manner of receiving.—God is no respecter of persons: but, in every nation, he that feareth him, and worketh righteousness, is *accepted* with him. *Acts*, x. 34.—It is used in a kind of juridical sense; as, to *accept terms*, *accept a treaty*. In the language of the Bible, to *accept persons*, is to act with personal and partial regard. It is sometimes used with the particle *of*—I will

appease him with the present that goeth before me, and afterwards I will see his face; peradventure he will *accept* of me. *Gen.* xxxii. 20.

ACCEPTABILITY, *f.* The quality of being acceptable.—He hath given us his natural blood to be shed for the remission of our sins, and for the obtaining the grace and *acceptability* of repentance. *Taylor*.

ACCEPTABLE, *adj.* [*acceptable*, Fr. from the Latin.] It is pronounced by some with the accent on the first syllable, as by Milton; by others, with the accent on the second, which is more analogical. That which is likely to be accepted; grateful; pleasing. It is used with the particle *to* before the person *accepting*—I do not see any other method left for men of that function to take, in order to reform the world, than by using all honest arts to make themselves *acceptable* to the laity. *Swift*.

ACCEPTABLENESS, *f.* The quality of being acceptable.

ACCEPTABLY, *adv.* In an acceptable manner; so as to please; with the particle *to*.—If you can teach them to love and respect other people, they will, as your age requires it, find ways to express it *acceptably* to every one. *Locke*.

ACCEPTANCE, *f.* [*acceptance*, Fr.] Reception with approbation. The meaning of a word as it is received or understood; *acceptation* is the word now commonly used.

ACCEPTANCE, in law, is as it were a kind of tacit agreement to a preceding act, which might have been defeated and avoided, were it not for such acceptance had. For example: If a bishop before the statute of 1 *Eliz.* leased part of his bishopric for a term of years, reserving rent, and then died; and afterwards another is made bishop, who accepts and receives the rent when due, by this acceptance the lease is made good, which otherwise the new bishop might have avoided. So if *husband and wife*, seised of lands in right of the wife, join and make a lease, reserving rent, and the husband dies, after whose death the wife receives or accepts the rent; by this the lease is confirmed, and it shall bind her. So if *tenant in dower* leases for years, and dies, and the heir accepts the rent. But if a *parson* makes a lease for years not warranted by the statute 32 Hen. VIII. and which consequently is void by his death, acceptance of rent by a new parson or successor will not make it good. 1 *Saund.* 241. And if a *tenant for life* makes a lease for years, there no acceptance will make the lease good, because the lease is void by his death. *Dyer*, 46. 239. But if *tenant in tail* makes a lease for years, rendering rent, and then dies, and the issue accepts the rent, it shall bind him. But if such tenant in tail makes a lease for years to commence after his death, rendering rent; in such case, acceptance of rent by the issue will not make the lease good to bar him, because the lease did not take effect in the life of his ancestor. *Plowd.* 418. If an *infant* accepts of rent at his full age, it makes the lease good, and shall bind him. If a lease is made on condition that the lessee shall do no *waste*, and he commits waste, and afterwards the lessor accepts the rent, he cannot enter for the condition broken; because he thereby affirms the lease to have continuance. 1 *Inst.* 211. If the lessor accepts from his tenant the last rent due to him, and gives the lessee a release for it; all rent in arrear is by law presumed to be satisfied. 1 *Inst.* 373.

Acceptance of a bill of exchange by the person on whom it is drawn (so as to charge the drawer with costs) must be in writing, under or on the back of the bill. But if he accepts it, either verbally or in writing, he thereby makes himself liable to pay it. If he refuses to accept it, and it is of the value of 20l. or upwards, and expressed to be for value received, the person to whom it is made payable, or to whom it is indorsed, may protest it for *non-acceptance*; which protest must be made in writing, under a copy of such bill of exchange, by a notary public; or, if no notary public be resident in the place, then by any other substantial inhabitant in the presence of two witnesses: and notice of such protest must, within fourteen days after, be

given to the drawer. But if the bill be accepted, and afterwards the acceptor fails or refuses to pay it within three days after it becomes due (which three days are called days of grace), the same must for non-payment be protested and notified, in like manner as for non-acceptance. And, on producing the protest, either of non-acceptance or non-payment, the drawer is bound to make good to the payee or indorsee, not only the amount of the bill (which he is bound to do within a reasonable time after non-payment, without any protest, by the rules of the common law), but also interest and all charges, to be computed from the time of making the protest. 2 *Blackst.* 469.

ACCEPTANCE, in the church of Rome, is put for receiving the pope's constitutions.

ACCEPTATION, *f.* Reception, whether good or bad. This large sense now seems wholly out of use.—What is new finds better *acceptation*, than what is good or great. *Denham*.—Good reception, acceptance.—Cain, envious of the *acceptation* of his brother's prayer and sacrifice, slew him; making himself the first manslayer, and his brother the first martyr. *Raleigh*.—The state of being acceptable; regard. Acceptance in the juridical sense: this sense occurs rarely. The meaning of a word, as it is commonly received.

ACCEPTER, *f.* The person that accepts.

ACCEPTILATION, *f.* [*acceptilatio*, Lat.] A term of the civil law, importing the remission of a debt by an acquittance from the creditor, testifying the receipt of money which has never been paid.

ACCEPTION, *f.* [*acceptio*, Fr. from *acceptio*, Lat.] The received sense of a word; the meaning. Not in use.

ACCESS, *f.* [In some of its senses, it seems derived from *accessus*; in others, from *accessio*, Lat. *accès*, Fr.] The way by which any thing may be approached. The means, or liberty, of approaching either to things or men. Encrease, enlargement, addition. It is sometimes used, after the French, to signify the returns or fits of a distemper; but this sense seems yet scarcely received into our language.

ACCESSARINESS, *f.* The state of being accessory.

ACCESSARY, *adj.* [A corruption, as it seems, of the word *accessory*, which see; but now more commonly used than the proper word.] That which, without being the chief constituent of a crime, contributes to it. But it had formerly a good and general sense.

ACCESSIBLE, *adj.* [*accessibilis*, Lat. *accessible*, Fr.] That which may be approached; that which we may reach or arrive at. It is applied both to persons and things, with the particle *to*.—As an island, we are *accessible* on every side, and exposed to perpetual invasions; against which it is impossible to fortify ourselves sufficiently, without a power at sea. *Addison*.

ACCESSION, *f.* [*accessio*, Lat. *accession*, Fr.] Increase by something added, enlargement, augmentation. The act of coming to, or joining one's self to; as, *accession* to a confederacy. The act of arriving at; as, the king's *accession* to the throne.

ACCESSION, in law, is a method of acquiring property, by which, in things that have a close connection or dependence upon one another, the property of the principal thing draws after it the property of the accessory. Thus, the owner of a cow becomes likewise the owner of the calf. It sometimes likewise signifies consent or acquiescence. **ACCESSION**, among physicians, is used for a paroxysm of a disease.

ACCESSORILY, *adv.* In the manner of an accessory.

ACCESSORY, *adj.* Joined to another thing so as to encrease it; additional.

ACCESSORY, *f.* [*accessorius*, Lat. *accessoire*, Fr.] This word, which had anciently a general signification, is now almost confined to forms of law.] Applied to persons:

Now were all transform'd

Alike, to serpents all, as *accessories*
To his bold riot.

Milton.

Applied to things.—An *accessory* is said to be that which does

does accede unto some principal fact or thing in law; and, as such, generally speaking, follows the reason and nature of its principal. *Ayliffe*.

ACCESSORY, in law, is of four kinds. 1. Accessory (quasi accedens ad culpam) is he that is not the chief actor, but one that is concerned in the felony by commandment, aid, or receipt. In the highest capital offence, namely, high-treason, there are no accessories, neither before nor after; for the consenters, aiders, abettors, and knowing receivers and comforters, of traitors, are all principals. 1 *Hale's Hist.* 613.

Also in cases that are criminal, but not capital, as in petit larceny and trespass, there are no accessories; for the accessories before are in the same degree as principals; and accessories after, by receiving the offenders, cannot be in law under any penalties as accessories, unless the acts of parliament that induce those penalties do expressly extend to receivers or comforters, as some do. Accessories therefore relate only to capital felonies; in which cases there may be accessories, either by common law, or by act of parliament.

2. Accessory before the fact committed, is he that, being absent at the time of the felony committed, doth yet procure, counsel, command, or abet, another to commit a felony. For if he is present, although another actually commits the felony, he is a principal offender; as if one present moves another to strike, or if one present did nothing, but yet came to assist the party if needful; or if one hold the party while the felon strikes him; or if one present delivers his weapon to the other that strikes. *Hale's Pleas*, 216.

So if several persons set out together, or in small parties, upon one common design, be it murder or other felony, or for any other purpose unlawful in itself, and each takes the part assigned him, some to commit the fact, others to watch at proper distances and stations to prevent a surprise, or to favour (if need be) the escape of those who are more immediately engaged: they are all, provided the fact be committed, in the eye of the law present at it. For it was made a common cause with them; each man operated in his station at one and the same instant towards the same common end; and the part each man took tended to give countenance, encouragement, and protection, to the whole gang, and to insure the success of their common enterprise. *Foss. Cr. Law*, 350.

3. Accessory after the fact, is, where a person knowing the felony to be committed, relieves, comforts, or assists, the felon. Generally, any assistance whatever given to a felon, to hinder his being apprehended or punished, makes the assister an accessory: as furnishing him with a horse to escape his pursuers, money or victuals to support him, a house or other shelter to conceal him, or open force and violence to rescue or protect him. So likewise to convey instruments to a felon to enable him to break gaol, or to bribe the gaoler to let him escape, makes a man accessory to the felony. 4 *Blackst.* 37.

To buy or receive stolen goods, knowing them to be stolen, falls under none of these descriptions: it was therefore at common law a mere misdemeanor, and made not the receiver accessory to the theft, because he received the goods only, and not the felon. But now, by the statutes 5 An. c. 31. and 4 Geo. c. 11. all such receivers are made accessories, and may be transported for fourteen years; and, in the case of receiving linen goods stolen from the bleaching grounds, are, by the statute 18 Geo. II. c. 27. declared felons without benefit of clergy. *Id.* 38.

4. If the principal and accessory appear together, and the principal pleads the general issue, the accessory shall be put to plead also; and, if he likewise plead the general issue, both may be tried by one inquest: but the principal must be first convicted, and the jury shall be charged, that, if they find the principal not guilty, they shall find the accessory not guilty. But if the principal plead a plea in bar, or abatement, or a former acquittal, the accessory shall not be forced to answer till that plea be determined; for, if it be

found for the principal, the accessory is discharged; if against the principal, yet he shall after plead over to the felony, and may be acquitted. 2 *Haw.* 323. 1 *Hale's Hist.* 624.

In the case of stolen goods, if the principal cannot be taken, the buyer or receiver may be prosecuted as for a misdemeanor, to be punished by fine and imprisonment, or other such corporal punishment as the court shall think fit, although the principal be not convicted; which shall exempt the offender from being punished as accessory, if the principal be afterwards taken and convicted. 1 An. st. 2. c. 9. 5 An. c. 31.

ACCESSORY, among painters, an epithet given to such parts of an history-piece as serve chiefly for ornament, and might have been wholly left out: such as vases, armour, &c.

ACCESSORY NERVES, in anatomy, a pair of nerves, which, arising from the medulla in the vertebrae of the neck, ascend, and enter the skull; and pass out of it again with the par vagum, wrapped up in the same common integument, and, after quitting them, are distributed into the muscles of the neck and shoulders. See ANATOMY.

ACCI, a town of Tarracoenfis, formerly called Acti; supposed to be Guadix, to the east of the city of Granada, at the foot of a mountain, near the source of the rivulet at Guadalantin; now greatly decayed.

ACCIAIOLI (Donata), a man famous for his learning and the honourable employments he possessed in Florence, his native country, in the 15th century. He wrote a Latin translation of some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the Life of Charlemagne. He was sent to France by the Florentines, to sue for succour from Louis XI. against Pope Sixtus IV. but on his journey died at Milan; his body was carried to Florence, and buried in the church of the Carthusians. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aristides, were married at the public expence, as an acknowledgment of his services. His funeral eulogium was spoken by Christopher Landini; and an elegant epitaph, by Politian, was inscribed on his tomb.

ACCIDENCE, *f.* [a corruption of *accidents*, from *accidentia*, Lat.] The little book containing the first rudiments of grammar, and explaining the properties of the eight parts of speech.

ACCIDENT, *f.* [*accidens*, Lat.] The property or quality of any being, which may be separated from it, at least in thought. That which happens unforeseen; casualty, chance.—The reformation owed nothing to the good intentions of king Henry. He was only an instrument of it (as logicians speak) by accident. *Swift*.

ACCIDENT, among logicians, is used in a threefold sense. 1. Whatever does not essentially belong to a thing; as the clothes a man wears, or the money in his pocket. 2. Such properties in any subject as are not essential to it; thus whiteness in paper is an accidental quality. 3. In opposition to substance, all qualities whatever are called accidents; as sweetness, softness, &c.

ACCIDENT, in grammar, implies a property attached to a word, without entering into its essential definition; for every word, notwithstanding its signification, will be either primitive, derivative, simple, or compound, which are the accidents of words. A word is said to be primitive, when it is taken from no other word in the language in which it is used: thus *heaven*, *king*, *good*, are primitive words. It is said to be derivative, when it is taken from some other word: thus, *heavenly*, *kingdom*, *goodness*, &c. are derivatives. A simple word is easily distinguished from a compound: thus, *just*, *justice*, are simple words; *unjust*, *injustice*, are compound: *res* is a simple word, as well as *publica*; but *respublica* is a compound. Besides these accidents, which are common to all sorts of words, each particular species has its accidents: thus the accidents of the noun substantive are the gender, declension, and number; and the adjective has another accident, namely, the comparison. See the articles GRAMMAR and LANGUAGE.

ACCIDENT,

ACCIDENT, in heraldry, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the essence of the armour; such as abatement, difference, and tincture.

ACCIDENTAL, *f.* [*accidental*, Fr.] A property non-essential.—Conceive, as much as you can, of the essentials of any subject, before you consider its *accidentals*. *Watts*.

ACCIDENTAL, *adj.* Having the quality of an accident, non-essential; used with the particle *to*, before that in which the accident inheres.—This is *accidental* to a state of religion, and therefore ought to be reckoned among the ordinary difficulties of it. *Tillotson*.—Casual, fortuitous, happening by chance.—Look upon things of the most *accidental* and mutable nature; *accidental* in their production, and mutable in their continuance; yet God's prescience of them is as certain in him, as the memory of them is, or can be, in us. *South*.—In the following passage it seems to signify *adventitious*:

Ay, such a minister as wind to fire,
That adds an *accidental* fierceness to
Its natural fury.

Denham.

ACCIDENTAL, in philosophy, is applied to that effect which flows from some cause intervening by accident, without being subject, or at least without any appearance of being subject, to general laws or regular returns. In this sense, *accident* is opposed to *constant* and *principal*. Thus the sun's place is, with respect to the earth, the constant and principal cause of the heat in summer and the cold in winter; whereas winds, snows, and rains, are the *accidental* causes which often alter and modify the action of the principal cause.

ACCIDENTAL COLOURS, are those which depend upon the affections of the eye, in contradistinction to those which belong to the light itself. The impressions made upon the eye by looking steadfastly at a particular colour are various, according to the single colour or combination of colours in the object; and they continue for some time after the eye is withdrawn, and give a false colouring to other objects. See **LIGHT** and **COLOURS**.

ACCIDENTAL POINT, in perspective, is that point in the horizontal line where the projections of two lines parallel to each other meet the perspective plane.

ACCIDENTALLY, *adv.* After an accidental manner; non-essentially. Casually, fortuitously.—Although virtuous men do sometimes *accidentally* make their way to preferment, yet the world is so corrupted, that no man can reasonably hope to be rewarded in it, merely upon account of his virtue. *Swift*.

ACCIDENTALNESS, *f.* The quality of being accidental.

ACCIDENTS, *f.* in law, are properly relievable in a court of equity. But there are many accidents which are also supplied in a court of law; as, loss of deeds, mistakes in receipts or accounts, wrong payments, deaths which make it impossible to perform a condition literally, and a multitude of other contingencies. And there are many which cannot be relieved even in a court of equity; as, if by accident a recovery is ill suffered, a devise ill executed, a contingent remainder destroyed, or a power of leasing omitted in a family settlement. 3 *Blackst.* 431.

ACCIDENTS, in astrology, denote the most extraordinary occurrences in the course of a person's life, either good or bad: such as a remarkable instance of good fortune, a signal deliverance, a great sickness, &c.

ACCIPENSER, *f.* in ichthyology, a genus of fishes belonging to the Amphibia Nantes of Linnæus. The accipenser has a single linear nostril: the mouth is in the under part of the head, and contains no teeth; the cirri are below the snout, and before the mouth. There are three species of this genus, viz.

1. The ruthenus has 4 cirri and 15 squamous protuberances. It is a native of Russia.

2. The huso has 4 cirri; the body is naked, i. e. has no prickles or protuberances. The skin of the huso is so

tough and strong, that it is employed for ropes in carts and other wheel-carriages; and the ichthyocollo, or isinglass of the shops, famous as an agglutinant, and used also for the fining of wines, is made from its found or scales. The huso is the largest of the genus, and grows to twenty-four feet in length. It inhabits the Danube and the rivers of Russia.

3. The sturio, or sturgeon, with 4 cirri, and 11 squamous protuberances on the back. This fish annually ascends our rivers, but in no great numbers, and is taken by accident in the salmon-nets. It seems a spiritless fish, making no manner of resistance when entangled, but is drawn out of the water like a lifeless lump. It is seldom taken far out at sea, but frequents such parts as are not remote from the estuaries of great rivers. It is admired for the delicacy and firmness of its flesh, which is white as veal, and extremely good when roasted. It is generally pickled. The most we receive comes either from the Baltic rivers or North America. Great numbers are taken during the summer in the lakes Frischehaff, and Curischhaff near Pillau, in large nets made of small cord. The adjacent shores are formed into districts, and farmed out to companies of fishermen, some of which are rented for 6000 guilders, or near 300l. per annum. They are found in vast abundance in the American rivers in May, June, and July; at which time they leap some yards out of the water, and, in falling, make a noise to be heard in still weather at some miles distant. Caviare is made of the roes of this, and also of all other sorts of sturgeons, dried, salted, and packed up close. Ichthyocollo, or isinglass, is likewise made of the sound of this fish, as well as that of the others; but in very small quantity. The sturgeon grows to a great size, to the length of eighteen feet, and to the weight of 500lb. but it is seldom taken in our rivers of that bulk. In the manner of breeding, this fish is an exception among the cartilaginous kind; being, like the bony fish, oviparous, spawning in water.

ACCIPIENT, *f.* [*accipiens*, Lat.] A receiver, perhaps sometimes used for *recipient*.

ACCIPITER, *f.* the name of Linnæus's first order of birds. See **ZOOLOGY**.—Among the Romans, the term *accipiter* signified a hawk; and which, from its being very carnivorous, they considered as a bird of bad omen.

ACCISMUS, *f.* denotes a feigned refusal of something which a person earnestly desires.

Accismus is sometimes considered as a virtue; sometimes as a vice, which Augustus and Tiberius practised with great success. Cromwell's refusal of the crown of England may be brought as an instance of an *accismus*. The word is more particularly used, in rhetoric, as a species of irony.

To ACCITE, *v. a.* [*accito*, Lat.] To call, to summons; a word not now in use.

ACCITUM, anciently a town of Hispania Batica, now Finiana, as appears from an ancient inscription; situate on an eminence of the mountain Alpuxaras in Granada.

ACCIIUS (Lucius), a Latin tragic poet, the son of a freedman, and, according to St. Jerom, born in the consulship of Hostilius Mancinus and Attilius Serranus, in the year of Rome 583. The titles of several of his tragedies are mentioned by various authors. He wrote on the most celebrated stories which had been represented on the Athenian stage; as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Meleager, Philoctetes, the civil wars of Thebes, Tereus, the Troades, &c. He composed one dramatic piece wholly Roman: it was entitled *Brutus*, and related to the expulsion of the Tarquins. He was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history; and, as this author had written annals, some insist that he is the person censured: but as Cicero himself, Horace, Quintilian, Ovid, and Paternulus, have spoken of this author with so much applause, we cannot think it is him whom the Roman orator censures with so much severity.

Accius,

ACCIPENSER.

1. The Staric, or Sturgeon. 2. The Ruthens, or Sturgeon of Russia?

Accius, a poet of the 16th century, to whom is attributed "A Paraphrase of Æsop's Fables," on which Julius Scaliger bestows great encomiums.

ACCLAIM, *f.* [*acclamo*, Lat. from which probably first the verb *acclaim*, now lost, and then the noun.] A shout of praise, acclamation:

The herald ends; the vaulted firmament
With loud *acclaims*, and vast applause, is rent. *Dryden.*

ACCLAMATION, *f.* [*acclamatio*, Lat.] A confused noise or shout of joy, by which the public express their applause, esteem, or approbation.

ACCLAMATION, in a more proper sense, denotes a certain form of words, uttered with extraordinary vehemence, and in a peculiar tone somewhat resembling a song, frequent in the ancient assemblies. Acclamations were usually accompanied with applauses, with which they are sometimes confounded: though they ought to be distinguished; as acclamation was given by the voice, applause by the hands; add, that acclamation was also bestowed on persons absent, applause only on those present. Acclamation was also given by women, whereas applause seems to have been confined to men.

Acclamations are of various kinds; ecclesiastical, military, nuptial, senatorial, synodical, scholastic, theatrical, &c. We meet with loud acclamations, musical and rhythmical acclamations; acclamations of joy and respect, and even of reproach and contumely.

Acclamations were not unknown on the theatres in the earliest ages of the Roman commonwealth; but they were artless then, and little other than confused shouts. Afterwards they became a sort of regular concerts. That mentioned by Phædrus, *latere incolumis Roma salvo principe*, which was made for Augustus, and proved the occasion of a pleasant mistake of a flute-player called Princeps, shows that musical acclamations were in use in that emperor's reign. Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. Charmed with the harmony wherewith the Alexandrians, who came to the games celebrated at Naples, had sung his praises, he brought several over to instruct a number of youth, chosen from among the knights and people, in the different kinds of acclamations practised at Alexandria. These continued in use as long as the reign of Theodoric. But the people did not always make a single chorus; sometimes there were two, who answered each other alternately: thus, when Nero played on the theatre, Burrhus and Seneca, who were on either hand, giving the signal by clapping, 5000 soldiers called Augustals, began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master called *Mesochorus* or *Pausanius*.—To theatrical acclamations may be added those of the soldiery and the people in time of triumph. The victorious army accompanied their general to the capitol; and, among the verses they sung in his praises, frequently repeated "Io Triumphe," which the people answered in the same strain. It was also in the way of acclamation that the soldiers gave their general the title of *Imperator* after some notable victory; a title which he only kept till the time of his triumph.

The acclamations of the senate were somewhat more serious than the popular ones; but arose from the same principle, viz. a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying "Omnes, Omnes;" or else, "Equum est, Justum est." Sometimes they began with acclamations, and sometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors,

where *Vivat Rex, Vive le Roi, and Long live the King*, are customary forms.

For the acclamations wherewith authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the capitol, temples, the Athenæum, and the houses of great men. Invitations were sent every where, in order to make the greater appearance. The chief care was, that the acclamations might be given with all the order and pomp possible. Men of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises.

The acclamations wherewith the spectators honoured the victories of the athlete, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

Acclamations made also a part of the ceremony of marriage. They were used for the omen's sake; being the *Lata Omina*, sometimes spoken of before marriage in Roman writers.

Acclamations, at first practised in the theatre, and passing thence to the senate, &c. were in process of time received into the acts of councils, and the ordinary assemblies of the church. The people expressed their approbation of the preacher variously; the more usual forms were, "Orthodox! Third Apostle, &c." These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use as low as the time of St. Bernard.

ACCLAMATION MEDALS, among antiquaries, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, *f.* [*acclivus*, Lat.] The steepness or slope of a line inclining to the horizon, reckoned upwards; as, the ascent of an hill is the *acclivity*, the descent is the declivity.

ACCLIVOUS, *adj.* [*acclivus*, Lat.] Rising with a slope.

To **ACCLOY**, *v. a.* To fill up, in an ill sense; to crowd, to stuff full; a word almost obsolete. To fill to satiety; in which sense *cloy* is still in use.—They that escape best in the temperate zone, would be *accloyed* with long nights, very tedious, no less than forty days. *Ray.*

To **ACCOIL**, *v. n.* To crowd, to keep a coil about, to bustle, to be in a hurry: a word now out of use.

ACCOLADE, *f.* a ceremony anciently used in the conferring of knighthood, and supposed to be the embrace or kiss, which princes anciently gave the new knight, as a token of their affection: whence the word *accolade*; *q. d.* a clapping, or taking round the neck. Others will rather have it to be a blow on the chine of the neck, given on the same occasion. Greg. de Tours writes, that the kings of France, even of the first race, in conferring the gilt shoulder-belt, kissed the knights on the left cheek. For the *accolée*, or blow, John of Salisbury assures us, was in use among the Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry. At first, it was given with the naked fist; but was afterwards changed into a blow with the flat of the sword on the shoulder of the knight.

ACCOLEE, *f.* sometimes synonymous with **ACCOLADE**. It is also used in various senses in heraldry: sometimes it is applied to two things joined; at other times, to animals with crowns, or collars, about their necks, as the lion in the Ogilvy's arms; and, lastly, to kews, battons, maces, swords, &c. placed saltierwise behind the shield.

ACCOLENT, *f.* [*accolens*, Lat.] He that inhabits near a place; a borderer.

ACCOLTI (Bernardo), secretary to the republic of Florence, was surnamed L'Unico, or the Nonsuch, probably from the great extent of his understanding, the variety of sciences he had acquired, and the excellency of his poetic vein; which not only gained him a seat among the academicians of the court of Urbino, but made that great Mecenas, Pope Leo X. in 1520, create him prince of the state of Nepi. He wrote many pieces; among others, a collection of beautiful poems, printed at Venice in 1519 and 1553.

ACCOMMODABLE, *adj.* [*accommodabilis*, Lat.] That which may be fitted; with the particle *to*.—As there is infinite variety in the circumstances of persons, things, actions, times, and places; so we must be furnished with such general rules as are *accommodable* to all this variety, by a wise judgment and discretion. *Watts.*

To ACCOMMODATE, *v. a.* [*accommodo*, Lat.] To supply with conveniences of any kind. It has *with* before the thing. With the particle *to*, to adapt, to fit, to make consistent with. To reconcile; to adjust what seems inconsistent, or at variance; to make consistency appear.

To ACCOMMODATE, *v. n.* To be conformable to.—They make the particular ensigns of the twelve tribes *accommodate* unto the twelve signs of the zodiac. *Brown.*

ACCOMMODATE, *adj.* [*accommodatus*, Lat.] Suitable, fit: used sometimes with the particle *for*, but more frequently with *to*.—They are so acted and directed by nature, as to cast their eggs in such places as are most *accommodate* for the exclusion of their young, and where there is food ready for them as soon as they be hatched. *Ray.*—In these cases we examine the why, the what, and the how, of things, and propose means *accommodate* to the end. *L'Esrange.*

ACCOMMODATELY, *adv.* Suitably, fitly.

ACCOMMODATION, *f.* Provision of conveniences. In the plural, conveniences, things requisite to ease or refreshment. Composition of a difference, reconciliation, adjustment: Adaptation, fitness; with the particle *to*.—The organization of the body, with *accommodation* to its functions, is fitted with the most curious mechanism. *Hale.*

ACCOMMODATION, in a scriptural sense, is the application of one thing, by analogy, to another; or the making two or more things agree with one another. To know a thing by *accommodation*, is to know it by the idea of a similar thing referred thereto. A prophecy of Scripture is said to be fulfilled various ways; properly, as when a thing foretold comes to pass; and improperly, or by way of *accommodation*, when an event happens to any place or people, like to what fell out some time before to another. Thus, the words of Isaiah, spoken to those of his own time, are said to be fulfilled in those who lived in our Saviour's; and are *accommodated* to them: "Ye hypocrites, well did Isaiah prophecy of you, &c." which same words St. Paul afterwards *accommodates* to the Jews of his time.

The primitive church *accommodated* multitudes of Jewish, and even heathen, ceremonies and practices, to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only *accommodated* by Moses to the purposes of Judaism.

ACCOMPANIER, *f.* The person that makes part of the company; companion.

To ACCOMPANY, *v. a.* [*accompagner*, Fr.] To be with another as a companion. It is used both of persons and things:

Go visit her, in her chaste bower of rest,
Accompany'd with angel-like delights.

Spenfer.

To ACCOMPANY, *v. n.* To associate with; to become a companion to.—No man in effect doth *accompany* with others, but he learneth, ere he is aware, some gesture, voice, or fashion. *Bacon.*

ACCOMPANIMENT, *f.* something attending or add-

ed as a circumstance to another, either by way of ornament, or for the sake of symmetry.

ACCOMPANIMENT, in music, denotes the instruments which accompany a voice, in order to sustain it, as well as to make the music more full. The accompaniment is used in recitative as well as in song; on the stage, as well as in the choir, &c. The ancients had likewise their accompaniments on the theatre; they had even different kinds of instruments to accompany the chorus, from those which accompanied the actors in the recitation.—The accompaniment among the moderns, is frequently a different part or melody from the song it accompanies. It is disputed whether it was so among the ancients. It is generally alleged, that their accompaniments went no farther than the playing in octave, or in antiphony to the voice.

ACCOMPANIMENT, in painting, denotes such objects as are added, either by way of ornament, or probability; as dogs, guns, game, &c. in a hunting-piece.

ACCOMPANIMENT, in heraldry, any thing added to a shield by way of ornament; as the belt, mantling, supporters, &c. It is also applied to several bearings about a principal one; as a saltier, bend, fess, chevron, &c.

ACCOMPLICE, *f.* [*complice*, Fr. from *complex*, a word in the barbarous Latin much in use.] An associate, a partner, usually in an ill sense. A partner, or co-operator; in a sense indifferent. It is used with the particle *to* before a thing, and *with* before a person:

Childless Arturius, vastly rich before,
Thus by his losses multiplies his store,
Suspected for *accomplice* to the fire,
That burnt his palace but to build it higher. *Dryden.*
Who, should they steal for want of his relief,
He judg'd himself *accomplice* with the thief. *Dryden.*

To ACCOMPLISH, *v. a.* [*accomplir*, Fr. from *compleo*, Lat.] To complete, to execute fully; as, to *accomplish* a design. To complete a period of time. To fulfil; as a prophecy. To gain, to obtain. To adorn, or furnish, either mind or body.

ACCOMPLISHED, *part. adj.* Complete in some qualification. Elegant; finished in respect of embellishments; used commonly of acquired qualifications, without including moral excellence.

ACCOMPLISHER, *f.* The person that accomplishes.

ACCOMPLISHMENT, *f.* [*accomplissement*, Fr.] Completion, full performance, perfection. Completion; as, of a prophecy. The act of obtaining or perfecting any thing; attainment; completion. Embellishment, elegance, ornament of mind or body.—Young heirs, and elder brothers, from their own reflecting upon the estates they are born to, and, therefore, thinking all other *accomplishments* unnecessary, are of no manner of use but to keep up their families. *Addison.*

ACCOMPLISHMENT, in a scriptural sense, is principally used in speaking of events foretold by the Jewish prophets in the Old Testament, and fulfilled under the New. We say a literal accomplishment, a mystical or spiritual accomplishment, a single accomplishment, a double accomplishment, a Jewish accomplishment, a Christian, a heathen, accomplishment. The same prophecy is sometimes accomplished in all, or in several of those different ways. Thus, of some of the prophecies of the Old Testament, the Jews find a literal accomplishment in their own history, about the time when the prophecy was given: the Christians find another in Christ, or the earliest days of the church; the heathens another, in some of their emperors; the Mahometans another, in their legislator, &c. There are two principal ways of accomplishing a prophecy; *directly*, and by *accommodation*. See **ACCOMMODATION** and **PROPHECY**.

ACCOMPT, *f.* [*Fr. compteur* and *compte*, anciently *acompter*.] An account, a reckoning. See **ACCOUNT**.

To ACCORD, *v. a.* [derived by some from *corda*, the string of a musical instrument, by others from *corda*, hearts; in the first implying *harmony*, in the other *unity*.] To make agree;

agree; to adjust one thing to another; with the particle *to*. To bring to agreement; to compose; to accommodate.

TO ACCORD, v. n. To agree, to suit one with another; with the particle *with*.—Several of the main parts of Moses's history, as concerning the flood, and the first fathers of the several nations of the world, do very well *accord with* the most ancient accounts of profane history. *Tillotson*.

ACCORD, f. [*accord*, Fr.] A compact; an agreement; adjustment of a difference. Concurrence, union of mind. Harmony, symmetry, just correspondence of one thing with another.—Beauty is nothing else but a just *accord* and mutual harmony of the members, animated by a healthful constitution. *Dryden*.—Own *accord*; voluntary motion: used both of persons and things. Action in speaking, correspondent to the words.

ACCORD, in law, is an agreement between the party injuring and the party injured, where one is injured by a trespass or offence done, or on a contract, to satisfy him with some recompence; which, if executed and performed, shall be a good bar in law, if the other party after the accord performed bring any action for the same. As if a man contract to build a house, or to deliver a horse, and fail in it; this is an injury, for which the sufferer may have his remedy by action: but, if the party injured accepts a sum of money or other thing as a satisfaction, this is a redress of that injury, and entirely takes away the action. 3 *Blackst* 15.

The accord must be executed before the action be commenced; and therefore an accord to do a thing at a day to come is not good. But, if it be executed before the action commenced, it is good, although it was executory only at the time of the accord. 1 *Roll's Rep.* 129.

If a man plead an accord, the safest way is to plead it as a satisfaction, and not by way of accord; and therefore he need say no more than that the defendant gave so much to the plaintiff in satisfaction, which the plaintiff received. 9 *Co.* 80.

The defendant must plead that the plaintiff accepted the thing agreed upon in full satisfaction; and, if it be on a bond, it must be in satisfaction of the money mentioned in the condition, and not of the bond itself, for that cannot be discharged but by writing under hand and seal. *Cro. Ja.* 254.

ACCORD, in painting, is the harmony that reigns among the lights and shades of a picture.

ACCORDANCE, f. Agreement with a person; with the particle *with*. Conformity to something.—The only way of defining of sin, is, by the contrariety to the will of God; as of good, by the *accordance with* that will. *Hammond*.

ACCORDANT, adj. [*accordant*, Fr.] Willing; in a good humour. Not in use.

ACCORDING, prep. [from *accord*, of which it is properly a participle, and is therefore never used but with *to*.] In a manner suitably to, agreeably to, in proportion.—Our zeal, then, should be *according to* the whole gospel: not only *according to* its truths, but precepts: not only *according to* its free grace, but necessary duties: not only *according to* its mysteries, but also its commandments. *Sprat*.—With regard to. In proportion. The following phrase is, I think, vicious:—A man may, with prudence and a good conscience, approve of the professed principles of one party more than the other, *according as* he thinks they best promise the good of church and state. *Swift*.

ACCORDINGLY, adv. Agreeably, suitably, conformably.—Mealy substances, fermented, turn sour. *Accordingly*, given to a weak child, they still retain their nature; for bread will give them the cholick. *Arbutnot*.

ACCORDS (Stephen Tabourot, Seigneur des), advocate in the parliament of Dijon in France, and king's advocate in the bailiwick and chancery of that city, born in the year 1549. He was a man of genius and learning. His work, intitled "Les Touches," was published at Paris in 1585; which is indeed a collection of witty poems,

but worked up rather in too loose a manner, according to the licentious taste of that age. His Bigarrures are written in the same strain. He was censured for this way of writing, which obliged him to publish an apology. The lordship of Accords is an imaginary fief or title from the device of his ancestors, which was a drum, with the motto, *à tous accords*, "chiming with all." He had sent a sonnet to a daughter of M. Begat, the great and learned president of Burgundy, "who (says he) did me the honour to love me:—And, inasmuch (continues he), as I had subscribed my sonnet with only my device, *à tous accords*, this lady first nicknamed me, in her answer, *Seigneur des Accords*; by which title her father also called me several times. For this reason I chose this surname, not only in all my writings composed at that time, but even in these books." He died July 24th, 1561, in the 46th year of his age.

TO ACCOST, v. a. [*accoster*, Fr.] To speak to first; to to address; to salute.—You mistake, knight: *accost* her, front her, board her, woo her, assail her. *Shakespeare*.

ACCONSTABLE, adj. Easy of access; familiar. Not in use.—They were both indubitable, strong, and high-minded, men, yet of sweet and *acconstable* nature, almost equally delighting in the press and affluence of dependents and suitors. *Wotton*.

ACCOUNT, f. [from the old French *acompt*, from *computus*, Lat. It was originally written *acompt*; but, by gradually softening the pronunciation, in time the orthography changed to *account*.] A computation of debts or expences; a register of facts relating to money. The state or result of a computation; as, the *account* stands thus between us. Such a state of persons or things, as may make them more or less worthy of being considered in the reckoning. Value, or estimation.—I should make more *account* of their judgment, who are men of sense, and yet have never touched a pencil, than of the opinion given by the greatest part of painters. *Dryden*.—Profit; advantage: to *turn to account*, is to produce advantage.—We would establish our souls in such a solid and substantial virtue, as will *turn to account* in that great day, when it must stand the test of infinite wisdom and justice. *Addison*.—Distinction, dignity, rank.—There is such a peculiarity in Homer's manner of apostrophizing Eumæus: it is generally applied, by that poet, only to men of *account* and distinction. *Pope*.—A reckoning verified by finding the value of a thing equal to what it was accounted.—Considering the usual motives of human actions, which are pleasure, profit, and ambition, I cannot yet comprehend how those persons find their *account* in any of the three. *Swift*.—A reckoning referred to, or sum charged upon, any particular person; and thence, figuratively, regard; consideration; sake.—This must be always remembered, that nothing can come into the *account* of recreation, that is not done with delight. *Locke*.—Nothing can recommend itself to our love, on any other *account*, but either as it promotes our present, or is a means to assure to us a future, happiness. *Rogers*.—A narrative, relation; in this use it may seem to derived from *conte*, Fr. a tale, a narration. The review or examination of an affair taken by authority; as, the magistrate took an *account* of the tumult. The relation and reasons of a transaction given to a person in authority.—The true ground of morality can only be the will and law of a God who sees men in the dark, has in his hands rewards and punishments, and power enough to call to *account* the proudest offender. *Locke*.—Explanation; assignment of causes.—It is easy to give *account*, how it came to pass, that, though all men desire happiness, yet their wills carry them contrarily. *Locke*.—An opinion previously established.—A prodigal young fellow, that had sold his clothes, upon the sight of a swallow, made *account* that summer was at hand, and away went his shirt too. *L'Estrange*.—The reasons of any thing collected.—Being convinced, upon all *accounts*, that they had the same reason to believe the history of our Saviour, as that of any other person to which they themselves were not actually eye-witnesses,

witnesses, they were bound, by all the rules of historical faith, and of right reason, to give credit to this history. *Addison.*

ACCOUNT, in law, is a writ or action, commanding the defendant to render a just account to the plaintiff, or shew to the court good cause to the contrary. In this action, if the plaintiff succeeds, there are two judgments; the first is, that the defendant do account (*quod computet*) before auditors appointed by the court; and, when such account is finished, then the second judgment is, that he pay to the plaintiff so much as he is found in arrear. This action, by the old common law, laid only against the parties themselves, and not their executors; because matters of account rested solely in their own knowledge. But this defect was remedied by statute 4 Anne, c. 16. which gives an action of account against the executors and administrators. But however it is found by experience, that the most ready and effectual way to settle these matters of account, is by bill in a court of equity, where a discovery may be had on the defendant's oath, without relying merely on the evidence which the plaintiff may be able to produce. Therefore actions of account, to compel a man to bring in and settle his accounts, are now very seldom used; though, when an account is once stated, nothing is more common than an action upon the implied *assumpsit* to pay the balance. *3 Blackst. 162.*

A plea of a stated account is bad, unless it shews the account was in writing, and what the balance was. *2 Atk. 399.*

A stated account is not an extinguishment of the original debt; therefore it cannot be pleaded in bar of an action for the debt. *Bur. Mansf. 9.*

ACCOUNT is taken sometimes, in a particular sense, for the computation of time: thus we say, "the Julian Account, the Gregorian Account, &c." in which sense it is equivalent to *style*.

To ACCOUNT, v. a. To esteem, to think, to hold in opinion. To reckon, to compute.—Neither the motion of the moon, whereby months are computed, nor the sun, whereby years are accounted, consisteth of whole numbers. *Brown.*—To assign to, as a debt; with the particle *to*.—For some years really accrued the yearly sum of two hundred thousand pounds to the king's coffers; and it was, in truth, the only project that was accounted to his own service. *Clarendon.*—To hold in esteem; with *of*.—Silver was nothing accounted of in the days of Solomon. *Chron.*

To ACCOUNT, v. n. To reckon. To give account, to assign the causes; in which sense it is followed by the particle *for*.—If any one should ask, why our general continued so easy to the last? I know no other way to account for it, but by that unmeasurable love of wealth, which his best friends allow to be his predominant passion. *Swift.*—To make up the reckoning; to answer; with *for*.

Then thou shalt see him plung'd, when least he fears,
At once accounting for his deep arrears. *Dryden.*

To appear as the medium, by which any thing may be explained.—Such as have a faulty circulation through the lungs, ought to eat very little at a time; because the increase of the quantity of fresh chyle must make that circulation still more uneasy; which, indeed, is the case of consumptive and some asthmatic persons, and accounts for the symptoms they are troubled with after eating. *Arbutnot.*

ACCOUNTABLE, adj. Of whom an account may be required; who must answer for: followed by the particle *to* before the person, and *for* before the thing:

Accountable to none,

But to my conscience and my God alone. *Oldham.*

The good magistrate will make no distinction; for the judgment is God's; and he will look upon himself as accountable at his bar for the equity of it. *Atterbury.*

ACCOUNTANT, adj. Accountable to; responsible for. Not in use.

ACCOUNTANT, f. A computer; a man skilled or employed in accounts.—In a more restricted sense, it is applied

to a person, or officer, appointed to keep the accounts of a public company or office; as the South-Sea and the India Companies, the Bank, the Exchequer, &c.

ACCOUNTANTSHIP, f. The art of keeping and balancing accounts. See **BOOK-KEEPING**.

ACCOUNTANT-GENERAL, f. an officer in the court of Chancery appointed by act of parliament to receive all moneys lodged in the court instead of the masters, and convey the same to the bank of England for security.

ACCOUNT-BOOK, f. A book containing accounts.

ACCOUNTING, f. The act of reckoning, or making up of accounts.—This method faithfully observed, must keep a man from breaking, or running behind-hand in his spiritual estate; which, without frequent accountings, he will hardly be able to prevent. *South.*

To ACCOUPLE, v. a. [*accoupler, Fr.*] To join, to link together. We now use *couple*.

To ACCOURAGE, v. a. To animate. Now obsolete.

To ACCOURT, v. a. To entertain with courtship, or courtesy. Not now in use.

To ACCOUTRE, v. a. [*accoutrer, Fr.*] To dress; to equip.

ACCOUTREMENT, f. [*accoutrement, Fr.*] Dress, equipage, furniture relation to the person; trappings, ornaments:

How gay, with all th' accoutrements of war,
The Britons come, with gold well-fraught. *Phil.*

ACCRETION, f. [*accretio, Lat.*] The act of growing to another, so as to increase it.—Plants do nourish; inanimate bodies do not: they have an *accretion*, but no alimantation. *Bacon.*

ACCRETION, in physics, the increase or growth of an organic body, by the accession of new parts. See **NUTRITION, PLANTS, and VEGETABLES**.

ACCRETION, among civilians, the property acquired in a vague or unoccupied thing, by its adhering to or following another already occupied: thus, if a legacy be left to two persons, one of whom dies before the testator, the legacy devolves to the survivor by right of accretion.

ACCRETIVE, adj. Growing; that which by growth is added.—If the motion be very slow, we perceive it not: we have no sense of the *accretive* motion of plants and animals; and the fly shadow steals away upon the dial; and the quickest eye can discover no more but that it is gone. *Glanville.*

To ACCROACH, v. a. [*acrocher, Fr.*] To draw to one as with a hook; to gripe; to draw away by degrees what is another's.

ACCROACHMENT, f. The act of accroaching.

ACCROCHE, f. in heraldry, denotes a thing's being hooked with another.

To ACCRUE, v. n. [from the participle *accrû*, formed from *accroître, Fr.*] To accede to, to be added to; as, a natural production or effect, without any particular respect to good or ill. To be added, as an advantage or improvement, in a sense inclining to good rather than ill; in which meaning it is more frequently used by later authors. To append to, to arise from: as, an ill consequence; this sense seems to be less proper. In a commercial sense, to be produced, or arise; as, profits. To follow, as loss; a vicious use.

ACCUBATION, f. a posture of the body, between sitting and lying. The word comes from the Latin *accubare*, compounded of *ad*, to, and *cubo*, I lie down. *Accubation*, or *accubitus*, was the table-posture of the Greeks and Romans; whence we find the words particularly used for the lying, or rather (as we call it) sitting, down to meat. The Greeks introduced this posture. The Romans, during the frugal ages of the republic, were strangers to it: but, as luxury got footing, this posture came to be adopted, at least by the men; for, as to women, it was reputed an indecency in them to lie down among the men: though, afterwards, this too was got over. But children did not lie down, nor servants, nor soldiers, nor persons of meaner condition,

condition, but took their meals sitting, as a posture less indulgent. The Roman manner of disposing themselves at table was this: A low round table was placed in the cœnaculum, or dining-room; and, about this, usually three, sometimes only two, beds or couches; according to the number of which, it was called *biclinium* or *triclinium*. These were covered with a sort of bed-clothes, richer or plainer according to the quality of the person, and furnished with quilts and pillows, that the guests might lie the more commodiously. There were usually three persons on each bed; to crowd more, was esteemed fordid. In eating, they lay down on their left sides, with their heads resting on the pillows, or rather on their elbows. The first lay at the head of the bed, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third, or fourth. The middle place was esteemed the most honourable. Before they came to table, they changed their clothes, putting on what they called *canatorii vestis*, the dining-garment; and pulled off their shoes, to prevent fouling the couch.

ACCUBITOR, *f.* an ancient officer of the emperors of Constantinople, whose business was to lie near the emperor. He was the head of the youth of the bed-chamber, and had the *cubicularis* and *procubitor* under him.

To **ACCUMB**, *v. a.* [*accumbo*, Lat.] To lie at table according to the ancient manner.

ACCUMBENT, *adj.* [*accumbens*, Lat.] Leaning.—The Roman recumbent, or, more properly, *accumbent*, posture in eating, was introduced after the first Punic war. *Arbutnot.*

To **ACCUMULATE**, *v. a.* [from *accumulo*, Lat.] To heap one thing upon another; to pile up, to heap together. It is used either literally, as, to *accumulate* money; or figuratively, as, to *accumulate* merit or wickedness:

If thou dost slander her, and torture me,
Never pray more; abandon all remorse;
On horror's head horrors *accumulate*;
For nothing canst thou to damnation add. *Shakespeare.*

ACCUMULATION, *f.* The act of accumulating. The state of being accumulated.

ACCUMULATION OF DEGREES, in an university, is the taking several of them together, or at smaller intervals than usual or than is allowed by the rules of the university.

ACCUMULATIVE, *adj.* That which accumulates. That which is accumulated.

ACCUMULATOR, *f.* He that accumulates; a gatherer or heaper together.—Injuries may fall upon the passive man, yet, without revenge, there would be no broils and quarrels, the great *accumulators* and multipliers of injuries.

ACCURACY, *f.* [*accuratio*, Lat.] Exactness, nicety.—Quickness of imagination is seen in the invention, fertility in the fancy, and the *accuracy* in the expression. *Dryden.*

ACCURATE, *adj.* [*accuratus*, Lat.] Exact, as opposed to negligence or ignorance, applied to persons. Exact, without defect or failure, applied to things. Determinate; precisely fixed.

ACCURATELY, *adv.* In an accurate manner; exactly, without error, nicely.—That all these distances, motions, and quantities of matter, should be so *accurately* and harmoniously adjusted in this great variety of our system, is above the fortuitous hits of blind material causes, and must certainly flow from that eternal fountain of wisdom. *Bentley.*

ACCURATENESS, *f.* Exactness, nicety.

To **ACCURSE**, *v. a.* To doom to misery; to invoke misery upon any one.

ACCURSED, *part. adj.* That which is cursed or doomed to misery. That which deserves the curse; execrable; hateful; detestable; and, by consequence, wicked; malignant.—In the Jewish idiom, *accursed* and *crucified* were synonymous. Among them every one was accounted ac-

cursed who died on a tree. This serves to explain the difficult passage in Rom. ix. 3. where the apostle Paul wishes himself “accursed after the manner of Christ,” i. e. crucified, if happily he might by such a death save his countrymen. The preposition *απο* here made use of, is used in the same sense, 2 Tim. i. 3. where it obviously signifies “after the manner of.”

ACCURSIUS, a law-professor in the 13th century, born in Florence. His authority was for some time so great, that he was called the Idol of the Lawyers.—Other three lawyers of note had the same name.

ACCURSIUS (Mariangelus), a famous critic of the 16th century, born at Aquilo in the kingdom of Naples. His *Diatresbes*, printed at Rome in folio, in 1524, on Ovid and Solinus, are a proof of his abilities in that kind of erudition. In his edition of Ammianus Marcellinus there are five books more than in any of the preceding ones; and he affirms he had corrected 5000 errors in that historian. His predominant passion was the searching for and collecting of old manuscripts: yet he made Latin and Italian verses; was complete master of the French, German, and Spanish, tongues; and understood optics and music. He purged himself by oath, being charged for being a plagiarist with regard to his Ausonius; it being reported, that he had appropriated to himself the labours of Fabricio Varana, bishop of Camerino.

ACCUSABLE, *adj.* That which may be censured; blameable; culpable.

ACCUSATION, *f.* The act of accusing. The charge brought against any one by the accuser. In the sense of the courts it is a declaration of some crime preferred before a competent judge, in order to inflict some judgment on the guilty person.—Writers on politics treat of the benefit and the inconveniences of public accusations. Various arguments are alleged, both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent accusations of persons trusted with the administration of public affairs. This, accordingly, was very strictly observed by the Romans, in the instances of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calumnies are pernicious; which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment, or absolution. Cato, the most innocent person of his age, had been accused forty-two times, and as often absolved. But the accusation of private crimes was never received but from the mouths of those who were immediately interested in them. None, for example, but the husband could accuse the wife of adultery.

The ancient Roman lawyers distinguished between *postulatio*, *delatio*, and *accusatio*. For, first, leave was desired to bring a charge against one, which was called *postulare*: then he against whom the charge was laid, was brought before the judge; which was called *deferre*, or *nominis delatio*: lastly, the charge was drawn up and presented, which was properly the *accusatio*. The accusation properly commenced, according to Pædianus, when the *reus* or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the *delatio* made by his opponent.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law; none shall be vexed with any accusation, but according to the law of the land; and no man may be molested by petition to the king, &c. unless it be by indictment or presentment of lawful men, or by process at common law. Promoters of suggestions, are to find surety to pursue them; and, if they do not make them good, shall pay damages to the party accused, and also a

fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

ACCUSATIVE, *adj.* [*accusativus*, Lat.] A term of grammar, signifying the relation of the noun, on which the action implied in the verb terminates; and hence, in such languages as have cases, these nouns have a particular termination, called *accusative*: as, *Augustus vicit Antonium*, Augustus vanquished Antony. Here *Antonium* is the noun, on which the action implied in the verb *vicit* terminates; and, therefore, must have the accusative termination. Ovid, speaking of the palace of the sun, says, *Materiem superabat opus*, The work surpassed the materials. Here *materiem* has the accusative termination; because it determines the action of the verb *superabat*.—In the English language there are no cases, except the genitive; the relation of the noun being shewn by the assistance of prepositions, as *of*, *to*, *from*, &c.

ACCUSATORY, *adj.* That which produceth or containeth an accusation.—In a charge of adultery, the accuser ought to set forth, in the *accusatory* libel, some certain and definite time. *Ayliffe*.

To **ACCUSE**, *v. a.* [*accuso*, Lat.] To charge with a crime. It requires the particle *of* before the subject of accusation:

He stripp'd the bear's-foot of its leafy growth;
And, calling western winds, *accus'd* the spring of sloth.
Dryden.

It sometimes admits the particle *for*.—Never send up a leg of a fowl at supper, while there is a cat or dog in the house that can be *accus'd for* running away with it: but, if there happen to be neither, you must lay it upon the rats, or a strange greyhound. *Swift*.—To blame or censure, in opposition to applause or justification.—Their conscience bearing witness, and their thoughts the mean while *accusing* or else excusing one another. *Rom. ii. 15*.

ACCUSER, *f.* He that brings a charge against another.—There are some persons forbidden to be *accusers*, on the score of their sex, as women; others, of their age, as pupils and infants; others, upon the account of some crimes committed by them; and others, on the score of some filthy lucre they propose to gain thereby; others, on the score of their conditions, as libertines against their patrons; and others, through a suspicion of calumny, as having once already given false evidence; and, lastly, others on account of their poverty, as not being worth more than fifty aurei. *Ayliffe*.

ACCUSIORUM COLONIA, anciently an inland town in the Cavares, in Gallia Narbonensis: now Grenoble, in Dauphiné. See **GRENOBLE**.

To **ACCUSTOM**, *v. a.* [*accoutumer*, Fr.] To habituate, to enure, with the particle *to*. It is used chiefly of persons:

How shall we breathe in other air
Lefs pure, *accustom'd* to immortal fruits? *Milton*.

To **ACCUSTOM**, *v. n.* To be wont to do any thing. Obsolete.—A boat over-freighted sunk, and all drowned, saving one woman, that in her first popping up again, which most living things *accustom*, got hold of the boat. *Carew*.

ACCUSTOMABLE, *adj.* Of long custom or habit; habitual, customary.—Animals even of the same original, extraction, and species, may be diversified by *accustomable* residence in one climate, from what they are in another. *Hale*.

ACCUSTOMABLY, *adv.* According to custom.—Touching the king's fines *accustomably* paid for the purchasing of writs original, I find no certain beginning of them, and do therefore think that they grew up with the chancery. *Bacon*.

ACCUSTOMANCE, *f.* [*accoutumance*, Fr.] Custom, habit, use.—Through *accustomance* and negligence, and perhaps some other causes, we neither feel it in our own bodies, nor take notice of it in others. *Boyle*.

ACCUSTOMARILY, *adv.* In a customary manner; according to common or customary practice.

ACCUSTOMARY, *adj.* [from *accustom*.] Usual, practiced; according to custom.

ACCUSTOMED, *adj.* [from *accustom*.] According to custom; frequent; usual.—Look how she rubs her hands. It is an *accustomed* action with her, to seem thus washing her hands: I have known her continue in this a quarter of an hour. *Shakespeare*.

ACE, *f.* [As not only signified a piece of money, but any integer, from whence is derived the word *ace*, or unit. Thus *as* signified the whole inheritance. *Arbutnot on coins*.]—An unit; a single point on cards or dice.—When lots are shuffled together in a lap, urn, or pitcher; or if a man blindfold casts a die, what reason in the world can he have to presume, that he shall draw a white stone rather than a black, or throw an *ace* rather than a six. *South*.—A small quantity; a particle; an atom.—I'll not wag an *ace* farther; the whole world shall not bribe me to it. *Dryden*.

ACELUM, or **ACELIUM**, anciently a town of the Venetian territory, now called *Azolo*, situated to the west of Treviso, at the source of the rivulet Mufone. E. lon. 13°. N. lat. 45°.

ACENTETUM, or **ACANTETA**, in natural history, a name given by the ancients to the purest and finest kind of rock-crystal. They used the crystal in many ways; sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the *vasa murrhina* of those times. The crystal they obtained from the island of Cyprus was much esteemed; but often faulty in particular parts, having hairs, cracks, and foulnesses, which they called *salts*, in the middle of the large pieces. Pliny tells us, that, when it was used for engraving on, the artist could conceal all these blemishes among the strokes of his work; but, when it was to be formed into cups or precious vases, they always chose the acentetum which had no flaws or blemishes.

ACEPHALI, or **ACEPHALITÆ**, a term applied to several sects who refused to follow some noted leader. Thus the persons who refused to follow either John of Antioch or St. Cyril, in a dispute that happened in the council of Ephesus, were termed *Acephali*, without a head or leader. Such bishops, also, as were exempt from the jurisdiction and discipline of their patriarch, were stiled *Acephali*.

ACEPHALI, the levellers in the reign of king Henry I. who acknowledged no head or superior. They were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord.

ACEPHALOUS, *adj.* [*ακεφαλος*, Gr.] Without a head. The term is more particularly used in speaking of certain nations, or people, represented by ancient naturalists and cosmographers, as well as by some modern travellers, as formed without heads; their eyes, mouths, &c. being placed in other parts.

Such are the Blemmyes, a nation of Africa near the head of the Niger, represented to be by Pliny and Solinus; *Blemmyes traduntur capita abesse, ore et oculis pectore affixis*. Ctesias and Solinus mention others in India near the Ganges, *sine cervice, oculos in humeris habentes*. Mela also speaks of people, *quibus capita et vultus in pectore sunt*. And Suidas, Stephanus Byzantinus, Vopiscus, and others after them, relate the like. Some modern travellers still pretend to find acephalous people in America.

Several opinions have been framed as to the origin of the fable of the Acephali. The first is that of Thomas Bartholin, who turns the whole into a metaphor; being convinced, that the name Acephali was anciently given to such as had less brain, or conducted themselves less by the rules of prudence, than others. Olearius rather apprehends, that the ancient voyagers, viewing certain barbarous people from the coasts, had been imposed on by their uncouth dress; for that the Samogitians, being short of stature, and going in the severity of winter with their heads covered in hoods, seem at a distance as if they were headless.

headless. F. Lafitan says, that by *Acephali* are only meant, people whose heads are sunk below their shoulders. In effect, Hulfius, in his epitome of Sir Walter Raleigh's voyage to Guiana, also speaks of a people which that traveller found in the province of Iripinama, between the lakes of Panama and Cassipa, who had no head or neck; and Hondius, in his map, marks the place with the figures of these monsters. Yet De Laet rejects the story; being informed by others, that the inhabitants of the banks of the Caora, a river that flows out of the lake of Cassipa, have their head so far sunk between their shoulders, that many believed they had their eyes in their shoulders and their mouths in their breasts.

But, though the existence of a nation of *Acephali* be ill warranted, naturalists furnish several instances of individuals born without heads, by some lusus or aberration of nature. Wepfer gives a catalogue of such acephalous births, from Schenckius, Licetus, Paræus, Wolfius, Mauriceau, &c.

ACEPHALUS, an obsolete term for the tænia or tapeworm, which was long supposed to be acephalous. See **TÆNIA**. The first who gave it a head was Tulpius; and after him, Fehr: the former even makes it *biceps*, or two-headed.

ACEPHALUS, is also used to express a verse defective in the beginning.

ACER, *f.* [according to some from *acris*, on account of the hardness of the wood: according to others, from *acre ingenium*, because it was much employed by ingenious artificers in fine works,] the **MAPLE-TREE**. This belongs to the polygamia monœcia class, and ranks in the natural order of trihilatæ. The generic character of the hermaphrodite flowers are—Calyx: perianth one-leaved, five-cleft, acute, coloured, flat and entire at the base, permanent. Corolla: petals five, ovate, broader outward, obtuse, scarcely larger than the calyx, spreading. Stamina: filaments eight, subulate, short. Antheræ simple: pollen cruciform. Pistillum: germ compressed, immersed in a convex perforated large receptacle. Style filiform, advancing in height daily. Stigmas two (or three) pointed, slender, reflex. Pericarpium: capsules the number of the stigmas, coalescent at the base, roundish, compressed, each terminated by a very large membranous wing. Seeds: solitary, roundish. The male flowers are the same with the hermaphrodites, except that they have neither germ nor style, but only a bifid stigma. On the first unfolding of the flower, the stigma only appears; and, a few days after, the style. Hermaphrodite flowers in the same umbel are often of two kinds: the lower ones feminine hermaphrodites, of which the antheræ do not burst, but the pistil grows into a fruit; the upper ones masculine hermaphrodites, of which the antheræ scatter their dust, and the pistils do not grow, but fall off.—*Essential Character.* Calyx, five-cleft; corolla, five-petalled; stamina, eight (or ten); germs, two (or three) superior; style, simple; capsule, two (sometimes three) with one seed in each, terminated by a wing; males, without germ or style.

The genus acer or maple consists entirely of trees, most of them yielding a saccharine juice from the trunk, branches, and leaves. All, except the two last, have simple leaves, generally palmate, or else divided into three or five lobes. The flowers are either in racemes or corymbs, commonly from the sides of the twigs; of an herbaceous or yellowish-green colour (except in the fourth): there are males and imperfect hermaphrodites, either mixed with or distinct from the perfect flowers. Sometimes the petals are wanting, or else they resemble the leaflets of the calyx so as scarcely to be distinguished from them. Two united winged capsules generally succeed to each perfect flower; but sometimes there are three.

Species. 1. *Acer sempervirens*, evergreen-maple: leaves ovate, quite entire, evergreen. Mr. Miller describes this species as a shrub, with the leaves of the colour and consistence of box. It was sent him from the Duke d'Ayen's garden; and he had the seeds from the Levant. Lin-

neus retains this as a distinct species: it appears to be but a variety, though a remarkable one, of the Cretan maple.

2. *Acer tartaricum*, Tartarian maple: leaves heart-shaped, undivided serrate, lobes obscure; flowers in racemes. It is an inhabitant of southern Russia; by the Tanais, Volga, &c. The wood is whitish, with some brownish veins. The seeds are used as astringents by the Calmuc Tartars, boiled with milk and butter. Linnæus describes this as a lofty shrub, or rather a low tree, not exceeding twenty feet in height; with leaves like those of hornbeam, having scarcely any apparent lobes: with flowers in racemes; as in the great maple, but the raceme compound, and the flowers petaloid. They appear early, and are sometimes followed by ripe seeds in our gardens.

3. *Acer pseudoplatanus*, or great maple: leaves five-lobed, unequally serrate, flowers in racemes. It grows wild in Switzerland, Germany, Austria, and Italy, in mountainous situations. With us it is vulgarly called the *ycamore-tree*, and by some mock-plane. In Scotland it is known by the appellation of plane-tree. It grows to a great height, has frequently a clean straight bole and a spreading top. It is in leaf by the middle of April; and on their first appearance the leaves are of a pleasant green, but they exude a clammy juice so abundantly, that they attract a variety of insects, which soon perforate and disfigure them. The bunches of flowers are in full blow within a fortnight after the appearance of the leaves; but, being of an herbaceous colour, they make no great appearance. The great maple was formerly much planted for walks and avenues, but has lately given way to better or more tightly trees. This, however, the Norway, and some of the rest, are peculiarly proper to make plantations near the sea, or to shelter other trees in that situation; for they resist the spray better than most trees. They also do less damage to grafts in pastures. An enormous tree of this sort is said to have been growing before the duke of Dorset's seat at Knowle, in Kent. It is represented in Badeslade's view of that seat, and is preserved in Dr. Harris's history of the county. It was twelve or fourteen feet in girth. The original plantations of Vauxhall and Marybone gardens were chiefly of this tree. Before earthenware came into use at the table, the wood of the great maple, which is soft and white, was in much request for trenchers. It is still used by the turners for bowls, dishes, &c. by the saddlers for saddle-trees; and is recommended by Mr. Evelyn as excellent for cart and plow timber, being light and tough. It is however inferior to the ash for these purposes. In spring and autumn, this species will pour forth from the wounded stem, in the same manner as the birch, abundance of saccharine juice; from which a good wine may be made, as Mr. Ray affirms, from the information of Dr. Martin Lister. There are two varieties of this tree common in the nurseries; one which has only broader leaves and larger keys; the other with variegated leaves, producing a pleasing variety in the tints of large plantations.

4. *Acer rubrum*, or scarlet-flowering maple: leaves five-lobed, slightly toothed, glaucous underneath; peduncles very simple and aggregate. Of this species there are two varieties in the nurseries: 1. Virginian scarlet-flowering maple. 2. Sir Charles Wager's flowering maple. This sort is propagated with us for the sake of the scarlet flowers, which come out early in the spring. In Pennsylvania, where it grows in the swamps, the natives use it for almost all sorts of wood-work; with the bark they dye a dark-blue, and make a good black ink. The Canadians tap the tree for the juice, of which they make sugar and treacle.

5. *Acer saccharinum*, or American sugar maple: leaves five-parted-palmate, point-toothed, pubescent. This maple will grow to the height of forty feet. It has some resemblance to the Norway, when the plant is young; but, as they grow up, the leaves of this are more deeply divided, and their surfaces less smooth, so that the two species are then easily distinguished. From this tree the

inhabitants of North America make a very good sort of sugar, in large quantities, by tapping the trees early in the spring, and boiling the juice. Large tracts in North America are covered with the sugar maple; this tree yields a sugar equal to the best from the cane, and in great quantity, with no other labour than what women and girls can bestow, in drawing off and boiling the liquor; and when skilfully tapped will last many years. It is therefore believed by judicious persons that the country can not only supply their own demand, but even make sugar for exportation. We are assured by Dr. Rush, that this tree is so far from being injured by tapping, that it yields the more syrup the oftener it is tapped; and that a tree flourished after forty-two annual operations. From twenty-three gallons and one quart of sap, procured in twenty-four hours from two trees, four pounds and thirteen ounces of good grained sugar have been obtained. But a tree of an ordinary size yields in a good season from twenty to thirty gallons of sap, from which are made from five to six pounds of sugar. It is supposed that by transplanting to an open exposure, the quantity of sap may be increased, and its quality improved. For a farmer in Pennsylvania having planted a number of these trees above twenty years ago in his meadow, he obtains every year a pound of sugar from every three gallons of the sap. The season for tapping is in February, March, and April, according to the weather. Warm days and frosty nights are most favourable to a plentiful discharge of sap. The quantity obtained in a day from one tree is from five gallons to a pint: but twenty-three gallons were procured from a single tree on the 14th of April, 1789. For a number of years many hundred private families in New York and Pennsylvania have supplied themselves plentifully with this sugar. Many have made from 200 to 400 pounds in a year. One man sold 600 pounds, all made with his own hands in one season; another made 640 pounds, without any assistance, in less than four weeks, besides attending to the other business of his farm, for which he received 16l. and a family consisting of a man and his two sons made 1800 pounds weight in one season. The quality of this sugar is superior to that which is made in the West Indies from the cane; and it deposits less sediment when dissolved in water. The Indians of Canada have practised the making of sugar from the maple, time out of mind, and they gained a pound of sugar from eight pints of liquor. The French began to refine it in that country towards the close of the last century; and Dr. Robinson sent some of the sugar to Mr. Ray in 1684. A friend of Mr. Ray's tried the experiment with our great maple, and obtained a sugar from the juice, but in small quantity.

6. *Acer dissectum*, or cut-leaved maple: leaves many-parted-palmate, the divisions subpinnatifid and serrate. 7. *Acer japonicum*, or Japanese maple: leaves many-parted, gashed, and villous; flowers subumbellated. 8. *Acer palmatum*, or hand-leaved maple: leaves palmate-serrate smooth, flowers in umbels. 9. *Acer septemlobum*, or seven-lobed maple: leaves seven-lobed smooth, lobes pointed, regularly and sharply serrate. 10. *Acer pictum*, or painted maple: leaves seven-lobed smooth, lobes pointed entire.—These five species, and also the seventeenth, grow in Japan.

11. *Acer platanoides*, or Norway maple: leaves five-lobed pointed sharply toothed smooth, flowers in corymbs. This grows to a large size; the leaves being smooth and of a shining green, as large or larger than those of the sycamore, and being seldom eaten or defaced, because the tree abounds in a sharp milky juice disliked by insects; they have a much better appearance than those of the sycamore; and in the spring, when the flowers are out, which are of a fine yellow colour, this tree has great beauty. Hanbury observes, that in the autumn the leaves die to a golden-yellow colour, which produces a good effect at that season, when the different tints of the decaying vegetable world are displayed. He says farther that

it is a quick growing tree, arrives at a great bulk, and is one of the best trees for sheltering habitations. Linnæus recommends it for walks and plantations; as yielding a juice from which sugar may be made, if it be wounded in the winter; and as cutting out into a white smooth wood, fit for the stocks of guns, the joiner, and the turner. Dr. Hunter observes, that as it is a quick grower, arrives at a great bulk, and answers all the purposes of the sycamore, the raising it for use, as well as ornament and variety, should not be neglected. Norway maple is found on mountains in the northern countries of Europe, Germany, Switzerland, Stiria, Carniola, and Savoy.

12. *Acer montanum*, or mountain maple: leaves slightly five-lobed acute serrate, racemes compound, calyxes hairy. This is a native of North America.

13. *Acer pennsylvanicum*, or Pennsylvanian maple: leaves three-lobed acuminate, sharply double-serrate, racemes simple, calyxes smooth. It is a small tree, which in some situations may be considered rather as a shrub. It will grow to the height of about fifteen feet, with a slender stem, covered with a whitish bark, and sending forth several red branches. The flowers are on long pendulous racemes, of a greenish-yellow colour. The seeds generally fall off before they are ripe. It is a native of Pennsylvania, Virginia, and Canada. The thickness of the shade, the beauty of the bark, and the tree not being liable to insects, would make it desirable for plantations, were it not for the litter occasioned by the abundance of the leaves and fruits which it produces, and its being subject to be torn by storms.

14. *Acer campestre*, or common or small maple. The common maple, though it does not become a large tree, should not however have been degraded by Linnæus to a shrub; nor does it make a bad figure in plantations. Evelyn says, that by shredding up the boughs to a head, he has caused it to shoot to a wonderful height in a little time. The common maple is chiefly seen in hedge-rows and coppices. We meet with high encomiums on this wood among the ancients; and Virgil introduces Evander sitting on a maple throne. It was chiefly valued among them for the fineness of its grain. The timber is far superior to that of the beech for all uses of the turner, particularly dishes, cups, trenchers, and bowls; and when it abounds in knots, as it very frequently does, it is highly esteemed by the joiners for inlaying, &c. On account also of the lightness of the wood, it is often used by musical instrument makers; from its hardness, for gun-stocks and other purposes; and from its whiteness it was formerly in great request for tables. In the vale of Gloucester, where oak timber is scarce, it is used for gate-stuff and other purposes of husbandry; and sometimes screws for cyder-presses are made of this wood: but the principal value of the maple is for underwood: it is of quick growth and affords good fuel.

15. *Acer opalus*, or Italian maple: leaves roundish five-lobed, loosely serrate, capsules ovate, smooth, almost upright. This is common in many parts of Italy, particularly about Rome and Viterbo. It is one of the loftiest trees of that country, and is esteemed for the leaves, which are large, and afford a great shade; so that it is planted frequently there by the sides of roads, and near habitations. This tree is not noticed by Linnæus, and many other modern authors. It is rarely to be met with in England, though hardy enough to bear the open air; and, being a noble tree, acquiring a considerable stature, having a spreading head adorned with large and beautiful foliage, it deserves the attention of ornamental planters.

16. *Acer monspessulanum*, or Montpellier maple: leaves three-lobed very entire smooth annual. This species grows about twenty feet in height. The leaves resemble those of the common maple, but are of a much thicker substance, and not so large; they are of a shining-green colour, and continue their verdure very late in the autumn, which renders this tree more valuable. At present this sort is not common in England. The flowers have little

little beauty, their blow is soon over, and the seeds sometimes come to perfection with us. It is common in the South of France, and Italy: and was cultivated by Mr. Miller in 1739.

17. *Acer creticum*, or Cretan maple: leaves three-lobed very entire pubescent perennial. This bears some resemblance to the last, and gains the same height. The leaves of the young trees are ovate, but afterwards become shaped like those of ivy: they are of a much thinner texture than in that, and their petioles are covered with a soft hairy down; whereas those of the other are smooth and stiff: Where the trees are well sheltered, they continue green most part of the year. The flowers are seldom followed by good seeds. It grows naturally in the Levant.

18. *Acer trifidum*, or trifid-leaved maple: leaves undivided and trifid, without indentations on the edge. The twigs are round, smooth, and purplish. The leaves at the ends of the twigs, scattered, undivided, and of two or three lobes, smooth on both sides, pale underneath, ovate and sharp.

19. *Acer negundo*, or Virginian ash-leaved maple: leaves compound, flowers racemed. This is a very strong shooting tree, of quick growth, and is in Virginia and Carolina one of the largest trees of this kind. It is well adapted by its pale-green leaves, so different in form from those of the other species, to make a beautiful variety in woods, but they fall very soon in autumn; and it must be planted in places not too much exposed to violent winds, being subject to split. The timber is fit for the same uses with that of the Norway maple and sycamore, but is soft and brittle.

20. *Acer pinnatum*, or wing-leaved maple: leaves pinnate: leaflets oblong quite entire. The maple of Cochin China is a tree of a middling size, with a very hard wood, and spreading branches. The leaves have about four pairs of alternate, small, smooth, leaflets, terminated by an odd one. The flowers are white, in compound racemes. It is a native of woods in Cochin China.

Propagation and Culture. The genus *acer* consists of deciduous trees; most of them sufficiently hardy. They are easily propagated by sowing their seeds, soon after they are ripe, in a bed of common earth, covering them about half an inch thick with light mould. In the spring they will appear above ground; and, if kept clear from weeds, and watered in dry weather, some of the sorts will grow above a foot high the first summer. The autumn or spring following, if they are close in the seed-bed, it will be proper to transplant them into a nursery, in rows at three feet distance, and two feet asunder in the rows; in this situation they may remain three or four years, by which time they will be large enough to plant out for continuance. If the seeds are kept out of the ground till spring, they rarely come up the same year, and many times do not grow. When therefore they are to be transported to any distance, it will be proper to put them up in sand or earth.

The common, sugar, Norway, and ash-leaved, maples, being large-growing trees forty feet high and upwards, with large spreading heads, and exuberant foliage, are fit for large plantations; and the leaves being of different sizes, shapes, and colours, they will make a considerable variety, especially if we take in the variegated sorts: and the large pendulous branches of flowers, though deficient in colour, are not without their beauty, especially those of the Norway maple.—The other sorts are of inferior growth, seldom rising more than from twenty to thirty feet.

ACER, *f.* in botany. See *BANISTERIA* and *TRIOP-TERIS*.

ACERB, *adj.* [*acerbus*, Lat.] Acid, with an addition of roughness, as most fruits are before they are ripe.

ACERBITY, *f.* [*acerbitas*, Lat.] A rough four taste. Applied to men, sharpness of temper; severity.—True it is, that the talents for criticism, namely, smartness, quick

cenfure, vivacity of remark, indeed all but *acerbity*, seem rather the gifts of youth than of old age. *Pope*.

ACERNO, a town of Italy, in the citorior principality of Naples, with a bishop's fee. E. lon. 15. 46. N. lat. 40. 50.

ACERINA, *f.* in ichthyology, a name given by Pliny and other of the old naturalists, to the fish we at this time call the *ruffe*. See *PERCA*.

ACERRA, *f.* in antiquity, an altar erected, among the Romans, near the bed of a person deceased, on which his friends daily offered incense till his burial.—The real intention probably was to overcome any offensive smell that might arise about the corpse. The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning; and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes.

The *acerra* also signified a little pot wherein were put the incense and perfumes to be burnt on the altars of the gods and before the dead. It appears to have been the same with what was otherwise called *thuribulum*, and *pyxis*.

We find mention of *acerræ* in the ancient church. The Jews had also their *acerra*, in our version rendered *cenfers*; and the Romanists still retain them under the name of *incense-pots*. In Roman writers, we frequently meet with *plena acerra*, a full *acerra*: to understand which, it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out *acerras* full on the altar, the latter took out two or three bits with their fingers.

ACERRA, a town of Italy, in the kingdom of Naples, and in the Terra di Lavarò; seated on the river Agno. E. lon. 15. 10. N. lat. 40. 55.

ACERRÆ, the ancient name of a town, now called *la Girola*, in the territory and to the south-east of Lodi, where the rivulet Serio falls into the Adda, to the west of Cremona and north of Placentia.

To *ACERVATE*, *v. a.* [*acervo*, Lat.] To heap up.

ACERVATION, *f.* The act of heaping together.

ACERVOSE, *adj.* Full of heaps.

ACESCENT, *adj.* [*acescens*, Lat.] That which has a tendency to sourness or acidity.—The same persons, perhaps, had enjoyed their health as well with a mixture of animal diet, qualified with a sufficient quantity of *acescents*; as bread, vinegar, and fermented liquors. *Asbuthnot*.

ACESTRIDES, a name used among the Greeks for female physicians or midwives.

ACETABULUM, in antiquity, a measure used by the ancients, equal to one eighth of our pint. It seems to have acquired its name from a vessel in which acetum or vinegar was brought to their tables, and which probably contained about this quantity.

ACETABULUM, in anatomy, a cavity in any bone for receiving the protuberant head of another, and thereby forming that species of articulation called *ENARTHROSIS*.

ACETABULUM, in botany, the trivial name of a species of the *peziza*, or *cup-peziza*, a genus belonging to the *cryptogamia fungi* of Linnæus. It has got the name of *acetabulum*, from the resemblance its leaves bear to a cup. See *PEZIZA*.

ACETARY, a pulpy substance in certain fruits, *e. g.* the pear, which is inclosed in a congeries of small calculous bodies towards the base of the fruit, and is always of an acid taste.

AC ETIAM are words or a clause in a writ, where, in order to intitle the court to jurisdiction, an additional cause of action is alleged; as where, upon the usual complaint of *trespass*, the defendant is required to be brought in to answer the plaintiff of a plea of *trespass*, and also (*ac etiam*) to a bill of debt: or where, to the usual complaint of breaking the plaintiff's close, a clause is added containing the real cause of action.

ACETOSA, *f.* sorrel; by Linnæus joined to the genus of dock, under the title of *Rumex*. See *RUMEX*.

ACETOSE, *adj.* That which has in it any thing four.

ACETOSELLA, *f.* in botany, a species of OXALIS. See OXALIS and RUMEX.

ACETOSITY, *f.* The state of being acetose, or of containing fourness.

ACETOUS, *adj.* [from *acetum*, vinegar, Lat.] Having the quality of vinegar; four.—Raisins which consist chiefly of the juice of grapes, inspissated in the skins or hulks by the avolation of the superfluous moisture through their pores, being distilled in a retort, did not afford any vinous, but rather an *acetous*, spirit. Boyle.

ACETUM, *f.* VINEGAR, the vegetable ACID of the chemists. See VINEGAR.

ACHABYTUS, a high mountain in Rhodes, on the top of which stood a temple of Jupiter.

ACHÆA, anciently a town of the island of Rhodes, in the district of Jolytus, and the first and most ancient of all, said to be built by the Heliades, or grandsons of the sun.

ACHÆA, a hamlet of Asiatic Sarmatia, on the Euxine. The inhabitants were called Achæzi, a colony of the Orchomenians.

ACHÆANS, the inhabitants of ACHAIA PROPRIA, a Peloponnesian state. This republic was not considerable in early times, for the number of its troops, nor for its wealth, nor for the extent of its territories; but it was famed for its probity, its justice, and its love of liberty. Its high reputation for these virtues was very ancient. The Crotonians and Sybarites, to re-establish order in their towns, adopted the laws and customs of the Achæans. After the famous battle of Leuctra, a difference arose betwixt the Lacedæmonians and Thebans, who held the virtue of this people in such veneration, that they terminated the dispute by their decision. The government of the Achæans was democratical. They preserved their liberty till the time of Philip and Alexander; but, in the reign of those princes, and afterwards, they were either subject to the Macedonians, who had made themselves masters of Greece, or oppressed by cruel tyrants. The Achæan commonwealth consisted of twelve inconsiderable towns in Peloponnesus. Its first annals are not marked by any great action, for they are not graced with one eminent character. After the death of Alexander, this little republic was a prey to all the evils which flow from political discord. A zeal for the good of the community was now extinguished. Each town was only attentive to its private interest. There was no longer any stability in the state; for it changed its masters with every revolution in Macedonia. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old institutions and unanimity. The inhabitants of Patræ and of Dymæ were the first assertors of ancient liberty. The tyrants were banished, and the towns again made one commonwealth. A public council was then held, in which affairs of importance were discussed and determined. A register was appointed to record the transactions of the council. This assembly had two presidents, who were nominated alternately by the different towns. But instead of two presidents, they soon elected but one. Many neighbouring towns which admired the constitution of this republic, founded on equality, liberty, the love of justice, and of the public good, were incorporated with the Achæans, and admitted to the full enjoyment of their laws and privileges.—The arms which the Achæans chiefly used were slings. They were trained to the art from their infancy, by slinging, from a great distance, at a circular mark of a moderate circumference. By long practice they took so nice an aim, that they were sure, not only to hit their enemies on the head, but on any part of the face they chose. Their slings were of a different kind from those of the Balearians, whom they far surpassed in dexterity.

ACHÆI (Achæans); the inhabitants of Achaia Propria. In Livy, the people of Greece; for the most part

called Achivi, by the Roman poets. In Homer, the general name for Grecians.

ACHÆORUM PORTUS, (Pliny;) now Porto Buon, a harbour of the Chersonesus Taurica, on the Euxine. Another, near Sigæum, into which the Xanthus, after being joined by the Simois, falls.

ACHÆMÈNES, according to Herodotus, was father of Cambyfes, and grandfather of Cyrus I. king of Persia. Most of the commentators of Horace are of opinion, that the Achæmenes whom that poet mentions, Ode xii. of his 2d Book, was one of the Persian monarchs: but, if that were true, he must have reigned before the Medes subdued the Persians; for we do not hear of any king of that name from the time that the Persians founded that great monarchy, which is looked upon as the second universal one. However this be, the epithet *achæmenians* is very frequently given to the Persians in the old Latin poets.

ACHÆMÈNES, son of Darius I. king of Persia, and brother of Xerxes, had the government of Egypt bestowed on him, after Xerxes had forced the Egyptians to return to their allegiance. He some time after commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. The Egyptians having again taken up arms after the death of Xerxes, Achæmenes was sent into Egypt to suppress the rebellion; but was vanquished by Inarus, chief of the rebels, succoured by the Athenians.

ACHÆUS, cousin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, became a very powerful monarch, and enjoyed the dominions he had usurped for many years; but at last he was punished for his usurpations in a dreadful manner, in the 146th year of Rome, as related by Polybius.

ACHAIA, a name taken for that part of Greece which Ptolemy calls Hellas; the younger Pliny, Græcia; now called Livadia: bounded on the north by Thessaly, the river Sperchius, the Sinus Maliacus, and mount Oeta; on the west by the river Achelous; on the east, turning a little to the north, it is washed by the Archipelago, down to the promontory of Sunium; on the south, joined to the Peloponnesus or Morea, by the isthmus of Corinth, five miles broad. It contained the cities of Athens, Thebes, Delphi, Pythia, &c. also the mounts Parnassus, Helicon, and several other places mentioned in ancient history.

ACHAIA PROPRIA, anciently a small district in the north of Peloponnesus, running westward along the bay of Corinth, and bounded on the west by the Ionian sea, on the south by Elis and Arcadia, and on the east by Sicynia: inhabitants, the Achæans, properly so called; its metropolis Patræ. It is now called Romania Alta, in the Morea.

Achaia was also taken for all those countries that joined in the Achæan league, reduced by the Romans to a province. Likewise for Peloponnesus.

ACHAË PRÆBYTERI, or the Presbyters of Achaia, were those who were present at the martyrdom of St. Andrew the Apostle, A. D. 59; and are said to have written an epistle in relation to it. Bellarmine, and several other eminent writers in the church of Rome, allow it to be genuine; while Du Pin, and some others, expressly reject it.

ACHAIS, a town near the river Oxus in Sogdiana, built by Alexander, and called Heraclea; afterwards overthrown and re-built by Antiochus, who gave it the name of Achais.

ACHAIUS, son of Ethwin, was raised to the crown of Scotland, A. D. 788. The emperor Charlemagne sent an embassy to desire an alliance with him against the English, whose pirates so infested the seas, that the merchants could not carry on their trade. This alliance was concluded in France upon conditions so advantageous to the Scots, that Achaius, to perpetuate the memory of it, added to the arms of Scotland a double field sowed with lilies. He died in 819.

ACHALALACTLI, *f.* in ornithology, a species of king's fisher. See ALCEO.

ACHAM,

ACHAM, an inland country of Asia, lying between Hindostan and China, and but little known to Europeans.

ACHAN, the son of Carmi, of the tribe of Juda, at the taking of Jericho concealed two hundred shekels of silver, a Babylonish garment, and a wedge of gold, contrary to the express command of God. This sin proved fatal to the Israelites, who were repulsed at the siege of Ai. In this dreadful exigence, Joshua prostrated himself before the Lord, and begged that he would have mercy upon his people. Achan was discovered by casting lots, and he and his children were stoned to death. This expiation being made, Ai was taken by stratagem. *Joshua*, chap. vii. ver. 3, 9.

ACHANE, an ancient Persian corn-measure, containing $\frac{1}{45}$ Attic midimni.

ACHANIA, *f.* [*αχανια*], because the corolla does not open.] In botany, a genus of the monadelphia polyandria class, of the natural order of columniferae. The generic characters are—Calyx: perianthium double. Outer many-leaved; leaflets linear, permanent, slightly coalescing at the base. Inner one-leaved, subcylindric, streaked half way, five-cleft, permanent. Corolla: subclavate, convoluted. Petals five, obovate-oblong, erect, with a lobe at the base on one side, involving the column of stamens. Stamina: filaments numerous, coalescing into a writhed tube longer than the corolla, free at top, capillary. Antheræ oblong. Pistillum: germ subglobular. Style filiform, the same length with the tube of the stamens, ten-cleft at top: the segments spreading. Stigmas capitate. Pericarpium: berry subglobular, fleshy, five-celled. Seeds: foliary, convex on one side, angular on the other.—*Essential Character.* Calyx, double; outer many-leaved. Corolla, convolute. Berry, five-seeded.

Species. 1. *Achania malvaviscus*, scarlet achania, or bastard hibiscus; leaves somewhat scabrous, acuminate, leaflets of the outer calyx erect. This is a native of Mexico and Jamaica, and flowers most part of the year.

2. *Achania mollis*, or woolly achania; leaves tomentose, leaflets of the outer calyx spreading. A native of South America, and the West-India islands. It flowers in August and September.

3. *Achania pilosa*, or hairy achania; leaves hairy, obtuse and acute. This species has a very different appearance from the two former. It is shrubby as they are, but the stem and branches are smaller, thinner, and not downy; and it continues only two or three years. It is a native of Jamaica, and flowers in November.

Propagation and Culture. Achania is generally propagated by cuttings, because the seeds do not often ripen here; if the cuttings are planted in pots filled with light earth, and plunged into a gentle hot-bed, keeping the air from them, they will soon take root, and should be gradually injured to bear the open air. These plants require a moderate stove to preserve them through the winter; and, if they are kept in warmth in summer, they will flower, and sometimes ripen fruit; they may be placed abroad in a sheltered situation for two or three months, but the plants so treated seldom flower well.

ACHARACA, anciently a town of Lydia, situate between Tralles and Nyssa; in which were the temple of Pluto, and the cave Charonium, where patients slept in order to obtain a cure.

ACHAT, *f.* in law, implies a purchase or bargain; and hence, probably, purveyors were called *Achators*, from their making bargains.

ACHATES, the companion of Æneas, and his most faithful friend, celebrated in Virgil.

ACHATES, *f.* in natural history. See AGATE.

ACHATES, anciently a river of Sicily, now the Drillo; which runs from north to south, almost parallel with, and at no great distance from, the Gela; and rises in the north of the territory of Noto. It gave name to the achates, or agate, said to be first found there.

ACHAZIB, or ACHZIB, anciently a town of Galilee,

in the tribe of Asher, nine miles from Ptolemais. Also a town in the more southern parts of the tribe of Judah.

ACHE, *f.* [*ace*, Sax. *ax*], Gr. now generally written *ake*, and in the plural *akes*, of one syllable; the primitive manner being preserved chiefly in poetry, for the sake of the measure.] A continued pain. See AKE.

To ACHE, *v. n.* To be in pain.—Upon this account, our senses are dulled and spent by any extraordinary intention, and our very eyes will *ache*, if long fixed upon any difficultly-discerned object. *Glanville.*

ACHEEN, ACHE', or ACHEN, a kingdom of Sumatra, in the East Indies, situated on the north-western part of the island. The capital is situated on a river which empties itself near the north-west point, or Acheen-head, about two miles from the mouth. It lies in a wide valley, formed like an amphitheatre by two lofty ranges of hills. The river is not large, and by emptying itself in several channels is rendered very shallow at the bar. In the dry monsoon it will not admit boats of any burthen, much less large vessels, which lie without, in the road formed by the islands off the point. Though no longer the great mart of eastern commodities, it still carries on a considerable trade with the natives of that part of the coast of Indostan called Telinga, who supply it with the cotton-goods of their country, and receive in return, gold-dust, sapan-wood, betel-nut, patch-leaf (*colpus Indicus*), a little pepper, sulphur, camphire, and benzoin. The country is supplied with Bengal opium, and also with iron, and many other articles of merchandise, by the European traders.

Acheen is esteemed, comparatively, healthy, being more free from woods and swamps than most other portions of the island; and the fevers and dysenteries to which these are supposed to give occasion, are there said to be uncommon. The soil is light and fertile; and the products, beside those already enumerated as articles of export trade, and a variety of fine fruits, are chiefly rice and cotton. There is likewise some raw silk procured in the country, of very inferior quality. Gold-dust is collected in the mountains near Acheen, but the greatest part is brought from the southern ports of Nalaboo and Soofoo. The sulphur is gathered from a volcanic mountain in the neighbourhood, which supplies their own consumption for the manufacture of gun-powder, and admits of a large exportation.

In their persons, the Acheneſe differ from the rest of the Sumatrans; being taller, stouter, and darker-complexioned. They appear not to be a genuine people; but are thought, with great appearance of reason, to be a mixture of Battas, Malays, and Moors, from the west of India. In their dispositions they are more active and industrious than their neighbours; they possess more penetration and sagacity; have more general knowledge; and, as merchants, they deal upon a more extensive and liberal footing. Their religion is Mahometanism; and, having a great number of mosques and priests, its forms and ceremonies are strictly observed.

The appearance of the town, and the nature of the buildings, are much the same as are found in the generality of Malay bazars, excepting that the superior wealth of this place has occasioned a great number of public edifices, but without the smallest pretensions to magnificence. The king's palace, if it deserves the appellation, is a very rude and uncouth piece of architecture, designed to resist the force of an enemy, and surrounded for that purpose by strong walls, but without any regular plan, or view to the modern system of military attack. The houses in common are built of bamboos and rough timber, and raised some feet from the ground, on account of the place being overflowed in the rainy season.

A considerable fabric of a thick species of cotton-cloth, and of stuff for the short drawers worn both by Malays and Acheneſe, is established here, and supplies an extensive demand. They weave also very handsome silk-pieces, of a particular form, for that part of the dress which is called by the Malays *cayen farrong*.

The Achenese are expert and bold navigators, and employ a variety of vessels, according to the voyages they undertake, and the purposes for which they design them. The river is covered with a multitude of fishing sampans or canoes, which go to sea with the morning breeze, and return in the afternoon, with the sea-wind, full laden.—Having no convenient coins, though most species of money will be taken there at a valuation, they commonly make their payments in gold-dust, and for that purpose are all provided with scales or small steelyards. They carry their gold about them, wrapped up in pieces of bladder, and often purchase to so small an amount as to make use of grain or seeds for weights.—The monarchy is hereditary; and the king usually maintains a guard of 100 feyops about his palace.

According to Mr. Marsden, “the grand council of the nation consists of the king or sultan, four *oolooballangs*, and eight of a lower degree, who sit on his right hand, and sixteen *cajoorangs*, who sit on his left. At the king's feet sits a woman, to whom he makes known his pleasure; by her it is communicated to an eunuch, who sits next to her, and by him to an officer named *Cajoorang Gondong*, who then proclaims it aloud to the assembly. There are also present two other officers, one of whom has the government of the bazar or market, and the other the superintending and carrying into execution the punishment of criminals. All matters relative to commerce and the customs of the port come under the jurisdiction of the *Shabandar*, who performs the ceremony of giving the *chap* or licence for trade; which is done by lifting a golden-hafted creese over the head of the merchant who arrives, and without which he dares not to land his goods. Presents, the value of which are become pretty regularly ascertained, are then sent to the king and his officers. If the stranger be in the style of an ambassador, the royal elephants are sent down to carry him and his letters to the monarch's presence; these being first delivered into the hands of an eunuch, who places them in a silver dish, covered with rich silk, on the back of the largest elephant, which is provided with a machine (houder) for that purpose. Within about an hundred yards of an open hall where the king sits, the cavalcade stops, and the ambassador dismounts, making his obeisance by bending his body, and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his shoes; and, having made his second obeisance, is seated upon a carpet on the floor, where betel is brought to him. The throne was some years ago of ivory and tortoiseshell; and, when the place was governed by queens, a curtain of gauze was hung before it, which did not obstruct the audience, but prevented any perfect view. The stranger, after some general discourse, is then conducted to a separate building, where he is entertained with the delicacies of the country, by the officers of state, and in the evening returns in the manner he came, surrounded by a prodigious number of lights. On high days (*aree ryah*) the king goes in great state mounted on an elephant richly caparisoned, to the great mosque, preceded by his *oolooballangs*; who are armed nearly in the European manner.”

The country under the immediate jurisdiction of Acheen is divided into three districts, named *Duo pooloo duo*, *Duo pooloo leemo*, and *Duo pooloo anam*. Each district is governed by a pangleemo, and under him an imaum and four pangceches to each mosque.

“Acheen has ever been remarkable for the severity with which crimes are punished by their laws; the same rigour still subsists, and there is no commutation admitted, as is regularly established in the southern countries. There is great reason, however, to conclude, that the poor alone experience the rod of justice; the nobles being secure from retribution in the number of their dependants. Petty theft is punished by suspending the criminal from a tree, with a gun or heavy weight tied to his feet; or by cutting off a finger, a hand, or leg, according to the nature of the theft. Many of these mutilated and wretched ob-

jects are daily to be seen in the streets. Robbery on the highway and house-breaking are punished by drowning, and afterwards exposing the body on a stake for a few days. If the robbery is committed on an imaum or priest, the sacrilege is expiated by burning the criminal alive. A man who is convicted of adultery is seldom attempted to be screened by his friends, but is delivered up to the friends and relations of the injured husband. These take him to some large plain, and, forming themselves in a circle, place him in the middle. A large weapon, called a *gadoobong*, is then delivered to him by one of his family; and if he can force his way through those who surround him, and make his escape, he is not liable to further prosecution: but it commonly happens that he is instantly cut to pieces. In this case his relations bury him as they would a dead buffalo, refusing to admit the corpse into their house, or to perform any funeral rites.” These discouragements to vice might seem to bespeak a moral and virtuous people; yet all travellers agree in representing the Achenese as one of the most dishonest and flagitious nations of the east.

Acheen was visited by the Portuguese in 1509, only twelve years after they had discovered the passage to the East Indies by the Cape of Good Hope. They made various attempts to establish themselves in the country, but were expelled with disgrace. See SUMATRA.

ACHELOUS, in fabulous history, wrestled with Hercules, for no less a prize than Deianira, daughter to king Oenus: but, as Achelous had the power of assuming all shapes, the contest was long dubious: at last, as he took that of a bull, Hercules tore off one of his horns; so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, the same with the cornucopia, or horn of plenty; which Hercules, having filled with a variety of fruits, consecrated to Jupiter. Some explain this fable, by saying, That Achelous is a winding river of Greece, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and so restored plenty to the country. See the next article.

ACHELOUS, a river of Acarnania; which rises in mount Pindus, and, dividing Ætolia from Acarnania, falls from north to south into the Sinus Corinthiacus. It was formerly called *Thoas*, from its impetuosity, and *King of Rivers*, (Homer.) The epithet *Achelous* is used for *Aqueus*, (Virgil;) the ancients calling all water *Achelous*, especially in oaths, vows, and sacrifices, according to Ephorus: now called Aspro Potamo. Rivers are by the ancient poets called *Tauriformes*, either from the bellowing of their waters, or from their ploughing the earth in their course: Hercules, restraining by dykes and mounds the inundations of the Achelous, is said to have broken off one of his horns, and to have brought back plenty to the country. See the preceding article.

ACHERI (Luke D'), a learned Benedictine of the congregation of St. Maur, was born at St. Quintin, in Picardy, in 1609; and made himself famous by printing several works, which till then were only in manuscript: particularly, The Epistle attributed to St. Barnabas; the Works of Lanfrank, archbishop of Canterbury; a collection of scarce and curious pieces, under the title of *Spicilegium*, i. e. Gleanings, in thirteen volumes quarto. The prefaces and notes, which he annexed to many of these pieces, show him to have been a man of genius and abilities. He had also some share in the pieces inserted in the first volumes of the Acts of the Saints of the Order of St. Bennet; the title whereof acquaints us that they were collected and published by him and father Mabillon. After a very retired life, till the age of 73, he died at Paris the 29th of April, 1685, in the abbey of St. Germain in the Fields, where he had been librarian.

ACHERNER, or ACHARNER, *f.* a star of the first magnitude in the southern extremity of the constellation ERIDANUS, but invisible in our latitude.

ACHERON, a river of Epirus. The poets feigned it

to have been the son of Ceres, whom she hid in hell for fear of the Titans, and turned into a river, over which souls departed were ferried in their way to Elysium.

ACHERON, a river of Thesprotia, in Epirus; which, after forming the lake of Acherusia, at no great distance from, falls into the sea near, the promontory of Chimerium, to the west of the Sinus Ambracius, in a course from north to south.

ACHERON, or ACHEROS, a river of the Brutii, in Italy, running from east to west; where Alexander king of Epirus was slain by the Lucani, being deceived by the oracle of Dodona, which bade him beware of Acheron.

ACHERSET, *f.* an ancient measure of corn, conjectured to be the same with our quarter, or eight bushels.

ACHERUSIA PALUS, a lake between Cumæ and the promontory Misenum, now *il Lago della Collucia*, (Cluverius.) Some confound it with the Lacus Lucrinus, and others with the Lacus Averni. But Strabo and Pliny distinguish them. The former takes it to be an effusion, exundation, or washes of the sea, and therefore called by Lycophron, *Ασχηρσίου χυμός*.—Also a lake of Epirus, through which the Acheron runs.—There is also an Acherusia, a peninsula of Sithynia, on the Euxine, near Heraclæa; and a cave there of the same name, through which Hercules is fabled to have defended to hell to drag forth Cerberus.

ACHIAR, *f.* a Malayan word, which signifies all sorts of fruits and roots pickled with vinegar and spice. The Dutch import from Batavia all sorts of achiar, but particularly that of BAMBOO (see ARUNDO), a kind of cane, extremely thick, which grows in the East Indies. It is preserved there whilst it is still green, with very strong vinegar and spice; and is called *bamboo-achiar*. The name changes according to the fruit with which the achiar is made.

ACHICOLUM, *f.* is used to express the *fornix, tholus*, or *sudatorium*, of the ancient baths: which was a hot room where they used to sweat. It is also called architholus.

To ACHIEVE, *v. a.* [*achever*, Fr. to complete.] To perform, to finish a design prosperously. To gain, to obtain:

Show all the spoils by valiant kings *achiev'd*,
And groaning nations by their arms reliev'd. *Prior.*

ACHIEVER, *f.* He that performs; he that obtains what he endeavours after.—A victory is twice itself, when the *achiever* brings home full numbers. *Shakespeare.*

ACHIEVEMENT, *f.* [*achievement*, Fr.] The performance of an action. The escutcheon, or ensigns armorial, granted to any man for the performance of great actions:

Then shall the war, and stern debate, and strife
Immortal, be the bus'ness of my life;
And in thy fane, the dusty spoils among,
High on the burnish'd roof, my banner shall be hung;
Rank'd with my champion's bucklers, and below,
With arms revers'd, th' *achievements* of the foe. *Dryden.*

Achievement, in the first sense, is derived from *achieve*, as it signifies to perform: in the second, from *achieve*, as it imports to gain.

ACHILLEA, [so named from Achilles the famous Grecian hero, who is supposed to have imbibed the knowledge of botany from his master Chiron.] A plant belonging to the syngenesia polygamia superflua class, and ranking in the natural order of compositæ discoidææ. The generic characters are—Calyx: common ovate, imbricate; scales ovate, acute, converging. Corolla: compound, radiate; corollets hermaphrodite, tubular, in the disk. Females ligulate, five to ten; in the ray. Proper of the hermaphrodite, funnel-shaped, five-cleft, spreading. Female obcordate, spreading, trifid; the middle cleft less than the others. Stamens: in the hermaphrodites, filaments five, capillary, very short. Antheræ cylindrical, tubular. Pistillum: in the hermaphrodites germ small. Style filiform, the length of the stamens. Stigma obtuse,

emarginate. In the females germ small. Style filiform, the same length as in the others. Stigmas two, obtuse, reflex. Pericarpium: none. Calyx scarcely changed; receptacle filiform, elongate, as the disk of the seeds, ovate, twice the length of the calyx. Seeds: solitary, ovate, furnished with flocks; but having no down. Receptaculum: chaffy, elevated; chaffs lanceolate, the length of the florets.—*Essential Character.* Calyx, ovate, imbricate. Florets of the ray about four. Down, none. Receptaculum, chaffy.

Most of the milfoils are hardy, herbaceous, fibrous-rooted perennials; with the flowers commonly in corymbs at the ends of the stalk and branches; the ray in some yellow, in others white, in a few purple: the leaves in many of the species are pinnate, bipinnate, or superdecompound; in a few they are simple. They are chiefly inhabitants of the Levant or the south of Europe: the 12th and 20th only are natives of England. The species want to be better described; and probably it may be found that culture has produced some changes which have been taken for specific differences.

Species. 1. With yellow corollas. 1. *Achillea santolina*, or lavender-cotton leaved milfoil: leaves bristle-shaped toothed, toothlets nearly entire subulate reflex. This has large yellow flowers, which stand upon pretty long peduncles singly, not in close bunches, as in the common fort. It has leaves like those of lavender-cotton, which, when rubbed, emit a strong oily odour. It flowers in June and July. It is an inhabitant of the Levant.

2. *Achillea ageratum*, or sweet milfoil or maudlin: leaves lanceolate-obtuse sharply ferrate. It is a native of Italy, about Florence, Leghorn, Nice, &c. of the south of France, about Montpellier, Orange, &c. and of Spain; by road sides: flowering from August to October. Being now scarcely used in medicine, it is not cultivated in the gardens for sale: or, if it is asked for, the people in the markets give the thirteenth fort, which is a very hardy plant, and easily propagated. For, though this is hardy in respect to cold; yet in wet winters the roots are often killed, especially in good ground; but, when the plants grow out of the joints of walls, or in rubbish, they will live many years without care. There are two varieties of this plant; one of them having longer and more compact corymbs; the other broader leaves and smaller flowers. It is sweet to the smell, bitter to the taste, and aromatic. Linnæus sets it down as obsolete and superfluous. Allione, on the contrary, thinks it an efficacious plant, and recommends it in all disorders arising from a debility of the nerves. He prefers it much to tanfy.

3. *Achillea falcata*, or sickle-leaved milfoil: leaves linear toothed obtuse flat, toothlets crenate. It is a native of the east, where it is used in medicine.

4. *Achillea tomentosa*, or woolly milfoil: leaves pinnate hirsute, pinnae linear toothed. This is often planted in gardens for the sake of variety: is of humble growth, but the flowers continue long in beauty. It grows naturally in Spain, the south of France, the Valais, and Italy; but bears the open air very well in England.

5. *Achillea pubescens*, or downy milfoil: leaves pinnate, leaflets lanceolate gashed ferrate wool-bearing beneath. This hath no chaffs to the receptacle, and therefore recedes in that circumstance from the generic character. It is a native of the Levant, and was cultivated in the botanic garden at Chelsea in 1739.

6. *Achillea abrotanifolia*, or southernwood-leaved milfoil: leaves pinnate superdecompound, divisions linear distant. This is also a native of the Levant. It grows to the height of two feet and a half, and it flowers in June and July.

7. *Achillea bipinnata*, or bipinnate milfoil: leaves bipinnate tomentose, leaflets ovate entire. A native of the Levant.

8. *Achillea Ægyptiaca*, or Egyptian milfoil: leaves pinnate, leaflets obtusely lanceolate ferrate-toothed. It rises from nine inches to a foot in height. The flowers are produced

produced in corymbs, on the top of the stalks; appear from June to September, and some of them frequently continue the greater part of the winter. It is a native of the Levant.

II. Corollas white in the ray. 9. *Achillea macrophylla*, or feverfew-leaved milfoil: leaves pinnate, pinnae gash-ferrate, the outmost larger and connected. It is a native of the Alps, is very hardy, thrives in almost any soil, but loves an open exposure, and deserves a place in gardens. It flowers in July and August.

10. *Achillea impatiens*, or impatient milfoil: leaves pinnate, pinnae distant linear-lanceolate, acute from the base upwards. This species is frequent in all Siberia.

11. *Achillea clavennæ*, or silvery-leaved milfoil: leaves jagged flat obtuse tomentose. Silvery-leaved milfoil is a very humble plant, rarely rising above six inches high. The flowers are white, and grow in flat corymbs; they appear in June and July. The leaves have some likeness to those of common wormwood, and are very hoary, growing close to the ground, and decaying in autumn. It is a native of the Alps of Switzerland, Austria, Pannonia, and Carinthia.

12. *Achillea ptarmica*, or sneefewort milfoil: leaves lanceolate acuminate finely ferrate. This species grows wild in all the temperate parts of Europe. In Britain it is found not very uncommon in meadows, by the sides of ditches, on the banks of corn-fields, in moist woods and shady places. It creeps greatly by the roots. In the spring the young tender shoots are put into sallads, to correct the coldness of other herbs; and the roots, being hot and biting, are used for the tooth-ach, whence some have given the title of field or bastard pellitory to this plant. From the form of the leaf it is called goose-tongue. The dried powder of the leaves, snuffed up the nostrils, provokes sneezing, and hence its trivial and English name. In Siberia it is said to be used with success in internal hæmorrhages, taken in form of a decoction of the whole herb. There is a variety with double flowers, which is preserved in gardens, and is commonly known by the name of *double ptarmica*, or batchelors buttons. When this is planted in pots, so as to confine the roots from creeping, the stalks will grow closer together, and then it makes a tolerable appearance when in flower, which is in July and August.

13. *Achillea alpina*, or alpine milfoil: leaves lanceolate tooth-ferrate, toothlets very finely ferrate. This bears some resemblance to the last, but the leaves are longer, deeper cut on their edges, and of a darker green. It is very hardy; and is a native of Switzerland, Savoy, and Siberia. Linnæus questions whether situation may not have altered this from the last; and Gmelin suspects that it is only a variety.

14. *Achillea ferrata*, or notched-leaved milfoil: leaves linear-lanceolate sessile tomentose, deeply ferrate, lacinate at the base. It flowers in August and September.

15. *Achillea cristata*, or slender-branched milfoil: leaves linear ferrate, ferratures transverse crested, stem branched weak. This is a native of the east. It flowers here in July and August.

16. *Achillea atrata*, or camomile-leaved or black milfoil: pinnules pectinate almost entire, peduncles villous. This species is found on the mountains of Switzerland, the Valais, and Austria.

17. *Achillea moschata*, or musk milfoil, or Swiss genipi, leaves pinnate dotted, pinnae remote linear subulate almost entire, rays the length of the calyx. This bears so much resemblance to the last, as not readily to be distinguished, unless its pleasant aromatic smell be attended to. It is the true genipi of the Swifs. In Savoy they call it genipi batard, and give the name of true genipi to the *artemisia rupestris*. Either of them is an excellent sudorific; but hot, and frequently injurious in the pleurisy when the fever is high. It promises to be of much service in disorders arising from a debility of the solids: and is a

grateful food to all sorts of cattle. It grows wild in Switzerland on the high Alps, in Savoy, Piedmont, and Austria: and was introduced in 1775 by doctors Pitcairn and Fothergill.

18. *Achillea nana*, or dwarf milfoil: leaves pinnate toothed extremely hirsute, flowers glomerate-umbelled. The smell of this is somewhat weaker than that of the last, for which it is frequently sold. It grows on the high Alps of Switzerland, the Valais, and Savoy. It is hardy, and will thrive with us in almost any soil, but loves an open exposure. It deserves a place in gardens.

19. *Achillea magna*, or great milfoil or yarrow: leaves bipinnate rather hairy, the divisions linear and toothed; earlets decussated. This sort very much resembles common milfoil, but is twice the size. The stem has hairs thinly scattered over it. The leaves are also like those of common milfoil, but larger, and with two ears at the base, one under the leaf, the other prominent above the rib. It grows in Italy.

20. *Achillea millefolium*, or common milfoil or yarrow: leaves bipinnate naked, divisions linear toothed; stems furrowed towards the top. It is abundant in pastures and by road sides, flowering from June to September. The inhabitants of Dalecarlia mix it with their ale, instead of hops, in order to increase the inebriating quality of the liquor. This plant has been generally execrated as a noxious weed in pastures: it is found however to be eaten by cattle, at least by sheep; and has lately been even recommended for cultivation. Perhaps other plants besides this, may be of service to cattle in pastures, rather as medicine than as food. Linnæus recommends the bruised herb fresh as an excellent vulnerary and styptic: many foreign physicians still have an opinion of it in hæmorrhages; according to Dr. Hill, it is excellent in dysenteries, taken in form of a strong decoction: an ointment is made of it for the piles, and it is reckoned good against the scab in sheep. An essential oil is extracted from the flowers. It is not in use with us in the present practice. The variety with purple flowers of different shades is not uncommon, wild; and is frequently seen in gardens. The alpine is a variety arising merely from situation; and is different from the thirteenth sort. In cultivation they both approach to the common species.

21. *Achillea nobilis*, or noble milfoil: leaves bipinnate, the lower ones naked flat, the upper obtuse tomentose, the flowers in convex and very crowded corymbs. This approaches near to the foregoing or common sort, but the leaves are of a pale-green, and not so long, or so much cut: these have a strong sweet scent when bruised. It is a native of Italy, Germany, Switzerland, Narbonne, and Tartary.

22. *Achillea odorata*, or scented milfoil: leaves bipinnate oval almost naked, corymbs fastigate crowded. Gerard and Haller make this only a variety of the foregoing.

23. *Achillea cretica*, or Cretan milfoil: leaves linear, pinnae roundish imbricate backwards, stem tomentose. Cretan milfoil has the air of the common sort. The flowers are white; and it is a native of Crete.

24. *Achillea squarrosa*, or rough-headed milfoil: leaves lanceolate-linear pinnatifid, pinnae ovate, wedge-shaped, gash-acuminate vertical, stem somewhat villous.

25. *Achillea herbarota*, or herbarota milfoil: leaves wedge-shaped entire, toothed at the top. This species is in great and general esteem among the peasants of the Alps: and is recommended as a sudorific; against worms, flatulencies, and intermittent fevers.

26. *Achillea ligustica*, or marjoram-scented milfoil: leaves pinnate, pinnae sharply toothed flat smooth. This species, as well as the last, has a very strong smell, like mauldin.

27. *Achillea tanacetifolia*, or tanfy-leaved milfoil: leaves pinnate, pinnae lacinate flat gashed and entire. It is a native of the Grisons; and not uncommon in the pastures and valleys of the Alps.

Propagation and Culture. All the species of *Achillea* may be propagated by parting the roots either in spring or autumn. Many of them ripen their seeds, and may therefore be increased that way by sowing them in March or April; and transplanting them at Michaelmas. They will flower the summer following. Some also will grow from slips or cuttings, planted in a shady border in summer. They are mostly hardy, and require little care in the cultivation.

Those which are most commonly seen in gardens are, the purple variety of common milfoil, the double variety of common sneezewort, called double ptarmica, and woolly milfoil.

Whatever merit the alpine sorts may possess as medicines, it cannot answer to cultivate them with that view in gardens, for they owe their efficacy to their peculiar situation. But they, who are desirous of having them for variety, will find that they are very hardy, and will thrive almost in any soil, but that they love an open exposure.

ACHILLEA INODORA. See *ATHANASIA*.

ACHILLEA MONTANA. See *SENECIO*.

ACHILLEA TANECITIFOLIA. See *CHRYSANTHEMUM*.

ACHILLEA, an island, in the Euxine, opposite the Borythenes, where the monument of Achilles was erected.

ACHILLEID, *ACHILLEIS*, a celebrated poem of Statius, in which that author proposed to deliver the whole life and exploits of Achilles; but, being prevented by death, he has only treated of the infancy and education of his hero. See *STATIUS*.

ACHILLES, one of the greatest heroes of ancient Greece, was the son of Peleus and Thetis. He was a native of Phthia, in Thessaly. His mother, it is said, in order to consume every mortal part of his body, used to lay him every night under live coals, anointing him with ambrosia, which preserved every part from burning but one of his lips, owing to his having licked it. She dipped him also in the waters of the river Styx: by which his whole body became invulnerable, except that part of his heel by which he held him. But this opinion is not universal, nor is it a part of his character as drawn by Homer; for in the *Iliad*, b. xxi. 261, he is actually wounded in the right arm, by the lance of Asteropæus, in the battle near the river Scamander. Thetis afterwards intrusted him to the care of the centaur Chiron, who, to give him the strength necessary for martial toil, fed him with honey and the marrow of lions and wild boars. To prevent his going to the siege of Troy, she disguised him in female apparel, and hid him among the maidens at the court of king Lycomedes: but Ulysses, discovering him, persuaded him to follow the Greeks. Achilles distinguished himself by a number of heroic actions at the siege. Being disgusted, however, with Agamemnon for the loss of Briseis, he retired from the camp. But, returning to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged it round the walls of Troy. At last Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Philoxena, daughter to king Priam. Of this wound he died, and was interred on the promontory of Sigæum; and after Troy was taken, the Greeks sacrificed Philoxena on his tomb, in obedience to his desire, that he might enjoy her company in the Elysian fields. It is said, that Alexander, seeing this tomb, honoured it by placing a crown upon it; at the same time crying out, that "Achilles was happy in having, during his life, such a friend as Patroclus; and, after his death, a poet like Homer." Achilles is supposed to have died 1183 years before the Christian æra.

ACHILLES TATIUS. See *TATIUS*.

Tendo ACHILLIS, in anatomy, is a strong tendinous cord formed by the tendons of several muscles, and inserted into the os calcis. It has its name from the fatal wound Achilles is said to have received in that part from Paris the son of Priam.

ACHILLINI (Alexander), born at Bologna, and doctor of philosophy in that university. He flourished in the 15th and 16th centuries, and by way of eminence was styled the great philosopher. He was a steadfast follower and accurate interpreter of Averroes upon Aristotle, but most admired for his acuteness and strength of arguing in private and public disputations. He made a surprising quick progress in his studies, and was very early promoted to a professorship in the university; in which he acquitted himself with so much applause that his name became famous throughout all Italy. He continued at Bologna till the year 1506; when the university of Padua made choice of him to succeed Antonio Francatiano in the first chair of philosophy, and his fame brought vast numbers of students to his lectures at Padua: but the war, wherein the republic of Venice was engaged against the league of Cambray, putting a stop to the lectures of that university, he withdrew to his native country; where he was received with the same marks of honour and distinction as before, and again appointed professor of philosophy in Bologna. He spent the remainder of his life in that city, where he died, and was interred with great pomp in the church of St. Martin the Great, which belongs to the Carmelite friars. He wrote several pieces on philosophical subjects, which he published, and dedicated to John Bentivogli.

ACHILLINI (Claudius), grandson of the former, read lectures at Bologna, Ferrara, and Parma: where he was reputed a great philosopher, a learned divine, an excellent lawyer, an eloquent orator, a good mathematician, and an elegant poet. He accompanied Cardinal Ludovino, who went as legate into Piedmont; but being afterward neglected by this cardinal, when he became pope under the name of Gregory XV. he left Rome in disgust, and retired to Parma; where the duke appointed him professor of law, with a good salary. He published a volume of Latin letters, and another of Italian poems, which gained him great reputation: he died in 1640, aged 66.

ACHIMENES, *f.* in botany. See *COLUMNÆA*.

ACHING, *f.* [from *ache*.] Pain; uneasiness.—When old age comes to wait upon a great and worshipful sinner, it comes attended with many painful girds and *achings*, called the gout. *South*.

ACHIOTTE, or *ACHIOTL*, a foreign drug used in dyeing, and in the preparation of chocolate. It is the same with the substance more usually known by the name of *ARNOTTO*; which see.

ACHIROPOETOS, a name given by ancient writers to certain miraculous pictures of Christ and the Virgin, supposed to have been made without hands.—The most celebrated of these is the picture of Christ, preserved in the church of St. John Lateran at Rome; said to have been begun by St. Luke, but finished by the ministry of angels.

ACHLAM, a village twelve miles from York, where the body of the emperor Severus, who died at York, was burnt to ashes, agreeable to the custom of those times.

ACHMET, son of Seerim, has left a book concerning the interpretation of dreams according to the doctrine of the Indians, Persians, and Egyptians, which was translated out of Greek into Latin by Leo Tuscus in 1160. He lived in the 9th century.

ACHMET GEDUC, a famous general under Mahomet II. and Bajazet II. in the 15th century. When Mahomet II. died, Bajazet and Zezan both claimed the throne: Achmet sided with the former, and by his bravery and conduct fixed the crown on his head. But Bajazet took away his life; shining virtue being always an unpardonable crime in the eyes of a tyrant.

ACHMETSCHET, a town of the peninsula of Crimea, the residence of the sultan Galga, who is eldest son of the khan of Tartary. Lat. 45. o. lon. 51. 20.

ACHMIM, a large town of Upper Egypt, situated on the eastern bank of the Nile. "One admires there (says Abulfeda, as quoted by Mr. Savary) a temple, which is comparabile

comparable to the most celebrated monuments of antiquity. It is constructed with stones of a surprising size, on which are sculptured innumerable figures." Though this town be fallen from its ancient splendour, it is still one of the most beautiful of Upper Egypt. According to Mr. Savary, an Arab prince commands there, and the police is well attended to. The streets are wide and clean, and commerce and agriculture flourish. It has a manufactory of cotton, stuffs, and pottery, which are conveyed over all Egypt. It is the fame that Herodotus calls Chemmis, and Strabo Panopolis, or the City of Pan, who was worshipped there. Herodotus says, that Perseus was a native of this city, and that his descendants had established festivals there in his honour. It has lost its ancient edifices, and much of its extent; the ruins of the temple, described by Abulfeda, being without its limits, to the north. Nothing remains of it but some stones, of such magnitude that the Turks have not been able to move them. They are covered with hieroglyphics. On one of them are traced four concentric circles, in a square. The innermost of these contains a sun. The two succeeding ones, divided into twelve parts, contain, one, twelve birds, the other, twelve animals almost effaced, which appear to be the signs of the zodiac. The fourth has no divisions, and presents twelve human figures; which Mr. Savary imagines to represent the twelve gods, the twelve months of the year, and the twelve signs of the zodiac. The Egyptians, says Herodotus, are the first who divided the year into twelve months, and employed the names of the twelve gods. The four seasons occupy the angles of the square, on the side of which may be distinguished a globe with wings. Mr. Savary thinks it probable that this stone belonged to a temple dedicated to the sun, that the whole of these hieroglyphics mark his passage into the signs of the zodiac, and his course, whose revolution forms the year. The columns of this temple have been partly broken to make lime and millstones. Some of them have been transported into one of the mosques of Achmim, where they are placed without taste; others are heaped up in the squares of the town.

Mr. Savary tells us of a serpent which is worshipped here, and is the wonder of the country. "Upwards of a century ago (says he), a religious Turk called Scheilk Haridi died here. He passed for a saint among the Mahometans; who raised a monument to him, covered with a cupola, at the foot of the mountain. The people flocked from all parts to offer up their prayers to him. One of their priests, profiting by their credulity, persuaded them that God had made the soul of Scheilk Haridi pass into the body of a serpent. Many of these are found in the Thebais, which are harmless; and he had taught one to obey his voice. He appeared with his serpent, dazzled the vulgar by his surprising tricks, and pretended to cure all disorders. Some lucky instances of success, due to nature alone, and sometimes to the imagination of the patients, gave him great celebrity. He soon confined his serpent Haridi to the tomb, producing him only to oblige princes and persons capable of giving him a handsome recompence. The successors of this priest, brought up in the same principles, found no difficulty in giving sanction to so advantageous an error. They added to the general persuasion of his virtue that of his immortality. They had the boldness even to make a public proof of it. The serpent was cut in pieces in presence of the emir, and placed for two hours under a vase. At the instant of lifting up the vase, the priests, no doubt, had the address to substitute one exactly resembling it. A miracle was proclaimed, and the immortal Haridi acquired a fresh degree of consideration. This knavery procures them great advantages. The people flock from all quarters to pray at this tomb; and, if the serpent crawls out from under the stone, and approaches the suppliant, it is a sign that his malady will be cured. It may be imagined, that he does not appear till an offering has been made proportioned to the quality and richness of the different persons. In

extraordinary cases, where the sick person cannot be cured without the presence of the serpent, a *pure virgin* must come and solicit him. To avoid inconveniences on this head, they take care to choose a *very young girl indeed*. She is decked out in her best clothes, and crowned with flowers. She puts herself in a praying attitude; and, as the priests are inclined, the serpent comes out, makes circles round the young suppliant, and goes and reposes on her. The virgin, accompanied by a vast multitude, carries him in triumph amidst the general acclamation. No human reasoning would persuade these ignorant and credulous Egyptians that they are the dupes of a few impostors: they believe in the serpent Haridi as firmly as in the prophet."

ACHONRY, a small town of Ireland, in the province of Connaught and county of Sligo, seated on the river Shannon.

ACHOR, *f.* [achor, Lat. *axor*, Gr. *surfur*.] A species of the HERPES. It appears with a crusty scab, which causes an itching on the surface of the head, occasioned by a salt sharp serum oozing through the skin.

ACHOR, *f.* Lactumen: abas, acores, cerion; favus. The *crusta lactea* of authors, and in England the SCALD HEAD. Trallian says, that it is a sore on the outside of the head, full of little perforations, which discharge a humour like ichor, whence its name. He farther says, that the *cerion* resembles an achor; but that the mouths of the perforations are larger, resembling the cells of a honey-comb, whence the name; the matter is also nearly of the consistence of thin honey. When these diseases spread, the serum, which oozes out, dries, and forms a scab.

The achor differs from the *favus* and *tinea* only in the degree of virulence. It is called favus when the perforations are large; and tinea when they are like those made by moths in cloth: but generally by tinea is understood a dry scab on the hairy scalp of children, with thick scales and an offensive smell; when this disorder affects the face, it is called *crusta lactea* or MILK-SCAB. Mr. Bell, in his Treatise on Ulcers, says, that the *tinea capitis* & *crusta lactea*, may both be reduced to the same species of herpes, viz. the *herpes pustulosus*, they being naturally the same, differing only in situation; the tinea is on the hair-scalp, and the *crusta lactea* on the face. Dr. Cullen places this disease under *ULCERS*, as a synonyme; where also he places the *crusta lactea*, the *claus locales*, and *order dialyses*. When it happens to children, if in other respects they are healthy, the best treatment, besides keeping the belly moderately lax, is cleanliness and a moderate diet. An issue may be made and continued till the disorder is cleared, and the strength of the constitution is established; keep the hair short, and wash the head with soap suds. Some instances of this sort are very difficult of cure, and attended with violent itching, a pale countenance, &c. but still the same method generally succeeds in all the species and degrees of virulence. Small doses of calomel may be given as an alterative rather than as a laxative, and the vin. antim. in such doses, at proper intervals, as the stomach will easily retain. Externally unguent e pice may be used two or three times in a week, or cream mixed with chalk in fine powder. If the humour is repelled, give warm sudorifics until it returns. Scabby eruptions on children should not be repelled when about the mouth, ears, or indeed on any part of the body. Though these eruptions depend not on the habit, but the difficulty of passing through the skin, yet cold bathing should not be used. Cleanliness and a frequent use of the warm bath are of great service. The practice of tearing up the roots of the hair is useless, therefore cruel. Keep the hair short, and wash the part with aq. pur. ℞i. in qua solut. est gr. x. hydrargyri muriati.

ACHOR, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from Achan, the troubler of Israel, being there stoned to death.

ACHOR, in mythology, the God of Flies; to whom, according to Pliny, the inhabitants of Cyrene sacrificed,

in order to obtain deliverance from the insects and the divisions occasioned by them.

ACHRADINA, anciently one of the four cities or divisions of Syracuse, and the strongest, largest, and most beautiful, part of it; separated by a very strong wall from the outer town, Tycha and Neapolis. It was adorned with a very large forum, with beautiful porticos, a most elegant prytaneum, a spacious senate-house, and a superb temple of Jupiter Olympius.

ACHRAS, *f.* [the Greek name of a tree in Theophrastus, commonly translated the *wild pear*.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of *dumosæ*. The generic characters are—**Calyx**: perianthium six-leaved; leaflets ovate, concave, erect; outer broader shorter, inner coloured. **Corolla**: one-petalled, ovate, of the same height with the calyx; border cut into six subovate flat divisions; scales at the jaws of the corolla, equal in length to the divisions, narrower, spreading, emarginate. **Stamina**: filaments short, awl-shaped, at the jaws of the corolla, alternate with the divisions, bent inwards; antheræ sharp. **Pistillum**: germ roundish, flattened; style awl-shaped, longer than the corolla; stigma obtuse. **Pericarpium**: a globose very succulent pome, with twelve cells. **Seeds**: solitary, ovate, shining, scarred on one side and pointed at the base.—*Essential Character*. **Calyx**: six-leaved. **Corolla**: ovate, sexfid; with six scales alternate, more within. **Pome**, ten-celled. **Seeds** solitary, with a scar on the edge, and a tail or process at the top.

Species. 1. *Achras mammosa*, or mamme sapota, otherwise called the nipples sapota or American marmalade, grows in America to the height of thirty-five or forty feet, having a straight trunk, covered with an ash-coloured bark. The branches are produced on every side, so as to form a regular head. The leaves are a foot in length, and near three inches broad in the middle. The flowers are cream-coloured, and are succeeded by large oval or top-shaped fruit, covered with a brownish skin, under which is a thick pulp of a russet colour, very luscious, called natural marmalade, from its likeness to marmalade of quinces. This tree is commonly planted in gardens for the fruit, in Jamaica, Barbadoes, Cuba, and most of the West-India islands. This species has a sixth part less in the parts of fructification.—There is also a variety of this, called the bully or nishery-bully tree, because it generally grows the tallest of all the trees in the woods: its fruit is small, and the seeds oblong and narrow. It is esteemed one of the best timber-trees in Jamaica.

2. *Achras sapota*, or common sapota: flowers solitary, leaves lanceolate-ovate. This is a large, tall, straight, tree, without knots or branches, for sixty or seventy feet or more. The head spreads into many small branches, which grow pretty thick and close together. The bark is dark grey, thick and rough, full of large chops. The fruit is bigger than a quince, round, and covered with a thick grey rind, which when the fruit is ripe becomes yellow and tough. The flesh is yellow as a carrot, and in the middle are two large rough stones, flat, and each much bigger than an almond. The fruit smells very well, and the taste is unagreeable. It is described by Swartz as a soft roundish berry, the size of a small apple, having from six to twelve cells, with several seeds in each: he remarks, however, that most of the seeds are usually lost by cultivation.—The American sapota, or nishery-tree, is common about Panama, and some other places in the Spanish West Indies, but is not to be found in many of the English settlements.—The sapodilla is thus described by Browne. It rises to a considerable height, throwing out its branches on all sides. Leaves smooth and beautiful; and the fruit, which generally grows among them, of a moderate size, and when ripe of a delicate mellow taste. All the tender parts are full of a milky juice, extremely harsh, and bitterish; but the fruit, though full of this while young, is very sweet and agreeable when it ripens. The

shells that cover the seeds are generally of a shining or glossy brown cast, but the inward edge is always whitish and rugged. The kernel is bitter, and may be used occasionally in strengthening emulsions. The sapadillo-tree, says Dampier, is as big as a large pear-tree, the fruit much like a Bergoma pear in colour, shape, and size; but in some trees the fruit is a little longer. When it is green or first gathered the juice is white and clammy, and will stick like glue; then the fruit is hard, but, when it has been gathered two or three days, it grows soft and juicy, and then the juice is clear as spring water, and very sweet; in the midst of the fruit are two or three black stones or seeds, about the bigness of a pompon-seed. This is an excellent fruit.

3. *Achras difsecta*, or cloven-flowered sapota: flowers crowded, corollas cloven into eight parts, leaves obovate, bluntly notched at the end. This is a lofty tree, with a thick upright trunk, and abundance of branches, tubercled, and bearing leaves and branches at the ends. The flowers are white, and about half an inch in diameter. All the herbaceous parts of this tree are milky. It is cultivated in Malabar for the fruit, which is a pome of the form and size of an olive, succulent, the pulp of a sweetish acid flavour, and containing only one or two seeds, the rest of the cells being usually abortive. The leaves are used for cataplasms to tumours, being bruised and boiled with the root of curcuma and the leaves of ginger. It is supposed to be a native of the Philippine islands, whence it is called *Manykara* and *Manil-gale*, and by the Portuguese *Fruita Manilha*. It probably grows also in China, for the Dutch call it *Chineefche pruynen*. Forster found it flowering in September, in the island of Tongataboo.

4. *Achras falcifolia*, or willow-leaved sapota: flowers crowded, leaves lanceolate-ovate, acuminate. This tree, called in Jamaica white-bully tree or galimeta-wood, grows to a considerable height, with many branches towards the top, rising irregularly, at distant stages, as in most firs. It is commonly straight and tapering, and most frequently found in the lower lands. The wood is pale yellow, and reckoned good timber, but is mostly used in such parts of the building as are least exposed to the weather. No part of the tree is milky.

The bark of the sapota and mammosa is very astringent, and goes under the name of *Cortex Jacamienfis*. It was once supposed by some to be the true jesuit's bark, has been given as such to the negroes with very ill effect, and has been tried in England. It is an excellent astringent, but very different from jesuit's bark.

Propagation and Culture. As these trees are natives of very warm countries, they cannot be preserved in England, unless they are placed in the warmest stoves and managed with great care. They are propagated by planting the stones, but, as these will not keep good long out of the ground, the surest method to obtain these plants is, to have the stones planted in tubs of earth as soon as they are taken out of the fruit, and the tubs placed in a situation where they may have the morning sun, and kept duly watered. When the plants come up, they must be secured from vermin, and kept clear from weeds, but should remain in the country till they are about a foot high, when they may be shipped for England; they should be brought over in the summer, and, if possible, time enough for the plants to make good roots after they arrive. During their passage they must have some water, while they continue in a warm climate; but, as they come into colder weather, they should have very little moisture; and they must be secured from salt water, which will soon destroy the plants if it gets at them. When these plants arrive in England, they should be carefully taken out of the tubs, preserving some earth to their roots, and planted into pots filled with fresh earth, and then plunged into a moderate hot-bed of tanners' bark, observing, if the weather is hot, to shade the glasses with mats every day, to screen the plants from the

fun until they have taken new root; observing also not to water them too much at first, especially if the earth in which they come over is moist; because too much water is very injurious to the plants before they are well rooted, but afterward they must be frequently refreshed with water in warm weather; and they must have a large share of air admitted to them, otherwise their leaves will be infested with insects, and become foul; in which case they must be washed with a sponge to clean them, without which the plants will not thrive. In the winter these plants must be placed in the warmest stove, and in cold weather they should have but little water given to them, though they must be frequently refreshed when the earth is dry; especially if they retain their leaves all the winter, they will require a greater share of water than when they drop their leaves; so that this must be done with discretion, according to the state in which the plants are. As these plants grow in magnitude, they should be shifted into pots of a larger size, but they must not be over-potted, for that will infallibly destroy them.

ACHROMATIC, *adj.* in optics, without colour; a term which, it seems, was first used by M. de la Lande, in his astronomy, to denote telescopes of a new invention, contrived to remedy aberrations and colours. See **ABERRATION** and **TELESCOPE**.

ACHROMATIC TELESCOPE, a singular species of refracting telescope, said to be invented by the late Mr. John Dollond, optician to the king, and since improved by his son Mr. Peter Dollond, and others.

Every ray of light passing obliquely from a rarer into a denser medium, changes its direction towards the perpendicular; and every ray passing obliquely from a denser into a rarer medium, changes its direction from the perpendicular. This bending of the ray, caused by the change of its direction, is called its refraction; and the quality of light which subjects it to this refraction, is called its refrangibility. Every ray of light, before it is refracted, is white, though it consists of a number of component rays, each of which is of a different colour. As soon as its refracted, it is separated into its component rays, which, from that time, proceed diverging from each other, like rays from a center: and this divergency is caused by the different refrangibility of the component rays, in such sort, that the more the original or component ray is refracted, the more will the compound rays diverge when the light is refracted by one given medium only.

From hence it has been concluded, that any two different mediums that can be made to produce equal refractions, will necessarily produce equal divergencies: whence it should also follow, that equal and contrary refractions should not only destroy each other, but that the divergency of the colours caused by one refraction should be corrected by the other; and that to produce refraction that would not be affected by the different refrangibility of light, is impossible.

But Mr. Dollond has proved, by many experiments, that these conclusions are not well founded; from which experiments it appeared, that a ray of light, after equal and contrary refractions, was still spread into component rays differently coloured; in other words, that two different mediums may cause equal refraction, but different divergency; and equal divergency, with different refraction. It follows therefore that refraction may be produced, which is not affected by the different refrangibility of light. In other words, that, if the mediums be different, different refractions may be produced, though at the same time the divergency caused by one refraction shall be exactly counteracted by the divergency caused by the other; and so an object may be seen through mediums which, together, cause the rays to converge, without appearing of different colours.

This is the foundation of Mr. Dollond's improvement of refracting telescopes. By subsequent experiments he found, that different sorts of glass differed greatly in their refractive qualities, with respect to the divergency of co-

lours. He found that crown glass causes the least divergency, and white flint the most, when they are wrought into forms that produce equal refractions. He ground a piece of white flint glass into a wedge, whose angle was about 25 degrees; and a piece of crown glass to another, whose angle was about 29 degrees; and these he found refracted nearly alike, but that their divergency of colours was very different.

He then ground several other pieces of crown glass to wedges of different angles, till he got one that was equal, in the divergency it produced, to that of a wedge of flint glass of 25 degrees; so that when they were put together, in such a manner as to refract in contrary directions, the refracted light was perfectly free from colour. Then, measuring the fractions of each wedge, he found that that of the white flint glass was to that of the crown glass nearly as two to three. And hence any two wedges, made of these two substances, and in this proportion, would, when applied together so as to refract in contrary directions, refract the light without any effect arising from the different refrangibility of the component rays.

Therefore, to make two spherical glasses that refract the light in contrary directions, one must be concave, and the other convex; and as the rays, after passing through both, must meet in a focus, the excess of the refraction must be in the convex one: and, as the convex is to refract most, it appears from the experiment that it must be made of crown glass; and, as the concave is to refract least, it must be made of white flint.

And farther, as the refraction of spherical glasses are in an inverse ratio of their focal distances, it follows that the focal distances of the two glasses should be in the ratio of the refractions of the wedges; for, being thus proportioned, every ray of light that passes through this combined glass, at whatever distance from its axis, will constantly be refracted by the difference between two contrary refractions, in the proportion required; and therefore the effect of the different refrangibility of light will be prevented.

The removal of this impediment, however, produced another: for the two glasses, which were thus combined, being segments of very deep spheres, the aberrations from the spherical surfaces became so considerable, as greatly to disturb the distinctness of the image. Yet considering that the surfaces of spherical glasses admit of great variations, though the focal distance be limited, and that by these variations their aberration might be made more or less at pleasure, Mr. Dollond plainly saw that it was possible to make the aberrating of any two glasses equal; and that, as in this case the refractions of the two glasses were contrary to each other, and their aberrations being equal, these would destroy each other.

Thus he obtained a perfect theory of making object glasses, to the apertures of which he could hardly perceive any limits; for, if the practice could come up to the theory, they must admit of apertures of great extent, and consequently bear great magnifying powers.

The difficulties of the practice are, however, still very considerable. For first, the focal distances, as well as the particular surfaces, must be proportioned with the utmost accuracy to the densities and refracting powers of the glasses, which vary even in the same sort of glass, when made at different times. Secondly, there are four surfaces to be wrought perfectly spherical. However, Mr. Dollond could construct refracting telescopes upon these principles, with such apertures and magnifying powers, under limited lengths, as greatly exceed any that were produced before, in-forming the images of objects bright, distinct, and uninfected with colours about the edges, through the whole extent of a very large field or compass of view; of which he has given abundant and undeniable testimony. See **TELESCOPE**.

There has lately appeared in the Gentleman's Magazine (1790, p. 890) a paper on the refracting telescope, by an author who signs *Veritus*, in which the invention is ascribed

to another person, not heretofore mentioned, in these words:—"As the invention has been claimed by M. Euler, M. Klingenshierna, and some other foreigners, we ought, for the honour of England, to assert our right, and give the merit of the discovery to whom it is due; and, therefore, without farther preface, I shall observe, that the inventor was Chester More Hall, Esq. of More-hall, in Essex; who, about 1729, as appears by his papers, considering the different humours of the eye, imagined they were placed so, as to correct the different refrangibility of light. He then conceived, that if he could find substances having such properties as he supposed these humours might possess, he should be enabled to construct an object glass that would shew objects colourless. After many experiments he had the good fortune to find those properties in two different sorts of glass, and, making them disperse the rays of light in different directions, he succeeded. About 1733 he completed several achromatic object glasses (though he did not give them this name) that bore an aperture of more than $2\frac{1}{2}$ inches, though the focal length did not exceed 20 inches; one of which is now in the possession of the Rev. Mr. Smith, of Charlotte-street, Rathbone-place. This glass has been examined by several gentlemen of eminence and scientific abilities, and found to possess the properties of the present achromatic glasses.

Mr. Hall used to employ the working opticians to grind his lenses; at the same time he finished them with the radii of the surfaces, not only to correct the different refrangibility of rays, but also the aberration arising from the spherical figure of the lenses. Old Mr. Baf, who at that time lived in Bridewell Precinct, was one of these working opticians, from whom Mr. Hall's invention seems to have been obtained.

In the trial at Westminster-hall about the patent for making achromatic telescopes, Mr. Hall was allowed to be the inventor; but Lord Mansfield observed, "It was not the person that locked up his invention in his scrutoire that ought to profit by a patent for such an invention, but he who brought it forth for the benefit of the public." This, perhaps, might be said with some degree of justice, as Mr. Hall was a gentleman of property, and did not look to any pecuniary advantage from his discovery; and, consequently, it is very probable that he might not have an intention to make it generally known at that time.

That Mr. Ayscough, optician, in Ludgate-street, was in possession of one of Mr. Hall's achromatic telescopes in 1754, is a fact which at this time will not be disputed."

ACHTELING, *f.* a measure for liquids used in Germany. Thirty-two *achtelings* make a *heemer*; four *sciltings*, make an *achteling*.

ACHYR, a strong town and castle of the Ukraine, subject to the Russians since 1667. It stands on the river Uorsklo near the frontiers of Russia, 127 miles west of Kiow. Lat. 49. 32. lon. 36. 0.

ACHYRANTHES, *f.* [*αχρῶν* chaff, and *ανθη* a flower.] In botany, a genus of the pentandria monogynia class, and in the natural order of amaranthi. The generic characters are—Calyx: perianthium, outer three-leaved, lanceolate, acute, permanent; inner five-leaved, permanent. Corolla: none; nectary of five valves surrounding the germ, bearded at the tip, concave, caducous. Stamina: filaments filiform, the length of the corolla; antheræ ovate, incumbent. Pistillum: germ superior, turbinate; style filiform, the length of the stamina; stigma bifid, villous. Pericarpium: capsule roundish, one-celled, not gaping. Seed: single, oblong.—*Essential Character*. Calyx, five-leaved. Corolla, none. Stigma, bifid. Seed, solitary.

Species. 1. *Achyranthes aspera*, or rough achyranthes: stem shrubby erect; calyxes reflex, pressed to the spike. The Sicilian plant grows near three feet high, with oblong pointed leaves; the flowers come out in long spikes from the extremity of the branches. As found in Malabar, Ceylon, Jamaica, and almost every where within the tropics, it has the leaves smooth and green on both sides, like *Plumbago zeylanica*; broader than in the Sicilian plant, and

dotted underneath: but the appearance, spike, stature, flower, &c. being the same in both, they are not distinct species.

2. *Achyranthes lappacea*, or burry achyranthes: stem shrubby, diffused, prostrate; spikes interrupted; lateral flowers having a bundle of hooked bristles on each side. This is a native of Malabar and Ceylon.

3. *Achyranthes muricata*, or prickly achyranthes: stem shrubby, patulous; leaves alternate; flowers in remote ovate spikes; calyxes squarrose. Leaves petiolcd, ovate, entire, almost naked. Spike alternate, peduncled, long, as in the first species, but the flowers more remote, more ovate, and not reflex, but three scales of the calyx shorter. Native of India.

4. *Achyranthes patula*, or spreading achyranthes: stem shrubby, patulous, pubescent; flowers in orbicular spikes, hedgehog-hooked. In a state of sleep, the opposite leaves of this species are bent down under the branch, and approximate to the under surface. It is a native of the East Indies.

5. *Achyranthes alternifolia*, or alternate-leaved achyranthes: stem herbaceous, erect; flowers in subglobular burrs. This species is also a native of the East Indies.

6. *Achyranthes corymbosa*, or corymbcd achyranthes: leaves four-fold, linear; panicle dichotomous corymbcd. The flowers resemble those of *celofia*, and it was put into that genus formerly by Linnæus. It is found in Ceylon.

7. *Achyranthes dichotoma*, or dichotomous achyranthes: stems suffruticose, leaves opposite linear flat acute; cyme dichotomous. This very much resembles the foregoing: it grows in Virginia.

8. *Achyranthes prostrata*, or prostrate achyranthes: the stems prostrate shrubby; spikes oblong; floscules in pairs, with a hooked fascicle on each side. This is a native of India.

9. *Achyranthes nivea*, or white achyranthes: leaves veicilled ovate tomentose, corymbs compact dichotomous, flowers corolled. It is a native of the Canary islands, whence it was introduced here by Mr. Francis Masson, in 1780. It flowers from May to July.

10. *Achyranthes altissima*, or tall achyranthes: stem suffruticose scandent, panicles terminating and axillary, branched. The stalks of this species climb up trees to the height of twenty feet. It is common among low bushes about Spanish Town and Kingston, in Jamaica; and in the woods of St. Domingo.

11. *Achyranthes polygonoides*: stem decumbent four-cornered, leaves ovate-cordate, spikes lax, short. This species was found in Arabia by Forskahl, and in Malabar by Koenig. It resembles the *polygonum orientale* in leaves and spikes, but the latter are less compact. The Arabians call this plant *didjar* and *budjer*: from the first of these the trivial name is formed.

Propagation and Culture. The first sort has been long known in England; but neither this, nor any of the others, having much beauty to recommend them, they are only preserved in botanic gardens. The first may be raised on a hot-bed from the seeds, and when the plants have acquired strength, they may be removed into the full ground, where they will flower in July, and the seeds will ripen in September. If they are kept in pots, and set into a warm green-house in winter, they will live two or three years.—The other sorts must be placed in a stove to preserve them through the winter: except the ninth, which will live in a green-house.

ACIA, *f.* [from the vernacular name *acioua*, in Guiana.] In botany, a genus of the monadelphica dodecandria class, of the natural order of pomaceæ. The generic characters are—Calyx: perianthium one-leaved, turbinate, curved; border five-parted; parts roundish, spreading; the uppermost and two lowest larger; the two middle ones smaller. Corolla: petals five, oblong, rounded; the three upper longer, ascending; the two lower shorter. Stamina: filaments twelve, unequal, uniting at bottom in a linear fleshy membrane, inserted into the calyx between the

two smaller petals; antheræ roundish, small. Pistillum: germ ovate, above the base adhering by the membrane of the stamina to a rib internally prominent from the bottom of the calyx; style filiform, curved; stigma acute. Pericarpium: drupe ovate, fibrous, chinked, large. Seed: nut ovate, with a brittle shell.—*Essential Character*. Calyx, five-parted. Corolla five-petalled, unequal. Drupe, full of chinks.

This is a tree, with a trunk sixty feet in height, and three or four feet in diameter, covered with a smooth grey bark. The branches which form the head are numerous, thick, and twisted. The leaves are alternate, smooth, entire, firm, waved about the edge, five inches long and three wide, on a very short petiole, at the base of which are two small stipules which fall off. The flowers grow in corymbs at the extremities of the twigs. Calyx white. Corolla violet. Fruit the size of a walnut, covered with a thick woody fibrous coriaceous skin, of a brown colour, cracking irregularly and adhering to the stone, which is thin and easily breaks. It incloses a large kernel, of an irregular form, dividing into two lobes, and covered with a russet membrane. The taste of it is agreeable; the Creoles eat it, when it is brought to market in August at Cayenne, and reckon it good fruit. They also extract an oil from it as sweet as that of almonds. They call the tree *coupi*. The timber of this tree is very hard, and heavy, of a white colour inclining to yellow.

ACICANTHERA, *f.* in botany, the trivial name of a species of **RHEDIA**.

ACICULÆ, the small pikes or prickles of the hedgehog, *echinus marinus*, &c.

ACID, *adj.* [*acidus*, Lat. *acide*, Fr.] Sour, sharp.—Wild trees last longer than garden trees; and, in the same kind, those whose fruit is *acid*, more than those who fruit is sweet. *Bacon*.

ACIDALIUS (Valens), was born at Wittstock, in Brandenburg; and, having visited several academies in Germany, Italy, and other countries, where he was greatly esteemed, he afterwards took up his residence at Breslaw, the metropolis of Silesia; and was chosen rector of a school at Nicla. It is related, that, as he was following a procession of the host, he was seized with a sudden phrenzy; and, being carried home, expired in a very short time. But Thuanus tells us, that his excessive application to study was the occasion of his untimely death; and that his sitting up at nights in composing his Conjectures on Plautus, brought upon him a distemper which carried him off in three days, on the 25th of May 1595, being just turned of 28. He wrote a Commentary on Quintus Curtius; also, Notes on Tacitus, on the Twelve Panegyrics; besides Speeches, Letters, and Poems. His poetical pieces are inserted in the *Deliciæ* of the German poets, and consist of epic verses, odes, and epigrams. A little piece, printed in 1595, under the title of *Mulieres non esse homines*, "That women were not of the human species," was falsely ascribed to him. But the fact was, that Acidalius happening to meet with the manuscript, and thinking it very whimsical, transcribed it, and gave it to the bookseller, who printed it. The performance was highly exclaimed against, inasmuch that the bookseller being seized, he discovered the person who gave him the manuscript, and a most terrible outcry was made against Acidalius. A story goes, that being one day to dine at a friend's house, there happened to be several ladies at table; who, supposing him to be the author, were moved with so much indignation, that they threatened to throw their plates at his head. Acidalius, however, ingeniously diverted their wrath. In his opinion, he said, the author was a judicious person, the ladies being certainly more of the species of *angels* than of *men*.

ACIDALUS, a fountain in Orchomenus, a city of Boeotia, in which the Graces, who are sacred to Venus, bathed. Hence the epithet *Acidalia*, given to Venus.

ACIDITY, *f.* The quality of being acid; an acid taste; sharpness; sourness.—When the taste of the mouth is bit-

ter, it is a sign of a redundancy of a bilious alkali, and demands a quite different diet from the case of *acidity* or sourness. *Arbutnot*.

ACIDNESS, *f.* The quality of being acid; acidity.

ACIDOTON, *f.* in botany, a genus of the monoecia polyandria class. The generic characters are—Male flowers. Calyx: perianthium five-leaved; leaflets ovate-lanceolate, reflex. Stamina: filaments numerous (35—40), placed on a globular receptacle; the outer shorter, the inner longer, upright; antheræ cordate-ovate, upright small.—Females on the same or a different tree. Calyx: perianthium six-leaved; leaflets linear-lanceolate, spreading. Pistillum: germ three-cornered; style short, acute, thick, trifid at the tip; stigmas tomentose, reflex. Pericarpium: capsule three-grained, hirsute, three-celled. Seeds: solitary, ovate.—*Essential Character*. Male. Calyx, five-leaved; stamina, fixed to a globular receptacle. Female. Calyx, six-leaved; style, trifid; capsule, three-grained.

Its height is eight or ten feet. Trunk round, straight, woody, the size of the little finger, covered with a smooth, brownish bark. Leaves towards the top, alternate, narrow-lanceolate, three or four inches long, and three quarters of an inch broad in the middle, even about the edges, except one small jag in some towards the top, making them appear as if eared. Petioles one-eighth of an inch in length: colour dark green, with several ribs on the under side; and on its surface and edges many long small prickles, which are said to sting very much. The shrub thus described by Sloane seems to have been young; and he never saw either the flower or fruit. Native of Jamaica.

ACIDOTON, *f.* in botany. See **ADELIA**.

ACIDS, *f.* in chemistry, the name by which one of the general classes of salts are distinguished. The characteristic marks of them are, 1. The peculiar taste which we call sour; though this does not hold universally: for the acid of arsenic has not this sour taste; nor are the volatile sulphureous acids, or those of *tungsten* and *molybdena*, very distinguishable in this way. 2. With water they combine into a fluid, the specific gravity of which is not a medium betwixt the water and acid separately taken. 3. With spirit of wine they unite into a very volatile and inflammable substance, called *ether*. This however must be understood only of the strong mineral acids, or of the acetous when concentrated. 4. They change the blue colour of vegetables to red, and heighten the colour of those that are already red. 5. They unite with all kinds of earths excepting the siliceous, with fixed and volatile alkalies, and with metals, so as to form compounds which cannot be separated without some difficulty. This is their most universal and distinguishing mark. 6. When mixed with any fermentable liquor, they prevent that process, or check it if already begun. This also must be understood only of the stronger acids. 7. They cannot be frozen but in cold below the freezing point. This property is also confined to the stronger acids.

The nature of acids has long been a matter of speculation, and of late has engaged the attention of philosophers very considerably. Some have supposed them to be simple chemical elements, while others imagined them to be composed of water and earth. But the late discoveries concerning air of different kinds have suggested a new theory, first published by M. Lavoisier, and strenuously maintained by the French chemists, viz. That the acid principle is contained in the air; which, according as it combines itself with different substances, forms acids of different denominations.

This theory he considers established by indisputable experiments; and his conclusions from the whole are, That "dephlogisticated air enters as a constituent part into the composition of several acids, particularly the phosphoric, vitriolic, and nitrous; that this pure and highly respirable air is the constitutive principle of acidity common to all acids; and that the difference by which they are distinguished from each other is produced by the union of one or more principles besides this air, so as to constitute the particular

particular form under which each acid appears." To dephlogisticated air in its state of fixity, therefore, he gives the title of the *acidifying* or *oxygenous* principle; and concludes farther from his experiments, 1. "That, when combined with the matter of fire, heat, and light, this principle produces dephlogisticated air; though he considers this position as not capable of absolute demonstration. It must not, therefore, be confounded with the following; which, he says, are supported by experiment and positive proofs. 2. That the same acidifying principle, combined with phlogistic substances or charcoal, forms fixed air. 3. That with sulphur it forms vitriolic acid. 4. That with nitrous air it forms nitrous acid. 5. That with Kunckel's phosphorus it forms the phosphoric acid. 6. With sugar it forms the acid of sugar, &c.

The opinion of M. Lavoisier has in part been adopted by Mr. Kirwan; whose Treatise in 1787, informs us, "that dephlogisticated air becomes an essential constituent part of acids. All acids (he adds) consist of two principles: one peculiar to each, which, in the opinion of the antiphlogistians, has not as yet been decomposed, and consequently must be looked upon, relatively to the present state of our knowledge, as a simple substance: the other, *pure air*, in a concrete state; that is, deprived of the greater part of its specific heat, and condensed into a smaller volume. The first they call the *acid basis*; the last, the *oxygenous principle*; thus the vitriolic acid, according to them, consists of sulphur as its basis, and pure air in a concrete state as its acidifying or oxygenous principle. This doctrine has been admitted by some of the ablest defenders of phlogiston, and particularly by M. de Morveau, with this single modification, that the bases of acids contain phlogiston, which they lose on uniting to pure air: yet it seems very difficult to conceive how pure air can unite to phlogiston, a substance to which it has the greatest affinity, without forming a new compound endowed with very different properties from those which it possessed before such union. It seems therefore more reasonable to conclude, either that it forms water, as Mr. Cavendish thinks; or fixed air," as Mr. Kirwan afterwards endeavours to prove.

With regard to the nitrous acid, the experiments of Mr. Cavendish, as well as of the French chemists, leave no room to doubt that it is produced during the deflagration of dephlogisticated and inflammable air. Mr. Cavendish has shewn, that the nitrous acid may be formed by taking the electric spark in a mixture of three measures of phlogisticated air, and seven of dephlogisticated air; or, in weight, one part of the former, and about 2.6 of the latter. Mr. Kirwan is of opinion, that 100 grains of pure dry, and colourless, nitrous acid, contain 38.17 grains of fixed air as its acidifying principle, 57.06 of nitrous basis, and 4.77 of phlogiston united to the nitrous basis. With regard to the nitrous basis itself, he says that one third of its weight is phlogisticated and two thirds dephlogisticated air, both in a concrete state.

"Nitrous basis (says Mr. Kirwan), saturated with phlogiston, constitutes nitrous air: 100 grains of this basis take up nearly 22 of phlogiston. Hence the constituent principles of nitrous acid are fixed air, dephlogisticated air, phlogisticated air, and inflammable air, all in their concrete state.

"Red, yellow, green, and blue, nitrous acids, when those colours are intense, owe their origin to the absorption of nitrous air; and consequently the proportion of their principles is variable, though all have the dephlogisticated acid for their ground. From Dr. Priestley's experiments it appears, that nitrous vapour consists of nitrous acid united to three or four times its weight of nitrous air and a little water."

To shew that nitrous air is not a constituent principle of the nitrous acid, but that fixed air is, Mr. Kirwan observes, that pure nitrous acid enters without decomposition into fixed alkalies, and forms nitre. Now if nitre be

distilled in a good earthen retort, it will be wholly decomposed; and so also will the acid itself, except a few drops which pass in the beginning of the distillation, and nothing but dephlogisticated air, more or less pure, and consequently intermixed with phlogisticated air and a slight proportion of fixed air, will be found: these, therefore, are its true constituent parts when disengaged from substances that cannot communicate phlogiston to it in any remarkable quantity, such as alkalies and earths; but if it be separated from substances that contain phlogiston, such as metals, it will then indeed be resolved into nitrous air, and dephlogisticated air more or less pure, the phlogiston of the fixed air being detained by the metal. Mr. Berthollet, who seems to have made the experiment with the greatest exactness, produced 714 cubic inches of dephlogisticated air from a Troy ounce of nitre. This, however, was far from being of the purest kind; and Dr. Priestley, Mr. Berthollet, and Mr. Succow, observed, that the air which first passes contains fixed air, and renders lime-water turbid. Here then we have three of the constituent parts of the nitrous acid, with scarcely any nitrous air; which the antiphlogistians suppose to be one of the constituent parts of the acid, and to make two-thirds of its bulk when exhibited in an aerial form."

To obviate an objection that the quantity of fixed air thus obtained is too small to deserve to be ranked among the constituent parts of the nitrous acid, Mr. Kirwan first enquires in what proportion it ought to exist there; and though this is variable, according to the different states of the nitrous acid with respect to phlogistication, he reckons it at one third of the acid as existing in the nitre; and from the decomposition of this fixed air, and the phlogiston emitted by it of consequence, he attributes the phlogistication and redness of the nitrous acid when exposed to more heat. As a proof that fixed air may be decomposed in this manner, he adduces two experiments of Dr. Priestley. In one of these, dephlogisticated air was obtained by means of acetic acid in that concentrated state in which it is called *radical vinegar*. Having mixed half an ounce of the acid with two ounces of calcined whiting, he obtained from it 350 ounce-measures of air; of which about one-third was fixed more in the first portions, and less in the last. The standard of the residuum in the first portions was 1.66, in the second 1.42, and in the third 1.38; which is very near the goodness of common air. The whiting then weighed 760 grains. On adding a quarter of an ounce more of radical vinegar, and repeating the operation, 120 ounce-measures of air were obtained, and the whiting was reduced to 730 grains. A third operation, in which another quarter of an ounce of vinegar was added, reduced the matter to 489 grains; but the last portion of air extracted had no fixed air, and was considerably better than that of the atmosphere.—The other experiment was made with lime-stone alone; from four ounces of the *white crystals* of which were obtained 830 ounce-measures of air, the first portion of which had only one-fourth of fixed air, and the standard of the residuum was never better than 1.56, nor worse than 1.66; so that it was nearly of the goodness of common air.

After detailing many other experiments, he says; "Here then are several ways of decomposing the nitrous acid; and in one only it is resolved into nitrous and dephlogisticated air; and in this way it may, at least, be strongly suspected to receive an addition of another principle. Why then should these be regarded as its constituent principles? And as in the two simplest methods of decomposition, in which the re-action of no foreign substance can be suspected, it appears in the form of dephlogisticated, phlogisticated, and fixed, air (the former always containing a portion of the two last), why then should not these be accounted its true constituent parts?—This theory is further confirmed by reflecting on the manner in which nitrous acid is generated by nature. Mr. Thouvenel found that this acid is constantly produced when chalk is exposed to

a mixture of putrid air and common air, or putrid and dephlogisticated air; but, if the putrid air be passed through lime-water, it is never generated; and that it is rarely produced by the exposure of quick-lime or fixed alkalies to these airs. The reason that alkalies, though aerated, are not so proper, is, that they do not combine with phlogisticated air as calcareous earths do. Mr. Cavendish, indeed, produced nitrous acid without any apparent mixture of fixed air; but the atom of it necessary for the formation of the small quantity of nitrous acid he produced (about one-third of a grain), might well be contained in the phlogisticated air he employed, or perhaps formed in the operation."

We shall now notice some experiments made by Mr. Watt, in order to determine whether the dephlogisticated air produced from nitre really proceeds from a decomposition of the acid, or what quantity of the latter is required to constitute a determinate quantity of the former. To ascertain this, 240 grains of mercury were put into a glass retort with 480 grains of diluted dephlogisticated nitrous acid, which was the quantity necessary to dissolve the whole of the mercury; and, as soon as the common air was expelled, a proper vessel was applied to receive the air produced in the operation. Sixteen ounce-measures of nitrous air came over during the solution, and on changing the receiver, a quantity of dilute, but highly phlogisticated nitrous acid, was obtained. The air receiver being again applied, four ounce-measures of strong and pure nitrous air were obtained, which, by the dephlogisticated air that arose immediately after, were reduced to half an ounce-measure. The production of dephlogisticated air continued very rapid, the mercury being all the while revived, until the operation was ended by the distillation or sublimation of the whole of the mercury. Two hundred and eighteen grains of the metal were obtained in its running form, and 22 remained in the form of an orange-coloured sublimate in the upper part of the retort. The 16 ounce-measures of nitrous air, first obtained, were then converted into nitrous acid by the gradual admission of common air, and then added to the water in the basin in which the receiver had been inverted; the whole quantity being about two quarts, and very acid to the taste, sparkling at the same time with nitrous air. To determine the quantity of acid thus recovered, as well as that which remained in the sublimate, a solution of alkali of tartar was made; and by experiment it was found that 120 grains of the acid, originally employed in dissolving the mercury, saturated 352 grains of this solution; the orange-coloured sublimate and all the acid liquor recovered being saturated by 1395 grains of the same. Hence it appears, by the rule of proportion, that, out of 480 grains of nitrous acid originally employed, only five were lost; "a smaller quantity (as Mr. Watt justly observes) than what might reasonably be supposed to be lost in the process by the extreme volatility of the nitrous acid." His conclusion therefore is, that "the nitrous acid does not enter into the composition of dephlogisticated air: it seems only to serve to absorb phlogiston from the watery part of the mercurial nitre."

This experiment was repeated with cubic nitre, and only 30 ounce-measures of air distilled from an ounce of the mineral alkali exactly saturated with nitrous acid. The water through which the air passed was acid, and the residuum in the retort alkaline; but, on mixing the two together, the solution was found to be exactly neutral by every possible test.

Not satisfied with these experiments, Mr. Watt engaged in others which appeared to be still more decisive, but to which, as well as the foregoing, Mr. Kirwan replies—"This opinion is exposed to insurmountable difficulties. For, in the first place, nitre affords dephlogisticated air at the rate of 146.125 cubic inches for every 100 grains of nitre, which, by the proper allowances for phlogisticated air, should weigh 46.77 grains; but then dephlogisticated air is only one of the constituent parts of water, for it

contains 13 per cent. of inflammable air, that is to say, 87 grains of dephlogisticated air: to form 100 grains of water requires an addition of 13 grains of inflammable air; consequently 46.77 grains of dephlogisticated air require nearly 7 of inflammable air, and would then form 53.77 grains of water, which exceeds half the weight of the nitre; a quantity of water, as Mr. Watt owns, certainly inadmissible. Mr. Watt found, that the water, over which the air proceeding from the decomposition of 960 grains of nitre had been received, contained only the acid belonging to 120 grains of nitre; and even this small quantity he inferred only from my experiments. But my experiments are totally inapplicable in this case; for I used only the dephlogisticated nitrous acid: and alkalis are saturable by a much smaller quantity of phlogisticated than of dephlogisticated acids, as is evident in the case of the *dephlogisticated marine acid*, as Stahl long ago observed; for he says, that the volatile acid of sulphur saturates ten times as much alkali as the fixed. Mr. Bergman and Mr. Scheele observe, that melted nitre is still neutral, though it be phlogisticated; therefore it is air, and not water, which it wants. Accordingly Dr. Priestley found it to injure common air by attracting its dephlogisticated part: but, if it be kept in fusion for some time, it loses its acid, and becomes alkaline; and the air it receives must surely be deemed rather to recompose the acid than to form water; of whose formation, in the temperature of the atmosphere, we have no sort of proof. On the contrary, the impossibility of accounting for the loss of acid in this case is an evident proof of the fallacy of that hypothesis.—By M. Lavoisier's analysis, 100 grains of nitre contain 57 of caustic alkali; by Mr. Bergman's, 49; by Mr. Wenzel's, 52; by Mr. Wiegand's, 46½; by mine, 63: the mean of all which is, 53½; which leaves 46.5 for acid and water, which is very nearly the weight of the air expelled. The different quantity of acid assigned by different persons to nitre, is in part owing to its degree of phlogistication in nitre. I believe at present, that 100 grains of nitre contain 34 of acid and about 12 of water, including the water in the acid and that of crystallization."

Mr. Kirwan next proceeds to consider the composition of the other acids.—The marine acid, according to him, consists of a peculiar basis united to phlogiston, and a certain quantity of fixed air; to both of which the basis seems to have a strong affinity.

M. Lavoisier, and other philosophers, who deny the existence of phlogiston, are of opinion, that the common marine acid consists of a peculiar basis united to a small proportion of pure air, or oxygenous principle, and the dephlogisticated marine acid differs from it only by containing an excess of this principle.—This opinion they are chiefly induced to maintain, because the acid in its dephlogisticated state is procured by distilling common marine acid from manganese; and the manganese, if distilled by itself, before the acid is distilled from it, affords dephlogisticated air; but, after the acid is distilled from it, it yields none.—"This experiment, however, (says Mr. Kirwan,) proves no more but that the manganese contains some air which is dephlogisticated during the calcination: And that this air is fixed air, appears from the following considerations: The black calx of manganese almost always gives out fixed air at first, before any dephlogisticated air appears; whence it is natural to think, that the dephlogisticated air proceeds from the dephlogistication of the fixed. And hence, if it be distilled with filings of iron, or in a gun-barrel, it scarcely gives out any other than fixed air; if at any time it gives out dephlogisticated air with little or no mixture of fixed air, this is owing to a very perfect dephlogistication of the calx, and to its containing very little moisture. Thus Dr. Priestley, having passed the steam of boiling water through manganese heated in an earthen tube, obtained a very large quantity of fixed air, and scarcely any other; though, on repeating this experiment with manganese well freed from calcareous earth, I obtained a large portion of dephlogisticated air; but

but I believe much depends on the degree of heat to which the tube is subjected. But having distilled manganese, which yielded of itself some fixed air with common spirit of salt, I obtained dephlogisticated marine acid, and not a particle of fixed air; which shews that this last combined with the dephlogisticated basis, and formed the dephlogisticated acid."

Several other experiments are related by Mr. Kirwan; but the following, he is of opinion, fully confirms his hypothesis, and subverts that of the antiphlogisticians. "Six cubic inches of inflammable air were mixed with as much dephlogisticated marine air over lime-water. In about ten minutes after the greater part of the diminution had taken place, a white cloud appeared on the surface of the lime-water, and by agitation it became still more turbid. As it was possible that the manganese might be mixed with calcareous earth, some dephlogisticated marine air was extracted from another portion of it, and received on lime-water; but it was wholly absorbed, without forming the least cloud, though there was lime enough; for, on adding aerated water, a cloud appeared."

The other acids particularly treated of by Mr. Kirwan are the phosphoric and saccharine. In his treatise on the former, he adopts the analysis of M. Lavoisier, changing only his acid principle of dephlogisticated for fixed air. From this it appears, that the phosphoric acid consists of a peculiar basis united to 2.265 of its weight of the acid principle; or, in other words, 100 grains of dry phosphoric acid contain about 69 of fixed air and 31 of its peculiar basis: 100 grains of the phosphoric basis take up 226.5 of fixed air, or 32.9 of phlogiston when it becomes phosphorus; and 100 grains of phosphorus contain 75.24 of basis and 24.76 of phlogiston.—The basis of this acid is the only one that can be procured free, both from the phlogiston and the acidifying principle; it is called, though improperly, as it is not soluble in water, the *glacial phosphoric acid*. M. Lavoisier and others are of opinion, that phosphorus is a simple substance containing no phlogiston, and that the acid consists of the oxygenous principle united to it.

With regard to the acid of fugar, Mr. Kirwan observes, that fugar itself is a compound of fixed air with a much larger proportion of inflammable air, and some water, all condensed to a degree of which we are ignorant, but retaining, upon the whole, much more specific heat than either oil or charcoal; though he seems inclined to the hypothesis of M. Morveau, that this substance has for its basis a fine ethereal oil, to which a large proportion of condensed inflammable air is superadded. The acid of fugar, then, according to him, consists of this peculiar basis deprived of its superfluous phlogiston, and united to a great quantity of fixed air in a concrete state. He is also of opinion, that it does not exist ready formed in the fugar, but is produced in the operations that substance undergoes: that it derives most of its acid principle from the nitrous acid employed; the nitrous basis taking up the phlogiston, and the fixed air of the nitrous acid combining with the saccharine basis. He contests strongly an opinion of M. Lavoisier, that fugar is a sort of *charcoal*, which uniting with the oxygenous principle of the nitrous acid, decomposes it, sets loose the nitrous air, and forms the saccharine acid; and that, towards the end of the operation, the saccharine acid itself is decomposed; the consequence of which is the production of fixed air, which, according to him, is only the oxygenous principle combined with charcoal. Among other objections, Mr. Kirwan says, "If the acid of fugar be distilled, it is wholly converted into water, fixed inflammable air, and not a particle of coal or dephlogisticated air is found in it. It is not therefore reasonable to look on either of them as its constituent principles; but, as fixed air alone can be extracted from all vegetable acids, it seems to be the true acidifiable principle."

Having given a view of the present opinions relative to the original formation of acids, it remains to treat a little

more particularly of each of the different kinds. They are divided into three different classes, expressive of their origin, viz. the Mineral, Vegetable, and Animal. The mineral acids are, those of vitriol, nitre, sea-salt, borax, amber, fluor, arsenic, tungsten, molybdena, &c. The vegetable are, those of vinegar, tartar, fugar, benzoïn, apples, citrons, lemons, tamarinds, sorrel, cork, &c. The animal acids are, the microcosmic or acid of urine, and that of bones, both of which are also called the *phosphoric*, though this might be accounted a vegetable acid, as it is procured by distilling mustard and some other vegetables by a violent fire. Besides these, there are the acids of ants, wasps, bees, silk-worms, milk, &c. It has also been discovered, that the human calculus is formed for the most part of a peculiar acid, which has received the name of *lithæic acid*. Lastly, as an acid distinct from all these, we may now add *fixed air*, by some called the *aerial* and by others the *cretaceous acid*: the latter appellation it derives from *creta*, chalk, because it is found in that substance in great quantity. See AEROLOGY.

The general properties of acids have already been enumerated; the most remarkable of which is their attraction for alkaline salts, earths, and metals. Though this is common to all, yet very considerable differences are observed among them in this respect, and on those differences depend almost all the phenomena of that part of CHEMISTRY which treats of salts. As these phenomena are particularly considered under that article, we shall here only in general take notice, that the three acids, named the *vitriolic*, *nitrous*, and *marine*, are the strongest of them all; that is, if any other acid be united to an alkali, earth, or metal, the union will be broken by adding to that compound any of the three acids just mentioned. Neither are these equal in power among themselves; for the vitriolic is stronger than the nitrous, and the nitrous stronger than the marine. The rule, however, is liable to certain exceptions and variations, depending chiefly on the circumstances of heat or cold, moisture or dryness, and particularly on the state of the marine acid with regard to its being in the form of an aqueous fluid or reduced to a dry vapour. In this last case it seems stronger than either the vitriolic or nitrous; and even when in an aqueous state, both the nitrous and marine acids, when added in great quantity, seem to oppress and overwhelm the stronger vitriolic acid, so that they will partly expel it from an alkaline salt. This does not depend on the mere quantity of acidity they possess: for the acetous acid may be concentrated to such a degree as to become stronger in this respect than spirit of salt; yet it will always be inferior in point of real strength, when tried with an alkali in competition with the latter. The aerial acid is the weakest of all; and may be expelled not only by vinegar, but by the acid juices of fruits, tartar, and the acids of tungsten and molybdena.

Some acids have the property of resisting the fire, and melting into a kind of glass, such as that of borax and phosphorus. This circumstance gives them an advantage over the stronger acids, which are volatile; and thus the two just mentioned, as well as those of arsenic and tungsten, will, in a very strong heat, expel the acid of vitriol itself, though the latter will, in the cold, expel any one of them with great ease.

Both the vitriolic and nitrous acids have a very strong attraction for phlogiston; and unite with certain oily and inflammable matter so vehemently as to occasion great heat, and sometimes even violent and unextinguishable flame. This is particularly the case with the nitrous acid, or with a mixture of the two; and indeed the nitrous acid, though weaker than the vitriolic, shews itself in every instance to be far more active, and to perform all its operations with vastly greater rapidity, than the other. All these however fall under the articles CHEMISTRY, &c.

We owe to Scheele not only the discovery of the oxygenated muriatic acid, commonly called dephlogisticated marine acid, but also that of the effects which it produces upon the

the colouring parts of vegetables. "It is in its elastic state (says that great chymist) that the qualities of this air are best discovered. In a sand-bath is to be placed a glass retort, in which muriatic acid has been poured upon manganese; to this small receivers are to be adapted, capable of containing about twelve ounces each, into which are to be poured about two drachms of water, without any other lute than a slip of blotting paper about the neck of the retort. In about a quarter of an hour, a yellow air is perceived in the receiver, which is to be taken off. If the paper has been properly applied, the air rushes out forcibly; the receiver must be quickly stopped, and another applied. Thus many receivers may be filled with the dephlogisticated muriatic acid; but it is necessary to place the retort in such a manner that the drops which rise into its neck may be able to fall back. The water serves to retain the vapours of the acid. I use many receivers that I may not be obliged to repeat a similar distillation for every experiment. It is not proper to employ large ones, because, every time they are opened, a great part of the acid is dissipated in the air. What I submitted to examination with this dephlogisticated muriatic acid was placed in the neck of the receiver, which I had stopped. The cork was turned yellow, as by aqua fortis. Paper tinged with turnsol became almost white; all red, blue, and yellow, flowers, as also green plants, turned yellow in a short time, and the water in the receiver was changed into a pure but weak muriatic acid. Neither alkalies nor acids were able to restore the colours of the flowers, or of the plants."

I took up the experiments of Scheele, says Mr. Berthollet, and I attempted to throw more light on the nature of the oxygenated muriatic acid, and upon its principal properties. I have shewn that one portion of the muriatic acid dissolved the calx of manganese, and separated a part of the base of vital air, or oxygene, (which was in excess in the calx of manganese,) that the dissolution might be performed; that this oxygene, being in a non-elastic state, or, according to the expression of Dr. Priestley, in a nascent one, and thereby very much disposed to form new combinations, unites itself with another portion of the muriatic acid, and that this combination constitutes the oxygenated muriatic acid gas.

According to Scheele, "The muriatic acid deprived of phlogiston, which is one of its constituent parts, does not unite with water but in very small quantity, and does not render it very acid." He appears to have contented himself with examining the water which had not been in contact with the gas except during the time of the operation, and to have concluded therefrom that the gas was very slightly soluble therein; so that it appeared to him better to employ the gas itself in his experiments than the water, which would be but weakly impregnated; and which at the same time would contain a small quantity of muriatic acid, which comes over in the distillation, when the necessary precautions are not taken to retain it by an intermediate bottle.

The first object which I proposed to myself was to examine the solubility of the oxygenated muriatic acid gas in water, because I imagined, that, if I was able to obtain a slightly concentrated solution, it might be more easy to submit this liquor to different experiments than the gas itself. I soon perceived that this gas dissolved in water more readily, and in greater quantity, than carbonic acid gas, or fixed air; and that the water which was saturated with it acquired a very strong odour, a yellowish colour, and other properties very strongly marked. I had made my first trials by agitating water in contact with the gas, in the manner in which water is generally impregnated with fixed air; but the suffocating vapour which exhaled determined me to employ Mr. Woulfe's apparatus, instead of that process. I placed, between the retort and the bottles filled with water, (designed to be impregnated with the gas,) a small bottle, which I surrounded with ice, to condense the muriatic vapour which was not oxygenated;

I also surrounded with ice the bottles filled with water. I observed during this operation, that, when the water became saturated with the gas, this last took a concrete form, and fell slowly to the bottom of the water.

If there is filled with water, impregnated with the gas that is disengaged, (that is to say, with oxygenated muriatic acid,) a bottle having a long tube bent and plunged under a recipient filled with water, and this bottle is exposed to the light of the sun, bubbles are soon observed to be disengaged, which pass into the recipient, and which are of pure air (vital air, or oxygene gas); when the bubbles cease to be disengaged, the liquor has lost its odour, its colour, and all its distinguishing properties; it is then no other than water impregnated with common muriatic acid. This simple experiment is sufficient to convince us that the oxygenated muriatic acid is really nothing but a combination of the muriatic acid with the base of vital air, or oxygene, which is in such quantity in the black calx of manganese, that we need only urge this calx by a violent heat to draw off a great quantity; and then it is no longer proper for forming the oxygenated muriatic acid, inasmuch as it is deprived of that portion of oxygene which should combine with a part of the muriatic acid.

It is observable, that light has the property of disengaging the oxygene which has combined with the muriatic acid, by restoring to it that elasticity of which it was partly deprived; which heat alone is not able to do. It appears that light combines with the oxygene, and that it is to this combination the elastic state of vital air is owing, which, in losing afresh its elasticity by combustion, (that is to say, by a rapid union with certain substances,) lets also the principle of light escape, and at the same time much heat is disengaged; the true relation of which to light we are as yet ignorant of.

If vegetable colours are plunged into the oxygenated muriatic acid, they disappear more or less speedily, and more or less completely; when there is a mixture of different colouring particles, some of them disappear more easily, and admit only those to be perceived which offer a great resistance, but which have nevertheless suffered a greater or less alteration. It is most commonly the yellow parts which resist the most, but all at last disappear; and, when the oxygenated muriatic acid has spent its power, it is brought back to the state of common muriatic acid; the colouring particles have therefore taken away its oxygene, and have acquired by that combination new properties, having lost that of producing colours. We shall not say any more at present about the properties of these oxygenated particles; the oxygenated muriatic acid evidently owes the property of destroying colours to oxygene, with which it is combined in great quantity, but with which it is very loosely connected, and therefore easily enters into combination with those substances which have any affinity with it. The affinities of these colouring particles (so various in nature) with oxygene, with light, with alkalies, and other chemical agents, cannot but form a very interesting, and almost entirely new, part of philosophy.

ACIDITY, also *Acor*, *f.* Diseases from this cause are frequent.

The feat of acidity in our bodies, as a disease, is principally the stomach and the small intestines. An acid acrimony is never sensibly prevalent in the blood; yet urine hath been fermented into wine.

An acid acrimony may derive its origin either from too great laxity and debility of the organs of digestion, or from an excess of acrescent food. The ferment excited in our food by the stomach is *sui generis*; if any part of our aliment is not digested by the proper ferment of the stomach, it will run into its own ferment, and if vegetable it will become four. The food of children is for the most part of the vegetable kind, and readily turns four in the stomach, if the body be in any way disordered; hence most of their disorders are accompanied with the evident signs of acidity, as green stools, gripes, &c. Many assert a prevailing acid to be the cause of all diseases in children, but
acidity

acidity in their stomach, is oftener an effect than a cause of their complaints. It is not acidity, but its excess, that injures.

The redundant acid in the primæ viæ is known by the sourness of the eructations, the frequent cardialgia, with curdling of the chyle, &c. in the stomach, flatulence, and spasms in the intestines; when this cause is excessive in its degree, the bile is inert, the belly costive, and the nourishment is unduly supplied, a paleness becomes general in the skin, an itching comes on, and pustules appear here and there, and a train of nervous symptoms soon succeed. Indeed in all diseases peculiar to children, there are for the most part the symptoms of an excess of irritation, the pulse sometimes beats one hundred, or one hundred and twenty, in a minute, the stomach is sick, the vessels of the skin are contracted, and epileptic or convulsive symptoms appear.

Infants are frequently swept off by this disorder. Among adults, the weakly and sedentary are the only subjects of it, except among the poor, whose scanty supplies reduce them to this unhappy state.

The cure, when adults are the subjects, consists of a diet fitted to oppose this faulty habit; animal food, and vegetables of the aromatic alkaline kind: these, with moderate exercise at proper intervals, bid fair for a recovery. Absorbent medicine may palliate symptoms in the stomach and intestines, but the limat. ferri will most conduce to an effectual and lasting cure. Children should be exercised more, and fed less, than is usual; irregularity in these begets flatus, acidity, &c. Antinomial emetics repeated at intervals of two or three days, until the more disagreeable symptoms abate, are highly useful. Small doses of P. Rhæi, with magnes. alb. so as to keep the belly soluble, is better than purging; and to this end give small doses frequently. To free from flatulency, R. ol. ess. sem. fenic. d. gr. i. ocul. 69. pp. gr. v—x. m. & rep. bis vel ter in die. As to absorbents, a mixture of the magnesia alba with the ocul. 69. or other calcareous earths, ought generally to be preferred, and the doses should be very frequently repeated until some relief is obtained, and then their distances may be increased. Indeed in some cases, small doses of fixed, or volatile alkali, particularly liquor. C. C. have been highly beneficial, and warm stimulant plaisters applied to the umbilical region.

ACIDULOUS, *adj.* denotes a thing slightly acid; it is synonymous with the word *sub-acid*.

ACIDULÆ, *f.* [that is, *aqua acidula*.] Medicinal springs impregnated with sharp particles, as all the nitrous, chalybeate, and alum, springs are.—The *acidula*, or medical springs, emit a greater quantity of their minerals than usual; and, even the ordinary springs, which were before clear, fresh, and limpid, become thick and turbid, and are impregnated with sulphur and other minerals, as long as the earthquake lasts. *Woodward*.

Mineral waters that contain a brisk spirit when unaccompanied with heat are thus named; but, if they are hot also, they are called thermæ. In Paracelsus *fontale acetosum* is of the same import. As to the antiquity of their use, see Galen, Cælius Aurelianus, Pliny, &c. who speak largely of their virtues.

Hoffman and many authors highly extol them, whilst others observe that a pure water, on account of its simplicity, such as that from Malvern and Toplitz springs, is to be preferred both for drinking and for bathing; and that, in want of these, they may be well supplied by distilled rain, or any other that is soft and pure. Objectors say, that the medicinal qualities in these waters only quicken their operation as water, but contribute nothing farther, and that solutions of the like materials are of equal efficacy: to which the best reply has been, that the mineral contents are often volatile, and of parts more subtil than those of art's producing; and that, when the powers of nature are expiring, experience proves their efficacy by their success as a last resource.

VOL. I. No. 6.

In general their views are according to the qualities of their contents; these known, their use is easily determined.

Bleeding, or purging, or both, are frequently prescribed before the use of mineral waters; but, except a plethora attends, they are not to be admitted. As these waters are designed to pass, so rest or exercise must be advised; rest and a cool situation favour their diuretic tendency; exercise and a warm air determine them to the skin; these, observed with temperance and moderation in the regimen, are the principal directions on which success depends.

Their brisk sparkling property is owing to the quantity of fixed air which they possess; and indeed to this, perhaps, is owing their chief use as medicine.

To ACIDULATE, *v. a.* [*aciduler*, Fr.] To impregnate or tinge with acids in a slight degree.

ACIDULATED, *f.* a name given to medicines that have an acid in their composition.

ACIDUM AEREUM, *f.* the same with FIXED AIR.

ACIDUM PINGUE, *f.* an imaginary acid, which some German chemists supposed to be contained in fire, and by combining with alkalies, lime, &c. to give them their caustic properties; an effect which is found certainly to depend on the loss of their fixed air.

ACILA, OCILA, or OCELIS, anciently a staple or mart town in Arabia Felix, on the Arabian gulf, from which, according to Pliny, they set sail for India. Now Ziden.

ACILIUS GLABRIO (Marcus), consul in the year of Rome 562, and 211 years before the Christian æra, distinguished himself by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the straits of Thermopylæ in Thessaly, and on several other occasions. He built the Temple of Piety at Rome, in consequence of a vow he made before the above-mentioned battle: and the reason of his giving it that name is very remarkable. The story is mentioned by Pliny, Valerius Maximus, and others.

ACINACES, *f.* in antiquity, a kind of scymetar or cutlafs used among the Persians.

ACINIPPO, anciently a town of Bætica; its ruins, called *Ronda la Vieja*, are to be seen near Arunda, in the kingdom of Granada.

ACINODENDRUM, *f.* in botany, the trivial name of a species of MELASTOMA.

ACINOS, *f.* in botany, a trivial name of a species of THYMUS. See THYMUS.

ACINUS, or ACINI, *f.* the small protuberances of mulberries, strawberries, &c. and by some applied to grapes. Generally it is used for those small grains growing in bunches, after the manner of grapes, as ligustrum, &c.

ACIS, in fabulous history, the son of Faunus and Simetheis, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he dashed out his brains against a rock; after which Galatea turned him into a river, which was called by his name.

ACIS (Ovid, Theocritus); a river of Sicily, running from a very cold spring, in the woody and shady foot of mount Ætna, eastward into, and not much above a mile from, the sea, along green and pleasant banks, with the speed of an arrow, from which it takes its name. It is now called *Aci Iaci*, or Chinci, according to the different Sicilian dialects: Antonine calls it Acius. Also the name of a hamlet at the mouth of the Acis.

To ACKNOWLEDGE, *v. a.* [a word formed, as it seems, between the Latin and English, from *agnosco*, and *knowledge*, which is deduced from *cnathan*, Sax. to know.] To own the knowledge of; to own any thing or person in a particular character:

None that acknowledge God, or Providence,
Their soul's eternity did ever doubt.

Davis.

To confess; as, a fault.—For I acknowledge my transgressions; and my sin is ever before me. *Psalms*, ii. 3.—To own; as, a benefit; sometimes with the particle *to* before the

the person conferring the benefit.—In the place, therefore, I thankfully *acknowledge* to the Almighty power the assistance he has given me in the beginning, and the prosecution of my present studies. *Dryden*.

ACKNOWLEDGING, *adj.* Grateful; ready to acknowledge benefits received. A Gallicism, *reconnoissant*.

ACKNOWLEDGMENT, *f.* Concession of any character in another; as, existence, superiority.—The due contemplation of the human nature doth, by a necessary connexion and chain of causes, carry us up to the unavoidable *acknowledgment* of the Deity; because it carries every thinking man to an original of every successive individual. *Hale*.—Concession of the truth of any position. Confession of a fault. Confession of a benefit received; gratitude. Act of attestation to any concession; such as homage. Something given or done in confession of a benefit received.—The second is an *acknowledgment* to his majesty for the leave of fishing upon his coasts; and, though this may not be grounded upon any treaty, yet, if it appear to be an ancient right on our side, and custom on theirs, not determined or extinguished by any treaty between us, it may with justice be insisted on. *Temple*.

ACKNOWLEDGMENT-MONEY, *adj.* a certain sum paid by tenants, in several parts of England, on the death of their landlords, as an acknowledgment of their new lords.

ACKWORTH, Yorkshire, near Pontefract. In this village, the Society of the Friends in Great-Britain have a seminary, for their children of both sexes.

ACLIDES, *f.* in Roman antiquity, a kind of missive weapon, with a thong affixed to it, whereby to draw it back. Most authors describe it as a sort of dart or javelin; but Scaliger makes it roundish or globular, and full of spikes, with a slender wooden stem to poise it by.

ACLOWA, *f.* in botany, a barbarous name of a species of *COLUTEA*. It is used by the natives of Guinea to cure the itch: they rub it on the body as we do unguents.

ACME, *f.* [*ακμή*, Gr.] The height of any thing; more especially used to denote the height of a distemper, which is divided into four periods. 1. The *arche*, the beginning or first attack. 2. *Anabasis*, the growth. 3. *Acme*, the height. And, 4. *Paracme*, which is the declension of the distemper.

ACMELLA, *f.* in botany, the trivial name of a species of *SPILANTHUS*.

ACMONIA, and **AGMONIA**, in Peutinger's map, a town of Phrygia Major, now in ruins. The inhabitants are called Acmonenses by Cicero, and the city Civitas Acmonensis. Also a city of Dacia, on the Danube, near the ruins of Trajan's bridge, built by Severus, and called Severicum; distant 12 German miles from Temeswar, to the south-east.

ACNIDA, *f.* [*ακανθία*, a nettle; to which it bears some resemblance, without having its puriency.] In botany, a genus of the dioecia pentandria class, ranking in the natural order of scabridæ. The generic characters are—Male. Calyx: perianthium five-leaved; leaflets ovate, concave, acute, membranaceous on the edge. Stamina: filaments five, capillary, very short; antheræ versatile, bilocular, forked each way.—Female. Calyx: involucre many-leaved, linear, deciduous; perianthium two-leaved (three-cleft *g.*) linear, very small, permanent. Pistillum: germ superior, ovate; styles five, long, reflex, pubescent; stigmas simple. Pericarpium: fruit ovate, compressed, many-angled, (three-furrowed, three-sided *g.*) furrowed, covered with the succulent calyx. Seed: solitary, round, compressed.—*Essential Character*. Male. Calyx, five-leaved. Female. Calyx, two-leaved; styles, five; seed one, covered with the succulent calyx.

This plant, which is called Virginian hemp, grows naturally in Virginia, and in some other parts of North America, but is rarely cultivated in Europe, except in some few botanic gardens. It is near of kin to hemp, under which title it has been ranged by some former bota-

nists; there is little beauty in it, and at present no use has been made of it.

ACNUA, *f.* in Roman antiquity, signified a measure of land, about the English rood, or fourth part of an acre.

ACOEMETÆ, or **ACOEMETI**, in church history; or, men who lived without sleep: a set of monks who chanted the divine service night and day in their places of worship. They divided themselves into three bodies, who alternately succeeded one another, so that their churches were never silent. This practice they founded upon the precept, *Pray without ceasing*. They flourished in the east about the middle of the 5th century. There are a kind of acoemeti still subsisting in the Roman church, viz. the religious of the holy sacrament, who keep up a perpetual adoration, some one or other of them praying before the holy sacrament day and night.

ACOLUTHI, or **ACOLUTHISTS**, *f.* in antiquity, was an appellation given to those persons who were steady and immovable in their resolutions: and hence the stoics, because they would not forsake their principles, nor alter their resolutions, acquired the title of acoluthi. The word is Greek, and compounded of *α*, priv. and *κολεῖσθαι*, way; as never turning from the original course.

ACOLUTHI, among the ancient Christians, implied a peculiar order of the inferior clergy in the Latin church; for they were unknown to the Greeks for above 400 years. They were next to the sub-deacon; and we learn from the fourth council of Carthage, that the archdeacon, at their ordination, put into their hands a candlestick with a taper, giving them thereby to understand that they were appointed to light the candles of the church; as also an empty pitcher, to imply that they were to furnish wine for the eucharist. Some think they had another office, that of attending the bishop wherever he went. The word is Greek, and compounded of *α*, priv. and *καλῶναι*, to hinder or disturb.

ACOLYTHIA, *f.* in the Greek church, denotes the office or order of divine service; or the prayers, ceremonies, hymns, &c. whereof the Greek service is composed.

ACOMA, a town of North America, in New Mexico, seated on a hill with a good castle. To go into the town, you must walk up fifty steps cut out of the rock. It is the capital of that province, and was taken by the Spaniards in 1599. Lat. 35. 0. lon. 104. 15. W.

ACOMAC, the name of a county in Virginia. It is on the eastern side of the Chesapeake-bay, on a slip of land, by the Virginians called the Eastern Shore.

ACOMINATUS (Nicetas), was secretary to Alexius Comnenus and to Isaacus Angelus successively: he wrote an History from the death of Alexius Comnenus 1118, where Zonaras ended his, to the year 1203, which has undergone many impressions, and is much applauded by the best critics.

ACONCROBA, *f.* in botany, the indigenous name of a plant which grows wild in Guinea, and is in great esteem among the natives for its virtues in the small-pox. They give an infusion of it in wine. The leaves of this plant are opaque, and as stiff as those of the phillyrea; they grow in pairs, and stand on short foot-stalks; they are small at each end, and broad in the middle; and the largest of them are about three inches in length, and an inch and a quarter in breadth in the middle. Like those of our bay, they are of a dusky colour on the upper side, and of a pale green underneath.

ACONITE, *f.* [*aconitum*, Lat.] Properly the herb wolf's-bane, but commonly used in poetical language for poison in general:

Our land is from the rage of tygers freed,
Nor nourishes the lion's angry feed;
Nor pois'nous aconite is here produc'd,
Or grows unknown, or is, when known, refus'd.

Dryden.

ACONITI,

ACONITI, *f.* in antiquity, an appellation given to some of the **ATHLETÆ**, but differently interpreted. Mercurialis understands it of those who only anointed their bodies with oil, but did not smear themselves over with dust, as was the usual practice.

ACONITUM, *f.* [*aconitos, pulveris experts*; because this plant grows on rocks destitute of soil.] In botany, a genus of the polyandria tryginia class, ranking in the natural order of multiflora. The generic characters are—Corolla: petals five, unequal, opposite in pairs. 1. The highest helmet-tubed, inverted, the back upwards, obtuse; the top reflected to the base, acuminate, to which top the connecting base is opposite. 2, 3, The two lateral ones broad, roundish, opposite, converging. 4, 5, The two lowest oblong, pointing downwards. Nectaries two, concealed under the first petal, fistulous, nodding; mouth oblique, tail recurved; sitting on long subulate peduncles. Six little, very short, coloured, scales, in the same circle as the nectaries. Stamina: filaments subulate, very small, broader at the base, inclining towards the first petal; antheræ erect, small. Pistillum: germs three (five) oblong, ending in styles the length of the stamina; stigmas simple, reflex. Pericarpium: capsules as many as the styles, ovate-subulate, straight, one-valved, gaping inward. Seeds: very many, angular, wrinkled.—*Essential Character*. Petals five, the highest arched, shaped like a hood or helmet; nectaries two, peduncled, recurved; capsules three or five.

Description. The aconites are hardy, herbaceous perennials, with tuberous or strong fibrous roots; stems from two to six feet in height, upright, strong, furnished with many digitate or palmate leaves, and terminated by panicles or loose spikes of blue or yellow flowers.

Species. 1. With three capsules. 1. *Aconitum lycoctonum*, or great yellow monk's-hood or wolf's-bane: leaves palmate multifid villous. This species flowers about the middle of June, and, if the season is not too hot, will continue in blow till August. In Sweden it is reckoned among the earliest spring-flowers. A decoction or the powder of the root is used for destroying flies and other insects. Linnaeus gives an account of its being eaten in Medelpadia, a province of Sweden, without injury. It seems indeed to be milder than some of the other species; and goats and horses are said to eat it. The mountains of Lapland, Sweden, Switzerland, Germany, Austria, Carniola, Italy, and Siberia, produce it, in a wild state: and it was cultivated here in 1596 by Gerard.

2. *Aconitum japonicum*, or Japanese monk's-hood: leaves trifid-palmate; divisions gashed, blunt. It differs but little from the first, and is a native of Japan, where it is called *foo huo*.

3. *Aconitum napellus*, or common monk's-hood or wolf's-bane: divisions of the leaves linear, broader above, and scored with a line. Linnaeus says, that this species is fatal to kine and goats, especially when they come fresh to it, and are not acquainted with the plant; but that it does no injury to horses, who eat it only when dry. He also relates (from the Stockholm acts) that an ignorant surgeon prescribed the leaves, and, on the patient refusing to take them, he took them himself, and died. The ancients, who were unacquainted with chemical poisons, regarded the aconite as the most violent of all poisons; and accordingly fabled it to be the invention of Hecate, and to have sprung from the foam of Cerberus. Its real virulence is however sufficiently established by fatal experiment. Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days. But the root is unquestionably the most powerful part of the plant. Mathioli relates, that a criminal was put to death by taking one drachm of it. Wepfer informs us, that a wolf would probably have died from a dose of two drachms, had not the animal been dissected living, in order to observe the effects of the poison. Dodonæus gives us an instance, recent in his time, of five persons at Antwerp, who ate the

root by mistake, and all died. Dr. Turner also mentions, that some Frenchmen at the same place, eating the shoots of this plant for those of masterwort, all died in the course of two days, except two, who quickly evacuated all they had taken, by vomit. We have an account, in the Philosophical Transactions, of a man who was poisoned, in the year 1732, by eating some of this plant in a salad, instead of celery. Dr. Willis also, in his work *De Anima Brutorum*, gives an instance of a man who died in a few hours, by eating the tender leaves of this plant also in a salad. He was seized with all the symptoms of mania.—The aconite, thus invested with terrors, has however been so far subdued as to become a powerful remedy in some of the most troublesome disorders incident to the human frame. Baron Stoeck led the way by administering it in violent pains of the side and joints, in glandulous schirrh, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose, of an extract, the method of making which he describes. In Sweden, successful experiments have been made of an extract of the juice of the leaves, in cases of rheumatisms and intermittent fevers, given in doses of from a grain to a scruple twice or oftener in a day. A much larger dose has also been safely administered. It is recommended, however, to begin with a small quantity: a caution the more necessary when we consider the fatal effects, which the recent plant ignorantly eaten has sometimes produced. According to Dr. Murray in his App. Med. the chief virtue of the plant is in rheumatic and other chronic disorders. In all these cases the extract above-mentioned is the best preparation. It has also been said to be of considerable service in venereal cases, even those of a confirmed nature; to have even dissolved nodes, and cured obstinate ulcers, &c. In the *Gutta Serena* its efficacy has been commended; but perhaps not so certainly as in the before-mentioned disorders. This species comes into blow in August, and, were it not for its noxious quality, would deserve a place in every garden. It was cultivated in 1596, by Gerard; and it is found wild in Sweden, Switzerland, France, Germany, Austria, Carniola, Italy, Siberia, and Virginia.

4. *Aconitum pyrenaicum*, or Pyrenean or fennel-leaved monk's-hood or wolf's-bane: leaves many-parted, divisions linear incumbent and squarrose. This species grows wild on the Pyrenees, in Tartary and Siberia. The spike nods before the time of flowering, which in our gardens is July: the height there is about four feet, and it has a long spike of yellow flowers of a middling size. It may be allowed a place among shrubs, or in such parts of the garden as are not frequented by children.

II. With five capsules. 5. *Aconitum anthora*, or salutory monk's-hood: flowers with five pistils; divisions of the leaves linear. It flowers in the middle of August, and often continues in beauty till the middle of September; the flowers are not so large as those of some other sorts, but, being of a sulphur colour, make a pretty appearance in the borders of the flower-garden. It was formerly made use of in medicine, and recommended as an antidote to the poisonous species. The taste of the root is sweet with a mixture of bitterness and acrimony. The smell is pleasant. It purges vehemently when fresh, but loses its qualities when dried; it is disused in the present practice; and is certainly poisonous, though in a smaller degree than the others. The native places are the Pyrenees, the Alps of Switzerland, Savoy, and Piedmont; Dauphiné, Austria, Carniola, Siberia, &c. Cultivated in 1596 by Gerard.

6. *Aconitum variegatum*, or variegated or small blue monk's-hood: flowers with five pistils; divisions of the leaves parted half-way, broader above. This is a native of Italy and Bohemia. It flowers at the end of June; seldom grows more than two feet high, and the spikes of flowers are much shorter than in the first sort.

7. *Aconitum album*, or white wolf's-bane or monk's-hood: flowers with five pistils; leaves smooth three-parted, segments acutely gashed; the claw of the upper petal longer than the side ones. This species was found by Tournefort

Tournefort in the Levant, and was first raised in the royal garden at Paris, from the seeds which he sent, but afterwards became rare in Europe.

8. *Aconitum cammarum*, or purple monk's-hood or wolf's-bane: flowers mostly with five styles; divisions of the leaves wedge-shaped, gashed, acute. It is found wild in Switzerland, Austria, Stiria, Piedmont, &c. Haller found it with a white flower; and others have remarked it in Switzerland with flowers of a pale blue, variegated with white.

9. *Aconitum uncinatum*, or American monk's-hood or wolf's-bane: flowers mostly with five styles; leaves many-lobed; helmet extended very far. This species, which is a native of Pennsylvania, has flowers resembling those of the last, but leaves approaching more to the third.

Propagation and Culture. All the sorts of monk's-hood may be propagated by seeds, which should be sown in the autumn, in a shady situation; thus they will appear the spring following; whereas if they are sown in the spring, they generally lie till the year after, before they come up. The ground must be kept clean from weeds all the summer; and the plants should be watered in dry weather, till they are fit to transplant; when they are to be carefully taken up, and planted in shady borders, at the distance of fourteen inches each way, observing to water them till they have taken good root; after which they will require no other care, but to keep them clean from weeds, till the following autumn, when they may be transplanted to the places where they are to remain. They then require no attention but to cut down the stalks in autumn, after they have done flowering. The common monk's-hood will grow under the shade of trees, and is therefore proper to plant in ornamental woods and wildernesses. It will also increase very fast by means of its creeping roots, every piece of which will grow. The other sorts may be increased the same way; though most of these delight in shade, yet few of them will thrive under the drip of trees; they should be planted therefore in shady borders, not immediately overhung by trees, and thus they will continue much longer in flower, and thrive better than in an open exposure. They are all hardy perennials, require little care or culture, and have mostly handsome spikes of specious flowers; and are therefore desirable plants for shrubberies, and wilderness quarters.

ACONITUM HYEMALE, *f.* in botany. See **HELLEBORUS**.

ACONTIAS, *f.* in zoology, an obsolete name of the anguis jaculis, or dart-snake, belonging to the order of amphibia serpentes. See **ANGUIS**.

ACONTIUM, *f.* [*αcontion*], in Grecian antiquity, a kind of dart or javelin, resembling the Roman pilum.

ACONTIUS (Jaimes), a philosopher, civilian, and divine, born at Trent in the 16th century: he embraced the reformed religion; and, coming into England in the reign of Queen Elizabeth, was much honoured by her, which he acknowledges in a book dedicated to that queen. This work is his celebrated Collection of the Stratagems of Satan, which has been so often translated, and borne so many editions.

ACOPA, or *Αcopon*, *f.* [*α, non, and πορος, lassitude.*] At first this word signified the quality of the medicines which was to relieve pain, stiffness, and other ill effects of excessive weariness; but afterwards it only signified the degree of confidence which the medicines were of. These medicines were always external ones. In time the word was used to express those kinds of soft cerates which were applied to tumors, &c. It is also a name of the *trifolium paludosum*.

ACOSTAN, a mountainous island in the north seas between Asia and America, observed by Captain Cook.

ACORN, *f.* [*acern*, Sax. from *ac*, an oak, and *corn*, corn or grain; that is, the grain or fruit of the oak.] The seed or fruit borne by the oak:

The lofty oak from a small acorn grows,
And to the skies ascends with spreading boughs;

As years increase, it shades th' extended plain,
Then, big with death, and vengeance, ploughs the main.
Hence rises fame and safety to our shore,
And from an acorn springs Britannia's power.

ACORN, *f.* in sea-language, a little ornamental piece of wood, fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the malt-head. It is used to keep the vane from being blown off the spindle in a whirlwind, or when the ship leans much to one side under sail.

ACORNED, *adj.* Stored with acorns:

Like a full acorn'd boar.

Shakespeare.

ACORUS, *f.* [*αcoros*, from *αcoron*, the pupil, because it was esteemed good for disorders of the eyes.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of piperitæ. The generic character, are—Calyx: spadix cylindric, entirely simple, covered with floscules; spathe, none; perianthium, none, unless the calyx be so named. Corolla: petals six, obtuse, concave, loose, thicker at the top, and in a manner truncate. Stamina: filaments thickish, a little longer than the corolla; antheræ thickish, twin, terminal, adnate. Pistillum: germ gibbous, rather oblong, the length of the stamina; style, none; stigma, a prominent point. Pericarpium: a short triangular capsule, attenuated to both ends, obtuse, three-celled. Seeds: many, ovate-oblong.—**Essential Character.** Spadix cylindric, covered with floscules. Corollas five-petalled, naked. Capsule three-celled.

Species. 1. *Acorus calamus*, or common sweet rush: the point of the scape very long and leafy. This species is sufficiently distinguished by its long sword-shaped leaves, resembling those of the flag (*iris pseudacorus*), but narrower, and of a brighter green. The root is also like that of the flag; long, cylindric, tuberos, spongy, marked with rings, and putting out abundance of fibres, which indeed are the proper roots. Linnæus observes, that the root powdered might supply the place of foreign spices; and that it is the only native aromatic plant of northern climates. It has a strong aromatic smell, and a warm, pungent, bitterish, taste. The flavour is greatly improved by drying. The roots are commonly imported from the Levant; but those of our own growth are full as good. The Turks candy them, and regard them as a preservative against contagion. They are also said to have cured agues, when the Peruvian bark has failed. No cattle whatever eat the plant. *Calamus aromaticus* grows naturally on the banks of rivers, and in standing waters that are shallow. It is found wild in many parts of England, as on Hounslow-heath near Uxbridge, and Harefield, in Middlesex; near Hedley, in Surrey; in the river Yare near Norwich, and about Lynn and Hillington, in Norfolk; in the river Waveney, by Bungay, in Suffolk; near Cambridge; in the Soar, between Loughborough and Kegworth; about Tamworth; in the Avon, near Pershore; and in many parts of Cheshire. With us it is not very abundant; but it grows plentifully in most of the ditches and standing waters of Holland, and is common in many other parts of Europe.—The Indian *calamus*, which grows in marsh ditches in the East Indies, differs little from the European, except that in all its parts it is more tender and narrow, and at the same time is of a more hot and biting taste. According to Father Loureiro's description, the leaves of this are much shorter than in ours, for he says they are scarcely a foot in length.

2. *Acorus gramineus*, or grass-leaved sweet-rush, or Chinese sweet-grass: the point of the stalk scarcely extending beyond the top of the spadix. The whole herb has an aromatic smell when bruised, much resembling our English sweet-flag; from which the present species is distinguished by the shortness of that portion of its stalk, which is above the spadix, as well as by all its parts, except the florets, being five times smaller than in that plant. It is probably a native of China; at least it is frequently cultivated, for the sake of its smell, in pots, about the habitations

habitations of the Chinese, from whence Mr. Aiton obtained it in 1786, by means of Allan Cooper, Esq. commander of the *Atlas* Indiaman. It flowers in the spring.

Propagation and Culture. The sweet-flag will succeed very well in gardens, if the ground be moist; but never produces its spikes unless it grows in the water. It loves an open situation, and does not thrive well under the shade of trees. The spikes of flowers appear towards the latter end of June, and continue till August. When this plant is fixed in a proper situation, it will multiply by its creeping roots fast enough.—The Chinese sweet-grass must be kept in a dry stove, and does not require a great degree of heat.

ACORUS, *f.* in the materia medica, a name sometimes given to the great galangal. See *KEMPFERIA*.

ACORUS, *f.* in natural history, blue coral. The true fort is very scarce; some, however, is fished on the coasts of Africa, particularly from Rio del Re to the river of the Camarones. This coral is part of the merchandise which the Dutch trade for with the Camarones: that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky bottom.

ACOSMIA, *f.* An irregularity or disturbed state of

things, particularly of the critical days of fevers, as *κοσμος* meant their regular order, from *α*, neg. and *κοσμος*, ornament; called also *madifis*, *madroles*. Bald people were called *acofmoi*, because they had lost their great ornament. Blancard says it is an ill state of health, joined with a loss of colour in the face.

ACOUSMATICI, *f.* sometimes also called *Acouffici*, in Grecian antiquity, such of the disciples of Pythagoras as had not completed their five years probation.

ACOUSTIC, *adj.* [*ακουστικα*, Gr.] in general, denotes any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

ACOUSTIC DUCT, in anatomy, the same with *meatus auditorius*, or the external passage of the ear.

ACOUSTIC VESSELS, in the ancient theatres, were a kind of vessels, made of brass, shaped in the bell fashion, which, being of all tones within the pitch of the voice or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of theatres, which were even 400 feet in diameter.

ACOUSTIC DISCIPLES, among the ancient Pythagoreans, those more commonly called *ACOUSMATICI*.

A C O U S T I C S.

ACOUSTICS, *f.* [*ακουστικα*, of *ακουω*, Gr. to hear.] is a science which instructs us in the nature of sound. As no sounds can be heard in *vacuo*, it is evident, that air is a vehicle for sound. However, we must not assert, that it is the only vehicle; for water, metals, and almost all substances of any density of texture, will not only transmit sound, but even convey it more regularly and perfectly than air, which is by no means a good vehicle. Fishes have a strong perception of sounds, even at the bottom of deep rivers. From hence, it would seem not to be very material in the propagation of sounds, whether the fluid which conveys them be elastic or otherwise. One thing, however, is certain, that whether the medium be elastic or not, whatever sound we hear is produced by a stroke, which the founding body makes against the fluid, whether air or water. The fluid being struck upon, carries the impression forward to the ear, and there produces its sensation. But the manner in which this conveyance is made, is still disputed. Whether the sound be diffused into the air, in circle beyond circle, like the waves of water when we disturb the smoothness of its surface by dropping in a stone; or whether it travels along, like rays diffused from a centre, somewhat in the swift manner that electricity runs along a rod of iron; are questions which have greatly divided the learned.

Newton was of the first opinion. He has explained the progression of sound by an undulatory, or rather a vermicular, motion in the parts of the air. If we have an exact idea of the crawling of some insects, we shall have a tolerable notion of the progression of sound upon this hypothesis. The worm for this instance, in its motion, first carries its contractions from the hinder part, in order to throw its fore part to the proper distance, then it carries its contractions from the fore part to the hinder to bring that forward. Something similar to this is the motion of the air when struck upon by a founding body, as the string of an harpichord screwed to a proper pitch, and made to vibrate by a stroke of the finger. From an impression thus made, there will be an alternate condensation and relaxation of the air during the time of one vibration; and, as the air going forward strikes any opposing body with great

er force than upon retiring, so each of these accelerated progressions has been called by Newton a *pulse* of sound. These pulses will move every way; for all motion impressed upon fluids in any direction whatsoever, operates all around in a sphere: so that sounds will be driven in all directions, and will go on succeeding each other, one on the outside of the other, like circles in disturbed water; or rather, they will lie one without the other, like the coats of an onion.

All who have remarked the tone of a bell, while its sounds are decaying away, must have an idea of these pulses of sound, which, according to Newton, are formed by the air's alternate progression and recession. And it must be observed, that, as each of these pulses is formed by a single vibration of the string, they must be equal to each other; for the vibrations of the string are known to be so.

The velocity with which sounds travel, Newton determines to be in proportion to the thickness of the parts of the air, and the distance of these parts from each other. He proves that each little part moves backward and forward like a pendulum; and demonstrates, that, if the atmosphere were of the same density every where as at the surface of the earth, a pendulum, that reached from its highest surface down to the surface of the earth, would by its vibrations discover to us the proportion of the velocity with which sounds travel. From hence he calculates, that the motion of sound will be 979 feet in one second. But, this not being consonant to experience, he takes in another consideration, namely, vapours in the air; and then finds the motion of sound to be 1142 feet in one second, or near 13 miles in a minute; a proportion which experience had established nearly before.

Various objections, however, have been made to the Newtonian System of Sounds. It is urged, that this theory can only agree with the motion of sound in an elastic fluid, whereas sounds are known to move forward through water, which is not elastic. To explain their progress therefore through water, a second theory must be formed; so that two theories must be made to explain a similar effect; which is contrary to true philosophy and the simplicity of nature.

nature. It is further urged, that this slow vermicular motion but ill represents the velocity with which sounds travel, as we know by experience that it is almost thirteen miles in a minute. In short, it is urged, that such undulations as have been described, when coming from several ignominious bodies at once, would cross, obstruct, and confound, each other; so that, if they were conveyed to the ear by this means, we should hear nothing but a medley of discord and broken articulations. These objections have given rise to the following theory:

Every sound may be considered as driven off from the sounding body in straight lines, and impressed upon the air in one direction only: but whatever impression is made upon the fluid in one direction, is diffused upon its surface into all directions; so that the sound first driven directly forward soon fills up a wide sphere, and is heard on every side. Now, as to the pulses, which a sounding body is known to make, each pulse (say the supporters of this theory) is itself a distinct and perfect sound, and the interval between every two pulses is profoundly silent. Continuity of sound from the same body is only a deception of the hearing; for, as each distinct sound succeeds at very small intervals, the organ has no time to transmit its images with equal swiftness to the mind, and the interval is thus lost to sense: just as when children run with their sticks along a rail, a continuing sound is thus represented, though the stroke against each is perfectly distinct.

According to this theory, therefore, the pulses are nothing more than distinct sounds repeated by the same body, the first stroke or vibration being ever the loudest, and travelling farther than those that follow; while each succeeding vibration gives a new sound, but with diminished force, till at last the pulses decay away totally, as the force decays that gives them existence.

Some bodies, wanting elasticity, give back no repetition of sound; the noise is at once begotten and dies: while other bodies, more elastic and capable of vibration, give back a sound, and repeat it several times successively. These last are said to have a *tone*. This tone of the elastic string, or bell, is notwithstanding nothing more than a similar sound of what the former bodies produced, but with the difference of being many times repeated. So that, if we would give the former bodies a tone, it will be necessary to make them repeat their sound, by repeating our blows swiftly upon them.

Let us now suppose, that by swift and continued strokes we give a non-elastic body its tone: it is very obvious, that no alterations will be made in this tone by the quickness of the strokes, though repeated ever so fast. These will only render the tone more equal and continuous, but make no alteration in the tone it gives. On the contrary, if we make an alteration in the force of each blow, a different tone will then undoubtedly be excited. The difference will be small, for the tones of inflexible bodies are capable but of small variation; however, there will certainly be a difference. The table on which we write, for instance, will return a different sound when struck with a club, from what it did when struck only with a switch. Thus non-elastic bodies return a difference of tone, not in proportion to the swiftness with which their sound is repeated, but in proportion to the greatness of the blow which produces it: for, in two equal non-elastic bodies, that body produces the deepest tone which is struck by the greatest blow.

We now then come to a critical question: What is it that produces the difference of tone in two elastic sounding bells, or strings? Or what makes one deep, and the other shrill? This question has been answered by saying, that the depth or height of the note proceeded from the slowness or swiftness of the times of the vibrations. The slowest vibrations, it has been said, are qualified for producing the deepest tones, while the swiftest vibrations produce the highest tones. In this case an effect has been given for a cause. It is in fact the force with which the sounding string strikes the air when struck upon, that

makes the true distinction in the tones of sounds. It is this force, with greater or less impressions, resembling the greater or less force of the blows upon a non-elastic body, which produces correspondent affections of sound. The greatest forces produce the deepest sound: the high notes are the effect of small efforts. In the same manner a bell, wide at the mouth, gives a grave sound; but, if it be very massy withal, that will render it still graver; but if massy, wide, and long or high, that will make the tone deepest of all.

Thus then will elastic bodies give the deepest sound, in proportion to the force with which they strike the air; but, if we should attempt to increase their force by giving them a stronger blow, this will be in vain; they will still return the same tone; for such is their formation, that they are sonorous only because they are elastic, and the force of this elasticity is not increased by our strength, as the greatness of a pendulum's vibration will not be increased by falling from a greater height.

Thus far of the length of chords. Now, as to the frequency with which they vibrate the deepest tones, it has been found, from the nature of elastic strings, that the longest strings have the widest vibrations, and consequently go backward and forward slowest; while, on the contrary, the shortest strings vibrate the quickest, or come and go in the shortest intervals. From hence those who have treated of sounds, have asserted, as was said before, that the tone of the string depended upon the length or the shortness of the vibrations. This, however, is not the case. One and the same string, when struck, must always, like the same pendulum, return precisely similar vibrations; but it is well known, that one and the same string, when struck upon, does not always return precisely the same tone: so that in this case the vibrations follow one rule, and the tone another. The vibrations must be invariably the same in the same string, which does not return the same tone invariably, as is well known to performers on the violin, who can alter the tone of a string an octave, by a softer method of drawing the bow; and these are called *flute-notes*. The only reason, it has been alleged, that can be assigned for this, must certainly be the different force of the strokes made upon the air. In one case, it has double the tone of the other; because, upon the soft touches of the bow, only half of its elasticity is put into vibration.

This being understood (continue the authors of this theory), we shall be able clearly to account for many things relating to sound that have hitherto been inexplicable. Thus, for instance, if it be asked, When two strings are stretched together of equal lengths, tensions, and thickness, how does it happen, that one of them being struck, and made to vibrate throughout, the other shall vibrate throughout also? The answer is obvious: The force that the string struck receives is communicated to the air, and the air communicates the same to the similar string; which therefore receives all the force of the former; and, the force being equal, the vibrations must be so too. Again, If one string be but half the length of the other, and be struck, how will the vibrations be? The answer is, The longest string will receive all the force of the string half as long as itself, and therefore it will vibrate in proportion, that is, through half its length. In the same manner, if the longest string were three times as long as the other, it would only vibrate in a third of its length; or, if four times, in a fourth of its length. In short, whatever force the smaller string impresses upon the air, the air will impress a similar force upon the longer string, and partially excite its vibrations.

From hence also we may account for the cause of those charming melancholy gradations of sound in the Eolian lyre; an instrument easily made, being nothing more than a long narrow box of thin deal, about 30 inches long, 3 inches broad, and $1\frac{1}{2}$ inches deep, with a circle in the middle of the upper side or belly about $1\frac{1}{2}$ inch diameter, pierced with small holes. On this side are from seven to fifteen strings of very fine gut, stretched over bridges at each

each end, like the bridge of a fiddle, and screwed up with screw-pins. The strings are all tuned to the same note; and the instrument is placed in some current of air, such as a window with the sash just raised. The air brushing the strings, will excite different tones of sound, and sometimes bring out all the tones in full concert, so as to occasion very pleasing gradations of sound.

It remains, lastly, to consider (by this theory) what the musicians call the strength and softness of sound. In vibrating elastic strings, the loudness of the tone is in proportion to the deepness of the note; that is, in two strings, all things in other circumstances alike, the deepest tone will be loudest. In musical instruments upon a different principle, as in the violin, it is otherwise; the tones are made in such instruments by a number of small vibrations crowded into one stroke. The refined bow, for instance, being drawn along a string, its roughness catches the string at very small intervals, and excites its vibrations. In this instrument, therefore, to excite loud tones, the bow must be drawn quick, and this will produce the greatest number of vibrations. But it must be observed, that the more quick the bow passes over the string, the less apt will the roughness of its surface be to touch the string at every instant: to remedy this, therefore, the bow must be pressed the harder as it is drawn quicker, and thus its fullest sound will be brought from the instrument. If the swiftness of the vibrations in an instrument thus rubbed upon, exceed the force of the deeper sound in another, then the swift vibrations will be heard at a greater distance, and as much farther off as the swiftness in them exceeds the force in the other.

By the same theory (it is alleged) may all the phenomena of musical sounds be easily explained. Let us suppose an anvil, or several similar anvils, to be struck upon by several hammers of different weights or forces. The hammer, which is double that of another, upon striking the anvil will produce a sound double that of the other: this double sound musicians have agreed to call an *octave*. The ear can judge of the difference or resemblance of these sounds with great ease, the numbers being as one and two, and therefore very readily compared. Suppose that an hammer, three times less than the first, strikes the anvil, the sound produced by this will be three times less than the first: so that the ear, in judging the similitude of these sounds, will find somewhat more difficulty; because it is not so easy to tell how often one is contained in three, as it is to tell how often it is contained in two. Again, suppose that an hammer four times less than the first strikes the anvil, the ear will find greater difficulty still in judging precisely the difference of the sounds; for the difference of the numbers four and one cannot so soon be determined with precision as three and one. If the hammer be five times less, the difficulty will increase. If the hammer be six times less, the difficulty still increases, and so also of the seventh, inasmuch that the ear cannot always readily and at once determine the precise gradation. Now, of all comparisons, those which the mind makes most easily, and with least labour, are the most pleasing. There is a certain regularity in the human soul, by which it finds happiness in exact, striking, and easily-made, comparisons. As the ear is but an instrument of the mind, it is therefore most pleased with the combination of any two sounds, the differences of which it can most readily distinguish. It is more pleased with the concord of two sounds which are to each other as one and two, than of two sounds which are as one and three, or one and four, or one and five, or one and six or seven. Upon this pleasure, which the mind takes in comparison, all harmony depends. The variety of sounds is infinite; but, because the ear cannot compare two sounds so as readily to distinguish their discriminations when they exceed the proportion of one and seven, musicians have been content to confine all harmony within that compass, and allowed but seven notes in musical composition.

Let us now then suppose a stringed instrument fitted up

in the order mentioned above. For instance, Let the first string be twice as long as the second; let the third string be three times shorter than the first; let the fourth be four times, the fifth string five times, and the sixth six times, as short as the first. Such an instrument would probably give us a representation of the lyre as it came first from the hand of the inventor. This instrument will give us all the seven notes following each other, in the order in which any two of them will accord together most pleasingly; but yet it will be a very inconvenient and a very disagreeable instrument: inconvenient, for, in a compass of seven strings only, the first must be seven times as long as the last; and disagreeable, because this first string will be seven times as loud also; so that, when the tones are to be played in a different order, loud and soft sounds would be intermixed with the most disgusting alternations. In order to improve the first instrument, therefore, succeeding musicians very judiciously threw in all the other strings between the two first, or, in other words, between the two octaves, giving to each, however, the same proportion to what it would have had in the first natural instrument. This made the instrument more portable, and the sounds more even and pleasing. They therefore disposed the sounds between the octave in their natural order, and gave each its own proportional dimensions. Of these sounds, where the proportion between any two is most obvious, the concord will be most pleasing. Thus octaves, which are as two to one, have a most harmonious effect; the fourth and fifth also sound sweetly together, and they will be found, upon calculation, to bear the same proportion to each other as the octaves do. Let us then cease to assign the coincidences of vibrations as the cause of harmony, since these coincidences in two strings vibrating at different intervals must at best be but fortuitous; whereas concord is always pleasing.

But there is another property in the vibration of a musical string not yet taken notice of, and which is alleged to confirm the foregoing theory. If we strike the string of an harpsichord, or any other elastic sounding chord whatever, it returns a continuing sound. This till of late was considered as one simple uniform tone; but all musicians now confess, that instead of one tone it actually returns four tones, and that constantly. The notes are, beside the fundamental tone, an octave above, a twelfth above, and a seventeenth. One of the bass-notes of an harpsichord has been dissected in this manner by Rameau, and the actual existence of these tones proved beyond a possibility of being controverted.

In the whole theory of sounds, nothing has given greater room for speculation, conjecture, and disappointment, than this amazing property in elastic strings. The whole string is universally acknowledged to be in vibration in all its parts, yet this single vibration returns no less than four different sounds. They who account for the tones of strings by the number of their vibrations, are here at the greatest loss; yet if we allow the difference of tone to proceed from the force, and not the frequency, of the vibrations, this difficulty will admit of an easy solution. These sounds, though they seem to exist together in the string, actually follow each other in succession: while the vibration has greatest force, the fundamental tone is brought forward: the force of the vibration decaying, the octave is produced, but almost only instantaneously; to this succeeds, with diminished force, the twelfth; and, lastly, the seventeenth is heard to vibrate with great distinctness, while the three other tones are always silent. These sounds, thus excited, are all of them the harmonic tones, whose differences from the fundamental tone are, as was said, strong, and distinct. On the other hand, the discordant tones cannot be heard. Their differences being but very small, they are overpowered, and in a manner drowned in the tones of superior difference: yet not always neither; for Daniel Bernoulli has been able, from the same stroke, to make the same string bring out its harmonic and its discordant tones also. So that from hence we may justly infer, that every note whatsoever is only a succession of tones;

tones; and that those are most distinctly heard whose differences are most easily perceivable.

To this theory, however, though it has a plausible appearance, there are strong and indeed insuperable objections. The very fundamental principle of it is false. No body whatever, whether elastic or non-elastic, yields a graver sound by being struck with a larger instrument, unless either the sounding body, or that part of it which emits the sound, is enlarged. In this case, the largest bodies always return the gravest sounds.

In speaking of elastic and non-elastic bodies in a musical sense, we are not to push the distinction so far as when we speak of them philosophically. A body is *musically* elastic, all of whose parts are thrown into vibrations so as to emit a sound when only part of their surface is struck. Of this kind are bells, musical strings, and all bodies whatever that are considerably hollow. Musical non-elastics are such bodies as emit a sound only from that particular place which is struck: thus, a table, a plate of iron nailed on wood, a bell sunk in the earth, are all of them non-elastics in a musical sense, though not philosophically so. When a solid body, such as a log of wood, is struck with a switch, only that part of it emits a sound which comes in contact with the switch; the note is acute and loud, but would be no less so though the adjacent parts of the log were removed. If, instead of the switch, a heavier or larger instrument is made use of, a larger portion of its surface then returns a sound, and the note is consequently more grave; but it would not be so, if the large instrument struck with a sharp edge, or a surface only equal to that of the small one.

In sounds of this kind, where there is only a single thwack, without any repetition, the immediate cause of the gravity or acuteness seems to be the quantity of air displaced by the sounding body; a large quantity of air displaced produces a grave sound, and a smaller quantity a more acute one, the force wherewith the air is displaced signifying very little.—What we here advance is confirmed by some experiments made by Dr. Priestley, concerning the *musical tone* of electrical discharges. These shew how much the gravity or acuteness of sounds depends on the quantity of air put in agitation by the sounding body. We know that the noise of the electric explosion arises from the return of the air into the vacuum produced by the electric flash. The larger the vacuum, the deeper is the note: for the same reason, the discharge of a musket produces a more acute note than that of a cannon; and thunder is deeper than either.

Besides this, however, other circumstances concur to produce different degrees of gravity or acuteness in sounds. The sound of a table struck upon with a piece of wood, will not be the same with that produced from a plate of iron struck by the same piece of wood, even if the blows should be exactly equal, and the iron perfectly kept from vibrating.—Here the sounds are generally said to differ in their degrees of acuteness according to the specific gravities or densities of the substances which emit them. Thus gold, which is the most dense of all metals, returns a much graver sound than silver; and metalline wires, which are more dense than thermes, return a proportionably greater sound.—But neither does this appear to be a general rule in which we can put confidence. Bell-metal is denser than copper, but it by no means appears to yield a graver sound; on the contrary, it seems very probable, that copper will give a graver sound than bell-metal, if both are struck upon in their non-elastic state; and we can by no means think that a bell of pure tin, the least dense of all the metals, will give a more acute sound than one of bell-metal, which is greatly more dense.—In some bodies harshness seems to have a considerable effect. Glass, which is considerably harder than any metal, gives a more acute sound; bell-metal is harder than gold, lead, or tin, and therefore sounds much more acutely; though how far this holds with regard to different substances, there are not a sufficient number of experiments for us to judge.

In bodies musically elastic, the whole substance vibrates with the slightest stroke, and therefore they always give the same note whether they are struck with a large or with a small instrument; so that striking a part of the surface of any body musically elastic is equivalent, in it, to striking the whole surface of a non-elastic one. If the whole surface of a table was struck with another table, the note produced would be neither more nor less acute whatever force was employed; the sound would indeed be louder in proportion to the force employed, but the gravity would remain the same. In like manner, when a bell, or musical string, is struck, the whole substance vibrates, and a greater stroke cannot increase the substance. Hence we see the fallacy of what is said concerning the Pythagorean anvils.

Lastly, The argument for the preceding theory, grounded on the production of what are called *flute-notes* on the violin, is built on a false foundation; for the bow, being lightly drawn on an open string, produces no *flute-notes*, but only the harmonies of the note to which the string is tuned. The *flute-notes* are produced by a particular motion of the bow, quick and near the bridge, and by fingering very gently. By this management, the same sounds are produced, though at certain intervals only, as if the vibrations were transferred to the space between the end of the finger-board and the finger, instead of that between the finger and the bridge.

Though these objections seem sufficiently to overturn the foregoing theory, with regard to acute sounds being the effects of weak strokes, and grave ones of stronger impulses, we cannot admit that longer or shorter vibrations are the occasion of gravity or acuteness in sound. A musical sound, however lengthened, either by string or bell, is only a repetition of a single one, whose duration by itself is but for a moment, and is therefore termed *inappreciable*, like the smack of a whip, or the explosion of an electrical battery. The continuation of the sound is nothing more than a repetition of this instantaneous inappreciable noise after the manner of an echo, and it is only this echo that makes the sound agreeable. For this reason, music is much more agreeable when played in a large hall where the sound is reverberated, than in a small room where there is no such reverberation. For the same reason, the sound of a string is more agreeable when put on a hollow violin than when fastened to a plain board, &c.—In the sound of a bell we cannot avoid observing this echo very distinctly. The sound appears to be made up of distinct pulses, or repetitions of the same note produced by the stroke of the hammer. It can by no means be allowed, that the note would be more acute though these pulses were to succeed one another more rapidly; the sound would indeed become more simple, but would still preserve the same tone.—In musical strings the reverberations are vastly more quick than in bells; and therefore their sound is more uniform or simple, and consequently more agreeable, than that of bells. In musical glasses, the vibrations must be inconceivably quicker than in any bell, or stringed instrument; and hence they are of all others the most simple and the most agreeable, though neither the most acute nor the loudest.—As far as we can judge, quickness of vibration contributes to the uniformity, or simplicity, but not to the acuteness, nor to the loudness, of a musical note.

It may here be objected, that each of the different pulses, of which we observe the sound of a bell to be composed, is of a very perceptible length, and far from being instantaneous; so that it is not fair to infer that the sound of a bell is only a repetition of a single instantaneous stroke, seeing it is evidently the repetition of a lengthened note.—To this it may be replied, that the inappreciable sound which is produced by striking a bell in a non-elastic state, is the very same which, being first propagated round the bell, forms one of these short pulses that is afterwards re-echoed as long as the vibrations of the metal continue, and it is impossible that the quickness of repetition of any sound

found can either increase or diminish its gravity, in any degree whatever.

The subject next to be considered in the order of the present work, is the propagation of sound; but, as the doctrine of Sir Isaac Newton is very generally known and acknowledged, we refer to the clear, explanatory, and able, defence of his 47th proposition, by Mr. Young, of Trinity College, Dublin.

Of the Velocity, &c. of Sound.

Experience has taught us, that sound travels at about the rate of 1142 feet in a second, or near 13 miles in a minute; nor do any obstacles hinder its progress, a contrary wind only a small matter diminishing its velocity. The method of calculating its progress is easily understood. When a gun is discharged at a distance, we see the fire long before we hear the sound. If then we know the distance of the place, and know the time of the interval between our first seeing the fire and hearing the report, it will shew us exactly the time the sound has been in travelling to us. For instance, if the gun is discharged a mile off, the moment the flash is seen, you take a watch and count the seconds till you hear the sound; the number of seconds is the time the sound has been travelling a mile. Again, by the above axiom, we are enabled to find the distance between objects that would be otherwise immeasurable. For example, suppose you see the flash of a gun in the night at sea, and tell seven seconds before you hear the report, it follows therefore, that the distance is seven times 1142 feet, that is, 24 yards more than a mile and a half. In like manner, if you observe the number of seconds between the lightning and the report of the thunder, you know the distance of the cloud from whence it proceeds.

Derham has proved, by experiment, that all sounds whatever travel at the same rate. The sound of a gun, and the striking of a hammer, are equally swift in their motions; the softest whisper flies as swiftly, as far as it goes, as the loudest thunder.

To these axioms we may add the following:—Smooth and clear sounds proceed from bodies that are homogeneous, and of an uniform figure; and harsh or obtuse sounds, from such as are of a mixed matter and irregular figure.

The velocity of sound is to that of a brisk wind as fifty to one.

The strength of sounds is greatest in cold and dense air, and least in that which is warm and rarefied.

Every point against which the pulses of sound strike, becomes a centre from which a new series of pulses are propagated in every direction.

Sound describes equal spaces in equal times.

Of Reverberated Sounds.

Sound, like light, after it has been reflected from several places, may be collected in one point, as into a focus; and it will be there more audible than in any other part, even than at the place from whence it proceeded. On this principle it is that a whispering gallery is constructed.

The form of this gallery must be that of a concave hemisphere, as ABC in the annexed figure; and, if a low sound or whisper be uttered at A, the vibrations expanding themselves every way will impinge on the points DDD, &c. and from thence be reflected to EEE, and from thence to the points F and G, till at last they all meet in C, where, as we have said, the sound will be the most distinctly heard.

The augmentation of sound by means of speaking-trumpets.

pets is accounted for in the following manner: When a person speaks through the trumpet, the whole force of his voice is spent upon the air contained in the tube, which will be agitated through the whole length of the tube; and, by various reflections from the side of the tube to the axis, the air along the middle part of the tube will be greatly condensed, and its *momentum* proportionally increased, so that when it comes to agitate the air at the orifice of the tube, its force will be as much greater than what it would have been without the tube, as the surface of a sphere, whose radius is equal to the length of the tube, is greater than the surface of the segment of such a sphere whose base is the orifice of the tube.

But it is obvious, notwithstanding, that the confinement of the voice can have little effect in increasing the strength of sound, as this strength depends on the velocity with which the particles move. Were this reasoning conclusive, the voice should issue through the smallest possible orifice; cylindrical tubes would be preferable to any that increased in diameter; and the less the diameter, the greater would be the effect of the instrument; because the plate or mass of air to be moved, would, in that case, be less, and consequently the effect of the voice the greater; all which is contradicted by experience.

The cause of the increase of sound in these tubes must therefore be derived from some other principles: amongst these we shall probably find, that what the ingenious Kircher has suggested in his *Phonurgia* is the most deserving of our attention. He tells us, that "the augmentation of the sound depends on its reflection from the tremulous sides of the tube; which reflections, conspiring in propagating the pulses in the same direction, must increase its intensity." Newton also seems to have considered this as the principal cause, in the Scholium of Prop. 50. B. 2. Princip. when he says, "We hence see why sounds are so much increased in stentorophonic tubes, for every reciprocal motion is, in each return, increased by the generating cause."

Farther, when we speak in the open air, the effect on the tympanum of a distant auditor is produced merely by a single pulse. But when we use a tube, all the pulses propagated from the mouth, except those in the direction of the axis, strike against the sides of the tube, and every point of impulse becoming a new centre, from whence the pulses are propagated in all directions, a pulse will arrive at the ear from each of those points: thus, by the use of a tube, a greater number of pulses are propagated to the ear, and consequently the sound increased. The confinement too of the voice may have an effect, though not such as is ascribed to it by some; for the condensed pulses produced by the naked voice freely expand every way; but, in tubes, the lateral expansion being diminished, the direct expansion will be increased, and consequently the velocity of the particles, and the intensity of the sound. The substance also of the tube has its effect; for it is found by experiment, that the more elastic the substance of the tube, and consequently the more susceptible it is of these tremulous motions, the stronger is the sound.

If the tube be laid on any non-elastic substance, it deadens the sound, because it prevents the vibratory motion of the parts. The sound is increased in speaking-trumpets, if the tube be suspended in the air; because the agitations are then carried on without interruption. These tubes should increase in diameter from the mouth-piece, because the parts, vibrating in directions perpendicular to the surface, will conspire in impelling forward the particles of air, and consequently, by increasing their velocity, will increase the intensity of the sound: and the surface also increasing, the number of points of impulse and of new propagations will increase proportionally. The several causes therefore, of the increase of sound in these tubes, Mr. Young concludes to be, 1. The diminution of the lateral, and consequently the increase of the direct, expansion and velocity of the included air. 2. The increase of

the number of pulses, by increasing the points of new propagation. 3. The reflections of the pulses from the tremulous sides of the tube, which impel the particles of air forward, and thus increase their velocity.

An echo is a reflection of sound striking against some object, as an image is reflected in a glass: but it has been disputed what are the proper qualities in a body for thus reflecting sounds. It is in general known, that caverns, grottoes, mountains, and ruined buildings, return this image of sound. We have heard of a very extraordinary echo, at a ruined fortress near Louvain, in Flanders. If a person sang, he only heard his own voice, without any repetition: on the contrary, those who stood at some distance, heard the echo but not the voice; but then they heard it with surprising variations, sometimes louder, sometimes softer, now more near, then more distant. There is an account in the *Memoires of the French Academy*, of a similar echo near Rouen.

As it is plain, that every point against which the pulses of sound strike becomes the centre of a new series of pulses, and sound describes equal distances in equal times, therefore, when any sound is propagated from a centre, and its pulses strike against a variety of obstacles, if the sum of the right lines drawn from that point to each of the obstacles, and from each obstacle to a second point, be equal, then will the latter be a point in which an echo will be heard. All the points of the obstacles which produce an echo, must lie in the surface of the oblong spheroid, generated by the revolution of this ellipse round its major axis; but, as there may be several spheroids of different magnitudes, so there may be several different echoes of the same original sound. And, as there may happen to be a greater number of reflecting points in the surface of an exterior spheroid than in that of an interior, a second or a third echo may be much more powerful than the first, provided that the superior number of reflecting points, that is, the superior number of reflected pulses propagated to the ear, be more than sufficient to compensate for the decay of sound which arises from its being propagated through a greater space. This is finely illustrated in the celebrated echoes at the lake of Killarney in Kerry, where the first return of the sound is much inferior in strength to those which immediately succeed it.

From what has been laid down it appears, that for the most powerful echo, the sounding body should be in one focus of the ellipse which is the section of the echoing spheroid, and the hearer in the other. However, an echo may be heard in other situations, though not so favourably; as such a number of reflected pulses may arrive at the same time at the ear as may be sufficient to excite a distinct perception. Thus a person often hears the echo of his own voice; but for this purpose he should stand at least sixty-three or sixty-four feet from the reflecting obstacle, according to what has been said before. At the common rate of speaking, we pronounce not above three syllables and an half, that is, seven half-syllables in a second; therefore, that the echo may return just as soon as three syllables are expressed, twice the distance of the speaker from the reflecting object must be equal to 1000 feet; for, as sound describes 1142 feet in a second, $\frac{2}{3}$ ths of that space, that is, 1000 feet nearly, will be described while six half or three whole syllables are pronounced: that is, the speaker must stand near 500 feet from the obstacle. And in general, the distance of the speaker from the echoing surface, for any number of syllables, must be equal to the seventh part of the product of 1142 feet multiplied by that number. In churches we never hear a distinct echo of the voice, but a confused sound when the speaker utters his words too rapidly; because the greatest difference of distance between the direct and reflected courses of such a number of pulses as would produce a distinct sound, is never in any church equal to 127 feet, the limit of echoes.

But though the first reflected pulses may produce no

echo, both on account of their being too few in number, and too rapid in their return to the ear; yet it is evident, that the reflecting surface may be so formed, as that the pulses which come to the ear after two reflections or more may, after having described 127 feet or more, arrive at the ear in sufficient numbers, and also so nearly at the same instant, as to produce an echo, though the distance of the reflecting surface from the ear be less than the limit of echoes. This is confirmed by a singular echo in a grotto on the banks of the little brook called the Dinan, about two miles from Castlecomber, in the county of Kilkenny. As you enter the cave, and continue speaking loud, no return of the voice is perceived; but on your arriving at a certain point, which is not above fourteen or fifteen feet from the reflecting surface, a very distinct echo is heard. Now this echo cannot arise from the first course of pulses that are reflected to the ear, because the breadth of the cave is so small, that they would return too quickly to produce a distinct sensation from that of the original sound: it therefore is produced by those pulses, which, after having been reflected several times from one side of the grotto to the other, and having run over a greater space than 127 feet, arrive at the ear in considerable numbers, and not more distant from each other, in point of time, than the ninth part of a second.

Entertaining Experiments and Contrivances.

I. Place a concave mirror of about two feet diameter in a perpendicular direction. The focus of this mirror may be at fifteen or eighteen inches distance from its surface. At the distance of about five or six feet let there be a partition, in which there is an opening equal to the size of the mirror; against this opening must be placed a picture, painted in water-colours, on a thin cloth, that the sound may easily pass through it.

Behind the partition, at the distance of two or three feet, place another mirror, of the same size as the former, and let it be diametrically opposite to it.

At the central point let there be placed the figure of a man seated on a pedestal, and let his ear be placed exactly in the focus of the first mirror: his lower jaw must be made to open by a wire, and shut by a spring; and there may be another wire to move the eyes: these wires must pass through the figure, go under the floor, and come up behind the partition.

Let a person, properly instructed, be placed behind the partition near the mirror. You then propose to any spectator to speak softly to the statue, by putting his mouth to the ear of it; assuring him that it will answer instantly. You then give the signal to the person behind the partition, who, by placing his ear to the focus of the mirror, will hear distinctly what the person said; and, moving the jaw and eyes of the statue by the wires, will return an answer directly, which will in like manner be distinctly heard by the first speaker.

This experiment appears to be taken from the *Century of Inventions* of the Marquis of Worcester; whose designs, at the time they were published, were treated with ridicule and neglect as being impracticable, but are now known to be generally, if not universally, practicable. The words of the marquis are these: "How to make a brazen or stone head in the midst of a great field or garden, so artificial and natural, that though a man speak ever so softly, and even whisper into the ear thereof, it will presently open its mouth, and resolve the question in French, Latin, Welsh, Irish, or English, in good terms, uttering it out of its mouth, and then shut it until the next question be asked."—The two following, of a similar nature, appear to have been the inventions of Kircher, by means of which, (as he informs us) he used to "utter feigned and ludicrous consultations, with a view to shew the fallacy and imposture of ancient oracles."

II. Let there be two heads of plaster of Paris, placed on pedestals, on the opposite sides of a room. There must

be a tin tube of an inch diameter, that must pass from the ear of one head, through the pedestal under the floor, and go up to the mouth of the other. Observe, that the end of the tube which is next the ear of the one head, should be considerably larger than that end which comes to the mouth of the other. Let the whole be so disposed that there may not be the least suspicion of a communication.

Now, when a person speaks, quite low, into the ear of one bust, the sound is reverberated through the length of the tube, and will be distinctly heard by any one who shall place his ear to the mouth of the other. It is not necessary that the tube should come to the lips of the bust. If there be two tubes, one going to the ear, and the other to the mouth, of each head, two persons may converse together, by applying their mouth and ear reciprocally to the mouth and ear of the busts; and at the same time other persons that stand in the middle of the chamber, between the two heads, will not hear any part of their conversation. This contrivance forms one of the most pleasing illusions now exhibited at Merlin's Museum of Mechanical Entertainments, in London.

III. Place a bust on a pedestal in the corner of a room, and let there be two tubes, as in the foregoing amusement, one of which must go from the mouth and the other from the ear of the bust, through the pedestal, and the floor, to an under apartment. There may be likewise wires that go from the under jaw and the eyes of the bust, by which they may be easily moved.

A person being placed in the under room, and at a signal given applying his ear to one of the tubes, will hear any question that is asked, and immediately reply; moving, at the same time, by means of the wires, the mouth and the eyes of the bust, as if the reply came from it.

IV. In a large case, such as is used for dials and spring-clocks, the front of which, or at least the lower part of it, must be of glass, covered on the inside with gauze, let there be placed a barrel-organ, which, when wound up, is prevented from playing, by a catch that takes a toothed wheel at the end of the barrel. To one end of this catch there must be joined a wire, at the end of which there is a flat circle of cork, of the same dimension with the inside of a glass tube, in which it is to rise and fall. This tube must communicate with a reservoir that goes across the front part of the bottom of the case, which is to be filled with spirits, such as is used in thermometers, but not coloured, that it may be the better concealed by the gauze.

This case being placed in the sun, the spirits will be ra-

refied by the heat; and, rising in the tube, will lift up the catch or trigger, and set the organ in play: which it will continue to do as long as it is kept in the sun; for the spirits cannot run out of the tube, that part of the catch to which the circle is fixed being prevented from rising beyond a certain point by a check placed over it.

When the machine is placed against the side of a room on which the sun shines strong, it may constantly remain in the same place, if you inclose it in a second case, made of thick wood, and placed at a little distance from the other. When you want it to perform, it will be only necessary to throw open the door of the outer case, and expose it to the sun.

But if the machine be moveable, it will perform on all seasons by being placed before the fire; and in the winter it will more readily stop when removed into the cold.

A machine of this sort is said to have been invented by Cornelius Dreble, in the last century. What the construction of that was, we know not; it might very likely be more complex, but could scarcely answer the intention more readily.

V. Under the keys of a common harpsichord, let there be fixed a barrel, something like that in a chamber-organ, with stops or pins corresponding to the tunes you would have it play. These stops must be moveable, so that the tunes may be varied at pleasure. From each of the keys let there go a wire perpendicular down: the ends of these wires must be turned up for about a quarter of an inch. Behind these wires let there be an iron bar, to prevent them from going too far back. Now, as the barrel turns round, its pins take the ends of the wires, which pull down the keys, and play the harpsichord. The barrel and wires are to be all inclosed in a case.

In the chimney of the same room where the harpsichord stands, or at least in one adjacent, there must be a smoke jack, from whence comes down a wire, or cord, that, passing behind the wainscot adjoining the chimney, goes under the floor, and up one of the legs of the harpsichord, into the case, and round a small wheel fixed on the axis of that first mentioned. There should be pulleys at different distances, behind the wainscot and under the floor, to facilitate the motion of the cord.

This machinery may be applied to any other keyed instrument, as well as to chimes, and to many other purposes where a regular continued motion is required.

An instrument of this sort may be considered as a perpetual motion, according to the vulgar acceptance of the term; for it will never cease going till the fire be extinguished, or some parts of the machinery be worn out.

A C Q

ACQS, a town at the foot of the Pyrenean mountains, in the government of Foix in France. It takes its name from the hot waters in these parts. Lat. 43. 0. lon. 1. 40. E.

ACQUA, a town in Tuscany, noted for warm baths. Lat. 43. 45. N. lon. 12. 10. E.

ACQUA-CHE-FAVELLA, a celebrated fountain in Calabria. It is near the mouth of the river Crata, and the ruins are called Sibari Rovinata.

To ACQUAINT, *v. a.* [*acquaint*, Fr.] To make familiar with; applied either to persons or things. It has *with* before the object.—*Acquaint* yourselves *with* things ancient and modern, natural, civil, and religious, domestic and rational; things of your own and foreign countries; and, above all, be well *acquainted with* God and yourselves; learn animal nature, and the workings of your own spirits. *Watts.*—To inform. *With* is more in use before the object than *of*.

ACQUAINTANCE, *f.* [*acquaintance*, Fr.] The state of

A C Q

being acquainted with; familiarity, knowledge. It is applied as well to persons as things, with the particle *with*.—Our admiration of a famous man lessens upon our nearer *acquaintance with* him; and we seldom hear of a celebrated person, without a catalogue of some notorious weaknesses and infirmities. *Addison.*—Familiar knowledge, simply without a preposition. A slight or initial knowledge, short of friendship, as applied to persons. The person with whom we are acquainted; him of whom we have some knowledge, without the intimacy of friendship. In this sense, the plural is in some authors, *acquaintance*, in others, *acquaintances*.—That young men travel under some tutor, I allow well, so that he be such a one that may be able to tell them, what *acquaintances* they are to seek, what exercises or discipline the place yieldeth. *Bacon.*

ACQUAINTED, *adj.* Familiar, well known; not new: Now call we our high court of parliament; That war or peace, or both at once, may be As things *acquainted* and familiar to us. *Shakespeare.*

ACQUEPENDENTE,

ACQUEPENDENTE, a pretty large town of Italy, in the territory of the church, and patrimony of St. Peter, with a bishop's see. It is seated on a mountain, near the river Paglia, ten miles W. of Orvieto, and fifty-seven N. by W. of Rome. Lat. 42. 43. lon. 11. 53. E.

ACQUARIA, a small town of Italy, in Frigiana, a district of Modena, which is remarkable for its medicinal waters. It is twelve miles south of the city of Modena. Lat. 44. 24. lon. 11. 17. E.

ACQUEST, *f.* [*acquies*, Fr. from *acquérir*, written by some *acquist*, with a view to the word *acquire*, or *acquista*.] Attachment, acquisition; the thing gained.—Mud, reposed near the ossea of rivers, makes continual additions to the land, thereby excluding the sea, and preserving these shells as trophies and signs of its new *acquists* and encroachments. *Woodward*.

ACQUEST, in law, signifies goods got by purchase or donation. See **CONQUEST**.

ACQUI, a town of Italy, in the duchy of Montferrat, with a bishop's see, and commodious baths. It was taken by the Spaniards in 1745, and re-taken by the Piedmontese in 1746; but after this, it was taken again and dismantled by the French, who afterwards forsook it. It is seated on the river Borno, 25 miles N. W. of Genoa, and 30 S. of Casal. Lat. 44. 40. lon. 8. 30. E.

To ACQUIESCE, *v. n.* [*acquiescer*, Fr. *acquiescere*, Lat.] To rest in, or remain satisfied with, without opposition or discontent. It has *in* before the object.—Others will, upon account of the receivedness of the proposed opinion, think it rather worthy to be examined than *acquiesced in*. *Boyle*.

ACQUIESCENCE, *f.* A silent appearance of content, distinguished on one side from avowed content, on the other from opposition.—Neither from any of the nobility, nor of the clergy, who were thought most averse from it, there appeared any sign of contradiction to that; but an entire *acquiescence* in all the bishops thought fit to do. *Clarendon*.—Satisfaction, rest, content. Submission, confidence.—The greatest part of the world take up their persuasions concerning good and evil, by an implicit faith, and a full *acquiescence* in the word of those, who shall represent things to them under these characters. *South*.

ACQUIRABLE, *adj.* That which may be acquired or obtained; attainable.—Those rational instincts, the connate principles engraven in the human soul, though they are truths *acquirable* and deducible by rational consequence and argumentation, yet seem to be inscribed in the very crasis and texture of the soul, antecedent to any acquisition by industry or the exercise of the discursive faculty in man. *Hale*.

To ACQUIRE, *v. a.* [*acquérir*, Fr. *acquiri*, Lat.] To gain by one's own labour or power; to obtain what is not received from nature, or transmitted by inheritance. To come to; to attain.—Motion cannot be perceived without the perception of its terms, viz. the parts of space which it immediately left, and those which it next *acquires*. *Glanville*.

ACQUIRED, *part. adj.* Gained by one's self, in opposition to those things which are bestowed by nature.

ACQUIRER, *f.* The person that acquires; a gainer.

ACQUIREMENT, *f.* That which is acquired; gain; attainment. The word may be properly used in opposition to the gifts of nature.—These his *acquirements*, by industry, were exceedingly both enriched and enlarged by many excellent endowments of nature. *Hayward*.

ACQUISITION, *f.* [*acquisitio*, Lat.] The act of acquiring or gaining. The thing gained; acquirement.—A state can never arrive to its period in a more deplorable crisis, than when some prince lies hovering like a vulture to dismember its dying carcase; by which means it becomes only an *acquisition* to some mighty monarchy, without hopes of a resurrection. *Swift*.

ACQUISITIVE, *adj.* [*acquisitivus*, Lat.] That which is acquired or gained.—He died not in his *acquisitive*, but in his native, soil; nature herself, as it were, claiming a

final interest in his body, when fortune had done with him. *Wotton*.

ACQUIST, *f.* Acquisition; attainment; gain. Not in use.

To ACQUIT, *v. a.* [*acquiter*, Fr.] To set free. To clear from a charge of guilt; to absolve; opposed to *condemn*, either simply with an accusative, as, *the jury acquitted him*, or with the particles *from* or *of*, which is more common, before the crime.—He that judges, without informing himself to the utmost that he is capable, cannot *acquit* himself of judging amiss. *Locke*.—To clear from any obligation.—Steady to my principles, and not dispirited with my afflictions, I have, by the blessing of God on my endeavours, overcome all difficulties; and, in some measure, *acquitted* myself of the debt which I owed the public, when I undertook this work. *Dryden*.—In a similar sense, it is said, *the man hath acquitted himself well*; that is, he hath discharged his duty.

ACQUITMENT, *f.* The state of being acquitted; or act of acquitting.—The word imports properly an *acquittal* or discharge of a man upon some precedent accusation, and a full trial and cognizance of his cause had thereupon. *South*.

ACQUITTAL, *f.* in law, signifies a discharge or being at rest from the suspicion of a crime; as he that is upon a trial and judgment given thereon discharged of a felony, is said to be acquitted of the felony: and, if he be drawn in question again for the same felony, he may plead *autrefois acquit*. For one shall not be brought into danger of his life upon the same accusation more than once: 1 *Inst.* 100. Acquittal is of two kinds; acquittal *in deed*, and acquittal *in law*. Acquittal in deed is, when a person is cleared by verdict. Acquittal in law is, as if two be indicted of felony, the one as principal, and the other as accessory, and the jury acquits the principal, in this case by law the accessory also is acquitted. 2 *Inst.* 384.

To ACQUITTANCE, *v. a.* To procure an acquittance; to acquit; a word not in present use:

But, if black scandal and foul-fac'd reproach
Attend the sequel of your imposition,
Your mere enforcement shall *acquittance* me
From all the impure blots and stains thereof.

Shakespeare.

ACQUITTANCE, *f.* The act of discharging from a debt.

ACQUITTANCE, in law, is a sort of release, being a discharge in writing of a sum of money or other duty, which ought to be paid or performed. As if one is bound to pay money upon an obligation, or rent reserved upon a lease, and the party to whom it is due, upon receipt thereof, gives a writing under his hand, witnessing that he is paid. This is such a discharge in law, that he cannot demand or recover the sum or duty again, if the acquittance is produced. *T. L.*

The obligor is not bound to pay money upon a single bond, unless the obligee will make him an acquittance. Nor is he bound to pay it before he has the acquittance. And in this case the obligor may compel the obligee to make him an acquittance. But otherwise it is in case of an obligation with a condition; for there one may aver payment. *Wood, b. ii. c. 3.*

But an acquittance is only an evidence of payment, and by the common law was not pleadable, because it is no deed.—But now, by the statute of 4 Anne, c. 16. where an action of debt shall be brought on a single bill or on a judgment, if the defendant hath paid the money due thereupon, such payment may be pleaded in bar of such action: and where an action of debt is brought upon a bond conditioned to be void on payment of a smaller sum, at a day and place certain; if the defendant hath paid, before the action brought, the principal and interest due by the condition of such bond, though not strictly according to the condition, yet it may be pleaded in bar of the action: and on payment into court of principal, interest, and costs, the same shall be a full discharge of the bond. *S. 12, 13.*

An acquittance in full of all *accounts* shall be extended only to accounts. *Wood, b. ii. c. 3.*

An acquittance in full of all *demands* will discharge all debts except such as are upon specialty under seal: for these can only be destroyed by some other specialty of equal force, as a general release. *Cro. Ja. 650.*

If a rent is behind for a number of years, and the landlord makes an acquittance of the last that is due, all the rest are presumed to be paid, and the law will admit no proof against this presumption. *1 Inst. 373.*

ACRA, a town of Africa, on the coast of Guinea, where the English, Dutch, and Danes, have strong forts, and each fort its particular village. Lat. 5. o. lon. o. 2. W.

ACRA was also one of the hills of Jerusalem, on which stood the lower town, which was Old Jerusalem; to which was afterwards added Zion, or the city of David. Probably called Acra, from the fortrefs which Antiochus built there in order to annoy the temple, and which Simon Maccabæus took and razed to the ground.

ACRA JAPYGiA, anciently called Salentia by Ptolemy; now *Capo di San Maria di Leuca*: a promontory in the kingdom of Naples, to the south-east of Otranto, where formerly was a town, now lying in ruins, on the Ionian sea, over against the Montes Acroceraunii of Epirus.

ACRÆ, anciently a town of Sicily, whose inhabitants were called Acrenses. It stood to the south of Syracuse, at the distance of twenty-four miles, near the place now called the monastery of *Santa Maria d'Arcia*.

ACRAGAS, or AGRAGAS, so called by the Greeks, and sometimes by the Romans, but more generally Agrigentum by the latter, was a town of Sicily. It was a place of great strength, standing on the top of a very steep rock, and washed on the south side by the river Acragas, now called *Fiume di Gergenti*, and on the south-west by the Hypsa, with a citadel to the south-east, externally surrounded by a deep gulf, which made it inaccessible but on the side next the town. It was famous for the tyrant Phalaris and his brazen bull. They were a people luxurious in their tables, and magnificent in their dwellings; of whom Empedocles, in Diogenes Laertius, says, that they lived to-day as if they were to die to-morrow, and built as if they were to live for ever. The country round the city was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. Lat. 37. 20. lon. 13. 30. E.

ACRASIA, *f.* INTemperance, [from *α*, priv. and *κραννυμι*, to mix.] The ancients mixed one pint of wine with four or five of water. Asclepiades ordered half wine and half water; hence wine unmixd was called acrasia, which we construe intemperance; for the Latin word *tempero* is of the same import as *κραννυμι*, to mix. Hence the word was applied to excess, as in eating, drinking, venery, &c. By Hippocrates, and some others, it signifies imbecility. By physicians, it means the predominancy of one quality above another, either with regard to artificial mixtures, or the humours of the body.

ACRATH, anciently a place in Mauritania Tingitana, now supposed to be *Velez de Gomara*: a fortified town in the kingdom of Fez, with a citadel and commodious harbour on the Mediterranean, scarcely a mile distant from Penon de Velez, a Spanish fort. Lat. 34. 45. lon. 5. o. W.

ACRATISMA, *f.* a BREAKFAST. The derivation of this word is the same as that of acrasia, because the wine used on this occasion was not mixed with water. A breakfast among the old Greeks consisting of a morsel of bread steeped in wine.

Children and weakly people should not omit this meal. Our breakfasts should consist of the harder kinds of aliment, to promote a plentiful discharge of saliva.

ACRE, or ACRA, a sea-port town in Syria. It was formerly called Ptolemais, and is a bishop's see. It was very famous in the time of the crusadoes, and underwent several sieges both by the Christians and Saracens. It is situated at the north angle of a bay, which extends in a semicircle of three leagues, as far as the point of Carmel.

During the crusades, the possession of this town was long disputed by the Christians and Saracens. In 1192 it was taken from the latter by Richard I. of England, and Philip of France; and they gave it to the knights of St. John of Jerusalem, who kept possession of it 100 years, when it was retaken by the Saracens, and almost entirely destroyed. This event is rendered memorable by an act of singular resolution with which it was accompanied. A number of beautiful young nuns, terrified at the prospect of being exposed to the brutal lust of the infidels, determined to avoid the violation of their chastity by rendering themselves objects of aversion. With this view they cut off their noses and mangled their faces. The Saracens, inflamed with resentment at a spectacle which prevented the gratification of their appetites, immediately put them all to the sword. After the expulsion of the crusaders, it remained almost deserted; but in our time has again revived by the industry of Daher; and the works erected by Djezzar, within the last fifteen years, have rendered it one of the principal towns upon the coast. The mosque of this pacha is boasted as a master-piece of eastern taste. The bazar, or covered market, is not inferior even to those of Aleppo; and its public fountain surpasses in elegance those of Damascus, though the water is of a very indifferent quality. The pacha has derived the more honour from these works, as he was himself both the engineer and architect: he formed the plans, drew the designs, and superintended the execution.

Corn and cotton form the basis of the commerce of Acre, which is becoming more flourishing every day. Of late, the pacha, by an abuse common throughout all the Turkish empire, has monopolized all the trade in his own hands; no cotton can be sold but to him, and from him every purchase must be made. In vain have the European merchants claimed the privileges granted them by the sultan: Djezzar replied, that he was the sultan in his country, and continued his monopoly. These merchants in general are French, and have six houses at Acre, with a consul: an imperial agent too is lately settled there; also a resident for Russia.

That part of the bay of Acre in which ships anchor with the greatest security lies to the north of mount Carmel, below the village of Haifa (commonly called Caiffa). The bottom is good holding ground, and does not chafe the cables; but the harbour is open to the north-west wind, which blows violently along all this coast. Mount Carmel, which commands it to the south, is a flattened cone, and very rocky; it is about 2000 feet high. We still find among the brambles wild vines and olive trees, which prove that industry has formerly been employed even in this ungrateful soil. On the summit is a chapel dedicated to the prophet Elias, which affords an extensive prospect over sea and land. It is 20 miles S. of Tyre, and 37 N. of Jerusalem. Lat. 32. 40. lon. 39. 25. E.

ACRE, *f.* in the Mogul's dominions, the same with lack, and signifies the sum of 100,000 rupees; the rupee is of the value of the French crown of three livres, or thirty shillings of Holland; and 100 lacks of rupees make a couaron in Indostan, or 10,000,000 rupees: the pound sterling is about eight rupees; according to which proportion, a lack of rupees amounts to 12,500l. sterling.

ACRE, *f.* [*acre*, Sax.] the universal measure of land in Britain. The word did not originally signify a determined quantity of land, but any open ground, especially a wide champaign; and in this antique sense it seems to be preserved in the names of places, as Cattle-acre, West-acre, &c. An acre in England contains four square rods, a rod 40 perches or poles of 16½ feet each by statute. Yet this measure does not prevail in all parts of England, as the length of the pole varies in different counties, and is called customary measure, the difference running from the 16½ feet to 28. The acre is also divided into 10 square chains, of 22 yards each, that is, 4840 square yards.

The French acre, *arpent*, contains 1½ English acre, or 54,450 square English feet, whereof the English acre contains

tains only 43,560. The Strasburg acre is about half an English acre. The Welsh acre contains commonly two English ones. The Irish acre is equal to 1 acre, 2 roods, and 19 perches $\frac{22}{11}$, English.

Dr. Grew attempts to ascertain the number of acres in England, which, according to him, amounts to 46 millions and 80,000. The United Provinces are said to contain 4,382,000 acres: the province of Holland but one million of acres. The territory of the United States of America, according to calculations lately made by order of congress, contains 589 millions of acres, exclusive of water, which is computed at 51 millions more.

ACRE-FIGHT, an old sort of duel fought by English and Scottish combatants, between the frontiers of their kingdoms, with sword and lance: it was also called camp-fight, and the combatants champions, from the open field being the stage of trial.

ACRE-TAX, a tax laid on land at so much per acre. In some places this is also called acre-shot. Impositions on lands in the great level are to be raised by a proportionable acre-tax, 20 Car. II. cap. 8. An acre-tax of 2s. 6d. per acre, for draining Hadenham-level, 13 Geo. I. cap. 18.

ACREA, *f.* also ACROTHERIA, the extremities, i. e. the legs, arms, nose, and ears. Coldness in the extremities, which do not easily warm, are bad prefaces in fevers.

ACRIBELA, *f.* a term purely Greek, literally denoting an exquisite or delicate accuracy; sometimes used in our language, for want of a word of equal signification.

ACRID, *adj.* [*acer*, Lat.] Of a hot biting taste; bitter; so as to leave a painful heat upon the organs of taste.—Bitter and *acrid* differ only by the sharp particles of the first being involved in a greater quantity of oil than those of the last. *Arbutnot*.

ACRID MEDICINES are substances of a penetrating pungency: applied to the skin, they inflame it; chewed, they promote a discharge of the saliva; and, snuffed up the nose, they provoke sneezing. Considered as the subjects of pharmacy, they may be divided into classes, according as they yield their acrimony; which they do, 1st, by distillation. Thus mustard, horse-radish, scurvy-grass, &c. give out their properties. 2dly, By infusion only, as is the case with the greater celandine, pyrethrum, &c. 3dly, Neither by infusion nor distillation, as happens with the arum, dracunculus, &c. The general effects of acrid medicines are to stimulate the solids, and to dissolve tenacious juices. In leucophlegmatic habits, they are powerful expectorants, deobstruents, diuretics, and emmenagogues; and, if the patient is kept warm, they are good diaphoretics. In constitutions disposed to inflammation, or where there is already a degree of irritation, where the juices are too thin and acrid, or the viscera not found, these medicines are not to be used, for they aggravate these disorders. The trouble which acrid medicines give to the stomach, is that on which their virtue frequently depends.

ACRIDOPHAGI, in the ancient geography, an Ethiopian people, represented as inhabiting near the deserts, and to have fed on locusts. This latter circumstance their name imports; the word being compounded of the Greek *ακρις*, locust, and *φαγω*, to eat. We have the following account of them by Diodorus Siculus. Their stature was lower than that of other men; they were meagre, and extremely black. In the spring, high west winds drove from the desert to their quarter locusts of an extraordinary size, and remarkable for the squalid colour of their wings. So great was the number of these insects, that they were the only sustenance of the barbarians, who took them in the following manner:—At the distance of some stadia from their habitations there was a wide and deep valley. They filled this valley with wood and wild herbs, with which their country abounded. When the cloud of locusts appeared, which were driven on by the wind, they set fire to the fuel which they had collected. The smoke which arose from this immense fire was so thick, that the locusts, in crossing the valley, were stifled by it, and fell

in heaps on the ground. The passage of the locusts being thus intercepted for many days, they made a large provision of those insects. As their country produced great quantities of salt, they salted them, to render them more palatable, and to make them keep till the next season. This peculiar supply was their sole food: they had neither herds nor flocks. They were unacquainted with fishing; for they lived at a distance from the sea. They were very active, and ran with great swiftness. But their life was not of long duration; it exceeded not forty years; and the close of it was extremely miserable; for, in their old age, winged lice of different, but all of ugly, forms, bred in their bodies. This malady, which began in the breast and belly, soon spread through the whole frame. The patient at first felt an itching; and the agreeable sensation produced by his scratching of himself, preceded a most deplorable calamity. For when those lice, which had bred in his body, forced their way out, they caused effusions of corrupt blood, with excruciating pains in the skin. The unhappy man, with lamentable cries, was industrious himself to make passages for them with his nails. In short, these lice issued forth successively from the wounds made by the hands of the patient, as from a vessel full of holes, and in such numbers that it was impossible to exterminate them. Whether this extraordinary and dreadful distemper was occasioned by the food of the inhabitants of this country, or by a pestilential quality of their climate, it is difficult to determine. Indeed, as to the credibility of the whole account, we must leave the reader to judge.

But though the circumstance of these people should be deemed fabulous, yet may the *acridophagia* be true. It is well known, that to this day the inhabitants of Ethiopia, Arabia, &c. frequently use locusts as food. A late traveller, Dr. Sparman, informs us, "That locusts sometimes afford a high treat to the more unpolished and remote hordes of the Hottentots; when, as sometimes happens, after an interval of eight, ten, or twenty, years, they make their appearance in incredible numbers. At these times they come from the north, migrating to the southward, and do not suffer themselves to be impeded by any obstacles, but fly boldly on, and are drowned in the sea whenever they come to it. The females of this race of insects, which are most apt to migrate, and are chiefly eaten, are said not to be able to fly; partly by reason of the shortness of their wings; and partly on account of their being heavy and distended with eggs; and, shortly after they have laid these in the sand, they are said to die. It is particularly of these that the Hottentots make a brown coffee-coloured soup, which, at the same time, acquires from the eggs a fat and greasy appearance. The Hottentots are highly rejoiced at the arrival of these locusts, though they are sure to destroy every bit of verdure on the ground; but the Hottentots make themselves ample amends for this loss, by falling foul on the animals themselves, eating them in such quantities as in the space of a few days to get visibly fatter and in better condition than before."

The Abbé Poiret, also, in his Memoir on the Insects of Barbary and Numidia, informs us, "That the Moors make locusts a part of their food; that they go to hunt them; fry them in oil and butter; and sell them publicly at Tunis, at Bonne," &c.

From these accounts, we may see the folly of that dispute among divines about the nature of St. John's food in the wilderness: some maintaining the original word to signify the fruits of certain trees; others, a kind of birds, &c. but those who adhered to the literal meaning of the text were at least the most orthodox, although their arguments were perhaps not so strong as they might have been, had they had an opportunity of quoting such authors as the above.

ACRIMONIOUS, *adj.* Abounding with acrimony; sharp; corrosive.—If gall cannot be rendered *acrimonious*,
and

ACROCHORDUS, AND ACTINIA.

1. The Javan Acrochord or Warty Snake. 2 to 11. Curious Species of Actinia.

and bitter of itself, then whatever acrimony or amaritude redounds in it, must be from the admixture of melancholy. *Harvey.*

ACRIMONY, *f.* [*acrimonia*, Lat.] Sharpness, corrosiveness.—There be plants that have a milk in them when they are cut; as, figs, old lettuce, fow-thistles, and spurge. The cause may be an inception of putrefaction: for those milks have all an *acrimony*, though one would think they should be lenitive. *Bacon.*—Sharpness of temper, severity, bitterness of thought or language.—John the Baptist set himself, with much *acrimony* and indignation, to baffle this senseless arrogant conceit of theirs, which made them huff at the doctrine of repentance, as a thing below them, and not at all belonging to them. *South.*

ACRIMONY, in medicine, is a term applied to any substances that produce particular sensations from the action of that stimulus which they possess, and which we express by the different terms, sharpness, eagerness, tartness, acid, alkali, &c. and it is also applicable to some states of the humours in the human body, as acrimony of the bile, and other materials, which are, by the laws of the animal economy, constantly thrown out of the machine, in order that the humours may be kept in a sound state; for, except when in a morbid state, they are free from all acrimony. When in a morbid state, we have different species of acrimony; such as acrimony of the gout, rheumatism, scrophula, cancer, &c. which are judged of, and denominated, from the effects they produce on the habit. Hence, we say, complaints of this nature originate from an acrimonious humour, *sui generis*.

ACRISIUS, king of Argos, in fabulous history, being told by the oracle that he should be killed by his grandchild, shut up his only daughter Danaë in a brazen tower: but Jupiter, coming down in a golden shower, begot Perseus upon her: after Perseus had slain the Gorgons, he carried Medusa's head to Argos; which Acrisius seeing, was turned into a statue.

ACRITAS, a promontory of Messenia, running into the sea, and forming the beginning of the bay of Messene. Now called *Capo di Gallo*, between Methone to the west, and Corone to the east, where the Sinus Coronæus begins.

ACRITUDE, *f.* An acrid taste; a biting heat on the palate.—In green vitriol, with its astringent and sweetish tastes, is joined some *acritude*. *Grew.*

ACROAMATICAL, *adj.* [*ακροαματις*, Gr. I hear.] Of or pertaining to deep learning; the opposite of exoteric.

ACROAMATICI, a denomination given the disciples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATICS, *f.* [*ακροατικά*, Gr.] Aristotle's lectures to his disciples were of two kinds, *exoteric* and *acroatic*. The *acroatic* were those to which only his own disciples and intimate friends were admitted; whereas the *exoteric* were public, and open to all. But there are other differences. The *acroatic* were set apart for the higher and more abstruse subjects; the *exoteric* were employed in rhetorical and civil speculations.

ACROATHOUM, or **ACROTHOUM**, anciently a town situated on the top of mount Athos, where the inhabitants, according to Mela, were longer lived by half than in any other country: called by the modern Greeks *Αγιος ορος*; by the Italians, *La Cima di Monte Santo*.

ACROBATICA, or **ACROBATICUM**, [from *ακρος*, high, and *βαίνω*, or *βαινω*, I go.] An ancient engine, whereby people were raised aloft, that they might see more conveniently about them. The *acrobatia* among the Greeks amounted to the same with what they call *scanzorium* among the Latins. Authors are divided as to the office of this engine. Turnebus and Barbarus take it to have been of the military kind, raised by besiegers, high enough to overlook the walls, and discover the state of things on the other side. Baldus rather supposes it a kind of moveable scaffold, or cradle, contrived for raising

painters, plasterers; and other workmen, to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes; which is the opinion of Vitruvius and Aquinas.

ACROCERAUNIA, or **MONTES CERAUNII**, mountains running out into the sea (so called from their being often thunder-struck), separating the Ionian Sea from the Adriatic; where Illyria ends and Epirus begins: now called *Monti della Chimera*.

ACROCHORDON, [from *ακρος*, extreme, and *χορδή*, a string.] This is one instance, which, as Galen observes, shews the oddity of the analogies by which the ancients gave name to things. This name they gave to a sort of warts, from their being situated on the skin. Wifeman calls them *peasile warts*. Galen in his *Def. Méd.* says it is a round excrescence on the skin, with a slender base; so that the excrescence seems to hang by a string. Sometimes they suddenly disappear, at others they inflame or suppurate. Celsus observes, that if they are cut out, they leave no root, so do not grow again.

ACROCHORISMUS, [from *ακρος*, extreme, and *χορεύω*, to dance.] An exercise of dancing, with violent motions of the legs and arms. Schulzius says, they joined head to head, and hand to hand, and strove to push one another out of their places.

ACROCORINTHUS, a high and steep hill, hanging over the city of Corinth, which was taken within the walls, as an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain Pyrene.

ACROMION, *f.* in anatomy, the upper part of the scapula or shoulder-blade. See **ANATOMY**.

ACROMONOGRAMMATICUM, *f.* in poetry, a kind of poem, wherein every subsequent verse begins with the letter wherewith the immediately preceding one terminated.

ACRON, a celebrated physician of Agrigentum, who first thought of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, and which was attended with success. He lived about 473 years before the Christian æra.

ACRON, a territory on the gold-coast of Guinea, in Africa, bordering on the Fantyneon country. The Dutch have a fort here called Fort Patience; and under it is a village, inhabited only by fishermen. The other inhabitants are addicted to husbandry, and sell their corn to other countries. There is plenty of game, which is very commodious for the Dutch factory. The people are very ignorant, and go naked like the rest of the negroes. This is called Little Acron; for Great Acron is farther inland, and is a kind of republic.

ACRONIUS LACUS (Mela); a small lake formed by the Rhine, soon after its rise out of the Alps, and after passing the greater lake at Constance, called *Venusus*, and now the *Bodensee*, or lake of Constance.

ACRONYCAL, *adj.* [from *ακρος*, *summus*, and *νύξ*, *nox*; importing the beginning of night.] In astronomy, is said of a star or planet, when it is opposite to the sun. It is from the Greek *ακρονυχος*, the point or extremity of night, because the star rose at sun-set, or the beginning of night, and set at sun-rise, or the end of night; and so it shone all the night.

The acronycal is one of the three Greek poetic risings and settings of the stars; and stands distinguished from cosmical and heliacal. And by means of which, for want of accurate instruments, and other observations, they might regulate the length of their year.

ACRONYCALLY, *adv.* [from *acronycal*.] At the acronycal time.—He is tempestuous in the summer, when he rises heliacally, and rainy in the winter, when he rises *acronycally*. *Dryden.*

ACROPATHOS, [from *ακρος*, extreme, and *παθος*, a disease.] It literally signifies a disease at the height, or, a disease which affects any superior part of the body. Hippocrates applies it to the internal orifice of the uterus; when

when affected; to occult cancers, and to cancers on the surface of the body, to distinguish them from those that are inward.

ACROPOLIS, the citadel, and one of the divisions of Athens; called *Polis*, because constituting the first and original city; and the Upper Polis, to distinguish it from the Lower, which was afterwards built round it in a large open plain, the Acropolis standing on a rock or eminence in the heart of this plain: and hence its name: To the north it had a wall, built by the Pelasgi, and therefore called *Pelasgic*; and to the south a wall, by Cymon the son of Miltiades, out of the Persian spoils, many ages after the building of the north wall. It had nine gates, and was therefore called *Enneapylon*; yet but one principal gate or entrance, the ascent to which was by a flight of steps of white marble, built by Pericles with great magnificence.

ACROPOLITA (George), one of the writers in the Byzantine history, was born at Constantinople, in the year 1220, and brought up at the court of the emperor John Ducas at Nice. He was employed in the most important affairs of the empire; being sent ambassador to Larissa, to establish a peace with Michael of Epirus; and was constituted judge to try Michael Comnenus, suspected of engaging in a conspiracy. Theodorus Lascaris, the son of John, whom he had taught logic, appointed him governor of all the western provinces in his empire. In 1255, he was taken prisoner in a war with Michael Angelus: but gaining his liberty in 1260, by means of the emperor Palæologus, he was sent by him ambassador to Constantine prince of Bulgaria; and was employed in several other negotiations. He wrote, *A Continuation of the Greek History*, from the taking of Constantinople by the Latins till it was recovered by Michael Palæologus in 1261, which makes part of the Byzantine history; a *Treatise concerning Faith, Virtue, and the Soul*; an *Exposition of the Sermons of St. Gregory Nazianzen*; and other pieces.

ACROSPIRE, *f.* [from *ακρος* and *σπिरα* Gr.] A shoot or sprout from the end of seeds before they are put into the ground.—Many corns will smilt, or have their pulp turned into a substance like thick cream; and will send forth their substance in an *acrospire*. *Mortimer*.

ACROSPURED, *part. adj.* Having sprouts, or having shot out.—For want of turning, when the malt is spread on the floor, it comes and sprouts at both ends, which is called *acrospired*, and is fit only for swine. *Mortimer*.

ACROSS, *adv.* [from *a* for *at*, or the French *à* as it is used in *à travers*, and *across*.] Athwart, laid over something so as to cross it.—The harp hath the concave not along the strings, but *across* the strings; and no harp hath the sound so melting and prolonged as the Irish harp. *Bacon*.

ACROSTIC, *f.* [from *ακρος* and *στιχος*, Gr.] A poem in which the first letter of every line being taken, makes up the name of the person or thing on which the poem is written.

ACROSTIC, *adj.* That which relates to an acrostic.—That which contains acrostics.

Leave writing plays, and choose for thy command
Some peaceful province in *acrostic* land:
There thou may'st wings display, and altars raise,
And torture one poor word ten thousand ways. *Dryden*.

ACROSTICHUM, *f.* [*ακρος* and *στιχος*, *summus ordo*.] In botany, a genus of the cryptogamia filices class. The generic character is, that the fructifications cover the whole under surface of the frond.

Description. There are forty-four species of ferns, of which two only are natives of Great-Britain, the ninth and twenty-eighth. They both grow on rocks in Wales, and the former is found also in the northern counties, and in Scotland. The twenty-seventh is a native of Europe, but all the rest are the growth of hotter climates, as the East or West Indies, Africa, and the southern provinces of North-America.

Species. I. Frond simple undivided. 1. *Acrostichum lanceolatum*: fronds linear-lanceolate acute, shoot climbing. It is a native of the East Indies and Cochin China; sticking to trees.

2. *Acrostichum citrifolium*: fronds lanceolate-ovate quite entire, shoot climbing. This is a native of America.

3. *Acrostichum heterophyllum*: fronds quite entire smooth petiolate; barren ones roundish, fertile linear. It is a native of the East Indies, Cochin China, and Africa, in woods.

4. *Acrostichum crinitum*: fronds ovate obtuse hirsute, crinite above.

5. *Acrostichum punctatum*: fronds heart-tongued, acuminate, quite entire, dotted above. It is used medicinally in China, where it was first remarked by J. Fothergill.

6. *Acrostichum spicatum*: fronds simple, petiolate, lanceolate, attenuated to both ends, quite entire, spike terminal linear. This was found by Commerfon in the island of Mauritius.

7. *Acrostichum lingua*: fronds oblong obtuse entire petiolate, shoot creeping. 8. *Acrostichum hastatum*: frond simple hastate. Both these are natives of Japan.

II. Frond simple divided. 9. *Acrostichum septentrionale*: fronds naked linear laciniate. It grows on tufts resembling at first sight some rushy grass, on clefts of rocks and old walls, in Yorkshire, Westmoreland, Wales, and Scotland.

10. *Acrostichum australe*: stipes naked, quite smooth, dichotomous at top, with five or six subulate rays, and flowering from the sides. This much resembles the foregoing, but it is silvery, and more regularly divided: and grows in the isles of France and Bourbon.

11. *Acrostichum pectinatum*: naked, perfectly simple, spike crescent-shaped, on one side, ascending, compressed. Hermann, Morison, Ray, and Plukenet, took this plant for a species of grass. Petiver alone suspected it to be a fern, as it proves really to be. It is a native of the Cape of Good Hope.

12. *Acrostichum dichotomum*: naked, dichotomous, spikes on one side, ascending, reflex, compressed. This resembles the pectinatum in stem and spike, but the stem has many more forkings, with spikes to each. It is found in China and the Society Islands.

13. *Acrostichum digitatum*: stipes naked three-sided, frond digitate linear quite entire equal. This is a native of Ceylon.

14. *Acrostichum ferrugineum*: fronds pinnatifid; pinnae linear acute spreading quite entire connate; stipe smooth.

15. *Acrostichum polypodioides*: fronds pinnatifid, pinnae linear obtuse quite entire spreading crowned, stipe scaly. Both these are natives of Jamaica and Virginia.

III. Frond pinnate. 16. *Acrostichum aureum*: pinnae alternate tongue-shaped quite entire smooth. It is a native of Jamaica, Dominica, and the Society Isles.

17. *Acrostichum rufum*: pinnae oblong-ovate quite entire pubescent. This is a native of Jamaica.

18. *Acrostichum punctatum*: leaflets alternate lanceolate quite entire, the lowest eared, the upper ones decurrent, the upper surface dotted smooth. It is a native of the isle of Bourbon.

19. *Acrostichum sorbifolium*: pinnae oblong-ovate entire ferrate acute, stipes scaly. This is a native of Jamaica and Domingo.

20. *Acrostichum areolatum*: pinnae alternate linear ferrate at top. The little floriferous buds in this species are divided into two phalanxes by the longitudinal nerves of the leaf, and are disposed in several parts transversely on each side. It is a native of Virginia and Maryland.

21. *Acrostichum marginatum*: pinnae oblong quite entire waved acuminate, stipe naked. 22. *Acrostichum sanctum*: fronds lanceolate, pinnae linear-lanceolate glaberrate, the lower ferratures largest. The first of these is only a barren frond of *Pteris grandifolia*. The latter is a polypodium.

23. *Acrostichum platyneuron*: pinnas alternate ovate crenate sessile bowed upwards. This species has the air of common polypody. It is a native of Virginia.

24. *Acrostichum trifoliatum*: leaflets ternate lanceolate. This is a native of Jamaica.

IV. Frond subpinnate. 25. *Acrostichum filiquosum*: pinnas alternate, pinnulate upwards, linear, the lower ones two-parted. 26. *Acrostichum thalioides*: pinnas alternate, on each side pinnatifid, the barren ones broader. Natives of Ceylon. These are supposed by Koenig to be one and the same species.

27. *Acrostichum marantæ*: fronds subbipinnate, pinnas oppositely coadunate, very hirsute underneath, a little toothed at the base. It is a native of the southern countries of Europe.

28. *Acrostichum ilvense*: fronds subbipinnate, pinnas oppositely coadunate, obtuse, hirsute underneath, quite entire at the base. This has a great similitude to the foregoing, but it is scarcely longer than the finger, never so high as seven inches. It is allied to the polypodies by having the fructifications in dots, but they are closely crowded.

29. *Acrostichum ebenum*: pinnas sessile oblong sinuate, the uppermost shortest and quite entire. 30. *Acrostichum furcatum*: dichotomous, leaflets pinnate; pinnas parallel lanceolate approximating, quite entire. V. Frond bipinnate. 31. *Acrostichum aculeatum*: fronds superdecompound, pinnas bifid, stipes prickly. These are all three natives of Jamaica.

32. *Acrostichum cruciatum*: leaflets opposite lanceolate, the lowest appendaged crosswise. It is a native of Dominica.

33. *Acrostichum barbarum*: leaflets opposite, pinnas lanceolate obtuse serrate sessile alternate. This is a native of Africa.

34. *Acrostichum calomelanos*: pinnas alternate lanceolate acuminate pinnatifid. This is a native of South America and Jamaica.

35. *Acrostichum viviparum*: fronds viviparous, pinnas in pairs one-sided, pinnules pinnatifid forked subulate, bearing the fructifications on the inner margin. It is a native of the Isles of France and Bourbon.

36. *Acrostichum velleum*, or woolly acrostichum: fronds bipinnate; all the pinnas ovate cordate gashed on the side and very hirsute underneath. This is a native of Madeira. Found there by Mr. Francis Maffon.

37. *Acrostichum simplex*: fronds entire smooth petioled; the barren ones lanceolate acuminate, the fertile ones linear-lanceolate. 38. *Acrostichum petiolatum*: fronds entire smooth petioled; the barren ones linear-lanceolate, the fertile ones linear. 39. *Acrostichum latifolium*: fronds petioled, broad-lanceolate, very smooth, entire, margined; the fruit-bearing ones ovate-lanceolate; shoots creeping. 40. *Acrostichum villosum*: fronds broad-lanceolate, somewhat crenulate, villous on both sides. 41. *Acrostichum muscosum*: fronds petioled entire scaly; the barren ones oblong-lanceolate blunt, the fertile ones linear-lanceolate. 42. *Acrostichum ferrulatum*: fronds linear toothed, fruit-bearing at the tip; shoots very short rooting. 43. *Acrostichum graminoides*: fronds naked linear, subdichotomous and fruit-bearing at the tip. 44. *Acrostichum sulphureum*: fronds bipinnate, pinnas alternate ovate pinnatifid, leaflets retuse serrate.—These are all natives of Jamaica.

Propagation and Culture. Few of the species have been yet introduced into gardens. Those of Europe may be either preserved in pots, filled with gravel and lime rubbish; or planted on walls and artificial rocks. The thirty-sixth species, with some few others, may be preserved in the green-house; but the greater part, being natives of very hot climates, must be planted in pots, and plunged into the bark-pit.

ACROSTOLIUM, in ancient naval architecture, the extreme part of the ornament used on the prows of their
VOL. I. No. 7.

ships, which was sometimes in the shape of a buckler, helmet, animal, &c. but more frequently circular, or spiral. It was usual to tear them from the prows of vanquished vessels, and fix them to the conquerors, as a signal of victory.

ACROTELEUTIC, *f.* among ecclesiastic writers, an appellation given to any thing added to the end of a psalm; as the Gloria Patri, or Doxology.

ACROTHERIA, *f.* [from *ακρον*, Gr. the extremity of any body.] In architecture, small pedestals, usually without bases, anciently placed at the middle or two extremes of pediments or frontispieces, serving to support the statues, &c. It also signifies the figures placed as ornaments on the tops of churches, and the sharp pinnacles that stand in ranges about flat buildings with rails and ballusters.

Among ancient physicians, it signified the larger extremities of the body, as the head, hands, and feet. It has also been used for the tips of the fingers, and sometimes for the eminences or processes of bones.

ACROTHYMION, *f.* [from *ακρον*, extreme, and *θυμον*, thyme.] A sort of wart described by Celsus as hard, rough, and with a narrow basis and broad top; the top is of the colour of thyme, it easily splits and bleeds. This tumour is also called *thymus*.

To **ACT**, *v. n.* [*ago*, *actum*, Lat.] To be in action, not to rest. To perform the proper functions. To practise arts or duties; to conduct one's self. To produce effects in some passive subject:

Hence 'tis we wait the wond'rous cause to find
How body *acts* upon impassive mind.

Garth.

The stomach, the intestines, the muscles of the lower belly, all *act* upon the aliment; besides, the chyle is not sucked, but squeezed into the mouths of the lacteals, by the action of the fibres of the guts. *Arbutnot.*

To **ACT**, *v. a.* To bear a borrowed character; as, a stage-player. To counterfeit; to feign by action:

Honour and shame from no condition rise;

Act well your part, there all the honour lies.

Pope.

To *actuate*; to put in motion; to regulate the movements. —Perhaps they are as proud as Lucifer, as covetous as Demas, as false as Judas, and, in the whole course of their conversation, *act*, and are *acted*, not by devotion, but design. *South.*

ACT, *f.* [*actum*, Lat.] Something done; a deed; an exploit, whether good or ill:

The conscious wretch must all his *acts* reveal;

Loth to confess, unable to conceal;

From the first moment of his vital breath,

To his last hour of unrepenting death.

Dryden.

Agency; the power of producing an effect. Action; the performance of exploits; production of effects:

Who forth from nothing call'd this comely frame,

His will and *act*, his word and work, the same.

Prior.

The doing of some particular thing; a step taken; a purpose executed. A state of reality; effect.—God alone excepted, who actually and everlastingly is whatsoever he may be, and which cannot hereafter be that which now he is not; all other things besides are somewhat in possibility, which as yet they are not in *act*. *Hooker.*—Incipient agency; tendency to an effort. A decree of a court of justice, or edict of a legislature.—They make edicts for usury to support usurers, repeal daily any wholesome *act* established against the rich, and provide more piercing statutes daily to chain up and restrain the poor. *Shakespeare.*—Record of judicial proceedings.—Judicial *acts* are all those matters which relate to judicial proceedings; and being reduced into writing by a public notary, are recorded by the authority of the judge. *Ascham.*

ACT, in logic, is particularly understood of an operation of the human mind. Thus to discern and examine, are *acts* of the understanding; to judge and affirm are *acts*.

C c

of

of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

ACT, in the universities, signifies a thesis maintained in public by a candidate for a degree; or to shew the capacity and proficiency of a student. The candidates for a degree of bachelor and master of arts are to hold philosophical acts; and those for bachelor of divinity, theological acts, &c. At Oxford, the time when masters or doctors complete their degrees is also called the *act*; which is held with great solemnity. At Cambridge, they call it the commencement.

ACT of FAITH, *Auto da Fe*, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics, and the absolution of the innocent accused. They usually contrive the *auto* to fall on some great festival, that the execution may pass with the more awe and regard; at least it is always on a Sunday.

The *auto da fe* may be called the last act of the inquisitorial tragedy; it is a kind of gaol-delivery, appointed as oft as a competent number of prisoners in the inquisition are convicted of heresy, either by their own voluntary or extorted confession, or on the evidence of certain witnesses. The process is thus:—In the morning they are brought into a great hall, where they have certain habits put on, which they are to wear in the procession. The procession is led up by Dominican friars; after which come the penitents, some with fan-benitoes, and some without, according to the nature of their crimes; being all in black coats without sleeves, and bare-footed, with a wax candle in their hands. These are followed by the penitents who have narrowly escaped being burnt, who over their black coats have flames painted with their points turned downwards, *Fuego revuelto*. Next come the negative and relapsed, who are to be burnt, having flames on their habits pointing upwards. After these come such as profess doctrines contrary to the faith of Rome, who, besides flames pointing upwards, have their picture painted on their breasts, with dogs, serpents, and devils, all open-mouthed, about it. Each prisoner is attended with a familiar of the inquisition; and those to be burnt have also a Jesuit on each hand, who are continually preaching to them to abjure. After the prisoners, comes a troop of familiars on horseback; and after them the inquisitors, and other officers of the court, on mules; last of all, the inquisitor-general on a white horse, led by two men with black hats and green hat-bands. A scaffold is erected in the Terriero de Paio, big enough for two or three thousand people; at one end of which are the prisoners, at the other the inquisitors. After a sermon made up of encomiums on the inquisition, and invectives against heretics, a priest ascends a desk near the middle of the scaffold, and having taken the abjurations of the penitents, recites the final sentence of those who are to be put to death; and delivers them to the secular arm, earnestly beseeching at the same time the secular power not to touch their blood, or put their lives in danger. The prisoners being thus in the hands of the civil magistrate, are presently loaded with chains, and carried first to the secular gaol, and from thence in an hour or two brought before the civil judge; who, after asking in what religion they intend to die, pronounces sentence, on such as declare they die in the communion of the church of Rome, that they shall be first strangled, and then burnt to ashes; on such as die in any other faith, that they be burnt alive. Both are immediately carried to the Ribera, the place of execution; where there are as many stakes set up as there are prisoners to be burnt, with a quantity of dry furze about them. The stakes of the professed, that is, such as persist in their heresy, are about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed being first strangled and burnt, the professed mount their stakes by a ladder; and the Jesuits, after several repeated exhortations to be reconciled to the church, part with them, telling them they leave them to

the devil, who is standing at their elbow to receive their souls, and carry them with him into the flames of hell. On this a great shout is raised; and the cry is, "Let the dogs' beards be made;" which is done by thrusting flaming furzes fastened to long poles against their faces, till their faces are burnt to a coal, which is accompanied with the loudest acclamations of joy. At last, fire is set to the furze at the bottom of the stake, over which the professed are chained so high, that the top of the flame seldom reaches higher than the seat they sit on; so that they rather seem roasted than burnt. There cannot be a more lamentable spectacle; the sufferers continually crying out, while they are able, *Misericordia per amor de Dios*, "Pity for the love of God!" yet it is beheld by all sexes, and ages, with transports of joy and satisfaction.

ACT, in dramatic poetry, signifies a certain division or part of a play, designed to give some respite both to the actors and spectators. The Romans were the first who divided their theatrical pieces into acts; for no such divisions appear in the works of the first dramatic poets. Their pieces indeed consisted of several parts or divisions, which they called *protasis*, *epitasis*, *catastasis*, and *catastrophe*; but these divisions were not marked by any real interruptions on the theatre. Nor does Aristotle mention any thing of acts in his Art of Poetry. But, in the time of Horace, all regular and finished pieces were divided into five acts.

ACT of GRACE. See GRACE.

ACT, among lawyers, is an instrument in writing for declaring or justifying the truth of any thing. In which sense, records, decrees, sentences, reports, certificates, &c. are called *acts*.

ACT of PARLIAMENT, is a statute, act, or edict, made by the king with the advice and consent of the lords spiritual and temporal, and commons, in parliament assembled. The oldest of those now extant, and printed in our statute books, is the famous Magna Charta, as confirmed in parliament 9 Hen. III. though doubtless there were many acts before that time, the records of which are now lost, and which possibly at present pass for parts of the ancient common law. 1 *Blackst.* 85.

An act of parliament is the exercise of the highest earthly authority that this kingdom acknowledges. It hath power to bind every subject in the land, and the dominions thereunto belonging; nay even the king himself, if particularly named therein: and it cannot be altered, amended, dispensed with, suspended, or repealed, but by the same authority of parliament; for it is a maxim in law, that it requires the same strength to dissolve as to create an obligation. 1 *Blackst.* 186.

The method of citing acts of parliament is various. Many of the ancient statutes are called after the name of the place where the parliament was held that made them; as the statutes of Merton and Marleberge, of Westminster, Gloucester, and Winchester. Others are denominated entirely from their subject; as the statutes of Wales and Ireland, the *Articuli cleri*, and the *Prerogativa regis*. Some are distinguished by their initial words, as the statute of *Quia emptores terrarum*, and that of *Circumspexisse agatis*. But the most usual way of citing them, especially since the time of Edward II. is by naming the year of the king's reign in which the act was made, together with the chapter or particular act according to its numeral order. *Id.* 85.

Statutes are either *general*, or *special*; *public*, or *private*. A *general* or *public* act is an universal rule that regards the whole community; and of this the courts of law are bound to take notice judicially and *ex officio*; without the statute being particularly pleaded, or formally set forth by the party who claims an advantage under it. *Special* or *private* acts are rather exceptions than rules, being those which only operate upon particular persons, and private concerns; and of these the judges are not bound to take notice, unless they be formally shewn and pleaded. *Ibid.*

There are three points to be considered in the construction of an act of parliament; the old law, the mischief, and

and the remedy: that is, how the common law stood at the making of the act, what the mischief was for which the common law did not provide, and what remedy the parliament hath provided to cure this mischief. *Id.* 87.

Where the common law and a statute differ, the common law gives place to the statute; and an old statute gives place to a new one. *Id.* 89.

If a statute that repeals another is itself repealed afterwards, the first statute is thereby revived, without any formal words for that purpose. *Id.* 90.

A statute made in the affirmative, without any negative expressed or implied, doth not take away the common law; and therefore the party may waive his benefit by such statute, and take his remedy by the common law. *2 Infl.* 200.

Regularly, a statute in the affirmative doth not repeal a precedent affirmative statute; but if the latter is contrary to the former it amounts to a repeal of the former. *L. Raym.* 160.

Penal statutes must be construed strictly: but statutes against frauds are to be construed liberally and beneficially. *1 Blackst.* 88.

One part of a statute must be so construed by another, that the whole, if possible, may stand together: but a saving totally repugnant to the body of the statute is void. *Id.* 89.

Where things of an inferior degree are first mentioned in a statute, those of a higher dignity shall not be included under subsequent general words; as where a statute speaks of indictments to be taken before justices of the peace, or others having power to take indictments, it shall be understood only of other inferior courts, and not of the King's Bench or other courts at Westminster. *2 Co.* 46.

All felonies by the common law have the benefit of clergy; therefore, where a statute enacts a felony, and says, the offender shall suffer death, clergy lies notwithstanding, and is never ousted without express words. *3 Infl.* 73.

Saving of dower in a statute making an offence felony is superfluous; for by 1 Edw. VI. c. 12. dower is not lost by the felony of the husband.

Where no particular penalty is appointed for disobedience to an act of parliament, it is punishable as a contempt, by fine and imprisonment at the discretion of the king's courts of justice. *4 Blackst.* 122.

ACTA CONSISTORII, the edicts or declarations of the council of state of the emperors. These edicts were generally expressed in this manner:—"The august emperors, Dioclesian and Maximilian, in council declared, That the children of decurions should not be exposed to wild beasts in the amphitheatre."

The senate and soldiers often swore, either through abject flattery or by compulsion, upon the Edicts of the Emperor, as we do upon the Bible. And the name of Apidius Merula was erased by Nero out of the Register of Senators, because he refused to swear upon the Edicts of the Emperor Augustus.

ACTA DIURNA, was a sort of Roman gazette, containing an authorized narrative of the transactions worthy of notice which happened at Rome. Petronius has given us a specimen of the *acta diurna* in his account of Trimalchis; and, as it may not perhaps be unentertaining to see how exactly a Roman newspaper runs in the style of an English one, the following is an article or two out of it:

"On the 26th of July, thirty boys and forty girls were born at Trimalchi's estate at Cuma.

"At the same time a slave was put to death for uttering disrespectful words against his lord.

"The same day a fire broke out in Pompey's gardens, which began in the night, in the steward's apartment."

ACTA POPULI, among the Romans, were journals or registers of the daily occurrences; as assemblies, trials, executions, buildings, births, marriages, deaths, &c. These were otherwise called *Acta Publica* and *Acta Diurna*, or simply *Acta*. The *Acta* differed from Annals, in that only the greater and more important matters were in the latter, and those of less note were in the former. Their

origin is attributed to Julius Cæsar, who first ordered the keeping and making public the acts of the people. Some trace them higher, to Servius Tullius; who, to discover the number of persons born, dead, and alive, ordered that the next of kin, upon a birth, should put a certain piece of money into the treasury of Juno Lucina; upon a death, into that of Venus Libitina: the like was also to be done upon assuming the toga virilis, &c. Under Marcus Antoninus, this was carried further: persons were obliged to notify the births of their children, with their names and surnames, the day, consul, and whether legitimate or spurious, to the præfects of the *Ærarium Saturni*, to be entered in the Public Acts; though before this time the births of persons of quality appear thus to have been registered.

ACTA SENATUS, among the Romans, were minutes of what passed and was debated in the senate-house. These were also called *Commentarii*, and by a Greek name *Ἱστορικὰ*. They had their origin in the consulship of Julius Cæsar, who ordered them both to be kept and published.

Public Acts. The knowledge of public acts forms part of a peculiar science, called the **DIPLOMATIC**, of great importance to an historian, statesman, chronologer, and even critic. The preservation of them was the first occasion of erecting libraries. The style of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineness, and even whether there be any certain rules at all. F. Germon will have the greater part of the acts of former ages to be spurious. Fontanini asserts, that the number of forged acts now extant is very small. It is certain there were severe punishments inflicted on the forgers and falsifiers of acts. The chief of the English acts, or public records, are published by Rymer, under the title of *Fœdera*, and continued by Saunderson; an extract whereof has been given in French by Rapin, and translated into English under the title of *Acta Regia*. Great commendations have been given this work: also some exceptions made to it; as that there are many spurious acts, as well as errors, in it; some have even charged it with falsifications. The public acts of France fell into the hands of the English after the battle of Poitiers, and are commonly said to have been carried by them out of the country. But the tradition is not supported by any sufficient testimony.

ACTS OF THE APOSTLES, one of the sacred books of the New Testament, containing the history of the infant church, during the space of twenty-nine or thirty years, from the ascension of our Lord to the year of Christ 63. It was written by St. Luke; and addressed to Theophilus, the person to whom the evangelist had before dedicated his gospel. We find here the accomplishment of several of the promises made by our Saviour; his ascension; the descent of the Holy Ghost; the first preaching of the apostles, and the miracles whereby their doctrines were confirmed; an admirable picture of the manners of the primitive Christians; and, in short, every thing that passed in the church till the dispersion of the apostles, who separated themselves in order to propagate the gospel throughout the world. From the period of that separation, St. Luke quits the history of the other apostles, who were then at too great a distance from him, and confines himself more particularly to that of St. Paul, who had chosen him for the companion of his labours. He follows that apostle in all his missions, and even to Rome itself; for it appears that the Acts were published in the second year of St. Paul's residence in that city, or the 36th year of the Christian æra, and in the ninth or tenth year of Nero's reign. The style of this work, which was originally composed in Greek, is much purer than that of the other canonical writers; and it is observable, that St. Luke, who was much better acquainted with the Greek than with the Hebrew language, always, in his quotations from the Old Testament, makes use of the Septuagint version. The council of Laodicea places the Acts of the Apostles

Apostles among the canonical books, and all the churches have acknowledged it as such without any controversy.

There were several *Spurious Acts of the Apostles*; particularly, I. *Acts*, supposed to be written by Abdias, the pretended bishop of Babylon, who gave out that he was ordained bishop by the apostles themselves when they were upon their journey into Persia. II. *The Acts of St. Peter*: this book came originally from the school of the Ebionites. III. *The Acts of St. Paul*, which is entirely lost. Eusebius, who had seen it, pronounces it of no authority. IV. *The Acts of St. John the Evangelist*; a book made use of by the Encratites, Manichæans, and Priscillianists. V. *The Acts of St. Andrew*; received by the Manichæans, Encratites, and Apotactics. VI. *The Acts of St. Thomas the Apostle*; received particularly by the Manichæans. VII. *The Acts of St. Philip*. This book the Gnostics made use of. VIII. *The Acts of St. Matthias*. Some have imagined that the Jews for a long time had concealed the original acts of the life and death of St. Matthias written in Hebrew; and that a monk of the abbey of St. Matthias at Treves, having got them out of their hands, procured them to be translated into Latin, and published them; but the critics will not allow them to be authentic.

ACTS OF PILATE; a relation sent by Pilate to the emperor Tiberius, concerning Jesus Christ, his death, resurrection, ascension, and the crimes of which he was convicted before him. It was a custom among the Romans, that the proconsuls and governors of provinces should draw up acts, or memoirs, of what happened in the course of their government, and send them to the emperor and senate. The genuine *acts* of Pilate were sent by him to Tiberius, who reported them to the senate; but they were rejected by that assembly, because not immediately addressed to them; as is testified by Tertullian, in his *Apol.* cap. 5. and 20, 21. The heretics forged acts in imitation of them: in the reign of the emperor Maximin, the Gentiles, to throw an odium on the Christian name, spread about spurious Acts of Pilate; which the emperor, by a solemn edict, ordered to be sent into all the provinces of the empire, and enjoined the school-masters to teach and explain them to their scholars, and make them learn them by heart. These acts, both the genuine and the spurious, are lost. There is indeed extant, in the Pseudo-Hegesippus, a letter from Pilate to the emperor Claudius, concerning Jesus Christ; but it discovers itself at first sight not to be authentic.

ACTÆ, were meadows of remarkable verdure and luxuriance near the sea-shore, where the Romans used to indulge themselves to a great degree in softness and delicacy of living. The word is used in this sense by Cicero and Virgil; but Vossius thinks it can only be used in speaking of Sicily, as these two authors did.

ACTÆA, *f.* [*ακταία*, shore-loving.] In botany, a genus of the polyandria monogynia class, of the natural order of multifloræ. The generic characters are—Calyx: perianth four-leaved: leaflets roundish, obtuse, concave, caducous. Corolla: petals four, acuminate to both ends, larger than the calyx, caducous. Stamina: filaments usually about thirty, capillary, broader at top. Antheræ roundish, twin, erect. Pistillum: germ superior, ovate. Stigmas thickish, obliquely depressed. Pericarpium: a berry oval-globose, smooth, one-furrowed, one-celled. Seeds: very many, semiorbicular, lying over each other in two rows.—*Essential Character*. Calyx, four-leaved. Corolla, four-petalled. Berry, one-celled. Seeds, semiorbicular, in two rows.

Species. 1. *Actæa spicata*: raceme ovate, fruits berried. This sort grows naturally in several places in the northern counties of England. It grows two feet and a half high, the footstalks of the leaves arise from the root; these divide into three smaller footstalks, each of which divide again into three, and these have each three lobes, so that each leaf is composed of twenty-seven lobes (or small

leaves). The flower stem which arises from the root, has leaves of the same form, but smaller. On the top of the stalk appear the flowers, which grow in ramose spikes, and are of a pure white; these come out in May, and are succeeded by black shining berries about the size of peas, which ripen in autumn. This plant is a powerful repellent. The root is useful in some nervous cases, but must be administered with caution. The berries are poisonous, the juice of them with alum yields a black dye. Toads allured by the fœtid smell of this plant resort to it. Dr. Withering observes very well, that this may be owing to its fondness for the same damp shady situations with the toad.

2. *Actæa racemosa*, or American black or wild snake-root: racemes very long; fruits dry. This species has large compound leaves, which rise immediately from the root, and are branched after the same manner with the first. The flower-stems frequently rise to the height of four or five feet. The flowers are white, in a long spike, reflex at the top. It flowers in June, or the beginning of July, but does not perfect seeds in England. During the time of flowering it makes a good appearance in a garden, and therefore deserves a place in shady borders, or among shrubs, where, if it be not overhung by them, it thrives very well, and, being hardy, will require no other care than the shrubs themselves. It is a native of North America, where it is called black snake-root, to distinguish it from common snake-root. The root is much used in that country against many disorders, and is supposed to be an antidote against poison, or the bite of the rattle-snake.

3. *Actæa japonica*, or Japanese herb Christopher: spikes very long; leaflets gashed, palmate, undivided. This species differs from the preceding in having simple, not pinnate, leaves; the leaflets are heart-shaped, nearly of the same length and breadth, not oblong; the petioles longer than the leaflets; and the flowers sessile.

4. *Actæa aspera*, or rough-leaved herb Christopher: stem climbing: leaves lanceolate, rough: spikes interrupted. This species is a native of China near Canton. The leaves being extremely rough, the Chinese use them in polishing, particularly tin ware.

Propagation and Culture. These plants may be propagated by seeds, which should be sown on a shady border, soon after they are ripe, where they can be obtained fresh; for, if they are kept out of the ground till spring, the plants will not come up till the year after, so that a whole season will be lost. As the seeds seldom come up all at the same time, the border should not be disturbed till the following autumn, in order to see what plants may appear; when they should be transplanted into another shady border, where they may remain to flower. The seeds of the second sort are annually sent from North America, and should be sown as soon as the season will permit.

ACTÆA CIMICIFUGA. See **CIMICIFUGA**.

ACTÆON, in fabulous history, the son of Aristæus and Autonoe; a great hunter. He was turned by Diana into a stag, for looking on her while bathing; and died by his own dogs.

ACTANIA, an island, according to Pliny, in the North sea. It lies to the west of Holstein and Dithmarsch, not far from the mouth of the Eyder and Elbe, and is now called *Heyligland*.

ACTE. See **SAMBUCUS**.

ACTIAN GAMES, in Roman antiquity, were solemn games instituted by Augustus, in memory of his victory over Marc Anthony at Actium, held every fifth year, and celebrated in honour of Apollo, since called *Actius*. Hence *Actian Years*, an æra commencing from the battle of Actium, called the *Æra of Augustus*.

ACTINIA, in zoology, a genus belonging to the order of vermes mollusca. The body is oblong and smooth, attaching itself firmly by its basis to rocks or other solid substances, having a dilatible apex hooked within. The mouth is furnished with crooked teeth, the rostrum cylindrical

driacal and radiated. There are five species, some of which make a beautiful appearance, and are called animal flowers, sea anemones, and *urtica marina*.

Progressive motion in these creatures is so slow, that it is difficult to perceive any, as they scarce advance the length of one inch in an hour. It would seem they do not all produce, when handled, the painful sensation which had acquired them the name of sea-nettles.—They are viviparous, feed on shell-fish, open their mouth more or less according to the size of the prey they have to deal with, and then reject the shell through the same aperture. When the mouth is open, all the tentacula of the actinia may be seen, resembling in that situation a full-blown flower, which has given it the denomination of the flower fish.

ACTIO, in Roman antiquities, an action at law in a court of justice. The formalities used by the Romans, in judicial actions, were these: If the difference failed to be made up by friends, the injured person proceeded *in jus reum vocare*, to summon the offending party to the court, who was obliged to go, or give bond for his appearance. The offending party might be summoned into court *viva voce*, by the plaintiff himself meeting the defendant, declaring his intention to him, and commanding him to go before the magistrate and make his defence. If he would not go willingly, he might drag and force him along, unless he gave security for his appearance on some appointed day. Both parties being met before the prætor, or other supreme magistrate presiding in the court, the plaintiff proposed the action to the defendant; in which he designed to prosecute him. This they termed *edere actionem*; and was commonly performed by writing it in a tablet, and offering it to the defendant, that he might see whether he had better stand the suit or compound. In the next place came the *postulatio actionis*, or the plaintiff's petition to the prætor, for leave to prosecute the defendant in such an action. And, the petition being granted, the plaintiff obliged him to give sureties for his appearance on such a day in the court; when, upon the non-appearance of either party, the defaulter lost his cause;—if they both appeared, they were said *se stetit*; and then the plaintiff proceeded *litē sive actionem intendere*, i. e. to prefer his suit, which was done in a set form of words, varying according to the difference of the actions. After this the plaintiff desired judgment of the prætor, that is, to be allowed a *judex* or *arbiter*, or else the *recuperatores* or *centumviri*. These he requested for the hearing and deciding the business; but none of them could be desired but by the consent of both parties.

The prætor having assigned them their judges, defined and determined the number of witnesses to be admitted, to hinder the protracting of the suit; and then the parties proceeded to give their caution, that the judgment, whatever it was, should stand and be performed on both sides. The judges took a solemn oath to be impartial; and the parties took the *juramentum calumniæ*. Then the trial began with the assistance of witnesses, writings, &c. which was called *disceptatio causæ*.

ACTION, *f.* [action, Fr. *actio*, Lat.] The quality or state of acting, opposite to *rest*:

O noble English! that could entertain
With half their forces the full power of France;
And let another half stand laughing by,
All out of work, and cold for action. *Shakespeare.*

An act or thing done; a deed. Agency, operation. The series of events represented in a fable. Gesticulation, the accordance of the motions of the body with the words spoken; a part of oratory.—Our orators are observed to make use of less gesture or *action* than those of other countries. *Addison.*

ACTION, in mechanics, implies either the effort which a body or power makes against another body or power, or the effect itself of that effort. As it is necessary in works of this kind to have a particular regard to the common language of mechanics and philosophers, we have given

this double definition: but the proper signification of the term is the motion which a body really produces, or tends to produce, in another; that is, such is the motion it would have produced, had nothing hindered its effect.

All power is nothing more than a body actually in motion, or which tends to move itself; that is, a body which would move itself if nothing opposed it. The action therefore of a body is rendered evident to us by its motion only; and consequently we must not fix any other idea to the word action, than that of actual motion, or a simple tendency to motion. The famous question relating to *vis viva*, and *vis mortua*, owes, in all probability, its existence to an adequate idea of the word action; for, had Leibnitz and his followers observed, that the only precise and distinct idea we can give to the word force or action, reduces it to its effect, that is, to the motion it actually produces or tends to produce, they would never have made that curious distinction.

Quantity of ACTION, a name given by M. de Maupertuis, in the Memoires of the Parisian Academy of Sciences for 1744, and those of Berlin for 1746, to the product of the mass of a body by the space which it runs through and by its celerity. He lays it down as a general law, "that, in the changes made in the state of a body, the quantity of action necessary to produce such change is the least possible." This principle he applies to the investigation of the laws of refraction, of equilibrium, &c. and even to the ways of acting employed by the Supreme Being. In this manner M. de Maupertuis attempts to connect the metaphysics of final causes with the fundamental truths of mechanics, to shew the dependence of the collision of both elastic and hard bodies upon one and the same law, which before had always been referred to separate laws; and to reduce the laws of motion, and those of equilibrium, to one and the same principle.

ACTION, in ethics, denotes the external signs or expressions of the sentiments of a moral agent.

ACTION, in painting and sculpture, is the attitude or position of the several parts of the face, body, and limbs, of such figures as are represented, and whereby they seem to be really actuated by passions. Thus we say, the action of such a figure finely expresses the passions with which it is agitated: we also use the same expression with regard to animals.

ACTION, in physiology, is applied to the functions of the body, whether vital, animal, or natural.—The *vital* functions, or actions, are those which are absolutely necessary to life, and without which there is no life, as the action of the heart, lungs, and arteries. On the action and reaction of the solids and fluids on each other, depend the vital functions. The pulse and respiration are the external signs of life. Vital diseases are all those which hinder the influx of the venous blood into the cavities of the heart, and the expulsion of the arterial blood from the same.—The *natural* functions are those which are instrumental in repairing the several losses which the body sustains; for life is destructive of itself, its very offices occasioning a perpetual waste. The manducation of food, the deglutition and digestion thereof, also the separation and distribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by these our aliment is converted into our nature. They are necessary to the continuance of our bodies.—The *animal* functions are those which we perform at will, as muscular motion, and all the voluntary actions of the body: they are those which constitute the senses of touch, taste, smell, sight, hearing; perception; reasoning, imagination, memory, judgment, affections of the mind. Without any or all of them, a man may live, but not so comfortably as with them.—The actions *peculiar to the sexes* are those of the organs of generation of either sex.—*Private* actions are such as regard particular parts.—*Public* actions are those which are performed for the sake of the whole body; such is the action of the stomach in digesting the aliment, &c. These are called functions. But each part hath an action peculiar

liar to itself; thus the office performed by the muscles, vessels, glands, and viscera, are called their respective actions.

ACTION, in commerce, is a term used abroad for a certain part or share of a public company's capital stock. Thus, if a company has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livres. Hence a man is said to have two, four, &c. actions, according as he has the property of two, four, &c. 1000 livres capital stock. The transferring of actions abroad is performed much in the same manner as stocks are with us.

ACTION, in law, is a demand made before a judge for obtaining what we are legally intitled to demand, and is more commonly known by the name of law-suit or process. Actions are of three kinds; *real, personal, and mixed*:—Action *real* is that which concerns real property only; whereby the plaintiff or demandant claims title to have any lands or tenements, rents, commons, or other hereditaments, in fee simple, fee tail, or for term of life. 3 *Blackst.* 117.

Action *personal* is such as one man brings against another, on any contract for money or goods, or on account of any offence or trespass. *Id.*

Action *mixed* is an action that lieth as well for the thing demanded, as against the person that hath it; on which the thing is recovered, and likewise damages for the wrong sustained. *Id.*

ACTIONABLE, *adj.* That which admits an action in law to be brought against it; punishable.

ACTIONARY, or **ACTIONIST**, *f.* a proprietor of stock in a trading company.

ACTIONS, *f.* among merchants, sometimes signify moveable effects; and we say the merchant's creditors have seized on all his actions, when we mean that they have taken possession of all his active debts.

ACTION-TAKING, *adj.* Accustomed to resent by means of law; litigious.—A knave, a rascal, a filthy worsted-stocking knave; a lily-liver'd *action-taking* knave. *Shakespeare.*

ACTITATION, *f.* [from *actito*, Lat.] Action quick and frequent.

To **ACTIVATE**, *v. a.* To make active. This word is perhaps used only by the author alleged.—As snow and ice, especially being holpen, and their cold *activated*, by nitre or salt, will turn water into ice, and that in a few hours; so it may be it will turn wood or stiff clay into stone, in longer time. *Bacon.*

ACTIVE, *adj.* [*activus*, Lat.] That which has the power or quality of acting. That which acts, opposed to *passive*, or that which suffers. Busy, engaged in action; opposed to *idle* or *sedentary*, or any state of which the duties are performed only by the mental powers. Practical; not merely theoretical. Nimble; agile; quick:

Some bend the stubborn bow for victory;
And some with darts their *active* sinews try. *Dryden.*

ACTIVE, in grammar, is applied to such words as express action; and is therefore opposite to passive. The active performs the action, as the passive receives it. Thus we say a verb *active*, a conjugation *active*, &c. or an *active* participle.

ACTIVE VERBS, are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression: Thus, *To love, to teach*, are verbs *active*; because we can say, *To love a thing, to teach a man*. Neuter verbs also denote an action, but are distinguished from active verbs, in that they cannot have a noun following them: such are, *To sleep, to go, &c.* Some grammarians, however, make three kinds of active verbs: the *transitive*, where the action passes into a subject different from the agent; *reflected*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon the two agents who produced it.

ACTIVE POWER, in metaphysics, the power of executing any work or labour; in contradistinction to *speculative*

powers, or the powers of seeing, hearing, remembering, judging, reasoning, &c.

ACTIVE PRINCIPLES, in chemistry, such as are supposed to act without any assistance from others; as mercury, sulphur, &c.

ACTIVELY, *adv.* In an active manner; busily; nimbly. In an active signification; as, the word is used *actively*.

ACTIVENESS, *f.* The quality of being active; quickness; nimbleness. This is a word more rarely used than *activity*.—What strange agility and *activeness* do our common tumblers and dancers on the rope attain to, by continual exercise. *Wilkins.*

ACTIVITY, *f.* The quality of being active, applied either to things or persons.—Salt put to ice, as in the producing of the artificial ice, increaseth the *activity* of cold. *Bacon.*

ACTIUM, anciently a town situated on the coast of Acarnia, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the name, in the mouth of the Sinus Ambracius, over against Nicopolis, on the other side of the bay: it afterwards became more famous on account of Augustus's victory over Anthony and Cleopatra; and for quinquennial games instituted there, called Actia or Ludi Actiaci. The promontory is now called Capo di Figalo.

ACTIUS, in mythology, a surname of Apollo, from Actium, where he was worshipped.

ACTON, a town near London, where is a well that affords a purging water, which is noted for the pungency of its salt. This water is whitish, to the taste it is sweetish, with a mixture of the same bitter which is in the Epsom water. The salt of this water is not quite so soft as that of Epsom; and is more calcareous than it, being more of the nature of salt of lime: for a quantity of the Acton water being boiled high, on being mixed with a solution of sublimate in pure water, threw down a yellow sediment. The salt of the Acton water is more nitrous than that of Epsom; it strikes a deep red, or purple, with the tincture of logwood in brandy, as is usual with nitrous salts; it does not precipitate silver out of the spirit of nitre, as common salt does.

From a gallon of this water Dr. Rutty got 340 grains, or five drachms two scruples, of sediment, by evaporation; of this five drachms and twenty-one grains were vitriolated magnesia, or vitriolated absorbent earth, called formerly nitrum calcarium; which took forty-eight times its own weight of water to dissolve it; and nineteen grains of earth, which did not calcine to lime, but dissolved in the vitriolic acid. This is esteemed one of the strongest purging waters near London. It is drank from one to three pints in a morning.

ACTON BURNEL, *f.* a statute so called, made 13 Edw. I. ordaining the *statute-merchant*: it was so termed from a place named Acton Burnel, where it was made; being a castle sometime belonging to the family of Burnel, and afterwards of Lovel, in Shropshire.

ACTOR, *f.* [*actor*, Lat.] He that acts, or performs any thing. He that personates a character; in the drama, a stage-player, or person who represents some character upon the theatre. The drama consisted originally of nothing more than a simple chorus, who sang hymns in honour of Bacchus; so that the primitive actors were only singers and musicians. Æschylus, finding a single person tiresome, attempted to introduce a second, and changed the ancient recitals into dialogues. Sophocles added a third, in order to represent the various incidents in a more natural manner: and here the Greeks stopped, at least we do not find in any of their tragedies above three persons in the same scene. This, however, did not prevent their increasing the number of actors in comedy. Before the opening of a play, they named their actors in full theatre, together with the parts they were to perform. The ancient actors were masked, and obliged to raise their voice extremely, in order to make themselves heard by the innumerable

numerable crowd of people who filled the amphitheatres: they were accompanied with a player on the flute, who played a prelude, gave them the tone, and played while they declaimed.

The moderns have introduced an infinite number of actors upon the stage. This heightens the trouble and distress that should reign there, and makes a diversity, in which the spectator is sure to be interested.

Actors were highly honoured at Athens. At Rome they were despised, and not only denied all rank among the citizens, but even, when any citizen appeared upon the stage, he was expelled his tribe and deprived of the right of suffrage by censors. Cicero, indeed, esteems the talents of Roscius; but he values his virtues still more; virtues which distinguished him so remarkably above all others of his profession, that they seemed to have excluded him from the theatre. The French, in this respect, adopted the ideas of the Romans; and the English those of the Greeks.

ACTRESS, f. [*actrice*, Fr.] She that performs any thing. A woman that plays on the stage. Women actors were unknown to the ancients, among whom men always performed the female character; and hence one reason for the use of masks among them.

Actresses are said not to have been introduced on the English stage till after the restoration of king Charles II. who has been charged with contributing to the corruption of our manners by importing this usage from abroad. But this can be but partly true: the queen of James I. acted a part in a pastoral; and Prynne, in his *Histriomastix*, speaks of women actors in his time as whores; which was one occasion of the severe prosecution brought against him for that book.

There are some very agreeable and beautiful talents, of which the possession commands a certain sort of admiration; but of which the exercise for the sake of gain is considered, whether from reason or prejudice, as a sort of public prostitution. The pecuniary recompence, therefore, of those who exercise them in this manner, must be sufficient, not only to pay for the time, labour, and expence, of acquiring the talents, but for the discredit which attends the employment of them as the means of subsistence. The exorbitant rewards of players, opera-singers, opera-dancers, &c. are founded upon those two principles; the rarity and beauty of the talents, and the great discredit of employing them in this manner. It seems absurd at first sight that we should despise their persons, and yet reward their talents with the most profuse liberality. While we do the one, however, we must of necessity do the other. Should the public opinion or prejudice ever alter with regard to such occupations, their pecuniary recompence would quickly diminish. More people would apply to them, and the competition would quickly reduce the price of their labour. Such talents, though far from being common, are by no means so rare as it is imagined.

ACTUAL, adj. [*actuel*, Fr.] That which comprises action. Really in act; not merely potential. In act; not purely in speculation:

For he that but conceives a crime in thought,
Contracts the danger of an *actual* fault:
Then what must he expect, that still proceeds
To finish sin, and work up thoughts to deeds? *Dryden.*

Philosophers use the terms *actual* heat, *actual* cold, &c. in opposition to *virtual* or *potential*. Hence, among physicians, a red-hot iron, or fire, is called an *actual* cautery; in distinction from cauteries, or caustics, that have the power of producing the same effect upon the animal solids as actual fire, and are called *potential* cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itself cold.

ACTUAL SIN, that which is committed by the person himself; in opposition to *original* sin, or that which he contracted from being a child of Adam.

ACTUALITY, f. The state of being actual.—The *actuality* of the spiritual qualities is thus imprisoned, tho' their potentiality be not quite destroyed; and thus a crass, extended, impenetrable, passive, divisible, unintelligent, substance, is generated, which we call matter. *Cheyne.*

ACTUALLY, adv. In act; in effect; really.—Though our temporal prospects should be full of danger, or though the days of sorrow should *actually* overtake us, yet still we must repose ourselves on God. *Rogers.*

ACTUALNESS, f. The quality of being actual.

ACTUARIÆ NAVES, f. a kind of ships among the Romans, chiefly designed for swift sailing.

ACTUARIUS, a celebrated Greek physician of the 13th century, and the first Greek author who has treated of mild purgatives, such as cassia, manna, fenna, &c. His works were printed in one volume folio, by Henry Stephens, in 1567.

ACTUARIUS, or ACTUARY, a notary or officer appointed to write the acts or proceedings of a court; or the like. In the eastern empire, the actuarii were properly officers who kept the military accounts, received the corn from the *suscptores*, or storekeepers, and delivered it to the soldiers.

ACTUATE, adj. Put into action; animated; brought into effect.—The active informations of the intellect, filling the passive reception of the will, like form closing with matter, grow *actuate* into a third and distinct perfection of practice. *South.*

To ACTUATE, v. a. [from *ago*, *actum*, Lat.] To put into action; to invigorate or increase the powers of motion; and thus the mind may be said to *actuate* the body.—Men of the greatest abilities are most fired with ambition; and, on the contrary, mean and narrow minds are the least *actuated* by it. *Addison.*

ACTUOSE, adj. That which hath strong powers of action: a word little used.

ACTUS, f. in ancient architecture, a measure in length equal to 120 Roman feet. In ancient agriculture, the word signified the length of one furrow, or the distance a plough goes before it turns.

ACTUS MINIMUS, was a quantity of land 120 feet in length, and four in breadth.

ACTUS MAJOR, or ACTUS QUADRATUS, a piece of ground in a square form, whose side was equal to 120 feet, equal to half the jugerum.

ACTUS INTERVICENALIS, a space of ground four feet in breadth, left between the lands as a path or way.

ACUANITES, f. in ecclesiastical history, the same with those called more frequently **MANICHEES**. They took the name from Acua, a disciple of Thomas, one of the twelve apostles.

To ACUATE, v. a. [*acuo*, Lat.] To sharpen, to invigorate with any powers of sharpness.—Immoderate feeding upon powdered beef, pickled meats, and debauching with strong wines, do inflame and *acuate* the blood, whereby it is capacitated to corrode the lungs. *Harvey.*

ACULEATE, adj. [*aculeatus*, Lat.] That which has a point or sting; prickly; that which terminates in a sharp point.

ACULEI, f. the prickles of animals or plants.

ACULEOSA, f. in botany. See **GORTERIA**.

ACULER, f. in the manege, is used for the motion of a horse, when, in working upon volts, he does not go far enough forward at every time or motion, so that his shoulders embrace or take in too little ground, and his croupe comes too near the centre of the volt. Horses are naturally inclined to this fault in making demi-volts.

ACUMEN, f. [Lat.] A sharp point; figuratively, quickness of intellects.—The word was much affected by the learned Aristarchus in common conversation, to signify genius or natural *acumen*. *Pope.*

The term *acumen* was introduced into anatomy by Daventer, in his *Ars Obstetricandi*; he calls the protuberances of the ossa innom. on which we sit, the *ossa sedentaria*, which he says are the *acumina* of the ossa pubis; and he

he calls the os coccygis the *sacri acumen ossis*, the pointed part of the sacrum.

ACUMINA, *f.* in antiquity, a kind of military omen, most generally supposed to have been taken from the points or edges of darts, swords, or other weapons.

ACUMINATED, *part. adj.* Ending in a point; sharp-pointed.—I appropriate this word, *Noli me tangere*, to a small found *acuminated* tubercle, which hath not much pain, unless touched or rubbed, or exasperated by topics. *Wifeman*.

ACUNA (Christopher de), a Spanish Jesuit, born at Burgos. He was admitted into the society in 1612, being then but fifteen years of age. After having devoted some years to study, he went to America, where he assisted in making converts in Chili and Peru. In 1640, he returned to Spain, and gave the king an account how far he had succeeded in the commission he had received to make discoveries on the river of the Amazons; and the year following he published a description of this river at Madrid. Acuna was sent to Rome, as procurator of his province. He returned to Spain with the title of Qualificator of the Inquisition; but soon embarked again for the West Indies, and was at Lima in 1675, when Father Southwell published at Rome the *Bibliothèque* of the Jesuit Writers. Acuna's work is intitled, *Nuevo Descubrimiento del gran Rio de las Amazonas*; i. e. "A new Discovery of the great River of the Amazons." The copies of this work became extremely scarce, so that the publishers of the French translation at Paris asserted, that there was not one copy of the original extant, excepting one in the possession of the translator, and perhaps that in the Vatican library. M. de Gomberville was the author of this translation: it was published after his death, with a long dissertation. An account of the original may be seen in the *Paris Journal*, in that of *Leipsic*, and in *Chevreau's History of the World*.

ACUPUNCTURE, *f.* [from *acus*, a needle, and *pungo*, to prick.] Bleeding performed by making many small punctures with a silver needle on the part affected. This method is practised in Siam, Japan, and other oriental nations, on all parts of the body; and employed in headaches, lethargies, convulsions, cholics, &c. In some parts of America this practice is also in use, according to the accounts given in *Dampier's Voyages*.

ACUS, *f.* in ichthyology, the trivial name of a species of syngnathus. See *SYNGNATHUS*.

ACUSIO COLONIA, now Ancone, according to Holstenius, between Orange and Valence, near Montelimart, on the banks of the Rhone.

ACUSTICUS, *f.* [from *ακουω*, to hear.] Belonging to hearing. It is applied to the auditory nerve, and to medicines or instruments used to assist, preserve, or recover, hearing.

ACUTE, *adj.* [*acutus*, Lat.] Sharp, ending in a point; opposed to *obtuse* or *blunt*. In a figurative sense applied to men; ingenious; penetrating; opposed to *dull* or *stupid*.—The *acute* and ingenious author, among many very fine thoughts, and uncommon reflections, has started the notion of seeing all things in God. *Locke*.—Spoken of the senses, vigorous; powerful in operation.—Were our senses altered, and made much quicker and *acuter*, the appearance and outward scheme of things would have quite another face to us. *Locke*.

ACUTE, in music, is applied to a sound or tone that is sharp or high, in comparison of some other tone. In this sense, *acute* stands opposed to *grave*.

ACUTE ANGLE, in geometry, is that which is less than a right angle, or which does not subtend ninety degrees.

ACUTE-ANGLED TRIANGLE, is a triangle whose three angles are all acute.

ACUTE-ANGLED CONE is, according to the ancients, a right cone, whose axis makes an acute angle with its side.

ACUTE DISEASES, such as come suddenly to a crisis, and are always attended with danger. Though there are diseases without danger, of a short duration, so are dif-

fect from the acute, as an *ephemeris*, &c. *Acute* diseases are the opposite to *chronic*, which are slow in their progress, and not so generally dangerous.

ACUTELY, *adv.* After an acute manner; sharply: it is used as well in the figurative as primitive sense.—He that will look into many parts of Asia and America, will find men reason there, perhaps, as *acutely* as himself, who yet never heard of a syllogism. *Locke*.

ACUTENESS, *f.* Sharpness. Force of intellects. Quickness and vigour of senses. Violence and speedy crisis of a malady. Sharpness of sound.—This *acuteness* of sound will shew, that whilst, to the eye, the bell seems to be at rest, yet the minute parts of it continue in a very brisk motion, without which they could not strike the air. *Boyle*.

ACUTIATOR, *f.* in writers of the barbarous ages, denotes a person that whets or grinds cutting instruments; called also in ancient glossaries, *acutor*, *ακουτης*, *jamarius*, *coharius*, &c. In the ancient armies there were acutiatores, a kind of smiths, retained for whetting or keeping the arms sharp.

ACYISIS, *f.* in Vogel's Nofology, is a defect of conception, or barrenness in women.

AD, a Latin preposition, originally signifying *to*, and frequently used in composition both with and without the *d*, to express the relation of one thing to another.

AD BESTIAS, in antiquity, is the punishment of criminals condemned to be thrown to wild beasts.

AD HOMINEM, in logic, a kind of argument drawn from the principles or prejudices of those with whom we argue.

AD LUDOS, in antiquity, a sentence upon criminals among the Romans, whereby they were condemned to entertain the people by fighting either with wild beasts, or with one another, and thus executing justice upon themselves.

AD METALLA, in antiquity, the punishment of such criminals as were condemned to the mines, among the Romans; and therefore called *Metallici*.

AD VALOREM, a term chiefly used in speaking of the duties or customs paid for certain goods. The duties on some articles are paid by the number, weight, measure, tale, &c. and others are paid *ad valorem*, that is, according to their value.

ADACTED, *part. adj.* [*adactus*, Lat.] Driven by force; a word little used. The verb *adacl* is not used.

ADAGE, *f.* [*adagium*, Lat.] A maxim handed down from antiquity; a proverb:

Fine fruits of learning! old ambitious fool,
Dar'st thou apply the *adage* of the school,
As if 'tis nothing worth that lies conceal'd,
And science is not science till reveal'd?

Dryden.

Erasmus has made a very large and valuable collection of the Greek and Roman adages; and Mr. Ray has done the same with regard to the English. We have also Kelly's *Collection of Scots Proverbs*.

ADAGIO, *f.* [Ital. at leisure.] A term used by musicians, to mark a slow time.

ADAIR, an ancient little town, eight miles from Limerick, and 102 from Dublin; having a good bridge over the river Maige, which is navigable for large boats. From its extensive ruins of convents, &c. it appears to have once been a place of considerable importance.

ADALIDES, in the Spanish policy, are officers of justice for matters touching the military forces. In the laws of king Alphonfus, the adalides are spoken of as officers appointed to guide and direct the marching of the forces in time of war. Lopez represents them as a sort of judges, who take cognizance of the differences arising upon excursions, the distribution of plunder, &c.

ADAM, the first of the human race, was formed by the Almighty on the sixth day of the creation. His body was made of the dust of the earth; after which, God animated or gave it life, and Adam then became a rational creature.

creature.—His heavenly parent did not leave his offspring in a destitute state to shift for himself; but planted a garden, in which he caused to grow not only every tree that was proper for producing food, but likewise such as were agreeable to the eye, or merely ornamental. In this garden were assembled all the brute creation; and, by their Maker, caused to pass before Adam, who gave all of them names, which were judged proper by the Deity himself.—In this review, Adam found none for a companion to himself. This solitary state was seen by the Deity to be attended with some degree of unhappiness; and therefore he threw Adam into a deep sleep, in which condition he took a rib from his side, and healing up the wound formed a woman of the rib he had taken out. On Adam's awaking, the woman was brought to him; and he immediately knew her to be one of his own species, called her his bone and his flesh, giving her the name of *woman* because she was taken out of man.

The first pair being thus created, God gave them authority over the inferior creation, commanding them to subdue the earth, also to increase and multiply and fill it. They were informed of the proper food for the beasts and for them; the grass, or green herbs, being appointed for beasts; and fruits, or seeds, for man. Their proper employment also was assigned them; namely, *to dress the garden and to keep it*.

Though Adam was thus highly favoured and instructed by his Maker, there was a single tree, which grew in the middle of the garden, of the fruit of which they were not allowed to eat; being told, that they should surely die in the day they ate of it. This tree was named, *the Tree of the Knowledge of Good and Evil*. This prohibition, however, they soon broke through. The woman having entered into conversation with the *Serpent*, was by him persuaded, that by eating of the tree she should become as wise as God himself; and accordingly, being invited by the beauty of the fruit, and its desirable property of imparting wisdom, she plucked and ate; giving her husband of it at the same time, who did likewise eat.

Before this transgression of the divine command, Adam and his wife had no occasion for clothes, neither had they any sense of shame; but, immediately on eating the forbidden fruit, they were ashamed of being naked, and made aprons of fig-leaves for themselves. On hearing the voice of God in the garden, they were terrified, and hid themselves: but, being questioned by the Deity, they confessed what they had done, and received sentence accordingly; the man being condemned to labour; the woman to subjection to her husband, and to pain in child-bearing. They were now driven out of the garden, and their access to it prevented by a terrible apparition. They had clothes given them by the Deity made of the skins of beasts. In this state Adam had several children; viz. Cain, Abel, and Seth. He died at the age of 930 years.

These are all the particulars concerning Adam's life, that we have on divine authority: but a vast multitude of others are added by the Jews, Mahometans, and others; all of which must be at best conjectural; most of them, indeed, appear downright falsehoods or absurdities. The curiosity of our readers, it is presumed, will be sufficiently gratified by the few which are here subjoined.

According to the Talmudists, when Adam was created, his body was of immense magnitude. When he sinned, his stature was reduced to an hundred ells, according to some; to nine hundred cubits, according to others; who think this was done at the request of the angels, who were afraid of so gigantic a creature. In the island of Ceylon is a mountain, called the *Peak* or mountain of Adam, from its being, according to the tradition of the country, the residence of our first parent. Here the print of his footsteps, above two palms in length, are still pointed out.

Many reveries have been formed concerning the personal beauty of Adam. That he was a handsome well-shaped man is probable; but some writers, not content with this,

affirm, that God, intending to create man, clothed Himself with a perfectly beautiful human body, making this his model in the formation of the body of Adam.

Nor has the imagination been less indulged concerning the formation of the human species male and female.—It would be endless to recount all the whimsical writings on this subject; but as Mad. Bourignon has made a considerable figure in the *religious*, or rather *superstitious*, world, we cannot help inserting some of her opinions concerning the first man, which are peculiarly marvellous. According to the *revelations* of this lady, Adam before his fall possessed in himself the principles of both sexes, and the virtue or power of producing his like, without the concurrent assistance of woman. The division into two sexes, she imagined, was a consequence of man's sin; and now, she observes, mankind are become so many *monsters in nature*, being much less perfect in this respect than plants or trees, who are capable of producing their like alone, and without pain or misery. She even imagined, that, being in an ecstasy, she saw the figure of Adam before he fell, with the manner how, by himself, he was capable of procreating other men. "God," says she, "represented to my mind the beauty of the first world, and the manner how he had drawn it from the chaos: every thing was bright, transparent, and darted forth light and ineffable glory. The body of Adam was purer and more transparent than crystal, and vastly finer; through his body were seen vessels and rivulets of light, which penetrated from the inward to the outward parts, through all his pores. In some vessels ran fluids of all kinds and colours, vastly bright, and quite diaphanous. The most ravishing harmony arose from every motion; and nothing resisted, or could annoy, him. His stature was taller than the present race of men; his hair was short, curled, and of a colour inclining to black; his upper lip covered with short hair: and, instead of the parts which modesty will not allow us to name, he was fashioned as our bodies will be in the life eternal, which I know not whether I dare reveal. In that region was diffused the most delicious fragrancy and perfumes; whence also men were to issue, all whose principles were inherent in him; there being in the genital system a vessel, where little eggs were formed; and a second vessel filled with a fluid, which impregnated those eggs: and, when man heated himself in the love of God, the desire he had that other creatures should exist besides himself caused the fluid above mentioned to drop on one or more of these eggs, with inexpressible delight; which being thus impregnated, issued, some time after, out of man, by this canal, in the shape of an egg, whence a perfect man emerged by insensible degrees. Woman was formed by taking out of Adam's sides the vessels that contained the eggs; which she still possesses, as is discovered by anatomists."

Many others have believed, that Adam at his first creation was both male and female: others, that he had two bodies joining together at the shoulders, and their faces looking opposite ways like those of Janus. Hence, say these, when God created Eve, he had no more to do than to separate the two bodies from one another.

Various conjectures have been formed concerning the place where man was first created, and where the garden of Eden was situated; but none of these have any solid foundation. The Jews tell us, that Eden was separated from the rest of the world by the ocean; and that Adam, being banished therefrom, walked across the sea, which he found every way fordable, by reason of his enormous stature. The Arabians imagined paradise to have been in the air; and that our first parents were thrown down from it on their transgression, as Vulcan is said to have been thrown down headlong from heaven by Jupiter.

Strange stories are told concerning Adam's children. That he had none in the state of innocence, is certain from scripture; but that his marriage with Eve was not consummated till after the fall, cannot be proved from thence. Some imagine, that, for many years after the

fall, Adam denied himself the connubial joys by way of penance; others, that he cohabited with another woman, whose name was LILITH. The Mahometans tell us, that our first parents having been thrown headlong from the celestial paradise, Adam fell upon the isle of Serendib, or Ceylon, in the East Indies; and Eve on Iodda, a port of the Red Sea, not far from Mecca. After a separation of upwards of two hundred years, they met in Ceylon, where they multiplied: according to some Eve had twenty, according to others only eight, deliveries; bringing forth at each time twins, a male and a female, who afterwards married. The rabbins imagine that eve brought forth Cain and Abel at a birth; that Adam wept for Abel an hundred years in the valley of tears near Hebron, during which time he did not cohabit with his wife; and that this separation would probably have continued longer, had it not been forbidden by the angel Gabriel. The inhabitants of Ceylon affirm, that the salt lake on the mountain of Colombo consists wholly of the tears which Eve for one hundred years together shed because of Abel's death.

Some of the Arabians tell us, that Adam was buried near Mecca on Mount Abukobeis; others, that Noah, having laid his body in the ark, caused it to be carried after the deluge to Jerusalem by Melchisedek the son of Shem: of this opinion are the eastern Christians; but the Persians affirm that he was interred in the Isle of Serendib, where his corpse was guarded by lions at the time the giants warred upon one another.—St. Jerome imagined that Adam was buried at Hebron; others, on Mount Calvary. Some are of opinion that he died on the very spot where Jerusalem was afterwards built; and was buried on the place where Christ suffered, that so his bones might be sprinkled with the Saviour's blood!!!

ADAM (Melchior) lived in the 17th century. He was born in the territory of Grotkaw in Silesia, and educated in the college of Brieg, where the dukes of that name, to the utmost of their power, encouraged learning and the reformed religion as professed by Calvin. Here he became a firm protestant; and was enabled to pursue his studies by the liberality of a person of quality, who had left several exhibitions for young students. He was appointed rector of a college at Heidelberg, where he published his *Lives of illustrious Men*. He wrote other works besides his *Lives*, and died in 1622.

ADAM'S APPLE, *f.* in botany, a name given to a species of CRITUS.

ADAM'S NEEDLE, *f.* in botany. See YUCCA.

ADAM'S PEAK, a high mountain of the East Indies, in the island of Ceylon, on the top of which they believe the first man was created.

ADAM, or ADOM, a town in the Peræa, or on the other side the Jordan, over against Jericho, where the Jordan began to be dried up on the passage of the Israelites.

ADAMA, or ADMAH, one of the towns that were involved in the destruction of Sodom.

ADAMANT, *f.* [*adamas*, Lat. from α and $\delta\alpha\mu\omega$, Gr. that is *insuperable, infrangible*.] A stone, imagined by writers, of impenetrable hardness. The diamond. Adamant is also taken for the loadstone.

ADAMANTEAN, *adj.* Hard as adamant.

ADAMANTINE, *adj.* [*adamantinus*, Lat.] Made of adamant.—Having the qualities of adamant; as hardness, indissolubility:

Him the Almighty Power
Hurl'd headlong flaming from th' ethereal sky,
With hideous ruin and combustion, down
To bottomless perdition, there to dwell
In adamant chains and penal fire.

Milton.

ADAMIC EARTH, a name given to common red clay, alluding to that species of earth of which the first man is supposed to have been made.

ADAMI POMUM, in anatomy, a protuberance in the fore-part of the throat, formed by the os hyoides. It is thought to be so called upon a strange conceit, that a piece

of the forbidden apple, which Adam ate, stuck by the way and occasioned it.

ADAMITES, in ecclesiastical history, the name of a sect of ancient heretics, supposed to have been a branch of the Basilidians and Carpocratians.

Epiphanius tells us, that they were called Adamites from their pretending to be re-established in the state of innocence, and to be such as Adam was at the moment of his creation, whence they ought to imitate him in his nakedness. They detested marriage; maintaining, that the conjugal union would never have taken place upon earth had sin been unknown.

ADAMUS, the philosopher's stone, so called by alchemists, who say that it is an animal; and that it has carried its invisible Eve in its body from the moment they were first united by the Creator. It is also called *Aquila*, *Philosophorum Lapis*, *Basiliscus*, *Benedictus*, *Boritis*, *Gryphus*; by way of eminence, *Antidotus*. This stone, the greatest object of alchemy, is a long-sought-for preparation, which, when found, is to transmute, or exalt, impurer metals, as tin, lead, and copper, into gold, and silver. Authors who have written on this stone, call sulphur the *maritus*, or husband; and mercury, the *uxor*, or wife.

ADAMSHIDE, a district of the circle of Rastenburg, belonging to the king of Prussia, which, with Dombrosken, was bought, in 1737, for 42,000 dollars.

ADAMSON (Patrick), a Scottish prelate, archbishop of St. Andrew's. He was born in the year 1543 in the town of Perth, and afterwards studied philosophy, and took his degree of master of arts, at the university of St. Andrew's. In the year 1566, he set out for France, as tutor to a young gentleman. He resided at Bourges during the massacre at Paris; and the same persecuting spirit prevailing among the catholics at Bourges as at the metropolis, he lived concealed for seven months in a public-house, the master of which, upwards of seventy years of age, was thrown from the top thereof, and had his brains dashed out, for his charity to heretics. Whilst Mr. Adamson lay thus in his sepulchre, as he called it, he wrote his Latin poetical version of the Book of Job, and his Tragedy of Herod. In the year 1573, he returned to Scotland; and became minister of Paisley. In the year 1575, he was appointed one of the commissioners, by the general assembly, to settle the jurisdiction and policy of the church; and the following year he was named, with Mr. David Lindsay, to report their proceedings to the earl of Mortoun, then regent. About this time the earl made him one of his chaplains; and, on the death of bishop Douglas, promoted him to the archiepiscopal see of St. Andrew's, a dignity which brought upon him great trouble and uneasiness: for now the clamour of the Presbyterian party rose very high against him, and many inconsistent stories were propagated concerning him. Soon after his promotion, he published his Catechism in Latin verse, a work highly approved even by his enemies; but, nevertheless, they still continued to persecute him with great violence. In the year 1582, being attacked with a grievous disease, in which the physicians could give him no relief, he happened to take a simple medicine from an old woman, which did him service. The woman, whose name was Alison Pearson, was thereupon charged with witchcraft, and committed to prison, but escaped out of her confinement; however, about four years afterwards, she was again found, and burnt for a witch. A provincial synod being held at St. Andrew's in April 1586, the archbishop was here accused and excommunicated: he appealed to the king and the states, but this availed him little; for, the mob being excited against him, he durst scarcely appear in public. At the next general assembly, a paper being produced, containing the archbishop's submission, he was absolved from the excommunication. In 1588, fresh accusations were brought against him. The year following, he published the Lamentations of the Prophet Jeremiah in Latin verse; which he dedicated to the king, complaining of his hard usage. The king, however,

ver, was so far from giving him assistance, that he granted the revenue of his fee to the duke of Lennox; so that the remaining part of his life was very wretched, having hardly subsistence for his family. He died in 1591.

ADANA, a town of Asia, in Natolia, and in the province of Carmania. It is seated on the river Choquen; on the banks of which stands a strong castle built on a rock. It has a great number of beautiful fountains brought from the river by means of water-works. Over the river there is a stately bridge of fifteen arches, which leads to the water-works. The climate is pleasant and healthy, and the winter mild and serene: but the summer is so hot as to oblige the principal inhabitants to retire into the neighbouring mountains, where they spend six months among shady trees and grottoes, in a most delicious manner. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse, and herbs of all sorts, all the year round; besides corn, wine, and fruits, in their proper season. It is thirty miles east of Tarsus, on the road to Aleppo. E. lon. 35. 42. N. lat. 38. 10.

ADANSONIA, [named from M. Adanson, a French surgeon, who resided many years in Senegal, brought home a curious collection of seeds and plants, published his travels, and a new arrangement of vegetables, entitled *Familles des Plantes*.] In botany, a genus of the monadelphia polyandria class, of the natural order of columniferæ. The generic characters are—Calyx: perianth one-leaved, femiinquifid, cyathiform; divisions revolute, deciduous. Corolla: petals five, roundish, nerved, revolute, connected by the claws with each other and the stamens. Stamina: filaments united at bottom into a tube, which they crown, expanding horizontally. Antheræ kidney-shaped. Pistillum: germ ovate. Style very long, tubulous, variously intorted. Stigmas many (ten) prismatic, villous, radiate-expanded. Pericarpium: capsule ovate, woody, not gaping, ten-celled, (ten to fourteen *g.*) with farinaceous pulp, the partitions membranaceous. Seeds: numerous, kidney-shaped, rather bony, involved in a friable pulp.—*Essential Character.* Calyx, simple, deciduous. Style, very long. Stigmas, many. Capsule, woody, ten-celled, with farinaceous pulp, and many seeds.

There is only one species, which is called *Adansonia digitata*, or Ethiopian four-gourd, or monkey's-bread.—The young plants, and also most of the new branches, have single spear-shaped leaves towards their lower part, but at their extremities the leaves have some three, and others five lobes, of the same size and form as the lower, which are disposed like a hand; these are entire, ending in a point, and fall off in winter. The stems are large and woody, but of a soft texture, and have generally a large swelling near the root. The account which Monsieur Adanson gives of the trees he saw at Senegal and other parts of Africa, in regard to the size of them, is amazing; he measured several from sixty-five to seventy-eight feet in circumference; but their height was not extraordinary. The trunks were from twelve to fifteen feet high, before they divided into many horizontal branches which touched the ground at their extremities; these were from forty-five to fifty-five feet long, and were so large, that each branch was equal to a monstrous tree: and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to sight, they measured one hundred and ten feet long, without including those parts of the roots which remained covered. Prosper Alpinus, in his history of Egyptian plants, describes this tree, to which he gives the title of *baobab*, so that it also grows in that country; but he does not mention any of them to be near the size of those described by Monsieur Adanson. The fresh fruit is very pleasant, of an acid flavour, and is eaten with sugar. The pulp or juice mixed with sugar, or a syrup made of it, is used in putrid and pestilential fevers. At Cairo they reduce the pulp to a powder, and use it in these disorders, in the lenteries, dysentery, and all sorts of fluxes.

Propagation and Culture. It is propagated by seeds, which must be procured from the country where it grows naturally, for it does not produce any in Europe; these must be sown in pots, and plunged into a hot-bed, where, in about six weeks, the plants will come up, and in a short time after be fit to transplant, when they should be each planted into a separate pot, filled with light sandy earth, and plunged into a fresh hot-bed, observing to shade them until they have taken new root; after which time they should have free air admitted to them every day in warm weather, but must be sparingly watered; for as their stems are soft, especially when young, too much wet will cause them to rot. As the plants advance in their growth, they are to be shifted into larger pots, but must constantly be plunged into the bark-bed, being too tender to thrive in this country without this artificial heat, therefore they must constantly remain in the stove with other tender exotic plants: the plants when young make great progress in their growth, where they are properly treated; for in three years many of them have been more than six feet high, and have put out several lateral branches; their stems are also proportionable; but after four or five years growth, they are almost at a stand, their annual shoots rarely exceeding two or three inches. There were some plants of this sort in several gardens, which were raised from seeds obtained from Grand Cairo in the year 1724, by the late Dr. William Sherard, some of which were grown to the height of eighteen feet; but in the severe winter 1740, they were all lost, and since that time there had not been any of the seeds brought to England, till the return of M. Adanson to Paris in 1754, who sent some of the seeds over here, which have succeeded, and many of the plants grew upwards of twelve or fifteen feet high.

To ADAPT, *v. a.* [*adapto*, Lat.] To fit one thing to another; to suit; to proportion.—It is not enough that nothing offends the ear, but a good poet will adapt the very sounds, as well as words, to the things he treats of. *Pope.*

ADAPTATION, *f.* The act of fitting one thing to another; the fitness of one thing to another.—Some species there be of middle natures, that is, of bird and beast, as bats; yet are their parts so set together, that we cannot define the beginning or end of either, there being a commixture of both, rather than adaptation or cement of the one unto the other. *Brown.*

ADAPTION, *f.* The act of fitting.—It were alone a sufficient work to shew all the necessities, the wife contrivances, and prudent adaptations, of these admirable machines, for the benefit of the whole. *Cheyne.*

ADAPTNESS, *f.* [for *adaptedness*, from *adapt*.]—Some notes are to display the adaptness of the sound to the sense. *Newton.*

ADAR, *f.* the name of a Hebrew month, answering to the end of February and beginning of March, the 12th of their sacred, and 6th of their civil, year. On the seventh day of it, the Jews keep a feast for the death of Moses; on the thirteenth they have the feast of Esther; and, on the 14th, they celebrate the feast of Purim, for their deliverance from Haman's conspiracy. As the lunar years, which the Jews followed in their calculation, is shorter than the solar by about eleven days, which at the end of three years make a month, they then intercalate a thirteenth month, which they call *Veadar*, or the second Adar.

ADARCE, *f.* a saltish concretion found about the reeds and grafs in marshy grounds in Galatia; it is also called *calomochanus*, or *calomochinus*. It is lax and porous, like bastard sponge, and is used to clear the skin with in leprosy, tetter, freckles, &c. Dr. Plott gives an account of this production in his Natural History of Oxfordshire.

ADARCON, *f.* in Jewish antiquity, a gold coin, mentioned in scripture, worth about 15s. sterling.

ADARETON, an island in the lake Van Turcomania, having on it several villages, and a monastery of Armenian monks.

ADARME, *f.* in commerce, a small weight in Spain, which is also used at Buenos-Aires, and in all Spanish America. It is the sixteenth part of an ounce, which at Paris is called the demi-gros. But the Spanish ounce is seven per cent. lighter than that of Paris. Stephens renders it in English by a drachm.

ADASA, a city of Judea, where Judas Maccabæus overthrew and killed Nicanor.

ADATAIS, **ADATSI**, or **ADATYS**, *f.* in commerce, a muslin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and $\frac{3}{4}$ broad. It comes from the East Indies; and the finest is made at Bengal.

ADCORDABILIS DENARI, *f.* in old law books, signifies money paid by the vassal to his lord, upon the selling or exchanging of a feud.

To ADCORPORATE, *v. a.* [from *ad* and *corpus*.] To unite one body with another; more usually wrote *accorporate*.

ADCRESCENTES, *f.* among the Romans, denoted a kind of soldiery, entered in the army, but not yet put on duty; from these the standing forces were recruited.

To ADD, *v. a.* [*addo*, Lat.] To join something to that which was before. To perform the mental operation of adding one number or conception to another. To *add* is proper, but to *add together* seems a solecism.—Whatever positive ideas a man has in his mind, of any quantity, he can repeat it, and *add* it to the former, as easily as he can *add together* the ideas of two days, or two years. *Locke*.

ADDA, a river of Switzerland and Italy, which rises in mount Braulio, in the country of the Grisons, and, passing through the Valteline, traverses the lake Como and the Milanese, and falls into the Po, near Cremona.

ADDALE, *adj.* That to which something may be added. *Addible* is more proper. It signifies more properly that which may be added.

To ADDECIMATE, *v. a.* [*addecimo*, Lat.] To take or ascertain tithes.

To ADDEEM, *v. a.* [from *deem*.] To esteem; to account. This word is now out of use.

ADDEPHAGIA, *f.* in medicine, a term used by some physicians for gluttony, or a voracious appetite.

ADDER, *f.* [*atter*, *attor*, *naddre*, as it seems from *eiller*, Sax. poison.] In zoology, a name for the **VIPER**. See **COLUBER**.

ADDER-BOLTS, or **ADDER-FLIES**. See **LIBELLULA**.
Sea ADDER, *f.* the English name of a species of **SYNGNATHUS**.

Water ADDER, *f.* a name given to the **COLUBER NATRIX**.

ADDER'S-TONGUE, *f.* in botany. See **OPHIOGLOSSUM**.

ADDER-STUNG, *part.* is used in respect of cattle, when stung with any kind of venomous reptiles, as adders, scorpions, &c. or bit by a hedge-hog or threw. For the cure of such bites, some use an ointment made of dragon's blood, with a little barley-meal, and the whites of eggs.

ADDER-WORT, or **SNAKEWOOD**, *f.* See **POLYGONUM**.

ADDEXTRATOIRES, *f.* in the court of Rome, the pope's mitre-bearers, so called, according to Ducange, because they walk at the pope's right hand when he rides to visit the churches.

ADDIBLE, *adj.* Possible to be added.—The clearest idea it can get of infinity, is the confused incomprehensible remainder of endless *addible* numbers, which affords no prospect of stop or boundary. *Locke*.

ADDIBILITY, *f.* The possibility of being added.—This endless addition or *addibility* of numbers, so apparent to the mind, is that which gives us the clearest and most distinct idea of infinity. *Locke*.

ADDICE, *f.* [for which we corruptly speak and write *adz*, from *adese*, Sax. an axe.]—The *addice* hath its blade made thin and somewhat arching. As the axe hath its edge parallel to its handle, so the *addice* hath its edge athwart the handle, and is ground to a basil on its inside to its outer edge. *Moxon*.

To ADDICT, *v. a.* [*addico*, Lat.] To devote, to dedicate, in a good sense; which is rarely used. It is commonly taken in a bad sense; as, *he addicted himself to vice*. To devote one's self to any person, party, or persuasion.

ADDICTEDNESS, *f.* The quality or state of being addicted.

ADDICTI, *f.* in antiquity, a kind of slaves, among the Romans, adjudged to serve some creditor whom they could not otherwise satisfy, and whose slaves they became till they could pay or work out the debt.

ADDICTION, *f.* [*addictio*, Lat.] The act of devoting, or giving up. The state of being devoted:

It is a wonder how his grace should glean it,
Since his *addiction* was to courtes vain;
His companies unletter'd, rude, and shallow;
His hours fill'd up with riots, banquets, sports.

Shakespeare.

ADDICTION, among the Romans, was the making over goods to another, either by sale or by legal sentence; the goods so delivered were called *bona addicta*. Debtors were sometimes delivered over in the same manner; and thence called *servi addicti*.

ADDICTIO IN DIEM, *f.* among the Romans, the adjudging a thing to a person for a certain price, unless by such a day the owner, or some other, give more for it.

ADDINGTON, Surrey, three miles from Croydon. The lord of this manor, in the reign of Henry III. held it by this service, viz. to make the king a mess of pottage at his coronation; and so lately as the restoration of Charles II. this service was ordered by the court of claims, and accepted of by the king at his table.

ADDISON (Lancelot), son of Lancelot Addison a clergyman, was born at Mouldisneaburne, in the parish of Crosby Ravensworth, in Westmoreland, in the year 1632. He was educated at Queen's College, Oxford; and, at the restoration of Charles II. accepted of the chaplainship of the garrison of Dunkirk: but that fortress being delivered up to the French in 1662, he returned to England, and was soon after made chaplain to the garrison of Tangier; where he continued seven years, and was greatly esteemed. In 1670 he again returned to England, and was soon after made chaplain in ordinary to the king; but his chaplainship of Tangier being taken from him on account of his absence, he found himself straitened in his circumstances, when he seasonably obtained the rectory of Milton in Wiltshire, worth about 120*l.* per annum. He afterwards became a prebendary of Sarum; took his degree of doctor of divinity at Oxford; and in 1683 was made dean of Litchfield, and next year archdeacon of Coventry. His life was exemplary; his conversation pleasing; and greatly instructive; and his behaviour, as a gentleman, a clergyman, and a neighbour, did honour to the place of his residence. He wrote, 1. A Short Narrative of the Revolutions of the Kingdoms of Fez and Morocco. 2. The present History of the Jews. 3. A Discourse on Catechising. 4. A Modest Plea for the Clergy. 5. An Introduction to the Sacrament. 6. The first State of Mahometanism; and several other pieces. This worthy divine died on the 20th of April 1703, and left three sons: Joseph, the subject of the next article; Gullston, who died while governor of Fort St. George; Lancelot, master of arts, and fellow of Magdalene College in Oxford; and one daughter, first married to Dr. Saxe, prebendary of Westminster, and afterwards to Daniel Coombes, Esq.

ADDISON (Joseph), son of Dean Addison, the subject of the last article. He was born at Milton, near Amesbury, in Wiltshire, on the 11th of May 1672; and, not being thought likely to live, was baptized the same day. He received the first rudiments of his education at the place of his nativity, under the Rev. Mr. Naith; but was soon removed to Salisbury, under the care of Mr. Taylor; and from thence to the Charter-house, where he commenced his acquaintance with Sir Richard Steele. About fif-

teen,

JOSEPH ADDISON.

London Published as the Act directs, Novr 1796, by J. Wilkie.

teen, he was entered at Queen's College, Oxford, where he applied very closely to the study of classical learning, in which he made a surprising proficiency.

In the year 1687, Dr. Lancaster, dean of Magdalen College, having, by chance, seen a Latin poem of Mr. Addison's, was so pleased with it, that he immediately got him elected into that house, where he took up his degrees of bachelor and master of arts. His Latin pieces, in the course of a few years, were exceedingly admired in both universities; nor were they less esteemed abroad, particularly by the celebrated Boileau, who is reported to have said, that he would not have written against Perrault, had he before seen such excellent pieces by a modern hand. He published nothing in English before the 22d year of his age; when there appeared a short copy of verses written by him, and addressed to Mr. Dryden, which procured him great reputation from the best judges. This was soon followed by a translation of the Fourth Georgic of Virgil (omitting the story of Aristeus), much commended by Mr. Dryden. He wrote also the Essay on the Georgics, prefixed to Mr. Dryden's translation. There are several other pieces written by him about this time; amongst the rest, one dated the third of April 1694, addressed to H. S. that is, Dr. Sacheverel, who became afterwards so famous, and with whom Mr. Addison once lived in the greatest friendship; but their intimacy was some time after broken off by their disagreement in political principles. In the year 1695, he wrote a poem to King William on one of his campaigns, addressed to Sir John Somers lord keeper of the great seal. This gentleman received it with much pleasure, took the author into the number of his friends, and bestowed on him many marks of his favour.

Mr. Addison had been closely pressed, while at the university, to enter into holy orders; and had once resolved upon it: but, having expressed an inclination to travel, he was encouraged thereto by his patron above-mentioned, who by his interest procured him from the crown a pension of 300*l.* per annum to support him in his travels. He accordingly made a tour to Italy in the year 1699; and, in 1701, he wrote a poetical epistle from Italy to the Earl of Halifax, which has been universally esteemed as a most excellent performance. It was translated into Italian verse by the Abbot Antonio Maria Salvini, Greek professor at Florence. In the year 1705, he published an account of his travels, dedicated to Lord Somers; which, though at first but indifferently received, yet in a little time met with its deserved applause.

In the year 1702, he was about to return to England, when he received advice of his being appointed to attend prince Eugene, who then commanded for the emperor in Italy: but the death of king William, happening soon after, put an end to this affair as well as his pension; and he remained for a considerable time unemployed. But an unexpected incident at once raised him, and gave him an opportunity of exerting his talents to advantage: for, in the year 1704, the lord treasurer Godolphin happened to complain to lord Halifax, that the duke of Marlborough's victory at Blenheim had not been celebrated in verse in the manner it deserved; and intimated, that he would take it kindly if his lordship, who was the known patron of the poets, would name a gentleman capable of doing justice to so elevated a subject. Lord Halifax replied, somewhat hastily, that he did know such a person, but would not mention him; adding, that long had he seen, with indignation, men of no merit maintained in luxury at the public expence, whilst those of real worth and modesty were suffered to languish in obscurity. The treasurer answered very coolly, that he was sorry there should be occasion for such an observation, but that he would do his endeavour to wipe off such reproaches for the future; and he engaged his honour, that whoever his lordship named as a person capable of celebrating this victory, should meet with a suitable recompence. Lord Halifax thereupon named Mr. Addison; insisting, however, that the

treasurer himself should send to him; which he promised. Accordingly he prevailed on Mr. Boyle (afterwards Lord Carlton) then chancellor of the Exchequer, to make the proposal to Mr. Addison; which he did in so polite a manner, that our author readily undertook the task. The lord treasurer had a sight of the piece, when it was carried no farther than the celebrated simile of the angel; and was so pleased with it, that he immediately appointed Mr. Addison a commissioner of appeals, vacant by the promotion of Mr. Locke, chosen one of the lords commissioners for trade. The Campaign is addressed to the duke of Marlborough: it gives a short view of the military transactions in 1704, and contains a noble description of the two great actions of Schellenberg and Blenheim. In 1705, he attended lord Halifax to Hanover; and the ensuing year was appointed under-secretary to Sir Charles Hedges, secretary of state; in which office he acquitted himself so well, that the earl of Sunderland, who succeeded Sir Charles in December, continued Mr. Addison in his employment.

A taste for operas beginning at this time to prevail in England, and many persons having solicited Mr. Addison to write one, he complied with their request, and composed his *Rosamond*. This, however, whether from the defect of the music, or from the prejudices in favour of the Italian taste, did not succeed upon the stage; but the poetry of it has, and always will be, justly admired. About this time, Sir Richard Steele composed his comedy of the *Tender Husband*, to which Mr. Addison wrote a prologue. Sir Richard surprised him with a dedication of this play, and acquainted the public, that he was indebted to him for some of the most excellent strokes in the performance. The marquis of Wharton, being appointed lord-lieutenant of Ireland in 1709, took Mr. Addison with him as his secretary. Her majesty also made him keeper of the records of Ireland, and, as a farther mark of her favour, considerably augmented the salary annexed to that place. Whilst he was in this kingdom, the *Tatler* was first published; and he discovered his friend Sir Richard Steele to be the author, by an observation on Virgil, which he had communicated to him. He afterwards assisted considerably in carrying on this paper, which the author acknowledges. The *Tatler* being laid down, the *Spectator* was set on foot, and Mr. Addison furnished great part of the most admired papers. The *Spectator* made its appearance in March 1711, and was brought to a conclusion in September 1712.

His celebrated *Cato* appeared in 1713. He formed the design of a tragedy upon this subject when he was very young, and wrote it when on his travels: he retouched it in England, without any intention of bringing it on the stage; but, his friends being persuaded it would serve the cause of liberty, he was prevailed on by their solicitations, and it was accordingly exhibited on the theatre, with a prologue by Mr. Pope, and an epilogue by Dr. Garth. It was received with the most uncommon applause, having run thirty-five nights without interruption. The Whigs applauded every line in which liberty was mentioned, as a satire on the Tories; and the Tories echoed every clap, to shew that the satire was unfelt. When it was printed, notice was given that the queen would be pleased if it was dedicated to her; "but, as he had designed that compliment elsewhere, he found himself obliged (says Tickell) by his duty on the one hand, and his honour on the other, to send it into the world without any dedication." It was no less esteemed abroad, having been translated into French, Italian, and German; and it was acted at Leghorn, and several other places, with vast applause. The Jesuits of St. Omers made a Latin version of it, and the students acted it with great magnificence.

About this time, another paper called the *Guardian* was published by Steele, to which Addison was a principal contributor. It was a continuation of the *Spectator*, and was distinguished by the same elegance and the same variety; but, in consequence of Steele's propensity to politics,

was abruptly discontinued in order to write the Englishman.

The papers of Addison are marked in the Spectator by one of the letters in the name of *Clio*, and in the Guardian by a *hand*. Many of these papers were written with powers truly comic, with nice discrimination of characters, and accurate observation of natural or accidental deviations from propriety: but it was not supposed that he had tried a comedy on the stage, till Steele, after his death, declared him the author of "The Drummer." This, however, he did not know to be true by any cogent testimony: for, when Addison put the play into his hands, he only told him it was the work of a gentleman in the company; and when it was received, as is confessed, with cold disapprobation, he was probably less willing to claim it. Tickell omitted it in his collection; but the testimony of Steele, and the total silence of any other claimant, has determined the public to assign it to Addison, and it is now printed with his other poetry. Steele carried "The Drummer" to the playhouse, and afterwards to the press, and sold the copy for fifty guineas. To Steele's opinion may be added the proof supplied by the play itself, of which the characters are such as Addison would have delineated, and the tendency such as Addison would have promoted.

It is said that Mr. Addison intended to have composed an English dictionary upon the plan of the Italian (*Della Crusca*); but, upon the death of the queen, being appointed secretary to the lords justices, he had not leisure to carry on such a work. When the earl of Sunderland was appointed lord-lieutenant of Ireland, Mr. Addison was again made secretary for the affairs of that kingdom; and, upon the earl's being removed from the lieutenancy, he was chosen one of the lords of trade.

Not long afterwards an attempt was made to revive the Spectator, at a time indeed by no means favourable to literature, when the succession of a new family to the throne filled the nation with anxiety, discord, and confusion; and either the turbulence of the times or the satiety of readers put a stop to the publication, after an experiment of eighty numbers, which were afterwards collected into an eighth volume, perhaps more valuable than any of those that went before it: Addison produced more than a fourth part.

In 1715, he began the Freeholder, a political paper, which was much admired, and proved of great use at that juncture. He published also, about this time, verses to Sir Godfrey Kneller upon the king's picture, and some to the Princess of Wales, with the tragedy of Cato.

Before the arrival of king George he was made secretary to the regency, and was required by his office to send notice to Hanover that the queen was dead, and that the throne was vacant. To do this would not have been difficult to any man but Addison, who was so overwhelmed with the greatness of the event, and so distracted by choice of expression, that the lords, who could not wait for the niceties of criticism, called Mr. Southwell, a clerk in the house, and ordered him to dispatch the message. Southwell readily told what was necessary, in the common stile of business, and valued himself upon having done what was too hard for Addison.

In 1716, he married the countess dowager of Warwick, whom he had solicited by a very long and anxious courtship. He is said to have first known her by becoming tutor to her son. The marriage, if uncontradicted report can be credited, made no addition to his happiness; it neither found them nor made them equal. She always remembered her own rank, and thought herself intitled to treat with very little ceremony the tutor of her son. It is certain that Addison has left behind him no encouragement for ambitious love. The year after, 1717, he rose to his highest elevation, being made secretary of state; but is represented as having proved unequal to the duties of his place. In the house of commons he could not speak, and therefore was useless to the defence of the government. In

the office he could not issue an order without losing his time in quest of fine expressions. At last, finding by experience his own inability for public business, he was forced to solicit his dismissal, with a pension of 1500*l.* a year. Such was the account of those who were inclined to detract from his abilities; but by others his relinquishment was attributed to declining health, and the necessity of recess and quiet.

In his retirement, he applied himself to a religious work, which he had begun long before; part of which, scarcely finished, has been printed in his works. He intended also to have given an English paraphrase of some of David's Psalms. But his ailments increased, and cut short his designs. He had for some time been oppressed by an asthmatic disorder, which was now aggravated by a dropsy, and he prepared to die conformably to his precepts and professions. He sent, as Pope relates, a message by the earl of Warwick to Mr. Gay, desiring to see him: Gay, who had not visited him for some time before, obeyed the summons, and found himself received with great kindness. The purpose for which the interview had been solicited was then discovered: Addison told him that he had injured him; but that, if he recovered, he would recompence him. What the injury was he did not explain, nor did Gay ever know; but supposed that some preferment designed for him had by Addison's intervention been withheld. Another death-bed interview, of a more solemn nature, is recorded: Lord Warwick was a young man of very irregular life, and perhaps of loose opinions. Addison, for whom he did not want respect, had very diligently endeavoured to reclaim him; but his arguments and expostulations had no effect: one experiment, however, remained to be tried. When he found his life near its end, he directed the young lord to be called: and when he desired, with great tenderness, to hear his last injunctions, told him, "I have sent for you that you may see how a Christian can die." What effect this awful scene had on the earl's behaviour is not known: he died himself in a short time. Having given directions to Mr. Tickell for the publication of his works, and dedicated them on his death-bed to his friend Mr. Craggs, he died June 17, 1719, at Holland-house.

Addison's course of life before his marriage has been detailed by Pope. He had in the house with him Budgell, and perhaps Philips. His chief companions were Steele, Budgell, Philips, Carey, Davenant, and Colonel Brett. With one or other of these he always breakfasted. He studied all the morning; then dined at a tavern, and went afterwards to Button's. From the coffee-house he went again to the tavern, where he often sat late, and drank too much wine.

Dr. Johnson, in delineating the character of Addison, observes, with Tickell, that he employed wit on the side of virtue and religion. He not only made the proper use of wit himself, but taught it to others; and from his time it has been generally subservient to the cause of reason and truth. He has dissipated the prejudice that had long connected gaiety with vice, and easiness of manners with laxity of principles. He has restored virtue to its dignity, and taught innocence not to be ashamed. This is an elevation of literary character, "above all Greek above all Roman fame." No greater felicity can genius attain than that of having purified intellectual pleasure, separated mirth from indcency, and wit from licentiousness; of having taught a succession of writers to bring elegance and gaiety to the aid of goodness; and, to use expressions yet more awful, of having "turned many to righteousness." As a describer of life and manners, he must be allowed to stand perhaps the first of the first rank. His humour, which, as Steele observes, is peculiar to himself, is so happily diffused as to give the grace of novelty to domestic scenes and daily occurrences. He never "outsteps the modesty of nature," nor raises merriment or wonder by the violation of truth. His figures neither divert by distortion, nor amaze by aggravation. He copies life with so much

much fidelity, that he can be hardly said to invent; yet his exhibitions have an air so much original, that it is difficult to suppose them not merely the product of imagination. As a teacher of wisdom he may be confidently followed. His religion has nothing in it enthusiastic or superstitious; he appears neither weakly credulous nor wantonly sceptical; his morality is neither dangerously-lax nor impracticably rigid. All the enchantment of fancy and all the cogency of argument are employed to recommend to the reader his real interest, the care of pleasing the Author of his being. Truth is shewn sometimes as the phantom of a vision, sometimes appears half veiled in an allegory; sometimes attracts regard in the robes of fancy, and sometimes steps forth in the confidence of reason. She wears a thousand dresses, and in all is pleasing.

In Tickell's edition of Mr. Addison's Works there are several pieces hitherto unmentioned, viz. The Dissertation on Medals; which, though not published till after his death, yet he had collected the materials, and began to put them in order, at Vienna, in 1702. A pamphlet, intitled, The present State of the War, and the Necessity of an Augmentation, considered. The late Trial and Conviction of Count Tariff, &c. &c.

ADDITAMENT, f. [*additamentum*, Lat.] Something added to another. Thus physicians call the ingredients added to a medicine already compounded, *additaments*.

ADDITION, f. The act of adding one thing to another; opposed to *diminution*.—The infinite distance between the Creator and the noblest of all creatures, can never be measured, nor exhausted by endless *addition* of finite degrees. *Bentley*.—Additament, or the thing added. In arithmetic, *addition* is the reduction of two or more numbers of the like kind together into one sum or total.

ADDITION, in music, a dot marked on the right side of a note, signifying that it is to be sounded or lengthened half as much more as it would have been without such mark.

ADDITION, in law, signifies a title given to a man, besides his Christian-name and surname, setting forth his estate or degree, his trade, and the place where he inhabits; and this is, to prevent the inconvenience of mistaking one person for another. Additions of *estate or degree* are, yeoman, gentlemen, esquire, knight, and the like. Additions of *trade or occupation* are those of merchant, clothier, carpenter, taylor, husbandman, labourer, and all other lawful occupations. Additions of *place* are, of such a town or hamlet, and of such a county. Where a man hath household in two places, he shall be said to dwell in both; so that his addition in either may suffice. Knave was anciently a regular addition. By stat. 1 Hen. V. cap. 5. it was ordained, that in such suits or actions where process of outlawry lies, such addition should be made to the name of the defendant, to shew his estate, mystery, and place where he dwells; and that the writs not having such additions shall abide if the defendant take exception thereto; but not by the office of the court. The reason of this ordinance was, that one man might not be troubled by the outlawry of another; but, by reason of the certain addition, every person might bear his own burden. If there be a corporation of one sole person, he may be named by the common law by his Christian name without any surname, as Thomas bishop of Exeter. So a duke, marquis, earl, viscount, or baron, might by the common law be named by his Christian name, and by the name of his dignity, as John duke of Marlborough. An addition after an *alias dictus* is ill; for, if the party is not sufficiently named in the first part, the *alias dictus* will not help it. 3 *Salk.* 20. Where there are several persons of different names, and the same addition, it is safest to repeat the addition after each of their names, applying it particularly to every one of them. 2 *Haw.* 187. If a man hath divers trades or occupations, he may be named by any of them; but if a gentleman by birth be a tradesman, he shall not be named by his trade, but by the degree of a gentleman; because it is worthier than the addition of any

trade or mystery: and, in general, a man shall be named by his worthiest title of addition. 2 *Inst.* 668, 9. Where a son hath the same name and the same addition with his father, the addition of *the younger* is necessary to be made to the other additions of the son; but it is not necessary to add *the elder* to the additions of the father. 2 *Haw.* 187. The eldest sons of peers, in the life-time of their fathers, though frequently titular lords, yet are only esquires; and foreign noblemen in England have only the legal title of esquire. 2 *Haw.* 187. Clerk is a good addition of a clergyman; and, if a man hath taken any degree in either of the universities, he may be named by that degree. 1 *Blackst.* 405. Widow, single-woman, spinster, and (as some say) wife of such a one, are good additions; and the place of the habitation of a wife is sufficiently shewn, by shewing that of her husband. 2 *Haw.* 190. If a man lives in a hamlet of a town, he may be named either of the hamlet or of the town. But the addition of parish, if there be two or more towns in it, is not good; but, if there be but one town, the addition of parish is good. 2 *Inst.* 669.

ADDITIONS, in distilling, a name given to such things as are added to the wash, or liquor, while in a state of fermentation, in order to improve the vinosity of the spirit, procure a larger quantity of it, or give it a particular flavour. All things, of whatever kind, thus added in the time of fermentation, are called by those of the business who speak most intelligently *additions*; but many confound them with things of a very different nature, under the name of *ferments*. See **DISTILLING**.

ADDITIONS, in heraldry, some things added to a coat of arms, as marks of honour; and therefore directly opposite to abatements. Among additions we reckon **BORDURE, QUARTER, CANTON, GYRON, PILE, &c.** See these articles.

ADDITIONAL, adj. That which is added.—Our calendar being once reformed and set right, it may be kept so, without any considerable variation, for many ages, by omitting one leap-year; i. e. the *additional* day, at the end of every 134 years. *Holder*.

ADDITIONAL, f. Additament; something added. Not now in use.

ADDITORY, adj. [from *add.*] That which has the power or quality of adding.—The *additory* fiction gives to a great man a larger share of reputation than belongs to him, to enable him to serve some good end or purpose. *Arbutnot*.

ADDLE, adj. [from *adel*, Sax. a disease, according to Skinner and Junius; perhaps from *ydel*, idle, barren, unfruitful.] Originally applied to eggs, and signifying such as have not received an impregnation from the semen of the cock, but grow rotten under the hen: thence transferred to brains that produce nothing.

To ADDLE, v. a. To make addle; to corrupt; to make barren.—This is also evidenced in eggs, whereof the sound ones sink, and such as are *addled* swim; as do also those that are termed hypanemix, or wind-eggs. *Brown*.

To ADDLE, v. n. To grow; to increase. Now obsolete:

Where ivy embraceth the tree very fore,
Kill ivy, else tree will *addle* no more.

Tusser.

ADDLE-PATED, adj. Having addled brains:

Poor slaves in metre, dull and *addle-pated*,
Who rhyme below even David's psalms translated.

Dryden.

To ADDRESS, v. a. [*addresser*, Fr. from *dereçar*, Span. from *dirigo*, *directum*, Lat.] To prepare one's self to enter upon any action; as, *he addressed himself to the work*. It has to before the thing:

With him the palmer eke, in habit sad,
Himself *address* to the adventure hard.

Spencer.

To get ready; to put in a state for immediate use:

To-night in Harfleur we will be your guest,
To-morrow for the march we are *address*.

Shakespeare.

To

To apply to another by words, with various forms of construction. Sometimes without a preposition. Sometimes with *to*. Sometimes with the reciprocal pronoun; as, *he addressed himself to the general*. Sometimes with the accusative of the matter of the address, which may be nominative to the passive:

The prince himself, with awful dread possess'd,
His vows to great Apollo thus *address'd*. *Dryden.*

To address, in law, is to apply to the king in form.—The representatives of the nation in parliament, and the privy-council, *addressed* the king to have it recalled. *Swift.*

ADDRESS, *f.* [*adresse*, Fr.] Verbal application to any one, by way of persuasion; petition; courtship:

Henry, in knots involving Emma's name,
Had half confess'd and half conceal'd his flame
Upon this tree; and as the tender mark
Grew with the year, and widen'd with the bark,
Venus had heard the virgin's soft *addresses*,
That, as the wound, the passion might increase. *Prior.*

Manner of addressing another; as, we say, *a man of an happy or a pleasing address*; *a man of an awkward address*. Skill, dexterity. Manner of directing a letter; a sense chiefly mercantile.

ADDRESSER, *f.* The person that addresses or petitions.

ADDUCENT, *adj.* [*adducens*, Lat.] A word applied to those muscles that bring forward, close, or draw together, the parts of the body to which they are annexed.

To ADDULCE, *v. a.* [*addoucir*, Fr. *dulcis*, Lat.] To sweeten: a word not now in use.—Thus did the French embassadors, with great shew of their king's affection, and many figured words, seek to *addulce* all matters between the two kings. *Bacon.*

ADEA, a province of Upper Ethiopia, bordering on the Red Sea, once subject to Abyssinia, but now principally to the Turks and Portuguese.

ADEB, *f.* in commerce, the name of a large Egyptian weight, used principally for rice, and consisting of 210 okes, each of three rotolos, a weight of about two drachms less than an English pound. But this is no certain weight, for at Rosetto the adeb is only 150 okes.

ADEBETH, an island in the Nile, in Lower Egypt, containing many villages and stately palaces, which yet can hardly be seen from the river, on account of the luxuriant foliage of the surrounding lofty trees.

ADECTOS, *f.* [from α , priv. and *δακνω*, to bite.] An epithet given to medicines that relieve from the biting sense of pain, by removing the uneasiness caused by stimulants; whence Celsus calls them *lenia*.

ADEL, a kingdom on the eastern coast of Africa, which reaches as far as the straits of Babelmandel, which unite the Red Sea to the sea of Arabia. This country produces corn, and feeds a great number of cattle. The inhabitants carry on a trade in gold, silver, ivory, oil, frankincense, a sort of pepper, and other merchandises of Arabia and the Indies.

ADELIA, *f.* [*αδελος*, *incertus, obscurus*, obscure.] In botany, a genus of the dioecia monadelphia class, ranking in the natural order of tricocceæ. The generic characters are—I. Male. Calyx: perianthium one-leaved, three-parted; leaflets oblong, curved back. Stamina: filaments many, capillary, the length of the calyx, united into a cylinder at the base; antheræ roundish. II. Female. Calyx: perianthium five-parted; parts oblong, permanent. Pistillum: germ roundish; styles three, very short, divaricate; stigmas torn. Pericarpium: capsule tricocous, roundish, three-celled. Seeds: solitary, roundish.—*Essential Character.* Male. Calyx, three-parted; stamina many, united at the base. Female. Calyx, five-parted; styles three, torn; capsule tricocous.

Species. 1. *Adelia bernardia*, or villous-leaved bernardia: leaves oblong, tomentose, serrate. These shrubs grow naturally in the island of Jamaica, and are near of

kin to the *croton*. Dr. Housfoun constituted a genus of the two first by the title of bernardia, in honour of Dr. Bernard de Jussieu.

2. *Adelia ricinella*, or smooth-leaved bernardia: leaves obovate, quite entire. Grows to the height of eight or ten feet, and has slender flower-stalks.

3. *Adelia acidoton*, or box-leaved adelia: branches flexuose, spines gemmaceous. This seldom rises above four feet in height. The branches very slender and flexible; the leaves small, delicate, crowded, and associated with one or two flowers. It has much the appearance of a young ebony. It flowers in June with us; but, in Jamaica, early in April and May.

Propagation and Culture. These plants are propagated by seeds, when they can be procured from the countries where they grow; for they do not produce good seeds in England. They must be sown upon a hot-bed in the spring, and, when the plants are fit to remove, they should be each transplanted into a separate small pot, filled with light earth, and plunged into a hot-bed of tan, treating them in the same manner as is hereafter directed for *CROTON*. In the autumn the pots should be plunged into the tan-bed in the stove, where, if they are kept in a temperate heat in winter, and not over-watered during that season, the plants may be preserved, and the summer following will produce flowers; but as these have little beauty, the plants are seldom propagated except in botanic gardens.

ADELING, *f.* [from *adel*, Sax. illustrious.] A word of honour among the Angles, properly appertaining to the king's children. King Edward the Confessor, being without issue, and intending to make Edgar his heir, called him *adeling*.

ADELME, or ALDHELM, son to Kenred, nephew to Ina king of the West Saxons; after having been educated abroad, was abbot of Malmesbury thirty years. He was the first Englishman who wrote in Latin, the first who brought poetry into England, and the first bishop of Sherbourne. He lived in great esteem till his death, which happened in 709. He was canonized, and many miracles were told of him. He is mentioned with great honour by Camden and Bayle, and his life was written by William of Malmesbury.

ADELPHIANI, *f.* in church-history, a sect of ancient heretics, who fasted always on Sundays.

ADELPHIXIS, *f.* the analogy, relation, or similitude, of one thing with another; or the communication, consent, or sympathy, of a part with another.

ADELSCALC, *f.* in ancient customs, denotes a servant of the king. The word is also written *adelschalche* and *adelscalcus*. It is compounded of the German *anel*, or *edel*, "noble," and *scalch*, "servant." Among the Bavarians, *adelscales* appear to have been the same with royal *thanes* among the Saxons, and those called *ministri regis* in ancient charters.

ADEMONIA, *f.* [of α , priv. and *δαμων*, a genius or divinity or fortune.] Hippocrates uses this word for uneasiness, restlessness, or anxiety, felt in acute diseases, and some hysseric fits.

ADEPTION, *f.* in law, implies the taking away of a legacy, and arises from a supposed alteration of the testator's intention; as where a man bequeaths money due upon a certain bond, and afterwards calls it in; or bequeaths to the legatee such a horse, and afterwards sells the horse.

ADEN, formerly a rich and considerable town of Arabia the Happy. It is seated by the sea-side, a little eastward of the straits of Babelmandel.

ADENANTHERA, *f.* [*αδενος*, glandulous, and *ανθηρα*, an anther.] In botany, a genus of the decandria monogynia class, of the natural order of lomentaceæ. The generic characters are—Calyx: perianthium one-leaved, five-toothed, very small. Corolla: five-petalled, bell-shaped; petals lanceolate, sessile, convex inwards, concave underneath. Stamina: filaments subulate, erect, a little shorter than the corolla; antheræ roundish, incumbent, bearing a globose

globose gland at the outer tip. Pistillum: germ oblong, gibbous downwards. Style subulate, the length of the stamens. Stigma simple. Pericarpium: a legume long, compressed, membranaceous. Seeds: very many, roundish, remote.—*Essential Character.* Calyx, five-toothed. Petals, five. Globose glands, affixed to the outer tip of the antheræ. Legume, membranaceous.

Species. 1. *Adenanthera pavonina*: leaves smooth on both sides. This is one of the largest trees in the East Indies, and the timber is in common use on account of its solidity. It flowers in September, bears fruit at the beginning and end of the year, and is never without leaves. The duration is two hundred years. The natives use the powder of the leaf in their ceremonies. The seeds, besides being eaten by the common people, are of great use to the jewellers and goldsmiths, on account of their equality, for weights, each of them weighing four grains; they also make a cement, by beating them up with water and borax. Of the bruised leaves they make a drink which they esteem good against pains in the loins.

2. *Adenanthera falcata*: leaves tomentose underneath. It is a native of the East Indies.

3. *Adenanthera scandens*: leaves pinnate, two-paired; leaflets ovate, oblique, smooth: claspers terminal, bifid. This is a native of Mallicollo, an island in the South Seas.

Propagation and Culture. This tree must be raised on a hot-bed from the seeds, which are of a shining black colour, and somewhat larger than those of the great lentil, but nearly of the same shape. Afterwards it must be placed in the bark stove, where the fine branching leaves will make a very handsome appearance. It has not yet flowered in England. Of the second and third species we know very little, nor have they yet been cultivated in England.

ADENBURG, or ALDENBURG, a town of Westphalia, and in the duchy of Burg, subject to the Elector Palatine. It is twelve miles N. E. of Cologne, and seventeen W. of Bonn; E. lon. 7. 25. lat. 51. 2.

ADENOGRAPHY, *f.* [from *ἀδύων* and *γραφω*, Gr.] that part of anatomy which treats of the glandular parts. See ANATOMY.

ADENOIDES, glandulous, or of a glandular form; an epithet applied to the PROSTATE.

ADENOLOGY, the same with ADENOGRAPHY.

ADENOS, a kind of cotton, otherwise called *marine cotton*. It comes from Aleppo by the way of Marseilles, where it pays 20 per cent. duty.

ADEONA, in mythology, the name of a goddess invoked by the Romans when they set out upon a journey.

ADEPHAGIA, in mythology, the goddess of gluttony, to whom the Sicilians paid religious worship.

ADEPS, in anatomy, the fat found in the abdomen. It also signifies animal fat of any kind.

ADEPT, [from *adeptus*, Lat. that is, *adeptus artem*.] He that is completely skilled in all the secrets of his art. It is, in its original signification, appropriated to the chymists, but is now extended to other artists.—The preservation of chastity is easy to true adepts. *Pope*.

ADEPT, *adj.* Skilful; thoroughly versed.—If there be really such adept philosophers as we are told of, I am apt to think, that among their arcana, they are masters of extremely potent menstruums. *Boyle*.

ADEPT PHILOSOPHY, is that philosophy, whose end is the transmutation of metals, and an universal remedy. The professors of this philosophy are called ADEPTI, adepts. Paracelsus calls that, *medicina adepta*, which treats of the diseases that are contracted by celestial operations, or communicated from heaven.

ADERBIJAN, a province of Persia, bounded on the N. by Armenia Proper, on the S. by Irac-Agemi, on the E. by Ghilan, and on the W. by Curdistan. The principal town is Tauris; from 42. to 48. lon. from 36. to 39. lat.

ADERNO, a small place in the Val di Demona in the Vol. I. No. 8.

kingdom of Sicily: E. lon. 15. 25. lat. 28. 5. The ancient ADARANUM.

ADES, or HADES, denotes the invisible state. In the heathen mythology, it comprehends all those regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elysium. See HELL.

ADESPOTIC, *adj.* Not absolute; not despotic.

ADESSENARIANS, ADESSENARI, in church history, a sect of Christians who hold the real presence of Christ's body in the eucharist, though not like the Romanists, by way of transubstantiation.

ADFILIATION, a Gothic custom, whereby the children of a former marriage are put upon the same footing with those of the second. This is also called *unio prolium*, and still retained in some parts of Germany.

AD FINES (Antonine), a town of Switzerland, supposed to be the modern *Pfin*, in the north of the district of Turgow, on the rivulet Thur, not far from the borders of Suabia, about half-way between Constance and Frauenfeld. So called, because when Cecinna, general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far, their territory ending here; and, in time of the Romans, it was the last town in this quarter, and of some repute.

ADHA, a festival which the Mahometans celebrate on the 10th day of the month *Dhoulhegiat*, which is the 12th and last of their year. This month being particularly destined for the ceremonies which the pilgrims observe at Mecca, it takes its name from thence, for the word signifies the month of Pilgrimage. On that day they sacrifice with great solemnity, at Mecca, and no where else, a sheep, which is called by the same name as the festival itself. The Turks commonly call this festival the *Great Beiram*, to distinguish it from the less, which ends their fast, and which the Christians of the Levant call the *Easter of the Turks*.

ADHATODA, *f.* in botany. See JUSTICIA.

To ADHERE, *v. n.* [*adhæreo*, Lat.] To stick to; as, wax to the finger; with *to* before the thing. To stick, in a figurative sense; to be consistent; to hold together. To remain firmly fixed to a party, person, or opinion.—Every man of sense will agree with me, that singularity is laudable, when, in contradiction to a multitude, it adheres to the dictates of conscience, morality, and honour. *Boyle*.

ADHERENCE, *f.* the quality of adhering, or sticking; tenacity. In a figurative sense, fixedness of mind; steadiness; fidelity.—Plain good sense, and a firm adherence to the point, have proved more effectual than those arts, which are contemptuously called the spirit of negotiating. *Swift*.

ADHERENCY, *f.* the same with ADHERENCE. Steady attachment. That which adheres.—Vices have a native adherency of vexation.

ADHERENT, *adj.* sticking to. United with.—Modes are said to be inherent or *adherent*, that is, proper or improper. *Adherent* or improper modes arise from the joining of some accidental substance to the chief subject, which yet may be separated from it; so when a bowl is wet, or a boy is clothed, these are *adherent* modes; for the water and the clothes are distinct substances which adhere to the bowl, or to the boy. *Watts*.

ADHERENT, *f.* the person that adheres: one that supports the cause, or follows the fortune, of another; a follower, a partisan.—A new war must be undertaken upon the advice of those, who, with their partisans and adherents, were to be the sole gainers by it. *Swift*.

ADHERER, *f.* He that adheres.—He ought to be indulgent to tender consciences; but, at the same time, a firm adherer to the established church. *Swift*.

ADHESION, *f.* [*adhæsiō*, Lat.] The act or state of sticking to something. *Adhesion* is generally used in the natural, and *adherence* in the metaphorical, sense: as, the adhesion of iron to the magnet; and adherence of a client to his patron. It is sometimes taken, like *adherence*, figuratively.

ly, for firmness in an opinion, or steadiness in a practice.—The same want of sincerity, the same *adhesion* to vice, and aversion from goodness, will be equally a reason for their rejecting any proof whatsoever. *Atterbury*.

ADHESION, in medicine, a term used for two parts sticking together, which are naturally separate. If any of those parts in the thorax or belly lie in contact, and in flame, they commonly grow together. The lungs very frequently adhere to the pleura. On this subject see Dr. Fleming's Treatise on Adhæsiions, or Accretions of the Lungs; or an abstract from it in the Med. Mus. vol. i.

ADHESIVE, *adj.* Sticking; tenacious.

To **ADHIBIT**, *v. a.* [*adhibeo*, Lat.] To apply; to make use of.—Salt, a necessary ingredient in all sacrifices, was *adhibited* and required in this view only as an emblem of purification. *Forbes*.

ADHIBITION, *f.* Application; use.

ADHIL, in astronomy, a star of the sixth magnitude, upon the garment of Andromeda, under the last star in her foot.

ADHOA, in ancient customs, denotes what we otherwise call *relief*. In which sense we sometimes also find the word written *adola*, *adamentum*, and *adhogamentum*.

ADJACENCY, *f.* [from *adjaceo*, Lat.] The state of lying close to another thing. That which is adjacent.

ADJACENT, *adj.* [*adjacens*, Lat.] Lying near or close; bordering upon something.—Uniform pellucid mediums, such as water, have no sensible reflection but in their external superficies, where they are *adjacent* to other mediums of a different density. *Newton*.

ADJACENT, *f.* That which lies next another.

ADIACHYTOS, *f.* [from α negative, and *διαχυω*, to diffuse, scatter, or be profuse.] Decent in point of dress. Hippocrates thinks the dregs of a sop derogatory from the physician: he says, that many in his days hid their ignorance under ornaments of dress, and strove to get the good liking of the people by their appearance at the public games.

ADIANTUM, *f.* [*adiarvon*, because it repels water when plunged into it; others from α and *διασειν*, from its not withering.] In botany, a genus of the cryptogamia filices class. The generic characters are—Fructifications assembled in oval spots, at the end of the fronds, which are turned back, or at the reflex tip of the frond underneath.

Description. In this large genus of ferns one only (the fourteenth) is native of Great-Britain, and that in a single place or two of Scotland and Wales. The rest are chiefly the growth of hotter climates, particularly the West Indies.

Species. 1. Frond simple. 1. *Adiantum reniforme*, or kidney-leaved maiden-hair: fronds kidney-shaped, stalked, many-flowered. It is a native of the island of Madeira.

2. *Adiantum philippense*, or Philippine maiden-hair: fronds kidney-shaped, alternate, petiolate, lobate, many-flowered. This is a native of the Philippine islands.

3. *Adiantum repens*, or creeping maiden-hair: fronds trapezium-shaped, cordate, pinnatifid; divisions lance-shaped, ferrate at the tip, the lower ones gashed. It is a native of the Isle of France.

II. Frond compound. 4. *Adiantum radiatum*, or rayed maiden-hair: frond digitate; leaflets pinnate: pinnae one-flowered. This elegant little plant rises by a simple stalk to the height of six or eight inches, and then divides into five or more simple branches disposed in a radiated expanded form; these are sustained by a few simple leaves placed in the manner of an umbrella, under their inflexions. It is a native of Jamaica and Domingo.

5. *Adiantum pedatum*, or Canadian maiden-hair: fronds pedate: leaflets pinnate; pinnae gibbous before, gashed, fruit-bearing. John Tradescant, jun. brought this species into England from Virginia before the year 1640. It is also a native of Canada, Japan, and the Society Isles. It flowers in August and September.

6. *Adiantum lanceum*, or Surinam maiden-hair: fronds

pinnate: pinnae opposite oblong, the end ones triangularly hastate. This is a native of Surinam.

7. *Adiantum hastatum*, or hastate-leaved maiden-hair: fronds pinnate: pinnae hastate-trilobate straight. This is a native of the Cape of Good Hope.

8. *Adiantum trilobum*, or three-lobed maiden-hair: pinnae three-parted, obtuse, gashed, many-flowered. It is a native of America.

9. *Adiantum ferrulatum*, or ferrate-leaved maiden-hair: fronds bipinnate; pinnules deltoid-oblong ferrate; fructifications solitary superior. This is a native of Jamaica.

10. *Adiantum caudatum*, or tail-leaved maiden-hair: fronds pinnate sickled tailed at the tip. This is a native of the East Indies and Japan.

III. Fronds decomposed. 11. *Adiantum flabellulatum*, or fan-leaved maiden-hair: fronds decomposed: pinnae alternate rhombed rounded many-flowered, stipes pubescent above. It is a native of China.

12. *Adiantum trifoliatum*, or ternate-leaved maiden-hair: frond decomposed; leaflets alternate ternate linear one-flowered. This is a native of America.

13. *Adiantum chusanum*, or Chinese maiden-hair: fronds decomposed: pinnae alternate pinnatifid: lobes unequal. It is a native of China.

14. *Adiantum capillus Veneris*, or true maiden-hair: fronds decomposed: leaflets alternate; pinnae wedge-shaped, lobed, pedicelled. Maiden-hair is a very succulent plant, yielding almost its whole weight of juice; but neither taste nor smell promise any efficacy. Hallen says, that, if the syrup of capillaire, which they make from it, be good for any thing, it is from the orange-flower water which they put into it. It is a native of the south of Europe, and the Levant. Wales and Scotland, but rare.

15. *Adiantum villosum*, or hairy-stalked maiden-hair: fronds bipinnate: pinnae rhombed fructifying before and without, stipe villous. This is a native of Jamaica.

16. *Adiantum pulverulentum*, or dusty maiden-hair: fronds bipinnate: pinnae oval truncate, before one-flowered, stipe shaggy. 17. *Adiantum cristatum*, or crested maiden-hair: fronds bipinnate: lowest leaflets two-parted: pinnae crescent-shaped, many-flowered above. These are natives of South America.

18. *Adiantum furcatum*, or forked maiden-hair: frond bipinnate: pinnae generally two-parted, linear: line of fructification single.

19. *Adiantum cafferorum*, or Caffrarian maiden-hair: fronds bipinnate: pinnae ovate gash-toothletted chaisty underneath.

20. *Adiantum fragrans*, or sweet-scented maiden-hair: fronds bipinnate: pinnae ovate sublobed obtuse, naked underneath. A native of Madeira; and was introduced into England 1758 by Mr. Francis Maffon.

21. *Adiantum truncatum*, or truncate-leaved maiden-hair: fronds decomposed, with pinnate leaflets: pinnae alternate wedge-shaped rather sickle-shaped truncate entire.

IV. Frond superdecomposed. 22. *Adiantum clavatum*, or clubbed maiden-hair: leaflets alternate: pinnae wedge-shaped, quite entire, alternate, one-flowered. It is a native of Dominica.

23. *Adiantum aculeatum*, or prickly-stiped maiden-hair: pinnae palmate many-flowered, stipe prickly. This is a native of Jamaica and Dominica.

24. *Adiantum trapeziforme*, or rhomb-leaved maiden-hair: leaflets alternate; pinnae rhombed, gashed, fruit-bearing on each side. A native of New Zealand and between the tropics.

25. *Adiantum hexagonum*, or hexagon-leaved maiden-hair: pinnae hexangular, emarginate, quite entire, one-flowered on both sides.

26. *Adiantum pteroides*, or heart-leaved maiden-hair: pinnae ovate entire crenulate, stipe polished. A native of the Cape of Good Hope; introduced by Mr. Fr. Maffon.

27. *Adiantum aethiopicum*, or Cape maiden-hair: pinnae rounded entire crenulate, petioles capillary. A native of the Cape of Good Hope and Japan.

New Species. II. Frond compound. 28. *Adiantum triphyllum*, or three-leaved maiden-hair: frond three-leaved: leaflets sessile lanceolate pinnatifid crenate. This is a very beautiful little fern, tender, entirely smooth, a span high. It was found by Commerfon in Buenos Ayres.

29. *Adiantum cuneatum*, or wedge-leaved maiden-hair: fronds pinnate, leaflets opposite subpinnate, pinnae wedge-shaped retuse alternate.

30. *Adiantum pumilum*, or dwarf maiden-hair: frond pinnate, stipe capillary, pinnae alternate roundish ferrulate, the uppermost larger trapezium-shaped, fructifications interrupted. This little plant seldom rises above two or three inches from the root; its leaves and stalk are very delicate; and the fructifications but few. It is a native of Jamaica, in dry and rocky places.

31. *Adiantum deltoideum*, or deltoid-leaved maiden-hair: frond pinnate, pinnae alternate deltoid obtuse, the uppermost triangular; fructifications continued above and in front. A native of Jamaica.

32. *Adiantum macrophyllum*, or large-leaved maiden-hair: frond pinnate, pinnae opposite rhomboid acute, the lower larger, the lowest subhastate reflex; fructifications continued in front and below. This is a native of Jamaica, in moist and shady places.

III. Frond decomposed. 33. *Adiantum scandens*, or climbing maiden-hair: fronds decomposed: leaflets wedge-shaped, equally gashed: stem climbing. It is a native of Cochín China.

34. *Adiantum striatum*, or striated maiden-hair: frond bipinnate, pinnules rigid sickled-ovate, fructifications superior interrupted, stipe round rough. 35. *Adiantum strictum*, or stiff maiden-hair: frond bipinnate, pinnae four-cornered fastigiate erect, pinnules alternate polished entire, fructifications superior continued. These are natives of Jamaica.

36. *Adiantum microphyllum*, or small-leaved maiden-hair: frond bipinnate, leaflets alternate oblong obtuse crenate, the lowest pinnatifid. Height nine inches. It is a native of Jamaica, among rocks near St. Jago de la Vega, by the river.

37. *Adiantum denticulatum*, or tooth-leaved maiden-hair: fronds decomposed, pinnae alternate trapezoid acuminate crenate, notches toothletted, fructifications superior interrupted. IV. Frond superdecomposed. 38. *Adiantum fragile*, or brittle maiden-hair: frond superdecomposed bipinnate at top, pinnae obovate wedge-shaped entire, fructifications interrupted. These are natives of Jamaica.

39. *Adiantum tenerum*, or tender maiden-hair: frond superdecomposed, pinnules alternate rhomb wedge-shaped blunted gashed, fructifications interrupted. Height from fourteen to eighteen inches. A native of Jamaica, in shady places.

Propagation and Culture. The only species that have been cultivated with us are the first, fifth, fourteenth, fifteenth, twentieth, twenty-fourth, and twenty-sixth. The fourteenth may be preserved in pots filled with gravel and lime-rubbish, in which it will thrive much better than in good earth. Although the fifth or American maiden-hair will live through the winter in the open air in moderate seasons, yet in severe frosts it is sometimes destroyed, and therefore it will be prudent to keep a plant or two under shelter. This grows naturally in Canada in such quantities, that, when the French were in possession of that country, they sent it to France as package for goods, and the apothecaries at Paris used it instead of the true maiden-hair. The fifteenth and twenty-fourth, growing naturally in hot countries, must be preserved in a stove, where their shining black stalks and odd-shaped leaves will afford an agreeable variety among other exotic plants. The first, twentieth, and twenty-sixth, may be kept in the green-house.

ADIANTUM NIGRUM. See ASPLENIUM.

ADIAPHORISTS, in church-history, a name importing lukewarmness, given, in the 16th century, to the mo-

derate Lutherans, who embraced the opinions of Melancthon, whose disposition was vastly more pacific than that of Luther.

ADIAPHOROUS, *adj.* [*αδιαφορος*, Gr.] Neutral; particularly used of some spirits and salts, which are neither of an acid or alkaline nature.—Our *adiaphorous* spirit may be obtained, by distilling the liquor that is afforded by woods and divers other bodies. *Boyle.*

ADIAPHORY, *f.* [*αδιαφορια*, Gr.] Neutrality, indifference.

ADIAPNEUSTIA, [*α*, negative, and *διαπνεω*, to perspire, or *πνέω*, neg. *δια*, per, and *πνεω*, to breathe.] IMPEDED PERSPIRATION, which was considered by the ancient as the primary cause of fevers, from what they termed *vaporosa & fuliginosa effluvia* not being permitted to pass through the habits and cutaneous pores, hence productive of febrile affections.

ADIAPTOTOS, from *α*, negative, and *δανπτω*, to stumble, or slide. The word signifies firm; but in medicine it is the name of a remedy against the cholick, made of stone-parley, henbane-seed, white pepper, &c. formed into an electuary.

ADJAZZO, ADRAZZO, or AJACCIO, in geography, a handsome town and castle of Corsica in the Mediterranean, with a bishop's see, and a good harbour. It is populous, and fertile in wine. It is 27 miles S. W. of Corte. E. lon. 41. 54. lat. 38. 5.

TO ADJECT, *v. a.* [*adjicio*, *adjectum*, Lat.] To add to; to put to another thing.

ADJECTION, *f.* [*adjectio*, Lat.] The act of adjecting, or adding. The thing adjected, or added.

ADJECTITIOUS, *adj.* Added; thrown in upon the rest.

ADJECTIVE, *f.* [*adjectivum*, Lat.] A word added to a noun, to signify the addition or separation of some quality, circumstance, or manner of being; as, *good*, *bad*, are *adjectives*, because, in speech, they are applied to nouns, to modify their significations, or intimate the manner of existence in the things signified thereby.

ADJECTIVELY, *adv.* After the manner of an adjective; a term of grammar.

ADIEU, *adv.* [from *à Dieu*, used elliptically for *à Dieu je vous commende*, used at the departure of friends.] The form of parting, originally importing a commendation to the Divine care, but now used, in a popular sense, sometimes to things inanimate; farewell.

ADIGE, a river in Italy, which taking its rise south of the lake Glace among the Alps, runs south by Trent, then east by Verona in the territory of Venice, and falls into the gulph of Venice, north of the mouth of the Po.

TO ADJOIN, *v. a.* [*adjoindre*, Fr. *adjungo*, Lat.] To join to; to unite to; to put to. To fasten by a joint or juncture.

As a maffy wheel
Fixt on the fummit of the higheft mount,
To whose huge spoke ten thousand leffer things
Are mortis'd and *adjoined*. *Shakespeare.*

TO ADJOIN, *v. n.* To be contiguous to; to lie next, so as to have nothing between.—In learning any thing, as little should be proposed to the mind at once as is possible; and, that being understood and fully mastered, proceed to the next *adjoining*, yet unknown, simple, unperplexed, proposition, belonging to the matter in hand, and tending to the clearing what is principally designed. *Locke.*

TO ADJOURN, *v. a.* [*adjourner*, Fr.] To put off to another day, naming the time; a term used in juridical proceedings; as, of parliaments, or courts of justice. To put off; to defer; to let stay to a future time.

ADJOURNMENT, *f.* [*adjournement*, Fr.] An assignment of a day, or a putting off till another day. Delay; procrastination; dismissal to a future time.—We will and we will not, and then we will not again, and we will. At this rate we run our lives out in *adjournments* from time to

to time, out of a fantastical levity that holds us off and on; betwixt hawk and buzzard. *L'Estrange*.

ADIPOUS, *adj.* [*adiposus*, Lat.] Fat. It is also a term used by anatomists for any cell, membrane, &c. that is remarkable for its fatness.

ADIRBEITSTAN, a province of Persia, in Asia, and part of the ancient Media. It is bounded on the north by the province of Shirvan, on the south by Irac-Agemi and Curdistan, on the east by Gilan and the Caspian Sea, and on the west by Turcomania.

ADIT, *f.* [*aditus*, Lat.] A passage for the conveyance of water under ground; a passage under ground in general; a term among the minemen.

ADIT of a **MINE**, the hole, or aperture, whereby it is entered and dug, and by which the water and ores are carried away. The term amounts to the same with *cuniculus* or *drift*, and is distinguished from *air-shaft*. The *adit* is usually made on the side of a hill, towards the bottom thereof, about four, five, or six, feet high, and eight wide, in form of an arch; sometimes cut in the rock, and sometimes supported with timber, so conducted as that the sole or bottom of the *adit* may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump. Damps and the impurity of the air are great impediments against driving *adits* above twenty or thirty fathoms, by reason of the necessity, in this case, of letting down *air-shafts* from the day to meet the *adit*, which are often very expensive, both on account of the great depth of mines, and the hardness of the mineral strata to be cut through. The best remedy against this is that practised in the coal-mines near Liege, where they work their *adits* without *air-shafts*: the manner of which is described by Sir Robert Moray. Vid. Phil. Trans. No. 5.

ADIT of a **MINE** is sometimes used for the *air-shaft* itself, being a hole driven perpendicularly from the surface of the earth into some part of a mine, to give entrance to the air. To draw off standing water in winter, in deep mines, they drive up an *adit* or *air-shaft*, upon which the *air* disengages itself from the water, when it begins to run with such violence as produces a noise equal to the bursting of a cannon, dashes every thing in the way against the sides of the mine, and loosens the very rocks at a distance. Ibid, No. 26.

ADDITION, *f.* [from *adeo*, *aditum*, Lat.] The act of going to one another.

TO ADJUDGE, *v. a.* [*adjudico*, Lat.] To give the thing controverted to one of the parties by a judicial sentence; with the particle *to* before the person:

The great competitors for Rome, Caesar and Pompey, on Pharalain plains, Where stern Bellona, with one final stroke, *Adjug'd* the empire of this globe to one. *Phillips*.

To sentence, or condemn to a punishment; with *to* before the thing. Simply, to judge; to decree; to determine.—He *adjudged* him unworthy of his friendship, purposing sharply to revenge the wrong he had received. *Knolles*.

TO ADJUDICATE, *v. a.* [*adjudico*, Lat.] To adjudge; to give something controverted to one of the litigants, by a sentence or decision.

ADJUDICATION, *f.* [*adjudicatio*, Lat.] The act of judging, or of granting something to a litigant, by a judicial sentence.

ADJUDICATION, in the Scots law, the name of that action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or security of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect.

TO ADJUGATE, *v. a.* [*adjugo*, Lat.] To yoke to; to join to another by a yoke.

ADJUMENT, *f.* [*adjumentum*, Lat.] Help; support.

ADJUNCT, *f.* [*adjunctum*, Lat.] Something adherent

or united to another, though not essentially part of it. Thus water absorbed by a cloth or a sponge, is an *adjunct*, but no necessary part of either of these substances.

ADJUNCT, in metaphysics, some quality belonging to either the body or mind, whether natural or acquired. Thus thinking is an adjunct of the mind, and growth an adjunct of the body.

ADJUNCT, in music, a word which is employed to denote the connection or relation between the principal mode and the modes of its two-fifths, which, from the intervals that constitute the relation between them and it, are called its adjuncts.

ADJUNCT is also used to signify a colleague, or some person associated with another as an assistant.

ADJUNCT GODS, or **ADJUNCTS** of the **GODS**, among the Romans, were a kind of inferior deities, added as assistants to the principal ones, to ease them in their functions. Thus, to Mars was adjoined Bellona and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTION, *f.* [*adjunctio*, Lat.] The act of adjoining, or coupling together. The thing joined.

ADJUNCTIVE, *f.* [*adjunctivus*, Lat.] He that joins, That which is joined.

ADJUNCTS, *f.* in rhetoric and grammar, signify certain words or things added to others, to amplify or augment the force of the discourse.

ADJURATION, *f.* [*adjuratio*, Lat.] The act of adjuring, or proposing an oath to another. The form of oath proposed to another.—When these learned men saw sickness and frenzy cured, the dead raised, the oracles put to silence, the dæmons and evil spirits forced to confess themselves no gods, by persons who only made use of prayer and *adjurations* in the name of their crucified Saviour; how could they doubt of their Saviour's power on the like occasions? *Addison*.

TO ADJURE, *v. a.* [*adjuro*, Lat.] To impose an oath upon another, prescribing the form in which he shall swear.

TO ADJUST, *v. a.* [*ajuster*, Fr.] To regulate; to put in order; to settle in the right form. To reduce to the true state or standard; to make accurate. To make conformable. It requires the particle *to* before the thing to which the conformity is made.—As to the accomplishment of this remarkable prophecy, whoever reads the account given by Josephus, without knowing his character, and compares it with what our Saviour foretold, would think the historian had been a Christian, and that he had nothing else in view, but to *adjust* the event to the prediction. *Addison*.

ADJUSTMENT, *f.* [*adjustement*, Fr.] Regulation; the act of putting in method; settlement. The state of being put in method, or regulated.—It is a vulgar idea we have of a watch or clock, when we conceive of it as an instrument made to shew the hour: but it is a learned idea which the watchmaker has of it, who knows all the several parts of it, together with the various connections and *adjustments* of each part. *Watts*.

ADJUTANT, *f.* in the military art, is an officer whose business it is to assist the major. Each battalion of foot and regiment of horse has an adjutant, who receives the orders every night from the brigade-major; which, after carrying them to the colonel, he delivers out to the sergeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards; receives and distributes the ammunition to the companies, &c. and, by the major's orders, regulates the prices of bread, beer, and other provisions. The word is sometimes used by the French for an *aid-du-camp*.

ADJUTANTS-GENERAL, among the Jesuits, a select number of fathers, who resided with the general of the order, each of whom had a province or country assigned him, as England, Holland, &c. and their business was to inform the father-general of state-occurrences in such countries.

countries. To this end they had their correspondents delegated, emissaries, visitors, regents, provincials, &c.

To ADJUTE, *v. a.* [*adjuvo, adjutum*, Lat.] To help; to concur: a word not now in use.

ADJUTOR, *f.* [*adjutor*, Lat.] A helper.

ADJUTORIUM, *f.* a term used by physicians for any medicine in a prescription but the capital one.

ADJUTORY, *adj.* [*adjutorius*, Lat.] That which helps.

ADJUTRIX, *f.* [Lat.] She who helps.

ADJUVANT, *adj.* [*adjuvans*, Lat.] Helpful; useful.

To ADJUVATE, *v. a.* [*adjuvo*, Lat.] To help; to further; to put forward.

ADLEGATION, *f.* in the public law of the German empire, a right claimed by the states of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to those of the emperor, for the transacting of matters which relate to the empire in general. In which sense *adlegation* differs from *legation*, which is the right of sending ambassadors upon a person's own account. Several princes and states of the empire enjoy the right of *legation*, who have not that of *adlegation*, and *vice versa*. The bishops, for instance, have the right of *adlegation* in the treaties which concern the common interest, but no right of *legation* for their own private affairs. The like had the duke of Mantua. The emperor allows the princes of Germany the privilege of *legation*, but disputes that of *adlegation*. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himself.

ADLESBURG, an extraordinary cavern in Carniola; the passages in it are of some miles extent; from the top, sparricles, and along the sides, a sort of pillars, with various grotesque figures, have been formed by the exudations of the lapideous or petrifying fluid.

ADLOCUTION, *f.* [*adlocutio*, Lat.] In antiquity, chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find these *adlocutions* expressed on medals by the abbreviation ADLOCUT. CON. The general is sometimes represented as seated on a tribunal, often on a bank or mount of turf, with the cohorts ranged orderly round him.

ADMANUENSES, *f.* in ancient law-books, denote persons who swore by laying their hands on the book. In which sense, *admanuenses* amount to the same with laymen, and stand opposed to clerks, who were forbidden to swear on the book, their word being to be reputed as their oath; whence they were also denominated *fide digni*.

ADMEASUREMENT, *f.* [*admensuratio*, Lat.] In law, is a writ brought for remedy against such persons as usurp more than their share, to bring them to reason. It lies in two cases; one is, *admeasurement of dower*, where a man's widow after his decease holds from the heir more land as dower than of right belongs to her: in which case, the heir shall have this writ against the widow, whereby the shall be *admeasured*, and the heir restored to the overplus. The other is, *admeasurement of pasture*, where a man has common appendant or appurtenant to his land, or common in gross, the quantity of which common hath never yet been ascertained: in which case, as well the lord as any of the commoners is intitled to the writ of *admeasurement*; which is one of those writs that are called *vicontiel*, being directed to the sheriff (*vicecomiti*), and not to be returned to any superior court, till finally executed by him. It recites a complaint, that the defendant had *furcharged* the common; and therefore commands the sheriff to *admeasure* and apportion it, that the defendant may not have more than belongs to him, and that the plaintiff may have his rightful share. And upon this suit the commoners shall be *admeasured*, as well those who have not as those who have *furcharged* the common, as well the plaintiff as the defendant. The execution of this writ must be by a jury of twelve men, who are upon their oaths to ascertain, under the superintendence of the sheriff, what and how many cattle each commoner is intitled to put upon the common. And the rule for this *admeasurement* is generally understood to be, that the commoner shall not turn more cattle upon the common than are sufficient to manure and stock the land to which his right of common is annexed; or, as our ancient law expressed it, such cattle only as are *levant and couchant* upon his tenement; which being a thing uncertain before *admeasurement*, has frequently, though erroneously, occasioned this unmeasured right of common to be called a common without stint or without number; a thing which, though possible in law, doth in fact very rarely exist. If, after the *admeasurement* has thus ascertained the right, the same defendant *furcharges* the common again, the plaintiff may have a writ of second *furcharge*, *de secunda superoneracione*, which is given by statute 13 Edw. I. c. 8. and thereby the sheriff is directed to enquire by a jury, whether the defendant has in fact again *furcharged* the common, contrary to the tenor of the last *admeasurement*; and if he has, he shall then forfeit to the king the supernumerary cattle put in, and shall also pay damages to the plaintiff. 3 Blackf. 238.

ADMENSURATION, *f.* [*ad* and *mensura*, Lat.] The act, or practice, of measuring out to each his part.

ADMINICLE, *f.* [*adminiculum*, Lat.] Help; support; furtherance.

ADMINICULAR, *adj.* [from *adminiculum*, Lat.] That which gives help.

ADMINICULATOR, *f.* an ancient officer of the church, whose business it was to attend to and defend the cause of the widows, orphans, and others, destitute of help.

To ADMINISTER, *v. a.* [*administro*, Lat.] To give; to afford; to supply. To act as the minister or agent in any employment or office; generally, but not always, with some hint of subordination: as, to *administer* the government. To *administer* justice; to distribute right. To *administer* the sacraments, to dispense them. To *administer* an oath; to propose or require an oath authoritatively; to tender an oath. To *administer* physic; to give physic as it is wanted. To *administer* to; to contribute; to bring supplies. To perform the office of an administrator, in law.

To ADMINISTRATE, *v. a.* [*administro*, Lat.] To exhibit; to give as physic. Not now in use.

ADMINISTRATION, *f.* [*administratio*, Lat.] The act of administering or conducting any employment; as, the conducting the public affairs; dispensing the laws. The active or executive part of government.—It may pass for a maxim in state, that the *administration* cannot be placed in too few hands, nor the legislature in too many. *Swift*.—Collectively, those to whom the care of public affairs is committed; as, the *administration* has been opposed in parliament. Distribution; exhibition; dispensation.—By the universal *administration* of grace, begun by our blessed Saviour, enlarged by his apostles, carried on by their immediate successors, and to be completed by the rest to the world's end, all types that darkened this faith are enlightened. *Sprat*.

ADMINISTRATION, in law, is the management of the goods and chattels of one that died intestate, committed unto him by the ordinary. He or she to whom the administration is committed, is called the administrator or administratrix.

Administration of the goods and chattels of the wife shall be granted to the husband or his representatives; and of the husband's effects, to the widow, or next of kin, or to both. Among the kindred, those are to be preferred that are the nearest in degree to the intestate; but, of persons in equal degree, the ordinary may take which he pleases. This nearness of degree shall be reckoned according to the computation of the civilians, and not of the canonists, which the law of England adopts in the descent of real estates; because in the civil computation the intestate himself is the *terminus* from which the several degrees are numbered; and not the common ancestor, according to the rule of the canonists. And therefore, in the first place, the children, or (on failure of the children) the parents, of the deceased, are intitled to the administration: both

both which are indeed in the first degree, but with us the children are allowed the preference. Then follow brothers, grandfathers, uncles or nephews (and the females of each class respectively), and lastly, cousins. 2 *Blackst.* 504.

The *half blood* is admitted to the administration equally with the *whole blood*; but not so in the descent of lands, for in that case the half blood can never inherit.

If none of the kindred will administer, the ordinary may grant administration to a creditor, or he may grant letters *ad colligendum bona defuncti*, and thereby take the goods of the deceased into his own hands, and therewith pay the debts of the deceased; in which respect the ordinary becomes liable in law as other administrators.

If a *bastard*, or any other, who has no kindred, dies intestate; the goods belong to the king, and administration shall be committed to the king's grantee.

There are also several other kinds of administration, which do not strictly follow the rule of the next of kin. As, administration *durante minori etate*; which is, where an infant is made executor (for so he may be, how young soever): in which case, administration with the will annexed is granted to another, until the executor shall attain the age of seventeen years; at which age of the executor the administration *durante minori etate* ceaseth.

So also, administration *durante absentia*, during absence out of the kingdom: which is, where the next of kindred is beyond sea, in which case administration is grantable, lest the goods perish or the debts be lost: and this stands upon the same reason as an administration during the minority of an executor; namely, that there should be one to manage the estate of the testator, till the person appointed by him is able.

Administration *pendente lite*, pending a suit, is, where a suit is commenced in the ecclesiastical court concerning the validity of a will; in which case the ordinary grants administration until the suit shall be determined: otherwise there would be no person to take care of the estate of the deceased.

Also, if the testator makes his will, without naming any executor, or if he names a person incapable, or if the executor named refuses to act; in all these cases, the ordinary must grant administration with the will annexed.

The duty of an administrator is, to make an inventory, and to pay the debts of the deceased: and, if there be a deficiency of assets, the general order of preference or priority in payment is, first, debts of record, as judgments, statutes, and recognizances; next, specialties, as bonds or other writings under seal; and lastly, debts on simple contract, as notes unsealed, and verbal promises.

If there is a surplus, the administrator must distribute it amongst the kindred of the deceased, according to the statutes of distribution, and in some particular places according to the local customs. The general rules upon the statutes of distribution are, that one third shall go to the widow of the intestate, and the residue in equal proportions to his children, or, if dead, to their representatives, that is, their lineal descendants: if there are no children or legal representatives, then a moiety shall go to the widow, and a moiety to the next of kindred in equal degree and their representatives: if no widow, the whole shall go to the children: if neither widow nor child, the whole shall be distributed amongst the next of kindred in equal degree and their representatives; but no representatives are admitted among collaterals, farther than the children of the intestate's brothers and sisters. The father succeeds to the whole personal effects of his children, if they die intestate and without issue; but, if the father be dead, and the mother survives, she shall only come in for a share equally with each of the remaining children.

If an administrator die, his executor or administrator doth not represent the first intestate, but a new administration shall be granted *de bonis non*, that is, of the goods of the deceased not administered by the former executor or administrator. And this administrator *de bonis non* is the

only legal representative of the deceased in matters of personal property.

ADMINISTRATION, is also the name given by the Spaniards in Peru to the staple magazine, or warehouse, established at Callao, a small town on the South Sea, which is the port of Lima, the capital of that part of South America, and particularly of Peru. The foreign ships, which have leave to trade along that coast, are obliged to unload here, paying 13 per cent. of the price they sell for, if the cargo be entire, and even 16 per cent. if otherwise.

ADMINISTRATIVE, *adj.* That which administers; that by which any one administers.

ADMINISTRATOR, *f.* [*administrator*, Lat.] He that has the goods of a man dying intestate. He that officiates in divine rites. He that conducts the government.

ADMINISTRATOR, in law, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor. An action lies for, or against, an administrator, as for, or against, an executor; and he shall be accountable to the value of the goods of the deceased, and no farther: unless there be waste, or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration. If a stranger, who is neither administrator nor executor, takes the goods of the deceased, and administers, he shall be charged and sued as an executor, not as an administrator. The origin of administrators is derived from the civil law. Their establishment in England is owing to a statute made in the 31st year of Edw. III. Till then, no office of this kind was known beside that of executor; in case of a want of which, the ordinary had the disposal of goods of persons intestate, &c.

ADMINISTRATOR is sometimes used for the president of a province; for a person appointed to receive, manage, and distribute, the revenues of an hospital or religious house; for a prince who enjoys the revenues of a secularized bishopric; and for the regent of a kingdom during a minority of the prince, or a vacancy of the throne.

ADMINISTRATRIX, *f.* [Lat.] She who administers in consequence of a will.

ADMINISTRATORSHIP, *f.* The office of administrator.

ADMIRABILIS SAL, *f.* The same with GLAUBER'S SALT.

ADMIRABILITY, *f.* [*admirabilis*, Lat.] The quality or state of being admirable.

ADMIRABLE, *adj.* [*admirabilis*, Lat.] To be admired; worthy of admiration; of power to excite wonder: always taken in a good sense, and applied either to persons or things.—The more power he hath to hurt, the more *admirable* is his praise, that he will not hurt. *Sidney*.

AMIRABLENESS, *f.* The quality of being admirable; the power of raising wonder.

ADMIRABLY, *adv.* So as to raise wonder; in an admirable manner.

ADMIRAL, *f.* [*amiral*, Fr.] An officer or magistrate that has the government of the king's navy, and the hearing and determining all causes, as well civil as criminal; belonging to the sea. The chief commander of a fleet; also the ship which carries the admiral or commander of the fleet.

Authors are much divided with regard to the origin and denomination of this important officer, whom we find established in most kingdoms that border on the sea. According to Lord Coke, it comes from the Saxon *aen mere al*, (over all the sea,) the *praefectus maris*. But the most probable opinion is that of Sir Henry Spelman, who thinks, that both the name and dignity were derived from the Sarcenus, and, by reason of the holy wars, brought amongst us; for *admiral*, in the Arabian language, signifies a prince or chief ruler, and was the ordinary title of the governors of cities, provinces, &c. and therefore they called the commander of the navy by that name, as a name of dignity and honour. And indeed there are no instances of admirals in this part of Europe before the year 1284, when

Philip of France, who had attended St. Louis in the wars against the Saracens, created an admiral. Du Cange assures us, that the Sicilians were the first, and the Genoese the next, who gave denomination of admiral to the commanders of their naval armaments; and that they took it from the Saracen or Arabic *emir*, a general name for every commanding officer. As for the exact time when the word was introduced among us, it is uncertain; some think it was in the reign of Edward I. Sir Henry Spelman is of opinion that it was first used in the reign of Henry III. because neither the laws of Oleron made in 1266, nor Bracton who wrote about that time, make any mention of it; and that the term admiral was not used in a charter in the eighth of Henry III. wherein he granted this office to Richard de Lacey, by these words, *Maritimam Angliam*; but, in the 56th year of the same reign, not only the historians, but the charters themselves, very frequently use the word admiral.—Before the use of the word admiral was known, the title of *custos maris* was made use of.

Lord High ADMIRAL OF ENGLAND, in some ancient records called *capitanus maritimarum*, an officer of great antiquity and trust, as appears by the laws of Oleron, so denominated from the place they were made at by Richard I. The first title of admiral of England, expressly conferred upon a subject, was given by patent of Richard II. to Richard Fitz-Allen, jun. earl of Arundel and Surrey; for those who before enjoyed this office were simply termed admirals, though their jurisdiction seems at large, especially in the reign of Edward III. when the court of admiralty was first erected.

This great officer has the management of all maritime affairs, and the government of the royal navy, with power of decision in all maritime cases both civil and criminal: he judges of all things done upon or beyond the sea, in any part of the world; upon the sea-coasts, in all ports and havens, and upon all rivers below the first bridge from the sea. By him, vice-admirals, rear-admirals, and all sea-captains, are commissioned; all deputies for particular coasts, and coroners to view dead bodies found on the sea-coasts, or at sea: he also appoints the judges for his court of admiralty, and may imprison, release, &c. All ports and havens are *infra corpus comitatus*, and the admiral hath no jurisdiction of any thing done in them.

The lord high admiral has power, not only over the seamen serving in his ships of war, but over all other seamen, to arrest them for the service of the state; and, if any of them run away, without leave of the admiral, he hath power to make a record thereof, and certify the same to the sheriffs, mayors, bailiffs, &c. who shall cause them to be apprehended and imprisoned.

To the lord high admiral belong all penalties and amercements of all transgressions at sea, on the sea-shore, in ports and havens, and all rivers below the first bridge from the sea; the goods of pirates and felons condemned or enslaved, sea-wrecks, goods floating on the sea, or cast on the shore (not granted to lords of manors adjoining to the sea), and a share of lawful prizes; also all great fishes, commonly called *royal fishes*, except whales and sturgeons: with a salary of 7000*l.* a-year.

In short, this is so great an office, in point of trust, honour, and profit, that it has been usually given to princes of the blood, or the most eminent persons among the nobility. We have had no lord high admiral for some years; the office being put in commission, or under the administration of the lords commissioners of the admiralty, who by statute have the same power and authority as the lord high admiral.

ADMIRAL, also implies in general, any flag-officer whatever. The commander of a fleet carries his flag at the main-top-mast head.

Vice ADMIRAL, is the commander of the second squadron, and carries his flag at the fore-top-mast head.

Rear ADMIRAL, is the commander of the third squadron, and carries his flag at the mizen-top-mast head.

Vice ADMIRAL, is also an officer appointed by the lords

commissioners of the admiralty. There are several of these officers established in different parts of Great Britain, with judges and marshals under them, for executing jurisdiction within their respective limits. Their decrees, however, are not final, an appeal lying to the court of admiralty in London.

ADMIRAL is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod-fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders, and appoints the fishing-places to those who come after him; and, as long as the fishing-season continues, he carries a flag on his main-mast.

ADMIRAL, in zoology, the English name of a species of the voluta, a shell-fish belonging to the order of vermes testacea.

ADMIRALSHIP, *f.* The office or power of an admiral.

ADMIRALTY, *f.* [*amirauté*, Fr.] The power, or officers, appointed for the administration of naval affairs, called *lords of the admiralty*.

Court of ADMIRALTY, is a sovereign court, held by the lord high admiral, or lords of the admiralty, where cognizance is taken in all maritime affairs, whether civil or criminal. It was first of all erected by king Edw. III. Its proceedings are according to the method of the civil law, and is usually held at Doctors' Commons. 3 *Blackst.* 69.

This court hath power to try and determine all maritime causes, or such injuries which, though they are in their nature of common-law cognizance, yet being committed on the high seas, out of the reach of the ordinary courts of justice, are therefore to be remedied in a peculiar court of their own. *Id.* 106.

Beneath the low-water mark, the admiral hath sole and absolute jurisdiction: but between the high-water mark and the low-water mark, the common law and the admiral have jurisdiction by turns; one upon the water, the other upon the land. But, if the water is within a county, the common law hath the jurisdiction. 5 *Co.* 107.

Wreck of the sea shall be tried and determined by the laws of the land; but this cannot be extended to flotsam, jetsam, or lagan, for they are in or upon the sea, and therefore cannot be tried and determined by the common law, but are to be determined before the admiral. *Id.* 106.

For convenience of seamen, the admiralty hath been allowed to hold plea for mariners' wages; but yet with this limitation, that if there be any special agreement, by which the mariners are to receive their wages in any other manner than is usual, or if the agreement be under seal, so as to be more than a parole agreement, in such case they will be prohibited. This indulgence was permitted them, because the remedy in the admiralty is easier and better: easier, because they must sever at the common law, whereas here they may join; and better, because the ship itself is answerable. 1 *Salk.* 33.

But although pure maritime acquisitions, which are earned and become due on the high seas, are one proper object of the admiralty jurisdiction, even though the contract be made upon land; yet, in general, if there be a contract made in England, and to be executed upon the seas, as a charter-party, or covenant, that a ship shall sail to Jamaica, or shall be in such a latitude, by such a day; or a contract made upon the sea to be performed in England, as a bond made on ship-board to pay money in London, or the like; these kinds of mixed contracts belong not to the admiralty jurisdiction, but to the courts of common law. And it is not unfrequent for the plaintiff to feign that a contract, really made at sea, was made at some inland place, and thereby draw the cognizance of the suit from the courts of admiralty to those of Westminster-hall. 3 *Blackst.* 107.

From the sentence of an inferior court of admiralty, an appeal lies to the court of the lord high admiral. And from the sentence of the admiralty judge, an appeal lies

to the delegates. But in case of prize-vessels taken in time of war, in any part of the world, and condemned in any courts of admiralty as lawful prize, the appeal lies to certain commissioners of appeals, consisting chiefly of the privy council, and not to judges delegates; and this, by virtue of divers treaties with foreign nations; by which, particular courts are established in all the maritime countries of Europe, for the decision of this question, whether lawful prize or not. For, this being a question between subjects of different states, it belongs intirely to the law of nations, and not to the municipal laws of either country, to determine it. 3 *Blackst.* 69.

And sentence in a foreign court of admiralty is to be credited here, as ours is to be credited there; and the party may libel here for the execution of a sentence in a foreign court of admiralty.

The high court of admiralty is also a court not only of civil, but of criminal, jurisdiction. It hath cognizance of all crimes and offences committed either upon the sea, or on the coasts out of the body or extent of any English county. And heretofore they were determinable by the sole sentence of the judge of the admiralty; but by the 28 Henry VIII. c. 15. all felonies committed on the sea shall be tried by commissioners nominated by the lord chancellor, viz. the judge of the admiralty, and three or four more (among whom two common-law judges are constantly appointed, who in effect try all the prisoners), the indictment being first found by a grand jury of twelve men, and afterwards tried by another jury, as at common law. 4 *Blackst.* 268.

ADMIRALTY ISLANDS, lie in about 2° 18' S. lat. and 146° 44' E. lon. There are between twenty and thirty islands said to be scattered about here, one of which alone would make a large kingdom. Captain Carteret, who first discovered them, was prevented touching at them, although their appearance was very inviting, on account of the condition of his ship, and of his being entirely unprovided with the articles of barter which suit an Indian trade. He describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, interspersed with spots that have been cleared for plantations, groves of cocoa-nut trees, and houses of the natives, who seem to be very numerous. The largest of these islands is eighteen leagues long; in the direction of east and west. The discoverer thinks it highly probable that these islands produce several valuable articles of trade, particularly spices, as they lie in the same climate and latitude as the Moluccas.

ADMIRATION, *f.* [*admiratio*, Lat.] Wonder; the act of admiring or wondering. It is taken sometimes in a bad sense, though generally in a good.

To ADMIRE, *v. a.* [*admiro*, Lat. *admirer*, Fr.] To regard with wonder: generally in a good sense. It is sometimes used, in more familiar speech, for *to regard with love*. It is used, but rarely, in an ill sense.

To ADMIRE, *v. n.* To wonder; sometimes with the particle *at*.—The eye is already so perfect, that I believe the reason of a man would easily have rested here, and *admired at* his own contrivance. *Ray*.

ADMIRER, *f.* The person that wonders, or regards with admiration. In common speech, a lover.

ADMIRINGLY, *adv.* With admiration; in the manner of an admirer.—We may yet further *admiringly* observe, that men usually give freest where they have not given before. *Boyle*.

ADMISSIBLE, *adj.* [*admitto*, *admissum*, Lat.] That which may be admitted.—Suppose that this supposition were *admissible*, yet this would not any way be inconsistent with the eternity of the divine nature and essence. *Hale*.

ADMISSION, *f.* [*admissio*, Lat.] The act or practice of admitting. The state of being admitted. Admittance; the power of entering, or being admitted.—All springs have some degree of heat, none ever freezing, no not in the longest and severest frosts; especially those, where there is such a site and disposition of the strata as gives free and

easy *admission* to this heat. *Woodward*.—In the ecclesiastical law, it is, when the patron presents a clerk to a church that is vacant, and the bishop, upon examination, admits and allows of such clerk to be fitly qualified, by saying, *Admitto te habilem*. The allowance of an argument; the grant of a position not fully proved.

To ADMIT, *v. a.* [*admitto*, Lat.] To suffer to enter; to grant entrance. To suffer to enter upon an office; in which sense the phrase of *admission into a college*, &c. is used. To allow an argument or position. To allow, or grant in general; sometimes with the particle *of*.—If you once *admit* of a latitude, that thoughts may be exalted, and images raised above the life, that leads you insensibly from your own principles to mine. *Dryden*.

ADMITTABLE, *adj.* The person or thing which may be admitted.—Because they have not a bladder like those we observe in others, they have no gall at all, is a paradoxism not *admittable*, a fallacy that needs not the fun to scatter it. *Brown*.

ADMITTANCE, *f.* The act of admitting; allowance or permission to enter. The power or right of entering. Custom, or prerogative, of being admitted to great persons: a sense now out of use. Concession of a position.—Nor could the Pythagoreans give easy *admittance* thereto; for, holding that separate souls successively supplied other bodies, they could hardly allow the raising of souls from other worlds. *Brown*.

ADMITTANCE, in law, is the giving possession of a copyhold estate, as livery of seisin of a freehold. And it is of three kinds:—1. Upon a *voluntary grant by the lord*, where the land hath escheated or reverted to him. In this case, though he might keep the land in his own hand, or might grant the same in fee, and so infranchise it, yet, if he will dispose of it as copyhold, he is bound to grant the usual estate, and reserve the usual rent, and observe the ancient custom precisely in every point; otherwise it would be to create a new copyhold. 2. Upon *surrender by the former tenant*. In this case, the lord is not proprietor, but only a necessary instrument of conveyance; the party claiming his estate under him that made the surrender. But, until his admittance, the tenant hath no estate, and therefore cannot surrender it again to a stranger before admittance. 3. *Admittance by descent*; which is, where an heir is tenant immediately on the death of his ancestor. The lord here is a mere instrument; for the heir may enter upon the land, take the profits, bring actions of trespass, and surrender to whose use he pleases, before admittance; though, before admittance, he cannot be sworn of the homage. This admittance of the heir is not to strengthen his estate, but to entitle the lord to his fine. And, if the heir will not come in and take his admittance, he shall forfeit his estate, or be subject to a penalty, according as the custom of the manor may be. *Wood*, b. ii. c. 1.

To ADMIX, *v. a.* [*admixco*, Lat.] To mingle with something else.

ADMIXTION, *f.* The union of one body with another, by mingling them.—The elements are no where pure in these lower regions; and, if there is any free from the admixtion of another, sure it is above the concave of the moon. *Glanville*.

ADMIXTURE, *f.* The body mingled with another; perhaps sometimes the act of mingling.—A mass which to the eye appears to be nothing but mere simple earth, shall, to the smell or taste, discover a plentiful admixture of sulphur, alum, or some other mineral. *Woodward*.

To ADMONISH, *v. a.* [*admoneo*, Lat.] To warn of a fault; to reprove gently; to counsel against wrong practices; to put in mind of a fault or a duty; with the particle *of*, or *against*, which is more rare; or the infinitive mood of a verb.

ADMONISHER, *f.* The person that admonishes, or puts another in mind of his faults or duty.—Horace was a mild *admonisher*; a court-satirist fit for the gentle times of Augustus. *Dryden*.

ADMONISHMENT,

ADMONISHMENT, *f.* Admonition; the notice by which one is put in mind of faults or duties: a word not often used:

To th' infinitely Good we owe
Immortal thanks, and his *admonishment*
Receive, with solemn purpose to observe
Immutably his sovereign will, the end
Of what we are.

Milton.

ADMONITIO FUSTIUM, *f.* among the Romans, a military punishment, not unlike our whipping, only it was performed with vine-branches.

ADMONITION, *f.* [*admonitio*, Lat.] The hint of a fault or duty; counsel; gentle reproof.

ADMONITIONER, *f.* A liberal dispenser of admonition; a general adviser. A ludicrous term.

ADMONITORY, *adj.* [*admonitorius*, Lat.] That which admonishes.—The sentence of reason is either mandatory, shewing what must be done; or else permissive, declaring only what may be done; or thirdly, *admonitory*, opening what is most convenient for us to do. *Hooker.*

ADMORTIZATION, *f.* in the feudal customs, the reduction of the property of lands or tenements to mortmain. See **MORTMAIN**.

To **ADMOVE**, *v. a.* [*admoveo*, Lat.] To bring one thing to another. A word not in use.—If, unto the powder of loadstone or iron, we *admove* the north pole of the loadstone, the powders, or small divisions, will erect and conform themselves thereto. *Brown.*

ADMURMURATION, *f.* [*admurmuro*, Lat.] The act of murmuring, or whispering to another.

ADNATA, or **AGNATA**, *f.* [from *adnascor*, Lat. to grow to.] The outer coat of the eye; called also *circumcavalis*, *circumoffalis*, *albuginea*, *epiophycos*. It is that which makes the white of the eye, called also *exclonion*, and is thus formed: five of the muscles which move the eye take their origin from the bottom of the orbit, and the sixth arises from the edge of it; they are all inserted by a tendinous expansion into the anterior part of the tunica sclerotica; which expansion gives the whiteness peculiar to the fore part of the eye. It lies between the sclerotica and conjunctiva. It is extremely sensible, and abounds with blood-vessels, which are very visible in inflammations. It covers so much of the eye as is called the white; and, being reflected all round, it lines the two eye-lids, and thus hinders any thing from falling into the orbit. Where it covers the eye-lids, it is vascular and papillous. In passing over the orbit, it does not end at the cornea, but becomes transparent there, and is of different textures in different parts where it is spread. The sclerotica appears under it. When a foreign body gets between the eye and the eye-lid, it is hooked in the villi: the best way to extricate it is, to invert the eye-lid, and to introduce a probe armed with lint and dipped in oil, which will extract it. The inverted eye-lid proceeds from this coat. Though it is exactly commensurate to the orbit in health, yet in morbid habits, when it is inflamed, it is thickened and puffed out. If it does not yield to general remedies, as bleeding, purging, &c. scarify it; and, if this also fails, cut off the redundant part.

ADNATA, is also used for any hair, wool, or the like, which grows upon animals or vegetables.

ADNATA, or **ADNASCENTIA**, among gardeners, denote those off-sets, which, by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards grow to true roots. The French call them *cayeux*, "stalks."

ADO, *f.* [from the verb to *do*, with *a* before it, as the French *affaire* from *a* and *faire*.] Trouble, difficulty. Bustle; tumult; business; sometimes with the particle *about*. It has a light and ludicrous sense, implying more tumult and show of business than the affair is worth: in this sense it is of late generally used.—Come, says Puff, without any more *ado*, 'tis time to go to breakfast; cats don't live upon dialogues. *L'Esrange.*

VOL. I. No. 8.

ADOLESCENCE, or **ADOLESCENCY**, *f.* [*adolescencia*, Lat.] The age succeeding childhood, and succeeded by puberty; more largely that part of life in which the body has not yet reached its full perfection. The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. Adolescence is commonly computed to be between fifteen and twenty-five, or even thirty, years of age; though in different constitutions its terms are very different. The Romans usually reckoned it from twelve to twenty-five in boys; and to twenty-one in girls, &c. And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently for any person under forty-five years.

ADOLESCENS, *f.* [Lat.] The iron bars that support the fire in a grate or furnace.—Paracelsus would make a man without a woman, and digested semen masculinum in a glass placed in a dung-hill, and produced something like a man, according to the assertion of some of his disciples; this was called homunculus Paracelsi; but would be as properly named *adolescens*.

ADOLLAM, or **ODOLLAM**, anciently a town in the tribe of Judah, to the east of Eleutheropolis. David is said to have hid himself in a cave near this town.

ADON, a populous village in the province of Stuhl-Weissenberg, belonging to Hungary. It lies in a fruitful country, towards the Danube. Lat. 47. 30. lon. 19. 20.

ADONAI, *f.* [Heb.] One of the names of the Supreme Being, in the Scriptures. The proper meaning of the word is *my lords*, in the plural number; as *adoni* is *my lord*, in the singular. The Jews, who either out of respect, or superstition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. But the ancient Jews were not so scrupulous; nor is there any law which forbids them to pronounce the name of God.

ADONIA, *f.* in antiquity, solemn feasts in honour of Venus, and in memory of her beloved Adonis. The Adonia were observed with great solemnity by most nations; Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. From Syria, they are supposed to have passed into India. The prophet Ezekiel, viii. 14. is understood to speak of them. They were still observed at Alexandria in the time of St. Cyril; and at Antioch in that of Julian the Apostate, who happened to enter that city during the solemnity, which was taken for an ill omen. The Adonia lasted two days: on the first of which certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals: the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. The Syrians were not contented with weeping, but gave themselves discipline, shaved their heads, &c.

ADONIDES, *f.* in botany, a name given to botanists who described or made catalogues of plants cultivated in any particular place.

ADONIS, son to Cinyras king of Cyprus, the darling of the goddess Venus: being killed by a wild boar in the Italian woods, he was turned into a flower of a blood-colour, which still bears his name. Venus was inconsolable; and no grief was ever more celebrated than this, most nations, as stated above, having perpetuated the memory of it by a train of anniversary ceremonies. Among Shakespeare's Poems, is a long one on the subject of Venus's affection for Adonis.

ADONIS, or **ADONIUS**, a river of Phœnicia, rising in mount Lebanon, and falling into the sea, after a north-west course, at Bybulus; famous, in fable, as a beautiful shepherd-youth; son of Cinyras, king of the Cyprians; loved by Venus, slain by a boar, and turned into a river.

ADONIS, *f.* [so named from *Adonis*, the favourite of Venus.] In botany, a genus of the polyandria polygynia class, ranking in the natural order of multiflorae. The generic characters are—Calyx: perianthium five-leaved; leaflets obtuse, concave, a little coloured, deciduous. Corolla: petals five to fifteen, oblong, obtuse, shining. Sta-

mina:

mina: filaments very short, subulate; antheræ oblong, inflex. Pistillum: germis numerous, in a head; styles none; stigmas acute, reflex. Receptaculum: oblong, spiked. Seeds: numerous, irregular, angular, gibbous at the base, reflex at the top, a little prominent, naked.—*Essential Character.* Calyx, five-leaved; petals, five or more, without a nectary; seeds, naked.

Description. The leaves are multifid in some species, in others binate. The flowers are terminating, varying in the number of petals, from five to twelve or more; these are long, narrow, red or yellow, without any nectary as in anemone, which genus the flowers of adonis resemble. In fruit this genus approaches more to the ranunculus; having the seeds on a receptacle more or less lengthened out, forming a bunch, pretty much as in that genus.

Species. 1. *Adonis æstivalis*, or tall adonis: corollas five-petalled, heads of seeds ovate. Linnæus observes, that this is so nearly allied to the second species, as to be doubtful whether it is really distinct. Crantz unites them; and Mr. Curtis thinks it will most probably be found that they are the same. The number of petals is no certain character; and the time of flowering is none. Linnæus says, the corolla in this is red, in that dark purple: but the variation, even from scarlet to pale yellow, is no essential difference; the dark purple at the base of the petals remaining the same in all the varieties. According to M. Villars, this differs from *autumnalis*, in having the flower smaller, with the colour a higher red; the branches more open, and the fruit of an oval form. It is a native of the southern countries of Europe, among corn: flowering in May and June. Cultivated in 1768, by Mr. Miller.

2. *Adonis autumnalis*, or common adonis; called also bird's-eye, pheasant's-eye, red maithe, or red Morocco. Our common adonis is a native of most of the southern parts of Europe. Though now common in corn-fields with us near London, yet, not being mentioned as indigenous by any of our old writers, it is probably of no very long standing, and was originally conveyed from gardens, by the intervention of the dung-heap. It grows in Kent, particularly by the side of the river Medway, between Rochester and Maidstone, where it is found in great plenty, in the fields sown with wheat. Among spring corn, there is rarely a plant of it to be found; which shews the propriety of sowing the seeds in gardens in autumn; for those fields of spring corn, if suffered to remain undisturbed after the harvest, will abound with this plant the following year. Great quantities of the flowers are annually brought to London, and sold by the name of red Morocco. Both these annual sorts flower in the beginning of June, and the seeds ripen in August and September: this must be understood of those plants which grow from seeds sown in autumn, or such as have fallen to the ground; for, when any plants come up from seeds sown in the spring, they do not flower till July or August, and their seeds seldom ripen before October.

3. *Adonis vernalis*, or perennial or spring adonis: flower twelve-petalled; heads of seeds ovate; seeds equal thicker at the tip, styled below the tip, hirsute. Is a native of the mountains of Oeland, Switzerland, Austria, Carniola, Silesia, Prussia, Bohemia, the Palatinate, and other parts of Germany; where the root is often used for the true black hellebore. Its large yellow flowers are produced at the end of March or the beginning of April; and the seeds ripen in August. It is an old inhabitant of the English gardens; and was cultivated by Mr. Miller in 1731.

4. *Adonis Apennina*, or Apennine adonis: flowers fifteen-petalled; seeds angular acuminate-mucronate smooth. This species is found wild in the Apennines, and in Siberia.

5. *Adonis Capensis*, or Cape adonis: flowers ten-petalled; heads depressed; leaves binate; leaflets serrate heart-shaped. Found wild near the Cape of Good Hope.

6. *Adonis vesticaria*, or blister adonis: flowers ten-petalled; leaves binate; leaflets serrate smooth. This

is also a Cape plant, and the Africans use it for raising blisters.

Propagation and Culture. The two first sorts are annual; and, if the seeds are sown in autumn, the plants will come up the following spring; but, when they are not sown till spring, they rarely come up the same year: so that, when the seeds are permitted to fall on the ground, they generally succeed better than when sown by art. They will thrive best in a light soil, but by sowing some in a warm situation, and others in the shade, they may be continued longer in flower. The seeds ought to be sown where the plants are to remain to flower, for they do not bear transplanting, especially if they are not removed while the plants are very young: and when the plants come up, they should be thinned, leaving three or four in each patch, which will make a better appearance than where they grow single. The third and fourth are perennial, the seeds ripen in August, and should be sown soon after, otherwise they seldom succeed. When the plants come up, they must be carefully kept clean from weeds; and, in very dry weather, if they are now and then refreshed with water, it will promote their growth. They should remain in the place where they are sown until the second year, for they make but slow progress while young. The best time to transplant them is in autumn, when they ought to be planted where they are to remain; for, if often removed, they will not produce many flowers, nor those flowers be so strong as on the plants which are unremoved. They may be increased by parting the roots, either in autumn or spring. Being hardy and easily cultivated, and producing their showy flowers early in the season, they are desirable plants for the garden. The Cape species must be treated as other plants from that country.

ADONISTS, *f.* a sect or party among the divines and critics, who maintain, that the Hebrew points ordinarily annexed to the consonants of the word Jehovah are not the natural points belonging to that word, nor express the true pronunciation of it; but are the vowel-points, belonging to the words Adonai and Elohim, applied to the consonants of the ineffable name Jehovah; to warn the readers, that, instead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read Adonai. They are opposed to *Jehovists*: of whom the principal are Drusius, Capellus, Buxtorf, Altling, and Reland, who has published a collection of their writings on this subject.

To ADOPT, *v. a.* [*adopto*, Lat.] To take a son by choice; to make him a son, who was not so by birth. To place any person or thing in a nearer relation, than they have by nature, to something else.

ADOPTEDLY, *adv.* After the manner of something adopted.

ADOPTER, *f.* He that gives some one by choice the rights of a son.

ADOPTIANI, *f.* in church-history, a sect of ancient heretics, followers of Felix of Urgel, and Elipand of Toledo, who, towards the end of the 8th century, advanced the notion, that Jesus Christ, in his human nature, is the son of God, not by nature, but by adoption.

ADOPTION, *f.* [*adoptio*, Lat.] The act of adopting, or taking to one's self what is not native. The state of being adopted.—In every act of our Christian worship, we are taught to call upon him under the endearing character of our Father, to remind us of our adoption, that we are made heirs of God, and joint heirs of Christ. *Rogers.*

The custom of adoption was very common among the ancient Greeks and Romans: yet it was not practised but for certain causes expressed in the laws, and with certain formalities usual in such cases. It was a sort of imitation of nature, intended for the comfort of those who had no children: wherefore he that was to adopt was to have no children of his own, and to be past the age of getting any; nor were eunuchs allowed to adopt, as being under an actual impotency of begetting children; neither was it law-ful

ful for a young man to adopt an elder, because that it would have been contrary to the order of nature: nay, it was even required that the person who adopted should be eighteen years older than his adopted son, that there might at least appear a probability of his being the natural father.

To prevent rash and inconsiderate adoptions, the Lacedæmonians had a law, that adoptions should be transacted, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children; and, being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they first renounced their adoption; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had adopted them: thus providing against the ruin of families, which would otherwise have been extinguished by the desertion of those who had been adopted to preserve them. If the children adopted happened to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter. It should seem, that, by the Athenian law, a person, after having adopted another, was not allowed to marry without permission from the magistrate: in effect, there are instances of persons, who, being ill used by their adoptive children, petitioned for such leave. However this be, it is certain that some men married after they had adopted sons: in which case, if they begat legitimate children, their estates were equally shared between the begotten and adopted.

Besides the formalities abovementioned, various other methods have taken place; which have given denominations to different species of adoption, among the Gothic nations, in different ages. As,

ADOPTION by Arms, was when a prince made a present of arms to a person, in consideration of his merit and valour. Thus it was that the king of the Heruli was adopted by Theodoric; Athalaric by the emperor Justinian; and Cosroes, nephew of the king of Persia, by the emperor Justin.—The obligation here laid on the adoptive son was, to protect and defend the father from injuries, affronts, &c. And hence, according to Selden, the ceremony of dubbing knights took its origin as well as name.

ADOPTION by Baptism, is that spiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptism. This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitulars of Charlemagne. In reality, the god-father was so far considered as adoptive father, that his god-children were supposed to be intitled to a share in the inheritance of his estate.

ADOPTION by Hair, was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that pope John VIII. adopted Boson king of Arles; which, perhaps, is the only instance in history, of adoption, in the order of the ecclesiastics; a law that professes to imitate nature, not daring to give children to those in whom it would be thought a crime to beget any.

ADOPTION by Matrimony, is the taking the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom, it is more particularly known by the name of *einkindschaft*; among their writers in Latin, by that of *unio proutum*, or *union of issues*. But the more accurate writers observe, that this is no adoption. See **ADFILIA-TION**.

ADOPTION by Testament, that performed by appointing a person heir by will, on condition of his assuming the name, arms, &c. of the adopter. Of which kind we meet with several instances in the Roman history.

Among the Turks the ceremony of adoption is performed by obliging the person adopted to pass through the shirt of the adopter. Hence, among that people, to adopt is expressed by the phrase, *to draw another through my shirt*.

ADOPTION is also used, in theology, for a federal act of God's free grace; whereby those who are regenerated by faith are admitted into his household, and intitled to a share in the inheritance of the kingdom of heaven.

ADOPTION is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an *adoptive*, or *spiritual*, sister, or niece.

ADOPTION is also used in speaking of the admission of persons into certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

ADOPTIVE, *adj.* [*adoptivus*, Lat.] He that is adopted by another, and made his son. He that adopts another, and makes him his son.

ADORABLE, *adj.* [*adorable*, Fr.] That which ought to be adored; that which is worthy of divine honours.—On these two, the love of God and our neighbour, hang both the law and the prophets, says the *adorable* Author of Christianity; and the Apostle says, the end of the law is charity. *Cheyne*.

ADORABLENESS, *f.* The quality of being adorable; worthiness of divine honours.

ADORABLY, *adv.* In a manner worthy of adoration.

ADORATION, *f.* [*adoratio*, Lat.] The external homage paid to the Divinity, distinct from mental reverence. Homage paid to persons in high place or esteem:

O ceremony, shew me but thy worth:

What is thy toll, O adoration!

Art thou nought else but place, degree, and form,

Creating awe and fear in other men?

Wherein thou art less happy, being fear'd,

Than they in fearing.

What drink'st thou oft, instead of homage sweet,

But poison'd flattery? *Shakespeare.*

The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in or out to pay their respects to. The ceremony of adoration among the ancient Romans was thus: The devotee, having his head *covered*, applied his right hand to his lips, the fore-finger resting on his thumb, which was erect, and thus bowing his head, turned himself round from left to right.—The Jewish manner of adoration was by prostration, bowing, and kneeling. The Christians adopted the Grecian rather than the Roman method, and adored always *uncovered*. The ordinary posture of the ancient Christians was kneeling, but on Sundays standing: and they had a peculiar regard to the east, to which point they ordinarily directed their prayers.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This ceremony, which the Greeks called *προσκυνωσις*, Conon refused to perform to Artaxerxes, and Calisthenes to Alexander the Great, as repugnant to impiety and unlawful.

The adoration performed to the Roman and Grecian emperors consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand and clapping it to the lips. Some attribute the origin of this practice to Constantine. It was only persons of some rank or dignity that were intitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called *adoration*.

The practice of adoration may be said to be still subsisting

ing in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

ADORATION is also used, in the court of Rome, for the ceremony of kissing the pope's feet. The introduction of adoration among the Romans is ascribed to the low flattery of Vitellius, who, upon the return of C. Cæsar from Syria, would not approach him otherwise than with his head covered, turning himself round, and then falling on his face. Heliogabalus restored the practice, and Alexander Severus again prohibited it. Dioclesian redemanded it; and it was, in some measure, continued under the succeeding princes, even after the establishment of Christianity, as Constantine, Constantius, &c. It is particularly said of Dioclesian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this day. These prelates, finding a vehement disposition in the people to fall down before them and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope.

Barbarous ADORATION is a term used, in the laws of king Canute, for that performed after the manner of the heathens who adored idols. The Romish church is charged with the adoration of saints, martyrs, images, crucifixes, relics, the virgin, and the host; all which by Protestants are generally aggravated into idolatry, on a supposition, that the honour thus paid to them is absolute and supreme, called by way of distinction *Latria*, which is due only to God. Roman Catholics, on the contrary, explain them, as only a relative or subordinate worship, called *Dulia* and *Hyperdulia*, which terminates ultimately in God alone.

To ADORE, *v. à.* [*adoro*, Lat.] To worship with external homage: to pay divine honours. It is used, popularly, to denote a high degree of reverence or regard; to reverence; to honour; to love.—The people appear *adoring* their prince, and their prince *adoring* God. *Tatler*.

ADOREA, in Roman antiquity, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADOREMENT, *f.* Adoration; worship; a word scarcely used.

ADORER, *f.* He that adores; a worshipper; a term generally used in a low sense; as, by lovers, or admirers. A worshipper; in a serious sense.—He was so severe an *adorer* of truth, as not to dissimble; or to suffer any man to think that he would do any thing, which he resolved not to do. *Clarendon*.

To ADORN, *v. a.* [*adorno*, Lat.] To dress; to deck the person with ornaments.—He hath clothed me with the garments of salvation, he hath covered me with the robe of righteousness, as a bridegroom decketh himself with ornaments, and as a bride *adorneth* herself with her jewels. *Isaiah*, lxi. 10.—To set out any place or thing with decorations. To embellish with oratory or elegance of language:

Thousands there are in darker fame that dwell,
Whose names some nobler poem shall *adorn*;
For, tho' unknown to me, they sure fought well. *Dryden*.

ADORN, *adj.* Adorned; decorated: a word peculiar to Milton:

She'll to realities yield all her shows,
Made so *adorn* for thy delight the more. *Milton*.

ADORNMENT, *f.* Ornament; embellishment; elegance; not now in use.

ADOSCUATION, a term used by Dr. Grew, to imply a kind of impregnation, without intromission; and in this manner he supposes the impregnation of plants is effected by the falling of the farina fecundans on the pistil.

ADOSEE, in heraldry, signifies two figures or bearings being placed back to back.

ADOUR, the name of a river of France, which rises in the mountains of Bigorre, and, running N. by Tarbes through Gascony, afterwards turns E. and, passing by Dax, falls into the bay of Biscay, below Bayonne.

ADOWN, *adv.* Down; on the ground.

ADOWN, *prep.* Down; towards the ground; from a higher situation towards a lower:

In this remembrance Emily ere day
Arose, and dress'd herself in rich array;
Fresh as the month, and as the morning fair,
Adown her shoulders fell her length of hair. *Dryden*.

ADOXA, [*α* and *δοξα*, praise; an ignoble plant, one of no show.] In botany, a genus of the octandria tetragynia class, ranking in the natural order of succulentæ. The generic characters are—Calyx: perianth inferior, bifid, flat, permanent. Corolla: monopetalous, flat, quadrifid; clefts ovate, acute, longer than the calyx. Stamina: filaments subulate, the length of the calyx. Antheræ roundish. Pistillum: germ below the receptacle of the corolla. Styles simple, erect, the length of the stamens, permanent. Stigmas simple. Pericarpium: a globose berry, between the calyx and corolla, the calyx being united below with the berry, umbilicate, four-celled. Seeds: solitary, compressed.—*Essential Character*. Calyx, bifid, inferior; corolla, four or five cleft, superior; berry, four or five celled, united with the calyx.

There is but one *species*, which is called *adoxa moschatellina*, or bulbous fumitory, hollow-foot, tuberous moschatel. This plant grows naturally in shady places, and woods; as in Hampstead and Charlton woods, &c. The flowers appear at the end of March or the beginning of April, and the berries ripen in May, soon after which the leaves decay. These and the flowers smell like musk, from whence it has by some been called musk crowfoot.

Propagation and Culture. The roots may be transplanted any time after the leaves are decayed, till winter. They must be planted in the shade, under shrubs; for, if they are exposed to the open sun, they will not thrive.

AD PONDUS OMNIUM, among physicians, an abbreviation in their prescriptions, signifying that the last mentioned ingredient is to weigh as much as all the rest together.

AD QUOD DAMNUM is a writ, issuing out of and returnable into the chancery, directed to the sheriff, to enquire by a jury, of what damage it will be to the king, or any other, to grant a liberty, fair, market, highway, or the like. And, according to the sheriff's return thereof, the grant is issued or withheld.

ADRACHNE, in botany, a species of the strawberry-tree. See ARBUTUS.

ADRAMMELECH, one of the gods of the inhabitants of Sepharvaim, who were settled in the country of Samaria, in the room of those Israelites who were carried beyond the Euphrates. The Sepharvaites made their children pass through the fire, in honour of this idol and another called *Anamelech*. It is supposed, that *Adrammelech* meant the sun, and *Anamelech* the moon: the first signifies the magnificent king; the second the gentle king.

ADRAMYTTIUM, now *Andramiti*; a town of Mysia Major, at the foot of mount Ida, an Athenian colony, with a harbour and dock near the Caicus. *Adramyttenus* the epithet; as, *Adramyttenus Sinus*, a part of the Egean Sea, on the coast of Mysia; *Adramyttenus Convenus*, sessions or assizes. The eighth in order of the nine *Conventus Juridici* of the province of Asia.

ADRANA, a river of Germany, now the Eder, rising on the borders of the county of Nassau, to the north-east of

of Dillenburg, running through the landgraviate of Hesse, the county of Waldeck, by Fritzlar, and then falling into the Wefer, to the south of Caffel.

ADRANUM, or **HADRANUM**, now *Aderno*; a town of Sicily, built by the elder Dionysius, at the foot of mount *Ætna*, four hundred years before Christ.

ADRASTEIA, in antiquity, an epithet given to the goddess Nemesis, or Revenge. It was taken from king Adrastus, who first erected a temple to that deity.

ADRASTIA CERTAMINA, in antiquity, a kind of Pythian games, instituted by Adrastus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon. These are to be distinguished from the Pythian games celebrated at Delphi.

ADRASTUS, king of Argos, son of Talaus and Lysianissa, daughter of Polybius king of Sicyon, acquired great honour in the famous war of Thebes, in support of Polynices, his son-in-law, who had been excluded the sovereignty of Thebes by Eteocles his brother, notwithstanding their reciprocal agreement. Adrastus, followed by Polynices and Tideus his other son-in-law, by Capaneus and Hippomedon his sister's sons, by Amphiaras his brother-in-law, and by Parthenopæus, marched against the city of Thebes; and this is the expedition of the Seven Worthies, which the poets have so often sung. They all lost their lives in this war except Adrastus, who was saved by his horse called *Arian*. This war was revived ten years after by the sons of those deceased warriors, which was called the *war of the Epigones*, and ended with the taking of Thebes. None of them lost their lives except *Ægialeus* son of Adrastus; which afflicted him so much that he died of grief in Megara, as he was leading back his victorious army.

ADREAD, *adv.* In a state of fear; frightened; terrified; now obsolete.

ARIA, or **HADRIA**, the name of two ancient towns in Italy. One in the country of the Veneti, on the river Tartarus, between the Padus and the Athesis, called *Atria* by Pliny and Ptolemy, but *Adrias* by Strabo. Another on the river Vomanius, in the territory of the Piceni, the country of the ancestors of the emperor Adrian.

ADRIANUM, or **MARE ADRIATICUM**, a large bay in the Mediterranean, now the gulph of Venice, between Dalmatia, Sclavonia, Greece, and Italy.

ADRIAN, or **HADRIAN**, (Publius *Ælius*;) the Roman emperor. He was born at Rome the 24th of January, in the 76th year of Christ. His father left him an orphan, at ten years of age, under the guardianship of Trajan, and Cælius Tatianus a Roman knight. He accompanied Trajan in most of his expeditions, and particularly distinguished himself in the second war against the Daci; and having before been quaestor, as well as tribune of the people, he was now successively prætor, governor of Pannonia, and consul. After the siege of Atræ in Arabia was raised, Trajan, who had already given him the government of Syria, left him the command of the army: and at length, when he found death approaching, it is said he adopted him. Adrian, who was then in Antiochia, as soon as he received the news thereof, and of Trajan's death, declared himself emperor, on the 11th of August, 117. No sooner had he arrived at the imperial dignity, than he made peace with the Persians, to whom he yielded up great part of the conquests of his predecessors; and, from generosity, or policy, he remitted the debts of the Roman people, which, according to the calculation of those who have reduced them to modern money, amounted to 22,500,000 golden crowns; and he burnt all the bonds and obligations relating to those debts, that the people might be under no apprehension of being called to an account for them afterwards. There are medals in commemoration of this fact, in which he is represented holding a flambeau in his hand, to set fire to all those bonds which he had made void. He went to visit all the provinces; and did not return to Rome till the year 128, when the senate decreed him a triumph, and honoured him with the title of

Father of his country; but he refused both, and desired that Trajan's image might triumph. No prince travelled more than Adrian; there being hardly one province in the empire which he did not visit. In 120 he went into Gaul; from thence he came over to Britain, in order to subdue the Caledonians, who were making continual inroads into the provinces. Upon his arrival, they retired towards the north: he advanced however as far as York, where he was diverted from his intended conquest by the description some old soldiers he found there, who had served under Agricola, gave him of the country. In hopes, therefore, of keeping them quiet by enlarging their bounds, he delivered up to the Caledonians all the lands lying between the two Friths and the Tyne; and at the same time, to secure the Roman province from their future incursions, built the famous wall which still bears his name. It was carried on from the Solway Frith, a little west of the village of Burgh on the Sands, in as direct a line as possible, to the river Tyne on the east, at the place where the town of Newcastle now stands; so that it must have been above sixty English, and near seventy Roman, miles in length. Having thus settled matters in Britain, he returned to Rome, where he was honoured with the title of Restorer of Britain, as appears by some medals. He soon after went into Spain, to Mauritania, and at length into the east, where he quieted the commotions raised by the Parthians. After having visited all the provinces of Asia, he returned to Athens in 125, where he passed the winter, and was initiated in the mysteries of Eleusinian Ceres. He went from thence to Sicily, chiefly to view mount *Ætna*, contemplate its phenomena, and enjoy the beautiful and extensive prospect afforded from its top. He returned to Rome the beginning of the year 129; and, according to some, he went again, the same year, to Africa; and after his return from thence, to the east. He was in Egypt in the year 132, revisited Syria the year following, returned to Athens in 134, and to Rome in 135. The persecution against the Christians was very violent under his reign; but it was at length suspended, in consequence of the remonstrances of Quadrat bishop of Athens, and Aristides, two Christian philosophers, who presented the emperor with some books in favour of the Christian religion. He conquered the Jews; and, by way of insult, erected a temple to Jupiter on Calvary, and placed a statue of Adonis in the manner of Bethlehem; he caused also the images of swine to be engraven on the gates of Jerusalem. At last he was seized with a dropsy, which vexed him to such a degree, that he became almost raving mad. A great number of physicians were sent for, and to the multitude of them he ascribed his death. He died at Baia in the 62d year of his age, having reigned twenty-one years. The Latin verses he addressed to his soul, and which are translated by Mr. Pope, have been much criticised and variously interpreted. He also wrote the history of his own life: to which, however, he did not chuse to put his name; but that of Phlegon, one of his freed men, a very learned person, was prefixed to it. He had great wit, and an extensive memory. He understood the sciences perfectly well; but was very jealous of others who excelled in them. He was also cruel, envious, and lascivious. Antoninus his successor obtained his apotheosis; and prevented the rescission of his acts, which the senate once intended.

ADRIAN IV. (Pope), the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekepsere; and he was born at Langley, near St. Alban's, in Hertfordshire. His father having left his family, and taken the habit of the monastery of St. Alban's, Nicholas was obliged to submit to the lowest offices in that house for daily support. After some time, he desired to take the habit in that monastery, but was rejected by the abbot Richard. Upon this he resolved to try his fortune in another country, and accordingly went to Paris; where, though in very poor circumstances, he applied himself to his studies with great assiduity, and made a wonderful proficiency. But, having still a strong incli-

nation to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monastery of St. Rufus. He was not immediately allowed to take the habit; but passed some time, by way of trial, in recommending himself to the monks by a strict attention to all their commands. This behaviour, together with the beauty of his person, and prudent conversation, rendered him so acceptable to those religious, that after some time they intreated him to take the habit of the canonical order. Here he distinguished himself so much by his learning and strict observance of the monastic discipline, that, upon the death of the abbot, he was chosen superior of that house; and we are told that he rebuilt that convent. Pope Eugenius III. being apprised of the great merit of Nicholas, and thinking he might be serviceable to the church in a higher station, created him cardinal bishop of Alba in 1146. In 1148, his holiness sent him legate to Denmark and Norway; where, by his fervent preaching and diligent instructions, he converted those barbarous nations to the Christian faith; and erected Upsal into an archiepiscopal see. When he returned to Rome, he was received by the pope and cardinals with great marks of honour: and pope Anastasius, who succeeded Eugenius, happening to die at this time, Nicholas was unanimously chosen to the holy see, in November 1154, and he took the name of *Adrian*. When the news of his promotion reached England, king Henry II. sent Robert abbot of St. Alban's, and three bishops, to Rome, to congratulate him on his election; upon which occasion Adrian granted very considerable privileges to the monastery of St. Alban's, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. He died September 1st, 1159, in the fourth year and tenth month of his pontificate; and was buried in St. Peter's church, near the tomb of his predecessor Eugenius. There are extant several letters, and some homilies, written by Pope Adrian.

ADRIAN, cardinal-priest, of the title of St. Chrysogonus, was a native of Cornetto in Tuscany. Innocent VIII. sent him nuncio into Scotland and into France; and, after he had been clerk and treasurer of the apostolic chamber, pope Alexander VI. whose secretary he had been, honoured him with the cardinal's hat. His life was a continued scene of odd alterations. He narrowly escaped death the day Alexander VI. poisoned himself by mistake. Afterward he drew upon himself the hatred of Julius II. so that he was obliged to go and hide himself in the mountains of Trent. Having been recalled by Leo X. he was so ungrateful, that he engaged in a conspiracy against him. The pope pardoned his fault: but the cardinal, not caring to trust to this, made his escape, and it could never be known exactly what became of him. He was one of the first that effectually reformed the Latin style. He studied Cicero with great success, and made many excellent observations on the propriety of the Latin tongue. The treatise he composed *De sermone Latino*, is a proof of this. He had begun a Latin translation of the Old Testament. He wrote *De vera philosophia*. This treatise was printed at Cologne 1584.

ADRIAN VI. (Pope), was born at Utrecht in 1459. His father was not able to maintain him, but he got a place at Louvain, in a college in which a certain number of scholars were maintained *gratis*. It is reported that he used to read in the night-time by the light of the lamps in the churches or streets. He made a considerable progress in all the sciences; led an exemplary life; and there never was a man less intriguing and forward than he was. He took his degree of doctor of divinity at Louvain; was soon after made canon of St. Peter's, and professor of divinity at Utrecht, and then dean of St. Peter's and vice-chancellor of the university. He was obliged to leave an academical life, to be tutor to the archduke Charles. This young prince made no great progress under him: however, never was a tutor more considerably rewarded; for it was by Charles V.'s credit he was raised to the papal throne. He died Sept. 14, 1523.

ADRIANI (Joanni Battista), was born of a patrician family at Florence in 1511. He wrote a History of his own Times in Italian; which is a continuation of Guicciardini, beginning at the year 1536; to which Thuanus acknowledges himself greatly indebted: besides which he composed six funeral orations, on the emperor Charles V. and other noble personages. He died at Florence in 1579.

ADRIANISTS, in ecclesiastical history, a sect of heretics divided into two branches; the first were disciples of Simon Magus, and flourished about the year 34. Theodoret is the only person who has preserved their name and memory; but he gives us no account of their origin. Probably this sect, and the six others which sprung from the Simonians, took their name from the particular disciples of Simon. The second were the followers of Adrian Hamstead, the anabaptist; and held some particular errors concerning Christ.

ADRIANO-A-SIERRA, a chain of mountains of Biscay in Spain. There is a road over them to Aalba and Old Castile, which at its beginning is a dark path of fifty paces cut through a rock, and then leads over the highest of the Pyrenees.

ADRIANOPOLE, a city of Turkey in Europe, in the province of Rumania, and the see of an archbishop, under the patriarch of Constantinople. It is about seven or eight miles in circumference, including the old city and some gardens. The houses are low, and the streets dirty. The walls and towers are in a great measure fallen to decay. However, there is a beautiful bazar, or market, half a mile long, called Ali Basha. It is a vast arch building, with six gates, and 365 well-furnished shops, kept by Turks, Armenians, and Jews. The number of inhabitants of all nations and religions may be about 100,000; but it is dear living here, because the provisions are brought from distant places. The air is wholesome, and the country very pleasant in the summer time, on account of the river and streams that run near and about the city; the chief of which is the Mariza. These promote and preserve the verdure of the gardens, meadows, and fields, for a considerable part of the year. In the winter there is plenty of game. Near the principal bazar there is another, about a mile in length, full of shops, which contain all kinds of commodities. Sultan Selim's mosque stands on the side of a hill, in the midst of the city; and hence this magnificent structure may be seen on all sides. Gold and silver articles, jewels, pistols, scimitars, &c. are sold in another part of the city, called by travellers the *bizeftein*, though it differs little from a bazar. This contains about 200 shops, and is covered like the former: but the covering is supported by two rows of large pillars. The grand vizier's palace is an extensive house, after the Turkish manner of building. The emperor's seraglio, is a regular structure, in a plain near the river Tungia. It is two miles in compass, and has seven gates, besides those of the gardens, which are several miles in circumference. The city is governed by a mullah cadi, who has an absolute authority both in civil and criminal matters. In the time of the plague, or war, the grand signior sometimes resides here. The Turks took this city from the Greeks in 1362, and made it the capital of the empire, till Mahomet II. took Constantinople in 1453. E. lon. 26. 27. lat. 41. 41.

ADRIFT, *adv.* Floating at random; as any impulse may drive:

Then, shall this mount
Of paradise, by might of waves, be mov'd
Out of his place, push'd by the horned flood,
With all his verdure spoil'd, and trees *adrift*,
Down the great river, to the open gulf,
And there take root.

Milton.

ADROGATION, in Roman antiquities, a species of adoption, whereby a person who was capable of choosing for himself was admitted by another into the relation of a son.

fon. The word is compounded of *ad*, "to," and *rogare*, "to ask;" on account of a question put in the ceremony of it. Whether the adopter would take such a person for his son? and another to the adoptive, Whether he consented to become such a person's son?

ADROIT, *adj.* [Fr.] Dextrous; active; skilful.

ADROITNESS, *f.* Dexterity; readiness; activity. Neither this word, nor *adroit*, seem yet completely naturalized.

ADROP, *f.* A chemical term denoting the body itself, or lead, from whence mercury ought to be taken for the philosophers stone; in which signification it is taken also by Ripley. Or it denotes the philosophers stone itself. It is also called *saturnus*, i. e. antimony, or plumbum.

ADRY, *adv.* [from *a* and *dry*.] Athirst; thirsty; in want of drink.

ADSCITITIOUS, *adj.* [*adscititius*, Lat.] That which is taken in to complete something else, though originally extrinsic; supplemental; additional.

ADSIDELLA, *f.* in antiquity, the table at which the flames sat during the sacrifices.

ADSTRICTION, *f.* [*adstrictio*, Lat.] The act of binding together; and applied, generally, to medicaments and applications which have the power of making the part contract.

ADUACA, or **ATUACA**, anciently a large and famous city of the Tungri; now a small and inconsiderable village, called Tongeren, in the bishopric of Liege, in the territory of Haspengow, on the rivulet Jecker, that falls into the Maese. Lat. 50. 54. lon. 5. 52. E.

TO ADVANCE, *v. a.* [*avancer*, Fr.] To bring forward, in the local sense. To raise to preferment; to aggrandize. To improve.—What laws can be advised more proper and effectual to advance the nature of man to its highest perfection, than these precepts of Christianity? *Tillotson*.—To heighten; to grace; to give lustre to. To forward; to accelerate. To propose; to offer to the public; to bring to view or notice:

Some ne'er advance a judgment of their own,
But catch the spreading notion of the town. *Pope*.

TO ADVANCE, *v. n.* To come forward. To make improvement.—They who would advance in knowledge, and not deceive and swell themselves with a little articulated air, should not take words for real entities in nature, till they can frame clear and distinct ideas of those entities. *Locke*.

ADVANCE, *f.* The act of coming forward. A tendency to come forward to meet a lover; an act of invitation. Gradual progression; rise from one point to another. Improvement; progress towards perfection.—Our Saviour raised the ruler's daughter, the widow's son, and Lazarus; the first of these, when she had just expired; the second, as he was carried to his grave on the bier; and the third, after he had been some time buried. And having, by these gradual advances, manifested his divine power, he at last exerted the highest and most glorious degree of it; and raised himself also by his own all-quickening virtue, and according to his own express prediction. *Atterbury*.

ADVANCED, *adj.* in a general sense, denotes something posted or situated before another. Thus, *advanced-ditch*, in fortification, is that which surrounds the glacis or esplanade of a place.

ADVANCED-GUARD, or **VANGUARD**, in the art of war, the first line or division of an army, ranged or marching in order of battle; or, it is that part which is next the enemy, and marches first towards them. This term is more particularly used for a small party of horse stationed before the main-guard.

ADVANCEMENT, *f.* [*avancement*, Fr.] The act of coming forward. The state of being advanced; preferment. The act of advancing another. Improvement; promotion to a higher state of excellence.—Nor can we conceive it unwelcome unto those worthies, who endeavour the advancement of learning. *Brown*.

ADVANCER, *f.* He that advances any thing; a pro-

motor; forwarder. Among sportsmen, it is one of the starts or branches of a buck's attire, between the back antler and the palm.

ADVANTAGE, *f.* [*avantage*, Fr.] Superiority; often with *of* or *over* before a person.—In the practical prudence of managing such gifts, the laity may have some *advantage* over the clergy; whose experience is, and ought to be, less of this world than the other. *Sprat*.—All other sorts and sects of men would evidently have the *advantage* of us, and a much surer title to happiness than we. *Atterbury*.—Superiority gained by stratagem, or unlawful means. Opportunity; convenience. Favourable circumstances. Superior excellence. Gain; profit. Overplus; something more than the mere lawful gain. Preponderation on one side of the comparison.—Much more should the consideration of this pattern arm us with patience against ordinary calamities; especially if we consider his example with this advantage, that though his sufferings were wholly undeserved, and not for himself but for us, yet he bore them patiently. *Tillotson*.

TO ADVANTAGE, *v. a.* To benefit. To promote; to bring forward; to gain ground to.—The great business of the senses being to make us take notice of what hurts or *advantages* the body, it is wisely ordered by nature, that pain should accompany the reception of several ideas. *Locke*.

ADVANTAGEABLE, *adj.* Profitable; convenient; gainful.—As it is *advantageable* to a physician to be called to the cure of declining disease, so it is for a commander to suppress a sedition which has passed the height. *Hayward*.

ADVANTAGED, *adj.* Possessed of advantages; commodiously situated or disposed.—In the most *advantaged* tempers, this disposition is but comparative; whereas the most of men labour under disadvantages, which nothing can rid them of. *Glanville*.

ADVANTAGE-GROUND, *f.* Ground that gives superiority, and opportunities of annoyance or resistance.

ADVANTAGEOUS, *adj.* [*avantageux*, Fr.] Of advantage; profitable; useful; opportune; convenient. It is used with relation to persons, and followed by *to*.—Since every painter paints himself in his own works, 'tis *advantageous* to him to know himself, to the end that he may cultivate those talents which make his genius. *Dryden*.

ADVANTAGEOUSLY, *adv.* Conveniently; opportunely; profitably.

ADVANTAGEOUSNESS, *f.* Quality of being advantageous; profitableness; usefulness; convenience.—The last property, which qualifies God for the fittest object of our love, is the *advantageousness* of his to us, both in the present and the future life. *Boyle*.

ADUAR, *f.* in the Arabian and Moorish customs, a kind of ambulatory village, consisting of tents, which these people remove from one place to another, as suits their convenience.

TO ADVENE, *v. n.* [*advenio*, Lat.] To accede to something; to become part of something else, without being essential; to be superadded.

ADVENIENT, *adj.* [*adveniens*, Lat.] Advening; coming from outward causes; superadded.—If to suppose the soul a distinct substance from the body, and extrinsically *advenient*, be a great error in philosophy, almost all the world hath been mistaken. *Glanville*.

ADVENT, *f.* [from *adventus*; i. e. *adventus* *Redemptoris*, Lat.] The name of one of the holy seasons, signifying the coming; that is, the coming of our Saviour; which is made the subject of our devotion during the four weeks before Christmas. It begins on St. Andrew's day, or on the Sunday before or after it. During Advent, and to the end of the octaves of Epiphany, the solemnizing of marriage is forbidden without a special licence.

ADVENTINE, *adj.* [from *advenio*, *adventum*, Lat.] Adventitious; that which is extrinsically added; that which comes from outward causes; a word scarcely in use.

ADVENTITIOUS, *adj.* [*adventitius*, Lat.] That which advenes; accidental; supervenient; extrinsically added, not essentially inherent.—Diseases of continuance get an *adventitious*

adventitious strength from custom, besides their material cause from the humours. *Bacon.*

ADVENTIVE, *f.* [from *advenio*, Lat.] The thing or person that comes from without: a word not now in use.

ADVENTUAL, *adj.* [from *Advent*.] Relating to the season of Advent.

AD VENTREM INSPICIENDUM, *f.* in law, a writ by which a woman is to be searched whether she be with child by a former husband, on her withholding of lands from the next, failing issue of her own body.

ADVENTURE, *f.* [Fr.] An accident; a chance; a hazard; an event of which we have no direction.—The general summoned three castles; one desperate of succour, and not desirous to dispute the defence, presently yielded; but two stood upon their *adventure*. *Hayward.*—In this sense is used the phrase, *at all adventures*, [*à l'aventure*, Fr.] By chance; without any rational scheme.—Where the mind does not perceive probable connection, there men's opinions are the effects of chance and hazard, of a mind floating *at all adventures*, without choice and without direction. *Locke.*—The occasion of casual events; an enterprise in which something must be left to hazard. This noun, with all its derivatives, is frequently written without *ad*; as, *venture*, *venturous*.

TO ADVENTURE, *v. n.* [*adventurer*, Fr.] To try the chance; to dare.—The tender and delicate woman among you, which would not *adventure* to set the sole of her foot upon the ground, for delicateness and tenderness. *Deuter.* xxviii. 26.

TO ADVENTURE, *v. a.* To put into the power of chance.—For my father fought for you, and *adventured* his life for, and delivered you out of the hand of Midian. *Judges*, ix. 17.—It is often used with the reciprocal pronoun; as, *he adventured himself*.

BILL OF ADVENTURE, *f.* among merchants, a writing signed by a merchant, testifying the goods mentioned in it to be shipped on-board a certain vessel belonging to another person, who is to run all hazards; the merchant only obliging himself to account to him for the produce.

ADVENTURE-BAY, in Van Diemen's land. There is a beautiful sandy beach, about two miles long, at the bottom of Adventure-bay, formed to all appearance by the particles which the sea washes from a fine white sand-stone. This beach is very well adapted for hauling a seine. Behind it is a plain, with a brackish lake, out of which are caught, by angling, some bream and trout. The parts adjoining the bay are mostly hilly, and are an entire forest of tall trees, rendered almost impassable by brakes of fern, shrubs, &c. The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but further up the hills, it is of a grey tough cast. This country, upon the whole, bears many marks of being very dry, and the heat appears to be great. No mineral bodies, nor stones of any other kind than the white sand-stone, were observed by the late navigators; nor could they find any vegetables that afforded subsistence for man. The forest-trees are all of one kind, and generally quite straight: they bear clusters of small white flowers. The principal plants observed, are wood-sorrel, milk-wort, cud-weed, bell-flower, gladiolus, samphire, and several kinds of fern: the only quadruped, a species of opossum, about twice the size of a large rat. The kangaroo, found further northward in New Holland, may also be supposed to inhabit here, as some of the inhabitants had pieces of the skin of that animal. The principal sorts of birds in the woods are brown hawks or eagles, crows, large pigeons, yellowish paroquets, and a species which they call *motacilla cyanea*, from the beautiful azure colour of its head and neck. On the shore were seen several gulls, black oyster-catchers, or sea-pies, and plovers of a stone-colour.

The inhabitants seem mild and cheerful, with little of that wild appearance that savages in general have. They are almost totally devoid of personal activity or genius, and are nearly upon a par with the wretched natives of

Terra del Fuego. They display, however, some contrivance in their method of cutting their arms and bodies in lines of different directions, raised above the surface of the skin. Their indifference for presents, their general inattention, and want of curiosity, were very remarkable, and testified no acuteness of understanding. Their complexion is a dull black, which they sometimes heighten by smutting their bodies, as was supposed, from their leaving a mark behind on any clean substance. Their hair is perfectly woolly, and is clotted with grease and red ochre, like that of the Hottentots. Their noses are broad and full, and the lower part of their face projects considerably. Their eyes are of a moderate size, and though they are not very quick or piercing, they give the countenance a frank, cheerful, and pleasing cast. They are, upon the whole, well proportioned, though their belly is rather protuberant.

ADVENTURER, *f.* [*adventurier*, Fr.]—He that seeks occasions of hazard; he that puts himself in the hands of chance.

ADVENTURERS, *f.* is particularly used for an ancient company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown. The society of adventurers had its rise in Burgundy, and its first establishment from John duke of Brabant, in 1248, being known by the name of "The Brotherhood of St. Thomas-à-Becket." It was afterwards translated into England, and successively confirmed by several of our kings, under the appellation of "Merchant Adventurers."

ADVENTUROUS, *adj.* [*adventureux*, Fr.] He that is inclined to adventures; and, consequently bold, daring, courageous. Applied to things, that which is full of hazard; which requires courage; dangerous.

ADVENTUROUSLY, *adv.* After an adventurous manner; boldly; daringly.

ADVENTURESOME, *adj.* The same with **ADVENTUROUS**. A low word scarcely used in writing.

ADVENTURESOMENESS, *f.* The quality of being adventuresome.

ADVERB, *f.* [*adverbium*, Lat.] A word joined to a verb or adjective, and solely applied to the use of qualifying and restraining the latitude of their signification, by the intimation of some circumstance thereof; as, of quality, manner, degree. Thus we say, he runs *swiftly*; the bird flies *aloft*; he lives *virtuously*, &c.

ADVERBIAL, *adj.* [*adverbialis*, Lat.] That which has the quality or structure of an adverb.

ADVERBIALLY, *adv.* [*adverbialiter*, Lat.] Like an adverb; in the manner of an adverb.

ADVERSABLE, *adj.* [from *adverse*.] Contrary to; opposite to.

ADVERSARIA, *f.* [Lat. a book, as it should seem, in which *debtor* and *creditor* were set in opposition.] A common-place; a book to note in.

ADVERSARY, *f.* [*adversaire*, Fr. *adversarius*, Lat.] An opponent; antagonist; enemy: generally applied to those that have verbal or judicial quarrels; as, *controversists* or *litigants*: sometimes to an opponent in single combat. It may sometimes imply an open profession of enmity; as, we say, a secret enemy is worse than an open *adversary*.—An *adversary* makes a stricter search into us, and discovers every flaw and imperfection in our tempers. A friend exaggerates a man's virtues; an enemy inflames his crimes. *Addison.*

ADVERSATIVE, *adj.* [*adversativus*, Lat.] A term of grammar, applied to a word which makes some opposition or variety; as, in this sentence: This diamond is orient, *but* it is rough. *But* is an *adversative conjunction*.

ADVERSATOR, *f.* in antiquity, a servant who attended the rich in returning from supper, to give them notice of any obstacles in the way, at which they might be apt to stumble.

ADVERSE, *adj.* [*adversus*, Lat.] In prose it has now the accent on the first syllable; in verse, it is accented on the first by Shakespeare; on either, indifferently, by Milton;

ton; on the last, by Dryden; on the first, by Roscommon. Acting in contrary directions; as, two bodies in collision. Figuratively, contrary to the wish or desire; thence, calamitous; afflictive; pernicious. It is opposed to *prosperous*. Personally opponent; the person that counteracts another, or contests any thing.

ADVERSITY, *f.* [*adversus*, Fr.] Affliction; calamity; that is, opposition to our wishes. The cause of our sorrow; affliction; misfortune. In this sense it may have a plural. The state of unhappiness; misery.

Sweet are the uses of *adversity*,
Which like the toad, ugly and venomous;
Wears yet a precious jewel in his head. *Shakespeare*.

ADVERSELY, *adv.* In an adverse manner; oppositely; unfortunately.

To ADVERT, *v. n.* [*adverto*, Lat.] To attend to; to regard; to observe; with the particle *to* before the object of regard.—The mind of man being not capable at once to *advert* to more than one thing, a particular view and examination of such an innumerable number of vast bodies will afford matter of admiration. *Ray*.—We sometimes say, To *advert* the mind to an object.

ADVERTENCE, *f.* Attention to; regard to; consideration.

ADVERTENCY, *f.* The same with **ADVERTENCE**. Attention; regard; heedfulness.

ADVERTENT, *adj.* Attentive; vigilant; heedful.—This requires choice parts, great attention of mind, sequestration from the importunity of secular employments, and a long *advertent* and deliberate connexing of consequences. *Hale*.

To ADVERTISE, *v. a.* [*advertir*, Fr.] It is now spoken with the accent upon the last syllable; but appears to have been anciently accented on the second. To inform another; to give intelligence; with an accusative of the person informed. To inform; to give notice; with *of* before the subject of information. To give notice of any thing by means of an advertisement in the public prints; as, He *advertised* his loss.

ADVERTISEMENT, *f.* [*advertissement*, Fr.] Instruction; admonition. Intelligence; information. Notice of any thing published in a paper of intelligence.

ADVERTISER, *f.* [*advertiseur*, Fr.] He that gives intelligence or information. The paper in which advertisements are published.

ADVERTISING, *part. adj.* Active in giving intelligence; monitory: a word scarcely now in use.

To ADVESPERATE, *v. n.* [*advespero*, Lat.] To draw towards evening.

ADVICE, *f.* [*avis*, *avis*, Fr. from *adviseo*, low Lat.] Counsel; instruction: except that instruction implies superiority, and *advice* may be given by equals or inferiors; O troubled, weak, and coward, as thou art!
Without thy poor *advice*, the lab'ring heart
To worse extremes with swifter steps would run;
Not sav'd by virtue, yet by vice undone. *Prior*.

Reflection; prudent consideration: as, He always acts with good *advice*. Consultation; deliberation: with the particle *with*.—Great princes, taking *advice* with workmen, with no less cost, set their things together. *Bacon*.—Intelligence: as, The merchants received *advice* of their loss. This sense is somewhat low, and chiefly commercial.

ADVICE-BEAT, *f.* A vessel employed to bring intelligence.

ADVISABLE, *adj.* Prudent; fit to be advised.—Some judge it *advisable* for a man to account with his heart every day; and this, no doubt, is the best and surest course; for still the oftener, the better. *South*.

ADVISABLENESS, *f.* The quality of being advisable or fit; fitness; propriety.

To ADVISE, *v. a.* [*advise*, Fr.] To counsel: with the particle *to* before the thing advised.—I would *advise* all

gentlemen to learn merchants' accounts, and not to think it a skill that belongs not to them. *Locke*.—To give information; to inform; to make acquainted with any thing: often with the particle *of* before the thing told.

To ADVISE, *v. n.* To consult: with the particle *with* before the person consulted; as, He *advised* with his companions. To consider; to deliberate.

ADVISED, *part. adj.* Acting with deliberation and design; prudent; wise. Performed with deliberation; done on purpose; acted with design.

Th' Almighty Father, where he fits
Shrin'd in his sanctuary of heav'n secure,
Consulting on the sum of things foreseen,
This tumult, and permitted all, *advis'd*. *Milton*.

ADVISEDLY, *adv.* Soberly; heedfully; deliberately; purposely; by design; prudently.—This book, *advisedly* read and diligently followed but one year at home, would do more good than three years travel abroad. *Ascham*.

ADVISEDNESS, *f.* Deliberation; cool and prudent procedure.—While things are in agitation, private men may modestly tender their thoughts to the consideration of those that are in authority; to whose care it belongeth, in prescribing concerning indifferent things, to proceed with all just *advisedness* and moderation. *Saunderson*.

ADVISEMENT, *f.* [*advisement*, Fr.] Counsel; information. It is taken likewise, in old writers, for prudence and circumspection. It is now, in both senses, antiquated.

ADVISER, *f.* The person that advises, or gives counsel; a counsellor.

ADULA, anciently a mountain in Rætia, or the country of the Grisons, part of the Alps, in which are the fountains of the Rhine; now St. Godhards.

ADULATION, *f.* [*adulation*, Fr. *adulatio*, Lat.] Flattery; high compliment.

ADULATOR, *f.* [*adulator*, Lat.] A flatterer.

ADULATORY, *adj.* [*adulatorius*, Lat.] Flattering; full of compliments.

ADULE, or **ADULIS**, anciently a town of Egypt, built by fugitive slaves, distant from its port on the Red Sea twenty stadia. Pliny calls the inhabitants *Adulitae*.

ADULT, *adj.* [*adultus*, Lat.] Grown up; past the age of infancy and weakness.

ADULT, *f.* A person above the age of infancy, or grown to some degree of strength; sometimes full-grown: a word used chiefly by medicinal writers.—The depression of the cranium, without a fracture, can but seldom occur; and then it happens to children, whose bones are more pliable and soft than those of *adults*. *Sharp*.

ADULTNESS, *f.* The state of being adult.

To ADULTER, *v. a.* [*adulterer*, Fr. *adultero*, Lat.] To commit adultery with another: a word not classical.

ADULTERANT, *f.* [*adulterans*, Lat.] The person or thing which adulterates.

To ADULTERATE, *v. a.* [*adulterer*, Fr. *adultero*, Lat.] To commit adultery. To corrupt by some foreign admixture; to contaminate.—The present war has so *adulterated* our tongue with strange words, that it would be impossible for one of our great-grandfathers to know what his posterity have been doing. *Spektator*.

ADULTERATE, *adj.* Tainted with the guilt of adultery. Corrupted with some foreign mixture.

ADULTERATENESS, *f.* The quality or state of being adulterate, or counterfeit.

ADULTERATION, *f.* The act of adulterating or corrupting by foreign mixture; contamination. The state of being adulterated, or contaminated.

We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hair-powder, &c.

ADULTERATION of COIN, properly imports the making or casting of a wrong metal, or with too base or too much alloy. Adulterations of coins are effected divers ways; as, by forging another stamp or inscription; by mixing impure metals with the gold or silver: most properly,

perly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals with gold or silver.

To adulterate or debase the current coin, is a capital crime in all nations. The ancients punished it with great severity: among the Egyptians both hands were cut off; and, by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted, that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us.

ADULTERER, f. [*adulter*, Lat.] The person guilty of adultery:

With what impatience must the muse behold
The wife by her procuring husband sold;
For, though the law makes null th' *adulterer's* deed
Of lands to her, the cuckold may succeed. *Dryden.*

ADULTERESS, f. A woman that commits adultery.—The Spartan lady replied, when she was asked, What was the punishment for *adulteresses*? There are no such things here.

An adulteress, by our law, undergoes no temporal punishment whatever, except the loss of her dower; and she does not lose even that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Edw. I. cap. 34.

ADULTERINE, f. [*adulterine*, Fr. *adulterinus*, Lat.] A child born of an adulteress: a term of canon law.

ADULTEROUS, adj. [*adulter*, Lat.] Guilty of adultery.—An *adulterous* person is tied to restitution of the injury, so far as it is reparable; and to make provision for the children, that they may not injure the legitimate. *Taylor.*

ADULTERY, f. [*adulterium*, Lat.] The act of violating the bed of a married person. Punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In many it has been capital; in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are ferocious, and even cruel; others of a jocose and humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws, the criminals are forbid marrying together, in case they became single; by others, they are forbid to marry any besides each other; by some, they are incapacitated from ever committing the like crime again; by others, they are glutted with it till it becomes downright nauseous.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dower he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, practised at least on the poorer sort, who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, in defect thereof, a fish with a large head, called *mugil*, "mullet." Alcæus is said to have died this way, though it is doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom as received also among the Romans, though not authorised by an express law, as it was among the Greeks.

There are various conjectures concerning the ancient punishment of adultery among the Romans. Some will have it to have been made capital by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in the early days was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate than any formal authority from him. Thus we are told, the wife's father was allowed to

kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine first by law made the crime capital. Under Constantius and Constans, adulterers were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a farther mitigation was granted, at least in favour of the wife, who was only to be scourged, lose her dower, and be shut up in a monastery; after two years, the husband was at liberty to take her back again; if he refused, she was shaven, and made a nun for life: but it still remained death in the husband. The reason alleged for this difference is, that the woman is the weaker vessel.

Under Theodosius, women convicted of this crime were punished after a very singular manner, viz. by a public constupration; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themselves. To this end, the gallants were to dress themselves on purpose, having several little bells fastened to their clothes, the tinkling of which gave notice to those without of every motion. This custom was again abolished by the same prince.

By the Jewish law, adultery was punished by death in both parties, where they were both married, or only the woman. The Jews had a particular method of trying, or rather purging, an adulteress, or a woman suspected of the crime, by making her drink the bitter waters of jealousy; which, if she were guilty, made her swell.

Among the Mingrelians, according to Chardin, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulteress, and the cuckold. In some parts of the Indies, it is said any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her to have been rated so high. Adultery is said to be so frequent at Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Among the Japanese, and divers other nations, adultery is only penal in the woman. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife. In the Marian islands, on the contrary, the woman is not punishable for adultery; but if the man go astray he pays severely: the wife and her relations waste his lands, turn him out of his house, &c. Among the Chinese, adultery is not capital; for it is said that fond parents will make a contract for their daughters' future husbands to allow them the indulgence of a gallant.

In Spain, they punished adultery in men by cutting off that part which had been the instrument of the crime. In Poland, before Christianity was established, they punished adultery and fornication in a very particular manner: the criminal they carried to the market-place, and there fastened him by the testicles with a nail; laying a razor within his reach, and leaving him under a necessity, either of doing justice upon himself or of perishing in that condition.

The Saxons formerly burnt the adulterers, and over her ashes erected a gibbet, whereon the adulterer was hanged. In this kingdom, likewise, adultery, by the ancient laws, was severely punished. King Edmund the Saxon ordered adultery to be punished in the same manner as homicide; and Canute the Dane ordered that a man who

who committed adultery should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals.

In England adultery is a crime left by our laws to the coercion of the spiritual courts; yet, considered as a civil injury, the law gives a satisfaction to the husband for it by action of *trespas vi et armis* against the adulterer, where-in the damages recovered are usually very large and exemplary. 3 *Blackst.* 139.

As to the moral turpitude of this offence, some have vainly endeavoured to deny or explain it away by various arguments, and even by an appeal to scripture. On the part of the *man* who solicits the chastity of a married woman, it certainly includes the crime of SEDUCTION, and is attended with mischief still more complicated and extensive: it creates a new sufferer, the injured husband, upon whose simplicity and affection is inflicted a wound the most painful and incurable, that human nature knows. The infidelity of the *woman* is aggravated by cruelty to her children, who are generally involved in their parents' shame, and always made unhappy by their quarrel.

It has been argued, that these consequences ought less to be attributed to the crime than to the discovery. But in the first place, the crime could not be discovered unless it were committed, and the commission is never secure from discovery. 2dly, If adulterous connections were allowable whenever the parties could hope to escape detection, which is the conclusion to which this argument leads, the husband would be left no other security for his wife's chastity than in her want of opportunity or temptation: which would probably deter most men from marrying; or render marriage a state of continual jealousy and alarm to the husband, which would end in the slavery and confinement of the wife.

The marriage-vow is "witnessed before God," and accompanied with circumstances of solemnity and religion which approach to the nature of an oath. The married offender, therefore, incurs a crime little short of perjury, and the seduction of a married woman is little less than subornation of perjury:—and this guilt is independent of the discovery.

But the usual apology for adultery is the prior transgression of the other party; and so far, indeed, as the bad effects of adultery are anticipated by the conduct of the husband or wife who offends first, the guilt of the second offender is extenuated. But this can never amount to a justification; unless it could be shewn that the obligation of the marriage-vow depends upon the condition of reciprocal fidelity; a construction which appears founded neither in expediency, nor in the terms of the vow, nor in the design of the legislature which prescribed the marriage-rite.

It has been controverted, whether adultery may be lawfully committed in war, with the enemies' wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the procuring some great good to him? St. Austin apparently allows of it; at least, does not condemn it.

It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, conversed with Hagar; and likewise among the Greeks and Romans. Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

It is much disputed, whether adultery dissolves the bond of matrimony, and be a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even ana-

thematized those who maintained it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Céphalonie, &c. the contrary usage obtains. The ecclesiastical courts in England so far agree with the Papists, that they only grant a divorce *à mensa et thoro*, in case of adultery; so that a complete divorce, to enable the parties to marry again, cannot be had without an act of parliament.

ADULTERY is also used in ancient customs, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it. In which sense, *adulterium* amounts to the same with what the Saxons call *legerwita*.

ADULTERY is sometimes used, in a more extensive sense, for any species of impurity or crime against the virtue of chastity; and in this sense divines understand the seventh commandment.

ADULTERY is also used, especially in scripture, for idolatry, or departing from the true God to the worship of a false one.

ADULTERY is also used, in ecclesiastical writers, for a person's invading or intruding into a bishopric during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church.

ADULTERY is also used in ancient naturalists, for the act of ingrafting one plant upon another. In which sense Pliny speaks of the adulteries of trees, *arborum adulteria*, which he represents as contrary to nature, and a piece of luxury, or needless refinement.

ADUMBRANT, *adj.* That which gives a slight resemblance.

To ADUMBRATE, *v. a.* [*adumbro*, Lat.] To shadow out; to give a slight likeness; to exhibit a faint resemblance, like that which shadows afford of the bodies which they represent.—Heaven is designed for our reward, as well as rescue; and therefore is *adumbrated* by all those positive excellencies which can endear or recommend.

ADUMBRATION, *f.* The act of adumbrating, or giving a slight and imperfect representation. The slight and imperfect representation of a thing; a faint sketch.

ADUNATION, *f.* [from *ad* and *unus*, Lat.] The state of being united; union: a word of little use.

ADUNCITY, *f.* [*aduncitas*, Lat.] Crookedness; flexure inwards; hookedness.—There can be no question, but the *aduncity* of the pounces and beaks of the hawks, is the cause of the great and habitual immorality of those animals. *Arbutnot.*

ADUNQUE, *adj.* [*aduncus*, Lat.] Crooked; bending inwards; hooked.—The birds that are speakers, are parrots, pies, jays, daws, and ravens; of which parrots have an *adunque* bill, but the rest not. *Bacon.*

ADVOCACY, *f.* The act of pleading; vindication; defence; apology; a word in little use.—If any there are who are of opinion that there are no antipodes, or that the stars do fall, they shall not want herein the applause or advocacy of Satan. *Brown.*

ADVOCATE, *f.* [*advocatus*, Lat.] He that pleads the cause of another in a court of judicature. He that pleads any cause, in whatever manner, as a controvertist or vindicator. It is used with the participle *for* before the person or thing, in whose favour the plea is offered. The ecclesiastical or church advocate was originally of two sorts: either an advocate of the causes and interest of the church, retained as a counsellor and pleader of its rights; or an advocate or patron of the presentation or advowson. Both these offices at first belonged to the founders of churches and convents, and their heirs, who were bound to protect and defend their churches, as well as to nominate and present to them. The Romans, in the first ages of their state, held the profession of an advocate in great honour; and the seats of their bar were crowded with senators and consuls; they, whose voices commanded the people, thinking it an honour to be employed in defending them. They were styled *comites*, *honorati*, *clarissimi*, and even *patroni*;

as if their clients were not left obliged to them than freed men to their masters. The bar was not at that time venal. Those who aspired to honours and offices took this way of gaining an interest in the people, and always pleaded *gratis*. But no sooner were luxury and corruption introduced into the commonwealth, than the bar became a sharer in them. Then it was that the senators let out their voices for pay, and zeal and eloquence were sold to the highest bidder. To put a stop to this abuse, the tribune Cincius procured a law to be passed, called from him *Lex Cincia*, whereby the advocates were forbidden to take any money of their clients. It had before this been prohibited the advocates to take any presents or gratuities for their pleading. The emperor Augustus added a penalty to it: notwithstanding which, the advocates played their part so well, that the emperor Claudius thought it an extraordinary circumstance, when he obliged them not to take above eight great sesterces, which are equivalent to about 64*l.* sterling, for pleading each cause.

ADVOCATE of a CITY, in the German polity, a magistrate appointed in the emperor's name to administer justice.

Consistorial ADVOCATES; officers of the consistory at Rome, who plead in all oppositions to the disposal of benefices in that court: they are ten in number.

Elective ADVOCATES, those chosen by the abbot, bishop, or chapter; a particular licence being had from the king or prince for that purpose. The elections were originally made in the presence of the count of the province.

Feudal ADVOCATES. These were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king's service, in which they were the standard-bearers of their churches.

Fiscal ADVOCATE, [*fisci advocatus*,] in Roman antiquity, an officer of state under the Roman emperors, who pleaded in all causes wherein the *fiscus*, or private treasury, was concerned.

Juridical ADVOCATES, in the middle age, were those who from attending causes in the court of the comes, or count of the province, became judges themselves, and held courts of their vassals thrice a-year, under the name of the *tria placita generalia*. In consideration of this further service, they had a particular allowance of one third part of all fines, or mulcts, imposed on defaulters, &c. besides a proportion of diet for themselves and servants.

Matricular ADVOCATES, were the advocates of the mother or cathedral churches.

Military ADVOCATES, those appointed for the defence of the church, rather by arms and authority than by pleading and eloquence. These were introduced in the times of confusion, when every person was obliged to maintain their own property by force; bishops and abbots not being permitted to bear arms, and the scholastic or gown'd advocates being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, or even to princes.

Nominative ADVOCATES, those appointed by a king or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate; at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

Regular ADVOCATES, those duly formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, licence, &c.

Subordinate ADVOCATES, those appointed by other superior ones, acting under them, and accountable to them. There were various reasons for the creation of these subordinate advocates; as, the superior quality of the principal advocate, his being detained in war, or being involv-

ed in other affairs; but chiefly the too great distance of some of the church-lands, and their lying in the dominions of foreign princes.

Supreme or Sovereign ADVOCATES, were those who had the authority in chief; but acted by deputies or subordinate advocates. These were called also *principal*, *greater*, and sometimes *general*, advocates. Such in many cases were kings, &c. when either they had been chosen advocates, or became such by being founders or endowers of churches. Princes had also another title to advocateship, some of them pretending to be *advocati nati* of the churches within their dominions.

ADVOCATES, in the English courts, are more generally called *counsel*. See **COUNSEL**.

Faculty of ADVOCATES, in Scotland, a respectable body of lawyers, who plead in all causes before the Courts of Session, Justiciary, and Exchequer. They are also intitled to plead in the house of peers, and other supreme courts in England.

Lord ADVOCATE, or **KING'S ADVOCATE**, one of the eight great officers of state in Scotland, who as such sat in parliament without election. He is the principal crown-lawyer in Scotland. His business is to act as a public prosecutor, and to plead in all causes that concern the crown.

ADVOCATION, *f.* The office or act of pleading; plea; apology.

ADVOLUTION, *f.* [*advolo*, *advolutum*, Lat.] The act of flying to something.

ADVOLUTION, *f.* [*advolutio*, Lat.] The act of rolling to something.

ADVOUTRY, *f.* [*avoutrie*, Fr.] Adultery.—He was the most perfidious man upon the earth, and he had made a marriage compounded between an *advoutry* and a rape. *Bacon*.

To ADVOW, *v. a.* [*advocare*, Lat.] In law, to justify or maintain an act formerly done. As if one takes a distress for rent, and he that is distressed sues a replevin; in this case, the distrainer, justifying or maintaining the act, is said to *advow* or *avow*; and hence come *advowant*, and *advowry*. This word is also used to signify to bring forth any thing: anciently, when goods stolen were bought by one, and sold to another, it was lawful for the right owner to take them wherever they were found; and he, in whose possession they were found, was bound *advocare*; that is, to call in or produce the seller to justify the sale, and so on till they found the thief.

ADVOWEE, *f.* in ancient customs and law-books, denotes the advocate of a church, religious house, or the like. There were advowees of cathedrals, abbeys, monasteries, &c. Thus, Charlemagne had the title of advowee of St. Peter's; king Hugh, of St. Riquier; and Bolandus mentions some letters of pope Nicholas, by which he constituted king Edward the Confessor, and his successors, advowees of the monastery at Westminster, and of all the churches in England. These advowees were the guardians, protectors, and administrators, of the temporal concerns of the churches, &c. and under their authority were passed all contracts which related to them. It appears also, from the most ancient charters, that the donations made to churches were conferred on the persons of the advowees. They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes maintained duels for them.

Spelman distinguishes two kinds of ecclesiastical advowees. The one, of causes or processes, *advocati causarum*; the other, of territory or lands, *advocati soli*. The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries. The others, which still subsist, and are sometimes called by their primitive name, *advowees*, though more usually *patrons*, were hereditary; as being the founders and endowers of churches, &c. or their heirs. Women were

were sometimes advowees, *advocatifæ*. And, in effect, the canon law mentions some who had this title, and who had the same right of presentation, &c. in their churches, which the advowees themselves had. In a stat. 25 Edw. III. we meet with *advowee paramount* for the highest patron; that is, the king.

ADVOWSON, *f.* in law, is the right of presentation to a church or ecclesiastical benefice. It signifies being advocate of the church, or taking it into protection; and therefore is synonymous with *patronage*: and he who has the right of advowson is called the patron of the church. For when lords of manors first built churches on their own demesnes, and endowed them with glebe or other possessions, every such lord had of common right a power annexed of nominating a minister to officiate in that church of which he was the founder, endower, maintainer, or, in one word, the patron. 2 *Blackst.* 21.

Advowsons are either *appendant*, or *in grofs*. Lords of manors being originally the only founders, and of course the only patrons, of churches, the right of patronage or presentation, so long as it continues annexed to the possession of the manor, as some have done from the foundation of the church to this day, is called an advowson *appendant*; and it will pass or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words. But where the property of the advowson hath been once separated from the property of the manor, by legal conveyance, it is called an advowson *in grofs*, or at large, and never can be appendant any more; but is for the future annexed to the person of its owner, and not to his manor or lands.

Advowsons are also either *presentative*, *collative*, or *donative*. An advowson *presentative* is, where the patron hath a right of presentation to the bishop or ordinary, and moreover to demand of him to institute his clerk, if he finds him canonically qualified. An advowson *collative* is, where the bishop and patron are one and the same person: in which case the bishop cannot present to himself; but he doth, by the one act of collation or conferring the benefice, the whole that is done in common cases by both presentation and institution. An advowson *donative* is, when the king, or any subject by his licence, doth found a church or chapel, and ordains that it shall be merely in the gift or disposal of the patron, subject to his visitation only, and not to that of the ordinary; and vested absolutely in the clerk by the patron's deed of donation, without presentation, institution, or induction. *Id.* An advowson *in fee* is, aslets by descent, to satisfy bond creditors. 3 *Ath.* 465.

TO ADURE, *v. n.* [*aduro*, Lat.] To burn up: not in use.—Such a degree of heat, which doth neither melt nor scorch, doth mellow, and not *adure*. *Bacon*.

ADUST, *adj.* [*adustus*, Lat.] Burnt up; hot as with fire; scorched. It is generally now applied, in a medicinal or philosophical sense, to the complexion and humours of the body. Such is choler supposed to be. Melancholy is usually considered as black and adust bile. Blood is said to be adust, when, by reason of some extraordinary heat, its more subtle parts are all evaporated, leaving the grosser, with all the impurities therein, half torrifried.

ADUSTED, *adj.* Burnt; scorched; dried with fire. Hot, as the complexion.

ADUSTIBLE, *adj.* That which may be adusted, or burnt up.

ADUSTION, *f.* The act of burning up, or drying, as by fire.—This is ordinarily a consequent of a burning colliquative fever; the softer parts being melted away, the heat continuing its *adustion*, upon the drier and fleshy parts, changes into a marcid fever. *Harvey*.

ADY, *f.* in botany. See **PALMA ADY**.

ADYNAMIA, *f.* [from *α*, priv. and *δυναμις*, strength, force.] Lagour, weakness, impotence, from sickness or disease: *adunatos*, *leipopsychia*. Also drowsiness or sleepiness, lassitude, defect of vital powers. In Dr. Cullen's Nosology, this word distinguishes an order in his class neu-

roses: he defines it to be diseases consisting in a weakness or loss of motion, in either the vital or natural functions. These diseases are also called *defectivi*.

ADYNAMON, *f.* among ancient physicians, a kind of weak factitious wine, prepared from *musc* boiled down with water; to be given to patients to whom genuine wine might be hurtful.

ADYTUM, *f.* in pagan antiquity, the most retired and sacred place of their temples, into which none but the priests were allowed to enter. The Sanctum Sanctorum of the temple of Solomon was of the nature of the pagan adytum, none but the high-priest being admitted into it, and he but once a-year.

ADZ, *f.* See **ADDICE**.

Æ, or **Æ**, a diphthong of very frequent use in the Latin language, which seems not properly to have any place in the English; since the *æ* of the Saxons has been long out of use, being changed to *e* simple, to which, in words frequently occurring, the *æ* of the Romans is, in the same manner, altered, as in *æquator*, *æquinoctial*, and even in *Æneas*.

ÆACEA, *f.* in Grecian antiquity, solemn festivals and games celebrated at Ægina, in honour of Æacus.

ÆACUS, the son of Jupiter by Ægina. When the Isle of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called Myrmidons, from *μυρμις*, ant. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and, by commerce and industry, recover what they had lost. His character for justice was such, that, in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. See the article **ÆGINA**.

ÆBURA, an ancient town of Spain, in Estremadura, on the river Guadiana, to the west of Merida, now called Talavera. Lat. 38. 40. lon. 7. 15. W.

ÆCHMALOTARCHA, *f.* in Jewish antiquity, a title given to the principal leader or governor of the Hebrew captives residing in Chaldea, Assyria, and the neighbouring countries. This magistrate was called by the Jews *rosh-galath*, i. e. the chief of the captivity: but the above term, of like import in the Greek, is that used by Origen and others who wrote in the Greek tongue.

ÆCULANUM, anciently a town of the Hirpini, in Italy, at the foot of the Appenin, to the east of Abellinum, situate between Beneventum and Tarentum. Now called Fricento, forty-three miles east of Naples. Lat. 41. 15. lon. 15. 38. E.

ÆDES, *f.* in Roman antiquity, besides its more ordinary signification of a house, likewise signified an inferior kind of temple, consecrated to some deity.

ÆDÍCULA, *f.* a term used to denote the inner part of the temple, where the altar and statue of the deity stood.

ÆDILATE, *f.* the office of *ædile*, sometimes called *ædilitas*. See the next article.

ÆDILE, *f.* [*adilis*, Lat.] In Roman antiquity, a magistrate whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c. To the *ædiles* likewise belonged the care of the highways, public places, weights and measures, &c. They also fixed the prices of provisions, took cognizance of debauches, punished lewd women, and such persons as frequented gaming houses. The custody of the plebiscita, or orders of the people, was likewise committed to them. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expence, whereby many of them were ruined. To them also belonged the custody of the plebiscita, and the censure and examination of books. They had the power, on certain occasions, of issuing edicts; and, by degrees, they procured to themselves a considerable jurisdiction, the cognizance of

various causes, &c. This office ruined numbers by its expensiveness; so that, in Augustus's time, even many senators declined it on that account.

We also read of an *ædiles alimentarius*, expressed in abbreviation by *Ædil. alim.* whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office. In an ancient inscription we also meet with *ædile of the camp*, *ædilis castrorum*.

ÆDILITIUM EDICTUM, *f.* among the Romans, was that whereby a remedy was given a buyer, in case a vicious or unsound beast, or slave, was sold him. It was called *ædilitium*, because the preventing of frauds in sales and contracts belonged especially to the *ædiles*.

ÆDITUUS, *f.* in Roman antiquity, an officer belonging to the temple, who had the charge of the offerings, treasure, and sacred utensils. The female deities had a woman officer of this kind called *Æditua*.

ÆDOSOPHIA, *f.* [from *αἰδώς*, *puddenza*, and *δοσῶν*, *streptum edo*.] In the Nosology of Sauvages, also of Sagar, it is defined to be a flatus passing from the uterus, or from the urinary bladder, through the vagina or the urethra; hence it is formed into two species, *ædosophia urethræ & uterina*. This flatus is sometimes very fetid, which circumstance cannot always be accounted for. It sometimes happens when women are in labour, and hath been taken for a sign that the child is dead, but this cannot be depended on; an intolerable stench sometimes attends when the child is living.

ÆGAGROPILA, *f.* a ball composed of a substance resembling hair, generated in the stomach of the chamois-goat. This ball is of the same nature with those found in cows, hogs, &c.

ÆGÆ, or *ÆGÆA*, the ancient name of *Ædessa*, so called from the following adventure:—Caranus, the first king of Macedonia, being ordered by the oracle to seek out a settlement in Macedonia, under the conduct of a flock of goats, surprised the town of *Ædessa*, during a thick fog and rainy weather, in following the goats that fled from the rain; which goats ever after, in all his military expeditions, he caused to precede his standard; and in memory of this he called *Ædessa Ægæa*, and his people *Ægæadae*. And hence, probably, in the prophet Daniel, the he-goat is the symbol of the king of Macedonia.

ÆGEAN SEA, now the Archipelago, a part of the Mediterranean, separating Europe from Asia and Africa; washing, on the one hand, Greece and Macedonia; on the other, Caria and Ionia.

ÆGEIRINON, *f.* [αἰγύρεον, *Gr.* a poplar.] An ointment so called, because the fruit of the poplar, or its catkins, are an ingredient in it.

ÆGEUS, in fabulous history, was king of Athens, and the father of Theseus. The Athenians having basely killed the son of Minos king of Crete, for carrying away the prize from them, Minos made war upon the Athenians; and, being victorious, imposed this severe condition on *Ægeus*, that he should annually send into Crete seven of the noblest of the Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus; or, as others say, he himself intreated to be sent. The king, at his son's departure, gave orders, that, as the ship sailed with black sails, it should return with the same in case he perished; but, if he became victorious, he should change them into white. When Theseus returned to Crete, after killing the Minotaur, he forgot to change the sails in token of his victory, according to the agreement with his father; the latter, who watched the return of the vessel, supposing by the black sails that his son was dead, cast himself headlong into the sea, which thence obtained the name of the *Ægean Sea*.

ÆGIAS, *f.* among physicians, a white speck on the pupil of the eye, which occasions a dimness of sight.

ÆGICERAS, *f.* [from *αἰξ*, a goat, and *κερας*, a horn.]

In botany, a genus of the pentandria monogynia class. The generic characters are—Calyx: perianthium one-leaved, bell-shaped, half-five-cleft, coriaceous, permanent. Corolla: petals five. Stamina: filaments five. Pistillum: germ oblong; style single. Pericarpium: capsule bowed, coriaceous, one-celled, one-valved, gaping on the convex side. Seed: single.—*Essential Character*. Calyx bell-shaped, half-five-cleft. Capsule bow-shaped, one-celled, gaping on the convex side. Seed inverted.

Species. 1. *Ægiceras majus*: leaves ovate quite entire; legumes long sickle-shaped. This species is a shrub about twelve feet in height at the most, with several stems a foot in thickness, putting out many twigs and suckers. It is a native of the Molucca Islands.

2. *Ægiceras minus*: leaves ovate sometimes notched; legumes short crescent-shaped. This is a native of Ceylon.

ÆGIDA, now Capo d'Istria, the principal town on the north of the territory of Istria, situated on a little island, joined to the land by a bridge. Lat. 45. 50. lon. 14. 20. E. It was afterwards called Justinopolis, after the emperor Justinus.

ÆGIDES, *f.* [αἰγίς, *Gr.*] Small white cicatrices of the eyes, caused by a sharp humour there; or small white concretions on the pupil; called also *aglia*. In inflammations we see little white specks on the pupil of the eye, like a film, if an afflux of humours is considerable; these always disappear spontaneously when the inflammation is resolved and the humours diverted; but if sharp powders are used, or collyriums applied, they oft are hardened so as never after to be moved.

ÆGILOPS, or *ÆGYLOPS*, *f.* [from *αἶξ*, a goat, and *ὄψ*, an eye, or goat's eye.] A disease in the inward corner of the eye; so called because, according to some, goats are subject to this disease. Paulus *Ægineta* calls it *anchylops* before it bursts, and *ægylops* after. Avicenna calls it *garab* and *algarab*. *Anchylops* and *ægylops*, are but different states of the disorder called *fistula lachrymalis*. The *ægylops* is the fistula lachrymalis beginning to discharge pus. Dr. Wallis says, why the distinction of the ancients should be at present neglected with respect to the *anchylops* and *ægylops*, and a general term adopted which is in itself highly absurd, will not be easy to account for. Surely to denominate a complaint fistulous, where no fistula exists, must be ridiculous, and the two different species as well as the third are styled *fistula lachrymalis* by the moderns. Some of the ancient physicians considered the lachrymal sac in its state of tumefaction as an *anchylops*; when ruptured an *ægylops*; and certainly the distinction ought to be preserved.

It is either scrophulous, atheromatous, or of the nature of a meliceris. Sometimes it is a symptom of the lues veneria. Sometimes it is with, and at others without, inflammation. If it is attended with erosion, it terminates in a cancer. In opening this abscess, we should be careful not to cut the edge of the eye-lid, for thus an incurable wateriness will there be occasioned. When it is strumous, it proceeds from congestion, and the tubercle is round without discolouring the skin. If it is caused by fluxion, pain and redness appear, with inflammation all over the eye. Sometimes it begins with a weeping, and is not suspected until a redness appears in the eye, and then, by a gentle pressure on the part, a matter is discharged, a part of which resembles the white of an egg. If this matter makes its way into the nose, it acquires a foetid smell, and is discharged through the nostril.

As to the cure, if the case is recent, we should begin with a cautious use of bleeding and purging; or, if these are contra-indicated, give such alteratives as are most esteemed in scrophulous disorders. The tumour may be resolved by anodyne and discutient applications; but if there is a tendency to a suppuration it should be hastened, and the discharge of the pus, with all convenient speed, lest the bone underneath should be affected; the abscess cleaned

ÆCIDIDIUM, AND AGARICUS.

J. Pass sculp.

Fig. 1 to 4, *Æcidium abietinum*, *elatinum*, *columnare*, and *violæ*: the small Letters shew the same magnified. Fig. 5 to 9, *Agaricus scabellus*, *vitellum*, *tricolor*, *porphyria*, and *lepidomyces*.

London. Published as the Act directs. March 29. 1807. by J. Wilkes.

cleansed and healed, with the tinct. of myrrh and aloes mixed with mel rosæ. If the matter had passed also under the cilium, a powerful desiccative, such as strong lime-water, assisted by a compress, should be used.

If the periosteum under the tumour is laid bare, an exfoliation must be hastened by a caustic, and a passage opened into the nose, after which dry lint alone may suffice.

ÆGILOPS, *f.* [αἴγος ὤψ, goat's-face: from its roughness.] In botany, a genus of the polygamia monoecia class, in the natural order of gramina or grasses. The generic characters are—Calyx: a large bivalvular glume, sustaining three flowers; valves ovate, truncate, streaked, with various awns. Corolla: a bivalvular glume, the outer valve ovate, terminated by a double or triple awn; the inner lanceolate, erect, awnless, with the edge bent in longitudinally; nectary two-leaved, leaflets ovate, flat, transparent, very small. Stamina: filaments three, capillary, with oblong antheræ. Pistillum: germ turbinate; styles two, reflex, with hairy stigmas. Seeds: oblong, convex on one side, grooved on the other, with the inner valve of the corolla adhering to it, and not opening.—*Essential Character.* Calyx, a glume; subtriflorous, cartilaginous. Corolla, a glume, terminating in a threefold awn. Stamina, three. Styles, two. Seed, one.

Species. 1. *Ægilops ovata*: spike awned, all the calyxes with three awns. Scopoli makes no account of the sex in this grass, for the flowers are some hermaphrodite, others male, others without either stamens or germ: from the structure of the flower therefore he makes it a *phleum*. According to Gärtner there are sometimes two male flowers, differing in nothing from the others but in being only one-third of their size; no calyx; the larger valve of the corolla awned, the smaller not; both calyx and corolla permanent, covering the seed, and at length letting it drop.

2. *Ægilops caudata*: spike awned, all the calyxes with two awns.

3. *Ægilops triuncialis*: spike awned, the lower calyxes with two awns.

4. *Ægilops squarrosa*: spike awl-shaped, longer than the awns.

The first of these grasses is wild in the southern countries of Europe, and was cultivated in 1683 by Mr. Jas. Sutherland. The second was found by M. Tournefort in Crete. The third grows about Montpellier, Marseilles, Nice, and Smyrna. The last was found by Tournefort in the Levant, and by Cavanilles in Spain. They all seem to be annual.

ÆGILOPS, *f.* in botany. See *AVENA*, *ANDROPOGON*, *BROMUS*, *QUERCUS*.

ÆGIMURUS, an island on the bay of Carthage, about thirty miles distance from that city; now called Galetta. This island being afterwards sunk in the sea, two of its rocks remained above water, which were called *Aræ*, and mentioned by Virgil, because the Romans and Carthaginians entered into an agreement or league to settle their mutual boundaries at these rocks.

ÆGINA, in fabulous history, the daughter of *Æso-phus*, king of *Bæotia*, was beloved by Jupiter, who debauched her in the similitude of a lambent flame, and then carried her from *Epidaurus* to a desert island called *Oenope*, which afterwards obtained her own name.

ÆGINA, an island on the Saronic Bay, or Bay of *Engia*, twenty miles distant from the *Piræus*, formerly vying with *Athens* for naval power, and at the sea-fight of *Salamis* disputing the palm of victory with the *Athenians*. It was the country and kingdom of *Æacus*, who called it *Ægina* from his mother's name, it being before called *Oenopia*. The inhabitants were called *Æginetæ* and *Æginenses*. The Greeks had a common temple dedicated to Jupiter in *Ægina*. The *Æginetæ* applied to commerce; and were the first who coined money, called *νομισμα Ἀγιναιον*: hence *Ægineticum æs*, formerly in great repute. The inhabitants were called *Myrmidones*, or a nation of ants, from their great application to agriculture.

This island was surrounded by *Attica*, the territory of *Megara*, and the *Peloponnesus*, each distant about one hundred stadia, or twelve miles and a half. In circumference it was reckoned one hundred and eighty stadia, or twenty-two miles and a half. It was washed on the east and south by the *Myrtoan* and *Cretan* seas.

It is now called *Egina*, or *Egina*, the *g* soft and the *i* short. The temple above-mentioned is situated upon the summit of a mountain called *Panhellenius*, about an hour distant from the shore. The *Æginetans* affirmed it was erected by *Æacus*; in whose time *Hellas* being terribly oppressed by drought, the *Delphic* oracle was consulted; and the response was, "That Jupiter must be rendered propitious by *Æacus*." The cities intreated him to be their mediator: he sacrificed and prayed to Jupiter *Panhellenius*, and procured rain.

The temple was of the *Doric* order, and had six columns in front. Twenty-one of the exterior columns are yet standing, with two in the front of the *pronaos* and of the *posticum*, and five of the number which formed the ranges of the cell. The entablature, except the architrave, is fallen. The stone is of a light brownish colour, much eaten in many places, and indicating a very great age. Some of the columns have been injured by boring to their centres for the metal. In several, the junction of the parts is so exact, that each seems to consist of one piece. This ruin Mr. Chandler considers as scarcely to be paralleled in its claim to a remote antiquity. The situation on a lonely mountain, at a distance from the sea, has preserved it from total demolition, amid all the changes and accidents of numerous centuries.

The soil of this island is, as described by *Strabo*, very stony, especially the bottoms, but in some places not unfertile in grain. Besides corn, it produces olives, grapes, and almonds; and abounds in pigeons and partridges. It has been related, that the *Æginetans* annually wage war with the feathered race, carefully collecting or breaking their eggs, to prevent their multiplying, and in consequence a yearly famine. They have no hares, foxes, or wolves. The rivers in summer are all dry. The *vaiwode* or governor farms the revenue of the *Grand Signior* for twelve purshes, or 6000 piastres. About half this sum is repaid yearly by the caratch-money, or poll-tax.

ÆGINA, the capital of the above island. Its site has been long forsaken. Instead of the temples mentioned by *Pausanias*, there are thirteen lonely churches, all very mean; and two *Doric* columns supporting their architrave. These stand by the sea-side toward the low cape; and, it has been supposed, are a remnant of a temple of *Venus*, which was situated by the port principally frequented. The theatre, which is recorded as worth seeing, resembled that of the *Epidaurians* both in size and workmanship. It was not far from the private port; the stadium, which, like that at *Priene*, was constructed with only one side, being joined to it behind, and each structure mutually sustaining and propping the other. The walls belonging to the ports and arsenal were of excellent masonry, and may be traced to a considerable extent; above, or nearly even with, the water. At the entrance of the mole, on the left, is a small chapel of *St. Nicholas*; and opposite, a square tower with steps before it, detached, from which a bridge was laid across, to be removed on any alarm. This structure, which is mean, was erected by the *Venetians*, while at war with the *Turks* in 1693.

ÆGINETA (*Paulus*), a celebrated surgeon of the island of *Ægina*, from whence he derived his name. According to *M. Le Clerc's* calculation, he lived in the fourth century; but *Abulpharagius* the Arabian, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was very great, and his works are deservedly famous. *Fabricius ab Aquapendente* has thought fit to transcribe him in a great variety of places. Indeed the doctrine of *Paulus Ægineta*, together with that of *Celsus* and *Albucasis*, make up the whole text of this author. He is the first

first writer who takes notice of the cathartic quality of rhubarb; and, according to Dr. Milward, is the first in all antiquity who deserves the title of a man-midwife.

ÆGINETIA, *f.* in botany. See **OROBANCHE**.

ÆGINHARD, the celebrated secretary and supposed son-in-law of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate and ingenious Imma, to prevent his being tracked from her apartments by the emperor her father: a story which the elegant pen of Addison has copied and embellished from an old German Chronicle, and inserted in the 3d volume of the *Spectator*. This happy lover (supposing the story to be true) seems to have possessed a heart not unworthy of so enchanting a mistress, and to have returned her affection with the most faithful attachment; for there is a letter of Æginhard's still extant, lamenting the death of his wife; which is written in the tenderest strain of conjugal affection. He was a native of Germany, and educated by the munificence of his imperial master, of which he has left the most grateful testimony in his preface to the life of that monarch. Æginhard, after the loss of his lamented wife, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Charlemagne, his annals from 741 to 889, and his letters, are all inserted in the 2d volume of Duchesne's *Scriptores Francorum*. But there is an improved edition of this valuable historian, with the annotations of Hermann Schmincke, in 4to, 1711.

ÆGIPAN, in heathen mythology, a denomination given to the god Pan, because he was represented with the horns, legs, feet, &c. of a goat.

ÆGIPHILA, *f.* [*αἴξ* and *φύλον*, from goats being fond of it.] In botany, a genus of the tetrandria monogynia class, ranking in the natural order of viticeæ. The generic characters are—Calyx: perianth one-leaved, bell-shaped, four-toothed, loose, very short, permanent. Corolla: one-petalled, salver-shaped; tube cylindric; narrower and longer than the calyx, border quadrifid, flat, equal; clefts oblong. Stamina: filaments capillary, inserted into the mouth of the tube, erect. Antheræ roundish. Pistillum: germ roundish, superior. Style capillary, deeply bifid. Stigmas simple. Pericarpium: a roundish two-celled berry, surrounded with the permanent calyx. Seeds: either in pairs or solitary.—*Essential Character.* Calyx, four-toothed; corolla, quadrifid; style, semibifid; berry four-seeded.

Species. 1. *Ægiphila martinicensis*: leaves ovate-lanceolate acuminate smooth, branches diffused, panicles terminating or axillary, calyxes smooth. This is a shrub six feet high; simple, opposite, petioled, lanceolate-ovate, acuminate, very smooth, quite entire. Panicles terminal and axillary, leafy, compound, stiff. Flowers white; and is a native of Martinico, at the edge of the woods. It flowers in November.

2. *Ægiphila elata*: leaves elliptic acuminate membranaceous, panicles terminating, calyxes pubescent. It is a climber, and rises frequently to the height of six or seven feet, or more. This and the two following species are natives of Jamaica.

3. *Ægiphila foetida*: leaves ovate-lanceolate, beneath hirsute, as are also the petioles, peduncles axillary solitary.

4. *Ægiphila trifida*: leaves ovate-lanceolate, smooth, peduncles axillary trifid crowded.

ÆGIS, in the ancient mythology, a name given to the shield or buckler of Jupiter and Pallas. The goat Amalthea, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin thereof; whence the appellation *ægis*, from *αἴξ*, *αἴγος*, she-goat. Jupiter, afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars. As to his buckler, he made a present of it to Minerva: whence that goddess's buckler is also called *ægis*. Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the ægis, which henceforth had the faculty of

converting into stone all those who looked thereon; as Medusa herself had done during her life.

ÆGISTHUS, in ancient history, was the son of Thyestes by his own daughter Pilopeia, who, to conceal her shame, exposed him in the woods; some say he was taken up by a shepherd, and suckled by a goat, whence he was called *Ægisthus*. He corrupted Clytemnestra the wife of Agamemnon; and with her assistance slew her husband, and reigned seven years in Mycenæ. He was, together with Clytemnestra, slain by Orestes. Pompey used to call Julius Cæsar *Ægisthus*, on account of his having corrupted his wife Mutia, whom he afterwards put away, though he had three children by her.

ÆGITHALLUS, a promontory and citadel of Sicily, between Drepanum and the Emporium Aegistanum, afterwards called *Acellus*; corruptly written *Aegitharus*, in Ptolemy; situate near mount Eryx, and now called *Capo di Santo Teodoro*.

ÆGIUM, a town of Achaia Propria, five miles from the place where Helice stood, and famous for the council of the Aeheans, which usually met there on account either of the dignity or commodious situation of the place.

ÆGOBOLIUM, in antiquity, the sacrifices of a goat offered to Cybele. The ægobolium was an expiatory sacrifice, which bore a near resemblance to the taurobolium and eribolium, and seems to have been sometimes joined with them.

ÆGOCÉRATOS, *f.* in botany. See **HUGONIA**.

ÆGOPODIUM, *f.* [*αἴξ*, a goat, and *πῶς*, a foot.] In botany, a genus of the pentandria digynia class, of the natural order of umbellatæ or umbelliferæ. The generic characters are—Calyx: umbel universal manifold, convex: partial similar, but flat. Involucre none. Proper perianth scarcely observable. Corolla: universal uniform, with every floscule fertile: particular with five petals, obovate, concave, inflex at the tip, and equal. Stamina: filaments simple, twice as long as the corolla, with roundish antheræ. Pistillum: germ inferior. Styles simple, erect, the length of the corolla, with headed stigmas. Fruit ovate-oblong, streaked, bipartite. Seeds: two, ovate-oblong, convex and streaked on one side, and flat on the other.—*Essential Character.* Fruits, ovate-oblong, streaked.

The ægopodium podagraria, called in English herb-gerrard, gout-weed, ash-weed, and wild master-wort, is a weed not uncommon in hedges, orchards, &c. It is a perennial, and, being a great creeper, cannot be admitted into gardens without great caution. It requires no care, but to plant it in the shade and to confine the roots. The stem grows from two to three feet in height, is branching and furrowed: the upper leaves are ternate, and opposite: leaflets lanceolate, serrate. The umbels have about fourteen rays; the flowers are white, and appear from May to July. Though it has the quality of most umbellate plants in being aromatic, yet it is not used at all in medicine: nor has it any title to its name of goutweed, though the Germans formerly used it to assuage the pains both of the gout and piles. Linnæus says it is eaten in Sweden, boiled for greens, when tender in the spring. Ash-weed, one of the English names, is probably a corruption from ash-weed.

ÆGOPIDIUM, *f.* in botany. See **CICUTA**, **SMYRNIUM**.

ÆGOPRICON, *f.* [It seems to be derived from *αἴξ*, and *πρῶν* or *πρίον*, to sew, tie, or fasten.] In botany, a genus of the monœcia monandria class. The generic characters are—I. Male flowers small, in an ovate ament. Calyx: one-leaved, tubulous, trifid. Stamina: filament one, longer than the calyx, erect; with an ovate antheræ. II. Female flowers on the same plant, solitary. Calyx and corolla: same as in the male. Pistillum: germ ovate, superior; styles three; divaricate; with simple permanent stigmas. Pericarpium: a globular berry, tricoceous and trilocular within, with a bifid point. Capsule tricoceous and elastic.

elastic, *g.* Seeds: solitary, angular on one side.—*Essential Character.* Male, an ament. Calyx, common trifid; partial tubulous. Antheræ, four-lobed. Female flowers solitary. Calyx, as in the male; corolla, none; styles, three, coadunate at the base; capsule, trilocular.

It is called *Ægopricon betulinum*, and is a tree very much branched. Branchlets alternate, bent different ways, leafy, flowering at the ends. Bark somewhat wrinkled, except in the younger shoots. Dalberg noticed it in Surinam; and Aublet in Guiana.

ÆGOSPOTAMOS, a river in the Thracian Chersonesus, falling with a south-east course into the Hellespont, to the north of Sestos; also a town, station, or road, for ships, at its mouth. Here the Athenians, under Conon, through the fault of his colleague Isocrates, received a signal overthrow from the Lacedæmonians under Lysander, which was followed by the taking of Athens, and put an end to the Peloponnesian war. The Athenian fleet, having followed the Lacedæmonians, anchored in the road, over against the enemy, who lay before Lampacus. The Hellespont is not above two thousand paces broad in that place. The two armies, seeing themselves so near each other, expected only to rest that day, and were in hopes of coming to a battle on the next.

But Lysander had another design in view. He commanded the seamen and pilots to go on-board their galleys, as if they were in reality to fight the next morning at break of day, to hold themselves in readiness, and to wait his orders with profound silence. He commanded the land-army in like manner to draw up in battle upon the coast, and to wait the day without noise. On the morrow, as soon as the sun was risen, the Athenians began to row towards them with their whole fleet in one line, and to bid them defiance. Lysander, though his ships were ranged in order of battle, with their heads towards the enemy, lay still without making any movement. In the evening, when the Athenians withdrew, he did not suffer his soldiers to go a-shore, till two or three galleys, which he had sent out to observe them, were returned with advice that they had seen the enemy land. The next day passed in the same manner, as did the third and fourth. Such a conduct, which argued reserve and apprehension, extremely augmented the security and boldness of the Athenians, and inspired them with an extreme contempt for an army, which fear, in their sense, prevented from shewing themselves, and attempting any thing.

The fifth day the Athenians presented themselves again, and offered battle; retiring in the evening according to custom with more insulting airs than the days before. Lysander, as usual, detached some galleys to observe them, with orders to return with the utmost diligence when they saw the Athenians landed, and to put up a brazen buckler at each ship's head as soon as they reached the middle of the channel. Himself in the mean time ran through the whole line in his galley, exhorting the pilots and officers to hold the seamen and soldiers in readiness to row and fight on the first signal.

As soon as the bucklers were put up in the ships heads, and the admiral galley had given the signal by the sound of trumpet, the whole fleet set forward in good order. The land-army at the same time made all possible haste to the top of the promontory to see the battle. The strait that separates the two continents in this place is about fifteen stadia, or three quarters of a league, in breadth; which space was presently cleared through the activity and diligence of the rowers. Conon, the Athenian general, was the first who perceived from shore that fleet advance in good order to attack him; upon which he immediately cried out for the troops to embark. In the height of sorrow and trouble, some he called to by their names, some he conjured, and others he forced to go on-board their galleys; but all his endeavours and emotions were ineffectual, the soldiers being dispersed on all sides. For they were no sooner come on-shore, than some ran to the sut-

lers, some to walk in the country, some to sleep in their tents, and others had begun to dress their suppers. This proceeded from the want of vigilance and experience in their generals, who, not suspecting the least danger, indulged themselves in taking their repose, and gave their soldiers the same liberty.

The enemy had already fallen on with loud cries and a great noise of their oars, when Conon, disengaging himself with nine galleys, of which number was the sacred ship called the *Paralian*, stood away for Cyprus, where he took refuge with Evagoras. The Peloponnesians, falling upon the rest of the fleet, took immediately the galleys which were empty, and disabled and destroyed such as began to fill with men. The soldiers, who ran without order or arms to their relief, where either killed in the endeavour to get on-board, or flying on-shore were cut to pieces by the enemy, who landed in pursuit of them. Lysander took 3000 prisoners, with all the generals, and the whole fleet. After having plundered the camp, and fastened the enemy's galleys to the sterns of his own, he returned to Lampacus amidst the sound of flutes and songs of triumph. It was his glory to have achieved one of the greatest military exploits recorded in history with little or no loss, and to have terminated a war in the small space of an hour, which had already lasted twenty-seven years, and which, perhaps, without him, had been of much longer continuance.

ÆGYPTIACUM, *f.* in pharmacy, the name of several detergent ointments; which are described under the article **OINTMENT**.

ÆGYPTILLA, *f.* in natural history, the name of a stone described by the ancients, and said, by some authors, to have the remarkable quality of giving water the colour and taste of wine. This seems a very imaginary virtue, as are indeed too many of those in former ages attributed to stones. The descriptions left us of this remarkable fossil tell us, that it was variegated with, or composed of, veins of black and white, or black and bluish, with sometimes a plate or vein of whitish red. The authors of these accounts seem to have understood by this name the several stones of the onyx, sardonius, and camæa, kind; all which we have at present common among us, but none of which possess any such strange properties.

ÆGYPTUS, in fabulous history, was the son of Be-leus, and brother of Danaus.

ÆINATÆ, *f.* in antiquity, a denomination given to the senators of Miletus, because they held their deliberations on-board a ship, and never returned to land till matters had been agreed on.

ÆL, **EAL**, or **AL**, [in compound names, as *παι* in the Greek compounds,] signifies *all*, or *altogether*. So *Ælwin* is a complete conqueror; *Albert*, all illustrious; *Aldred*, altogether reverend; *Alfred*, altogether peaceful. To these *Pannachius*, *Pancratius*, *Pamphilus*, &c. do in some measure answer.

ÆLF, [which, according to various dialects, is pronounced *ulf*, *wolph*, *hulph*, *hilp*, *helfe*, and, at this day, *helpe*,] implies assistance. So *Ælfrin*, is victorious; and *Ælfwald*, an auxiliary governor; *Ælfgif*, a lender of assistance; with which, *Boetius*, *Symmachus*, *Epicurus*, &c. bear a plain analogy.

ÆLIAN (Claudius), born at Præneste, in Italy. He taught rhetoric at Rome, according to Perizonius, under the emperor Alexander Severus. He was surnamed *Μελιγλωστος*, *Honey-mouth*, on account of the sweetness of his style. He was likewise honoured with the title of *Sophist*, an appellation in his days given only to men of learning and wisdom. He loved retirement, and devoted himself to study. He greatly admired and studied Plato, Aristotle, Isocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives the preference to the writers of the Greek nation. His two most celebrated works are, his *Various History*, and *History of Animals*. He composed likewise a book on Providence, mentioned

tioned by Eusebii; and another on Divine Appearances, or The Declarations of Providence.

ÆLI PONS, one of the fortresses near the wall or rampart, or, in the words of the Notitia, through the line of the hither wall; built, as it is thought, by Adrian. Now Porteland, in Northumberland, between Newcastle and Morpeth.

ÆLIUS PONS, now il Ponte S. Angelo, a stone-bridge at Rome, over the Tyber, which leads to the Burgo and Vatican from the city, along Adrian's mole, built by the emperor Adrian.

ÆLURUS, in Egyptian mythology, the deity or god of cats; represented sometimes like a cat, and sometimes like a man with a cat's head. The Egyptians had so superstitious a regard for this animal, that the killing it, whether by accident or design, was punished with death: and Diodorus relates, that, in the time of extreme famine, they chose rather to eat one another than touch these sacred animals.

ÆM, **AM**, or **AME**, a liquid measure used in most parts of Germany; but different in different towns; the æm commonly contains 20 vertils, or 80 masses; that of Heidelbergh is equal to 48 masses; and that of Wirtemberg to 160 masses.

ÆMILIUS (Paulus), the son of Lucius Paulus, who was killed at the battle of Cannæ, was twice consul. In his first consulate he triumphed over the Ligurians; and in the second subdued Perseus king of Macedonia, and reduced that country to a Roman province, on which he obtained the surname of Macedonicus. He returned to Rome loaded with glory, and triumphed for three days. He died 168 years before Christ.

ÆMILIUS (Paulus), a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Louis XII. in order to write the history of the kings of France in Latin, and was given a canonry in the cathedral of Paris. He was near thirty years writing that history, which has been greatly admired. He died at Paris on the 5th of May, 1529.

ÆNOBOLIUM, *f.* in antiquity, the blood of a bull or ram offered in the sacrifices, called *taurobolia* and *criobolia*; in which sense the word occurs in ancient inscriptions.

ÆNARIA, an island on the bay of Cumæ, or over-against Cumæ in Italy. It is also called Inarime, and now Ischia: scarcely three miles distant from the coast, and the promontory Misenus to the west; twenty miles in compass; called Pithecusa by the Greeks. It is one of the Oenotrides, and fenced round by very high rocks, so as to be inaccessible but on one side; it was formerly famous for its earthenware.

ÆNEA, *f.* [as, Lat.] An epithet given to the instrument called a catheter, from its being formerly made of brass.

ÆNEAS, a famous Trojan prince, the son of Anchises and Venus. At the destruction of Troy, he bore his aged father on his back, and saved him from the Greeks; but, being too solicitous about his son and household gods, lost his wife Creusa in the escape. Landing in Africa, he was kindly received by queen Dido: but, quitting her coast, he arrived in Italy, where he married Lavinia the daughter of king Latinus, and defeated Turnus, to whom she had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but, joining with the Aborigines, he was slain in a battle against the Tuscans. Virgil has rendered the name of this prince immortal, by making him the hero of his poem.

ÆNEATORES, *f.* in antiquity, the musicians in an army, including those who played trumpets, horns, &c. The word is formed from *æneus*, on account of the brazen instruments used by them.

ÆNEID, the name of Virgil's celebrated epic poem. The subject of the *Æneid*, which is the establishment of Æneas in Italy, is extremely happy. Nothing could be more interesting to the Romans than to look back to their

origin from so famous a hero. While the object was splendid itself, the traditionary history of his country opened an interesting field to the poet; and he could glance at all the future great exploits of the Romans, in its ancient and fabulous state.

As to the unity of action, it is perfectly well preserved in the *Æneid*. The settlement of Æneas, by the order of the gods, is constantly kept in view. The episodes are linked properly with the main subject. The nodus, or intrigue of the poem, is happily managed. The wrath of Juno, who opposes Æneas, gives rise to all his difficulties, and connects the human with the celestial operations throughout the whole poem.

One great imperfection of the *Æneid*, however, is, that there are almost no marked characters in it. Achates, Cloanthus, Gyas, and other Trojan heroes, who accompanied Æneas into Italy, are insipid figures. Even Æneas himself is without interest. The character of Dido is the best supported in the whole *Æneid*.

The principal excellency of Virgil is tenderness. His soul was full of sensibility. He must have felt himself all the affecting circumstances in the scenes he describes; and he knew how to touch the heart by a single stroke. In an epic poem this merit is the next to sublimity. The second book of the *Æneid* is one of the greatest masterpieces that ever was executed. The death of old Priam, and the family-pieces of Æneas, Anchises and Crensa, are as tender as can be conceived. In the fourth book, the unhappy passion and death of Dido are admirable. The episodes of Pallas and Evander, of Nisus and Euryalus, of Lausus and Mezentius, are all superlatively fine. In his battles, Virgil is far inferior to Homer. But in the important episode, the descent into hell, he has outdone Homer by many degrees. There is nothing in antiquity to equal the sixth book of the *Æneid*.

ÆNGINA, one of the islands of the Archipelago. It lies in the bay of Engia, and the town of that name contains about 800 houses and a castle; and near it are the ruins of a magnificent structure, which was probably a temple.

ÆNIGMA, *f.* denotes any dark saying, wherein some well-known thing is concealed under obscure language. The word is Greek, *αἰνigma*, formed of *αἰνιτίζω*, *obscure innuere*, to hint a thing darkly, and of *αἶνος*, an obscure speech or discourse. The popular name is *riddle*; from the Belgic *racen*, or the Saxon *araethan*, to interpret. Fa. Bouhours, in the Memoirs of Trevoux, defines an *ænigma*, A discourse or painting, including some hidden meaning, which is proposed to be guessed.

Painted ÆNIGMAS, are representations of the works of nature or art, concealed under human figures, drawn from history or fable.

A Verbal ÆNIGMA, is a witty, artful, and abstruse, description of any thing. In a general sense, every dark saying, every difficult question, every parable, may pass for an *ænigma*. Hence obscure laws are called *Ænigmata juris*. The alchemists are great dealers in the *ænigmatic* language, their processes for the philosophers stone being generally wrapped up in riddles. F. Menestrier has attempted to reduce the composition and resolution of *ænigmata* to a kind of art, with fixed rules and principles, which he calls the philosophy of *ænigmatic* images. The subject of an *ænigma*, or the thing to be concealed and made a mystery of, he justly observes, ought not to be such in itself: but, on the contrary, common, obvious, and easy to be conceived. It is to be taken, either from nature, as the heavens or stars; or from art, as painting, the compass, a mirror, or the like.

The Form of ÆNIGMAS consists in the words, which, whether they be in prose or verse, contain either some description, a question, or a prosopopæia. The last kind are the most pleasing, inasmuch as they give life and action to things which otherwise have them not. To make an *ænigma*, therefore, two things are to be pitched on, which bear some resemblance to each other; as the sun and

and a monarch; or a ship and a house: and on this resemblance is to be raised a superstructure of contrarieties to amuse and perplex. It is easier to find great subjects for ænigmas in figures than in words, inasmuch as painting attracts the eyes and excites the attention to discover the sense. The subjects of ænigmas in painting, are to be taken either from history or fable: the composition here is a kind of metamorphosis, wherein human figures are changed into trees, and rivers into metals. It is essential to ænigmas, that the history or fable, under which they are presented, be known to every body; otherwise it will be two ænigmas instead of one; the first of the history or fable, the second of the sense in which it is to be taken. Another essential rule of the ænigma is, that it only admits of one sense. Every ænigma which is susceptible of different interpretations, all equally natural, is so far imperfect. What gives a kind of erudition to an ænigma, is the invention of figures in situations, gestures, colours, &c. authorized by passages of the poets, the customs of artists in statues, basso relievos, inscriptions, and medals. In foreign colleges, the explication of ænigmas makes a considerable exercise; and that one of the most difficult and amusing, where wit and penetration have the largest field.

ÆNIGMATOGRAPHY, or **ÆNIGMATHOLOGY**, *f.* the art of resolving or making ænigmas.

ÆNONA, a city of Liburnia, called by Pliny Civitas Prasini, also Enona, and is now called Nona; on the Adriatic, by which it is for the greater part surrounded, over-against the island Giffa, from which it is distant four miles to the west. Lat. 28. o. lon. 16. o. E.

ÆNUS, now the Inn, a river of Germany, which, rising in the country of the Grisons, out of the Alps, in the district called Gottes-haus-punt, runs throught the Grisons, the county of Tyrol, the duchy of Bavaria, and through Passau into the Danube.

ÆNUS, **ÆNOS**, or **ÆNUM**, anciently a town of Thrace, situate on the east mouth of the Hebrus, which has two mouths; and said to be built by the Cumeans. Now Eno.

ÆNITHOLOGUS, *f.* in poetry, a verse of two dactyls and three trochei; as, *Prælia dira placent truci juvenæ.*

ÆOLIAE INSULÆ, now Isle di Lipari, seven islands, situated between Sicily and Italy, so called from Æolus, who reigned there about the time of the Trojan war.

ÆOLIC, *adj.* in a general sense, denotes something belonging to Æolis.

ÆOLIC, or **ÆOLIAN**, in grammar, denotes one of the five dialects of the Greek tongue. It was first used in Bœotia; whence it passed into Æolia, and was that which Sappho and Alcæus wrote in. The Æolic dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the Doric dialect, that the two are usually confounded together.

ÆOLIC VERSE, in prosody, a verse consisting of an iambus, or spondee; then of two anapests, separated by a long syllable; and, lastly, of another syllable. Such as *O stelliferi conditor orbis*. This is otherwise called *eulogic verse*; and, from the chief poets who used it, *Archilochian* and *Pindaric*.

ÆOLIPILE, *f.* in hydraulics, is a hollow ball of metal, generally used in courses of experimental philosophy, in order to demonstrate the possibility of converting water into an elastic steam or vapour by heat. The instrument, therefore, consists of a slender neck, or pipe, having a narrow orifice inserted into the ball by means of a shouldered screw. This pipe being taken out, the ball is filled almost full of water, and, the pipe being again screwed in, the ball is placed on a pan of kindled charcoal, where it is well heated, and there issues from the orifice a vapour, with prodigious violence and great noise, which continues till all the included water is discharged. The stronger the fire is, the more elastic and violent will be the steam; but care must be taken that the small orifice of the pipe be not, by any accident, stopped up; because the instrument would in that case infallibly burst in pieces with such vio-

lence as may greatly endanger the lives of the persons near it. Another way of introducing the water is to heat the ball red-hot when empty, which will drive out almost all the air; and then by suddenly immersing it in water, the pressure of the atmosphere will force in the fluid till it is nearly full. Des Cartes and others have used this instrument to account for the natural cause and generation of the wind: and hence it was called *Æolopila*, *q. d. pila Æoli*, the ball of Æolus or of the god of the winds.

ÆOLIS, or **ÆOLIA**, the ancient name of a country of the Hither Asia, settled by colonies of Æolian Greeks. Taken at large, it comprehends all Troas, and the coast of the Hellespont to the Propontis, because in those parts there are several Æolian colonies: more strictly, it is situated between Troas to the north, and Ionia to the south. The people are called Æoles or Æolii.

ÆOLIUM MARE, a part of the Ægean Sea, washing Æolis; called also Myfium, from Myfia. It is now called Golfo di Smyrna.

ÆOLUS, in heathen mythology, the god of the winds, was said to be the son of Jupiter by Acasta, or Sigesia, the daughter of Hippotus: or, according to others, the son of Hippotus by Meneclea, daughter of Hyllus king of Lipara. He dwelt in the island Strongyle, now called Strombolo, one of the seven islands called Æolian, from their being under the dominion of Æolus. Others say, that his residence was at Regium, in Italy; and others again place him in the island Lipara. He is represented as having authority over the winds, which he held enchained in a vast cavern, to prevent their continuing the devastations they had been guilty of before they were put under his direction. Mythologists explain the original of these fables, by saying, that he was a wise and good prince; and, being skilled in astronomy, was able, by the flux and reflux of the tides, and the nature of the volcano in the island of Strongyle, to foretel storms and tempests.

ÆON, *f.* a Greek word, properly signifying the age or duration of any thing.

ÆON, among the followers of Plato, was used to signify any virtue, attribute, or perfection: hence they represented the deity as an assemblage of all possible æons; and called him *pleroma*, a Greek term signifying *fullness*. The Valentinians, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the Platonists, and the Chaldean philosophers, with the simplicity of the Christian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Hesiod), whom they called by several glorious names, and all by the general appellation of **ÆONS**: among which they reckoned *Zen, Life; Aelos; Word; Monseems; Only-begotten; Πανρωμα, Fullness*; and many other divine powers and emanations, amounting in number to thirty: which they fancied to be successively derived from one another; and all from self-originated deity, named *Bythus*, i. e. *profound or unfathomable*; whom they likewise called *The most high and ineffable Father*. See **VALENTINIANS**.

ÆORA, *f.* [from *αναοραω*, to lift up, to suspend on high.] A species of exercise used by the ancients for gestation, and of which Aetius gives the following account:

Gestation, while it exercises the body and limbs, still they seem to be at rest. Of the motion there are several kinds. 1st, Swinging in a hammock, which, at the decline of a fever, is beneficial. 2dly, Being carried in a litter, in which the patient either sits or lies along. It is useful when the gout, stone, and such other disorders, attend, that do not admit of violent motions. 3dly, Riding in a chariot, which is of service in most chronic disorders, especially before the stronger exercise can be admitted. 4thly, Sailing in a boat or ship. This produces various effects, according to the different agitation of the waters, and in many tedious chronic disorders proves efficacious beyond what is observed from the most skilful administration of drugs. These are instances of passive exercise, and are useful, particularly when active exercise would be improper, or impracticable. Asclepiades was the

the first who brought passive exercise into practice, which was used after severe illness, in order to conquer debility, and invigorate the system by gentle means.

ÆQUANA JUGA, mountains of Picedum, in the kingdom of Naples, now called Montagna di Sorrento, denominated from the town Equa, which being destroyed, was replaced by Vicus, now Vico di Sorrento.

ÆRA, *f.* in chronology, a fixed point of time from whence any number of years is begun to be counted. It is sometimes also written in ancient authors *era*. The origin of the term is contested, though it is generally allowed to have had its rise in Spain. Sepulveda supposes it formed from A. E. R. A. the note or abbreviations of the words, *annus erat Augusti*, occasioned by the Spaniards beginning their computation from the time their country came under the dominion of Augustus, or that of receiving the Roman calendar.

The difference between the terms *era* and *epoch* is, that the *æras* are certain points fixed by some people or nation, and the *epochs* are points fixed by chronologists and historians. The idea of an *æra* comprehends also a certain succession of years proceeding from a fixed point of time, and the *epoch* is that point itself. Thus the Christian *æra* began at the epoch of the birth of our Saviour Jesus Christ.

ÆRARIUM, *f.* the treasury or place where the public money was deposited amongst the Romans.

ÆRARIUM SANCTIUS contained the monies arising from the twentieth part of all legacies: this was kept for the extreme necessities of the state.

ÆRARIUM PRIVATUM was the emperor's privy purse, or the place where the money arising from his private patrimony was deposited.

ÆRARIUM VICESIMARUM, the place where the money arising from the taxes levied from foreign countries was laid up, so called because it most commonly consisted of a twentieth part of the produce.

ÆRARIUM ILITHYÆ, or **JUNONIS LUCINÆ**, was where the monies were deposited which parents paid for the birth of each child.

There are several other treasuries mentioned in history, as the *Ærarium Juventutis*, *Veneris*, &c. The temple of Saturn was the public treasury of Rome, either because Saturn first taught the Italians to coin money, or, which is most likely, because this temple was the strongest and most secure, and therefore the fittest place for that purpose. *Ærarium* differs from *fiscus*, as the first contained the public money, the second that of the prince.

The two are, however, sometimes indiscriminately used for each other.

ÆRARIUS, *f.* a name given by the Romans to a degraded citizen, who had been struck off the list of his century. Such persons were so called because they were liable to all the taxes, without enjoying any of its privileges.

ÆRARIUS was also an officer instituted by Alexander Severus, for the distribution of money given in largesses to the soldiery, or people. *Ærarius* was likewise used for a person employed in coining or working brass. These are sometimes called *ararii fusores*: at other times, *ararius* is distinguished from *fusor*; the former answering to what we now call copper-smiths, the latter to founders. *Ærarius* was likewise applied to a soldier who received pay.

AERIA, or **EERIA**, the ancient name of Egypt: the scholiast on Apollonius Rhodius, says, that not only Thesaly, but Egypt, was called *Hefia* by the Greeks, which Eusebius also confirms; and hence Apollinarius, in his translation of the 114th Psalm, uses it for Egypt. Heyfchius applies this name to Ethiopia.

AERIAL, *adj.* [*aërius*, Lat.] Belonging to the air, as consisting of it.—Vegetables abound more with *aerial* particles than animal substances. *Arbutnot.*—Produced by the air. Inhabiting the air. Placed in the air. High; elevated in situation, and therefore in the air.

AERIANS, in church-history, a branch of Arians, who, to the doctrines of that sect, added some peculiar dogmas of their own; as, that there is no difference between bishops and priests; a doctrine maintained by many modern divines, particularly of the presbyterian and reformed churches. The sect received its denomination from Aërius, an Armenian priest of the fourth century.

AERIE, *f.* [*airie*, Fr.] Is a proper term for hawks, which for other birds is called a *nest*. The liberty of keeping aeries of hawks was a privilege granted to great men: and the preserving the aeries in the king's forests, was one sort of tenure of lands by service.

Flos ÆRIS, *f.* among alchemists, small scales procured from copper melted by a strong heat; it is sometimes used for ærugo or verdegris.

AEROGRAPHY, *f.* [from *αἴρ*, air, and *γραφω*, I describe.] A description of the air or atmosphere, its limits, dimensions, properties, &c. This amounts to much the same with aerology, unless we suppose the latter to enter into the rationale, and the former to confine itself to a description of the more obvious affections thereof. See **ATMOSPHERE**.

A E R O L O G Y.

AEROLOGY, *f.* [*αἴρ*, and *λογος*, Gr.] The doctrine or science of **AIR**, its nature and different species, with their ingredients, properties, phenomena, and uses. **Air**, in a general sense, is that invisible fluid every-where surrounding this globe; on which depends not only animal but vegetable life; and which seems, in short, to be one of the great agents employed by nature in carrying on her operations throughout the world.

Though the attention of philosophers has in all ages been engaged in some measure by inquiries concerning the nature of the atmosphere, yet, till within these last thirty years, little more than the mere mechanical action of this fluid was discovered, with the existence of some anomalous and permanently-elastic vapours, whose properties and relation to the air we breathe were almost entirely un-

known. Within the above-mentioned period, however, the discoveries concerning the constituent parts of the atmosphere itself, as well as the nature of the different permanently-elastic fluids which go under the general name of *air*, have been so numerous and rapid, that they have at once raised this subject to the dignity of a *Science*, and now form a very considerable, as well as important, part of the modern system of natural philosophy.

Those discoveries, indeed, have not been more interesting to philosophers, than useful to science and beneficial to society. Many perplexing processes in chemistry have been explained in consequence of them, several have been facilitated, and a number of new and useful ones have been introduced. The phenomena attending metallic calcinations and reductions have been greatly elucidated.

The

The knowledge of the use of the air in respiration; the method of ascertaining its purity and fitness for that function; the investigation of dephlogisticated air; the method of impregnating water with fixed air; are all calculated to answer purposes of the highest utility. The medicinal properties of fixed air have been in a great measure ascertained, and its antiseptic qualities in other respects promise to be of considerable advantage. The method of ascertaining the purity of the air of a place, and the manner of ventilating an apartment, are of great use for those concerned in public buildings. In short, there is perhaps no station in life where some knowledge of this subject may not be of use.

Of the general Constitution, Mechanical Properties, and Operations, of the Air.

The general Constitution of the Air we breathe.—For many ages this fluid was supposed to be simple and homogeneous; its common operations to depend on its heat, cold, moisture, or dryness; and any effects which could not be explained by these (such as the appearance of pestilential diseases), were reckoned to be entirely supernatural, and the immediate effects of Divine power. But, however simple and homogeneous this fluid may have been thought in former times, it is so far from possessing the simplicity of an element, that it is the receptacle of all kinds of effluvia produced from terrestrial substances either naturally or artificially. Hence, whatever may be the nature of the aerial fluid when absolutely pure, that which we breathe, and commonly goes under the name of *air*, must be considered as an exceedingly heterogeneous mixture, various at various times, and which it is by no means possible to analyse with accuracy.

Though, in this view, air seems to be a kind of sink or common sewer, where all the poisonous effluvia arising from putrid and corrupted matters are deposited; yet it has a wonderful facility of purifying itself, and one way or other of depositing those vapours contained in it; so that it never becomes noxious except in particular places, and for a short time; the general mass remaining upon all occasions pretty much the same. The way in which this purification is effected is different, according to the nature of the vapour with which the air is loaded. That which most universally prevails is water; and from experiments it appears, that the quantity of aqueous vapour contained in the atmosphere is immense. Dr. Halley, from an experiment on the evaporation from a fluid surface heated to the same degree with that given by our meridian sun, has calculated, that the evaporation from the Mediterranean Sea alone is sufficient to yield all the water of the rivers which run into it. Dr. Watson, in his Chemical Essays, has given an account of some experiments made with a view to determine the quantity of the water raised from the earth itself alone in time of drought. He informs us, that when there had been no rain for above a month, and the grass was become quite brown and parched, the evaporation from an acre was not less than 1600 gallons in twenty-four hours. Making afterwards two experiments, when the ground had been wetted by a thunder-shower the day before, the one gave 1973, the other 1905, gallons, in twelve hours. From this the air is every moment purified by the ascent of the vapour, which, flying off into the clouds, thus leaves room for the exhalation of fresh quantities; so that as the vapour is considerably lighter than the common atmosphere, and of consequence ascends with great velocity, the air during all this time is said to be *dry*, notwithstanding the vast quantity of aqueous fluid that passes through it.

Nor is it only from the aqueous vapour that the air is purified at this time. Much of that vapour arising from decayed and putrid animal and vegetable substances, and which by some modern philosophers is called *phlogiston*, attaches itself to the aqueous vapour, and ascends along with it. Another part is absorbed by vegetables; for the phlogistic vapour is probably the food of plants. The

phlogistic vapours which ascend along with the water probably continue there, and descend along with the rain; whence the fertilizing qualities of rain-water above those of any other. Thus we may see why a dry air, whether cold or hot, must always be wholesome; but, as the atmosphere cannot always receive vapours, it is obvious, that when great rains come on, especially if attended with heat, the lower regions of the air must be overloaded with vapours both of the aqueous and phlogistic kind, and of consequence be very unwholesome.

But besides the aqueous and phlogistic vapours, both of which are specifically lighter than common air, there are others, which, being specifically heavier, cannot be carried off in this manner. Hence these gross vapours contaminate certain places of the atmosphere, rendering them not only unhealthy, but absolutely poisonous. Of these are, sulphureous, acid, and metalline, exhalations, produced principally by volcanoes; and, as they descend, in consequence of their specific gravity, they suffocate and spread destruction all around them, poisoning not only animals, but vegetables also. The vapours arising from houses where lead and other metals are melted, have the same pernicious qualities; inasmuch that the men who breathe them, the cattle who eat the grass, and the fishes who inhabit the waters on which they fall, are poisoned by them, if taken into the body in a certain proportion. Of the same kind are the *mofetes*, or emanations of fixed air, which sometimes proceed from old lavas, or perhaps from some other places even of the surface. From all these the air seems not capable of purifying itself, otherwise than either by dispersing them by winds, or by letting them subside by their superior gravity, till they are absorbed either by the earth or water, according as it is their nature to unite with one or other of these elements. Of this kind also seem to be the vapours which are called properly *pestilential*. The contagion of the plague itself seems to be of an heavy sluggish nature, incapable of arising in the air, but attaching itself to the walls of houses, bed-clothes, and wearing apparel. Hence, scarcely any constitution of the atmosphere can dispel these noxious effluvia; nor does it seem probable that pestilential distempers ever cease until the contagion has operated so long, and been so frequently communicated from one to another, that, like a ferment much exposed to the atmosphere, it becomes rapid, communicates a milder infection, and at last loses its strength altogether.

The two most important properties of the atmosphere are its gravity and its elasticity. The first compared to the specific gravity of water, according to the computations of Mr. Boyle, is as 1 to 938, but, according to later experiments, as 1 to 800. This property is rendered evident in a variety of ways, but in none more decisive than in simply evacuating the receiver of an air-pump, so as to evince the prodigious pressure of the atmosphere on its outside. M. Pascal has computed the quantity of this pressure on the earth's surface to be upwards of 2232lb. on every square foot.

On the gravity of the air depend the ascent of water in pumps, syphons, &c. and likewise all the phenomena of the barometer. But besides gravity, which the air has in common with other fluids, there is another property which it has only in common with steam or vapour. This is called its *elasticity*; by which, like a spring, it allows itself to be compressed into a smaller bulk, and then returns again to its original size upon removing the pressure.

The elasticity of the air, which was first ascertained by some experiments of lord Bacon, is no less easy of proof than its gravity. If a shrivelled bladder containing only a very small quantity of air be put under the receiver of an air-pump, and the pressure of the atmosphere taken off the outside of the bladder by exhausting the receiver, the elasticity of the air within will be shewn by its expanding the bladder to its full dimensions. The same fact is shewn in a variety of other experiments not necessary to be detailed here. It may be proper however to observe, that

this elasticity is capable of some diminution by long-continued and violent pressure, as late experiments have proved.

The weight or pressure of the air has no dependence on its elasticity; but would be the same whether it had such a property or not. The air, however, being elastic, is necessarily affected by the pressure, which reduces it into such a space, that the elasticity, which re-acts against the compressing weight, is equal to that weight. In effect, the law of this elasticity is, that it encreases as the density of the air encreases; and the density encreases as the force encreases by which it is pressed. Now there must necessarily be a balance between the action and re-action; i. e. the gravity of the air which tends to compress it, and the elasticity by which it endeavours to expand, must be equal. Hence the elasticity increasing or diminishing universally, as the density increases or diminishes, it is no matter whether the air be compressed and retained in such a space by the weight of the atmosphere, or by any other means; it must endeavour in either case to expand with the same force. And hence, if air near the earth be pent up in a vessel, and all communication with the external fluid cut off, the pressure of the inclosed air will be equal to the weight of the atmosphere at the time the quantity was confined. Accordingly, we find mercury sustained to the same height, by the elastic force of air inclosed in a glass vessel, as by the whole atmospherical pressure. On the same principle air may be artificially condensed; and hence the structure of the AIR-GUN.

The utmost limits to which air, of the density which it possesses at the surface of the earth, is capable of being compressed, have not been ascertained. Dr. Hales, by means of a press, condensed it 38 times; and, afterwards, by forcing water in an iron globe, into 1551 times less space than it naturally occupies. However, Dr. Halley, from the experiments made at London and Florence, concludes, that no force whatever is able to reduce air into 800 times less space than that which it naturally possesses on the surface of our earth. The dilatation of the air, however, by virtue of its elastic force, is found to be very surprising. In the experiments made by Mr. Boyle, it dilated into 10,000, and even at last into 13,679, times its space; and this altogether by its own expansive force, without the help of fire.

In fact, it appears, that the air we breathe is compressed by its own weight into at least the 13,679th part of the space it would possess in *vacuo*. But if the same air be condensed by art, the space it would take up when most dilated, to that it possesses when condensed, will be, according to the same author's experiments, as 550,000 to 1.

Dr. Hales found, that the air in a retort, when the bottom of the vessel was just beginning to be red-hot, was expanded through twice its former space; and, in a white heat, it occupied thrice its former space: but Mr. Robins found it was expanded by the heat of iron, just beginning to be white, to four times its former bulk.

The elastic power of the air is the second great source of the effects of this important fluid. Thus it enters the pores of bodies; and by this prodigious faculty of expanding, which is so easily excited, puts their particles into perpetual oscillations. Indeed, the degree of heat, and the air's gravity and density, and consequently its elasticity and expansion, never remaining the same for the least space of time, there must be an incessant vibration or dilatation and contraction in all bodies.

From this cause it is, that the air contained in bubbles of ice, by its continual action, bursts the ice. Thus also entire columns of marble sometimes are cleft, in the winter time, from the increased elasticity of some little bubble of air contained in them. From the same principle arise all putrefaction and fermentation; neither of which will proceed, even in the best disposed subjects, in *vacuo*.

Besides these properties of gravity and elasticity, authors have attributed to air several qualities which rather belong to the accidental mixture of other fluids in its composition. Of this nature is its property of corroding me-

tals, stones, &c. but we shall not dwell on them at present farther than to observe, that, in these cases the dissolving power of air is increased by heat, and by other causes. It combines with water; and, by access of cold, deposits part of the matter which was kept dissolved in it by a greater degree of heat. Hence the water, by being deposited and condensed upon any cold body, such as glass, &c. in windows, forms fogs, and becomes visible.

In the operations of chemistry, air is a very important agent; the result of particular processes depending on its presence or absence, on its being open or inclosed. Thus, the parts of animals and vegetables can only be calcined in open air; in close vessels they never become any other than black coals. And these operations are affected by the changes to which the air is liable. Many instances might be adduced to this purpose. Let it suffice to observe, that it is very difficult to procure oil of sulphur, *per campanam*, in a clear dry atmosphere; but in a thick moist air it may be obtained with greater ease, and in larger quantities. So, pure well fermented wine, if it be carried to a place where the air is replenished with the fumes of new wine then fermenting, will begin to ferment afresh.

The changes in the air arise from various causes, and are observable, not only in its mechanical properties, but in the ingredients that compose it. Thus, at Fahlun, noted for copper mines, the mineral exhalations affect the air in such a manner as to discolour the silver coin in purses, and change the colour of brads. In Carniola, Campania, &c. where are mines of sulphur, the air sometimes becomes very unwholesome, which occasions frequent epidemic diseases, &c. The effluvia of animals also have their effect in varying the air; as it is evident in contagious diseases, plagues, murrains, and other mortalities, which are spread by an infected air.

Of the successive discoveries relative to atmospheric and other aerial fluids, we might here give an historical account, were it not more our object rather to detail facts themselves, than dwell on the circumstances under which they were discovered. We shall however briefly observe that Van Helmont was the first who made discoveries on this important subject. Mr. Boyle followed his steps; and after him, Dr. Hales, and Professor Venel, contributed to the advancement of this important branch of philosophy. But their discoveries at length were greatly eclipsed by our modern chemists Dr. Black, Mr. Cavendish, and Dr. Priestley; but particularly the latter, to whom it was reserved, to prove by the most decisive tests the composition and nature of our atmosphere, which appears to be composed of two fluids; the one absolutely noxious, and incapable of supporting animal life for a moment; the other extremely salutary, and capable of preserving animals alive and healthy for a much longer time than the purest air we can meet with, the properties of which we shall now proceed to explain.

Of Dephlogificated or Vital Air.

This kind of air Dr. Priestley names *dephlogificated*, from his opinion that common air, in the act of burning, absorbs phlogiston. In the course of his inquiries, he fell upon a method of extracting it from a great variety of substances, viz. by moistening them with spirit of nitre, and then distilling them with a strong heat. Thus he obtained it from flowers of zinc, chalk, quicklime, slaked lime, tobacco-pipe clay, flint, Muscovy talcs, and even glass. He then found, that by simply dissolving any metal in the nitrous acid, and then distilling the solution, he could obtain very pure air: and Mr. Wartire found even the trouble of distillation unnecessary; nothing more being requisite than to moisten red lead with the spirit of nitre, and then pour upon it the oil of vitriol, which instantly disengaged the dephlogificated air without applying any more heat than what was generated by the mixture.

But Mr. Scheele, without knowing of Dr. Priestley's discovery, fell upon a method by which this air may be still more readily procured, viz. by the distillation of ni-

tre with a strong heat; by which means it may be obtained in very considerable quantity, and in as great purity as by the more expensive processes. It appears however, that the mode of applying heat has also a very considerable effect on the quantity of air produced. Thus, Dr. Priestley remarks, that "from equal quantities of red lead, without any mixture of spirit of nitre, and using the same apparatus for distilling it, he obtained, by means of heat applied suddenly, more air than when slowly applied in the proportion of ten to six. The proportion of fixed air was the same in both cases, and the remainder equally dephlogisticated."

By heat alone, the doctor found, that fedative salt, manganese, lapis calaminaris, and the mineral called *lapis ponderosus*, wolfram, or *tungsten*, would yield dephlogisticated air; the first indeed, in very small quantity, and sometimes even of a quality very little superior to common air. In these experiments, he made use of small-bellied retorts of green glass, which can stand the fire best, containing about an ounce of water, and having narrow necks eighteen or twenty inches long. The substance to be examined was put into a retort of this kind, and then exposed to a red heat, either in sand or over a naked fire, while the neck of the vessel was plunged in water or mercury.

Having dissolved six pennyweights of very clean iron in oil of vitriol, and then distilled the solution to dryness in a long-necked retort, he received the common air a little phlogisticated, some fixed air, much vitriolic acid air, and lastly eighteen ounce-measures of dephlogisticated air. The iron that remained undissolved weighed twenty-three grains, so that the air was yielded by five pennyweights one grain of iron. The ochre weighed seven pennyweights thirteen grains: so that, says he, there probably remained a quantity of oil of vitriol in it; and consequently, had the heat been greater, more air would have been obtained.

In his experiments with the nitrous acid, as it had constantly been found, that by pouring fresh nitrous acid on the residuum, and repeating the operation, more dephlogisticated air might be obtained, the doctor determined to try whether the same would not hold good with vitriolic acid also. For this purpose, he added more oil of vitriol to the residuum of the last-mentioned experiment. When in a red heat with a glass retort, it yielded a quantity of vitriolic acid air, no fixed air, but about twenty four ounce-measures of dephlogisticated air; when, the retort being melted, a good deal of the air was necessarily lost; but, on resuming the process in a gun-barrel, he procured as much air as had been got before.

The result of these and innumerable other experiments made by philosophers in different countries, was, that dephlogisticated air may be obtained from a vast variety of mineral and metallic substances by means of the vitriolic and nitrous acids. It now remained only to discover in what manner this fluid, so essentially necessary to the support of animal life, is naturally produced in quantities sufficient for the great expence of it throughout the whole world, by the breathing of animals, the support of fires, &c. This discovery, indeed, had been made before even the existence of dephlogisticated air itself was known. Dr. Priestley, after having tried various methods of purifying contaminated air unsuccessfully, found at last, that some kinds of vegetables, but particularly mint, answered this purpose very effectually. Having rendered a quantity of air thoroughly noxious, by mice breathing and dying in it, he divided it into two receivers inverted in water, introducing a sprig of mint into one of them, and keeping the other receiver unaltered. About eight or nine days after, he found that the air of the receiver into which he had introduced the sprig had become respirable; for a mouse lived very well in this, whereas it died the moment it was put into the other.

From these experiments he at first concluded, that in all cases the air was meliorated by the vegetation of plants: but some experiments of this kind did not answer so well towards the end of the year as they had done in the hot sea-

son; and a second course seemed to be almost entirely contrary to the former. At the time of making these experiments, he supposed that the air was meliorated merely by the absorption or phlogiston from that which had been tainted; but the experiments of Dr. Ingenhousz, in 1779, shewed that this was accomplished, not only by the absorption just mentioned, but also by the *emission* of dephlogisticated air. He observed in general, that plants have a power of correcting bad air, and even of improving common air in a few hours, when exposed to the light of the sun; but, in the night time, or when they are not influenced by the solar rays, they contaminate the air. This property, however, does not belong in an equal degree to all kinds of plants: nor is it possible to discover, by the external properties of a plant, whether it be fit for this purpose or not. Air phlogisticated by breathing, and in which a candle could not burn, after being exposed to the sun for three hours with a sprig of peppermint in it, was so far corrected, as to be again capable of supporting flame. The following experiment, made with a mustard plant, may be looked upon as decisive: A plant of this kind was put into a glass receiver containing common air, and its stem cut off even with the mouth of the receiver. The vessel was then inverted in an earthen pan, containing some water to keep the plant alive; and the whole apparatus was set overnight in a room. Next morning the air was found so much contaminated, that it extinguished the flame of a wax-taper. On exposing the apparatus to the sun for a quarter of an hour, the air was found to be somewhat corrected; and after an hour and an half it was so far improved, that by the test of nitrous air it appeared considerably better than common air.

Among the discoveries to which these experiments led, was that of procuring pure air from pump water, which had stood till a green matter had extended itself over the bottom and sides of the vessel containing it. Water, in this situation, emits pure air very copiously, and that even when the green matter exhibits signs of decay, and becomes yellowish; but the light of the sun, it appears, is essential to this process; very little pure air being emitted in the dark. An improvement on this idea was soon afterwards suggested by Dr. Ingenhousz, who procured pure air very readily from the leaves of different vegetables, some of them of the poisonous kind; but more especially from aquatic plants, the turpentine trees, and the green matter collected from a stone trough.

The purity of this dephlogisticated air was equal, if not superior, to that procured by the best chemical processes; as it sometimes required eight times its own quantity of nitrous air to saturate it. All parts of the plants were not found equally proper for the production of it; the full-grown leaves yielded it in the greatest quantity and purity, especially from their under surface. It was also procured from the green stalks.—One hundred leaves of *Nasturtium Indicum*, put into a jar holding a gallon, filled with ordinary pump-water, and exposed to the sun from ten to twelve o'clock, yielded as much air as filled a cylindrical jar four inches and an half in length, and one and three quarters in breadth. On removing this quantity of air, and exposing them again to the sun till seven o'clock, about half as much was produced, of a quality still superior to the former; and next morning by eleven o'clock they yielded as much more of an equal quality. The roots of plants he says, when kept out of ground, generally yield bad air, and at all times contaminate common air, a few only excepted. Flowers and fruits, in general, yield a very small quantity of noxious air, and contaminate a great quantity of common air at all times, especially in the night, and when kept in the dark. Two dozen of young and small French beans, kept in a quart-jar of common air for a single night, contaminated the air to such a degree, that a very lively chicken died by being confined in it less than half a minute.

That the vegetation of plants is one of the great means employed by nature to purify the atmosphere, so as to counteract,

counteract, in a great measure, the damage done by animal respiration, combustion, &c. is evident from these experiments. It may only be said, that vegetation does not appear to be sufficient to remedy entirely that damage. The power of vegetables in yielding dephlogificated air, begins a few hours after the sun has made its appearance in the horizon, or rather after it has passed the meridian, and ceases with the close of day; excepting some plants, which continue it a short time after sun-set. The quantity of dephlogificated air, in general, is greater in a clear day than when it is cloudy. It is also greater when the plants are more exposed to the sun than when they are situated in shady places. The damage done by plants in the night, is also more than counterbalanced by the benefit they afford in the day-time. By a rough calculation, the poisonous air, yielded by any plant during the whole night, could not amount to one hundredth part of the dephlogificated air which the same plant yielded in two hours time in a fair day. It does not appear, however, that plants yield dephlogificated air by any kind of generation of that fluid, but only by filtrating the common air, which all plants absorb through their pores; the phlogistic part becoming part of their substance. Dry plants have little or no effect upon the air until they are moistened. On all these experiments, however, it must be observed, that they have sometimes failed in the hands of those whom we cannot but suppose very capable of trying them; as Mr. Scheele, Mr. Cavallo, and the Abbé Fontana.

After the publication of Dr. Ingenhoufz's experiments, those of Sir Benjamin Thompson appeared, in which the green matter supposed to be vegetable was shewn to consist of a number of animalculæ. He observed further, that several animal substances, as well as vegetables, have a power of separating dephlogificated air from water when exposed to the light of the sun, and that for a very great length of time. Not that the same quantity of water will always continue to furnish air; but the same animal substance being taken out, washed, and again put into fresh water, seems to yield dephlogificated air, without any kind of limitation.

Raw silk was the substance on which his experiments were first attempted; and he not only found that it was capable of yielding pure air in considerable quantity when placed in the same circumstances with the leaves of plants, but also that the light, no less required to produce dephlogificated air from animal than vegetable substances, was not, in either case, necessarily that of the sun; though indeed the pure air was more sparingly supplied, under the influence of an artificial light, than in the other case. In making the experiments, as it was found somewhat troublesome to invert the globes in water, they were at last only kept in an inclined posture on the table, the air collecting itself in the upper part of the belly. Having provided himself with a number of globes, of different sizes, he proceeded in the following manner:

Finding that raw silk, exposed to the action of light, produced so great a quantity of air, he was induced to try some other substances. Having, therefore, prepared six globes of $4\frac{1}{2}$ inches in diameter, and filled them with spring water, he introduced into each of them fifteen grains of one of the following substances, viz. sheep's-wool, eider-down, fur of a Russian hare, cotton-wool, lint, or the ravelings of linen-yarn, and human-hair. The results of these experiments were various, though all yielded more or less of pure air. The wool, even in the most favourable circumstances, never afforded more than one-third of the quantity which would have been yielded by silk. The eider-down began to furnish air almost immediately, and continued to do so in quantities little less than had been furnished by the silk, and nearly of the same quality. The fur of the hare produced more air than the wool, but less than the eider-down. The cotton yielded a considerable quantity of air of better quality than any of the former. The ravelings of linen were very slow in furnishing air,

and produced but a small quantity; only two cubic inches being collected in the space of a fortnight. This substance appeared to be the very reverse of the hare's fur; for the air, instead of attaching and collecting itself about the substance in large bubbles, scarcely ever made its appearance in sufficient quantity to raise it to the top of the water. The human-hair furnished still less than the linen, and the produce was of inferior quality, though still superior to the common atmosphere.

In order to discover the comparative purity of air produced from vegetables and from raw silk, a small quantity of air from the stem of a pea-plant, which had four healthy leaves upon it, was proved with nitrous air, and found greatly inferior to that from raw silk, and several of the substances already mentioned. An entire plant of house-wort, of a moderate size, furnished only three-fourths of a cubic inch of air in seven hours, and that greatly inferior to common air; but the leaves alone afforded a much greater quantity, and of a quality greatly superior.

In order to ascertain how much air would be yielded by exposure to the sun's rays, a globe containing 296 inches, filled with fresh spring water, and thirty grains of raw silk, was exposed to the air for three days in the month of May, but for the most part cold and cloudy. Only nine inches and a half of air were produced; but next day, by exposure to the sun from nine in the morning till five in the afternoon, 8.46 inches more were produced. Next day, the product of air was nine cubic inches, of a better quality; and the day following, six inches still superior, though exposed only for three hours and a half; but the next day, it being cold and cloudy, only three-fourths of an inch of air were produced, and these manifestly inferior to the foregoing. No more air could afterwards be procured, except one quarter of a cubic inch; so that from 296 inches of this water, 33.96 of air were obtained.

In this experiment the air was every day removed, and its place supplied with water: the following was made to determine what alteration would take place on allowing the quantity of air produced to remain from first to last. The globe being therefore filled again, and the silk well washed and replaced in it, the quantity of air produced amounted in four days to 30.1 cubic inches; and would probably have been still more considerable.

On employing unwashed raw silk, it was found, that seventeen grains in twenty cubic inches of water, produced, for the first four days, air of a worse quality than the atmosphere; but afterwards yielded near two inches of a superior quality. The quantity of this air was superior to that in other experiments, though its quality was somewhat inferior.

These results led to a trial of the cotton-like substance yielded by the *populus nigra*. One hundred and twenty grains of this in 296 inches of water, during the first four days gave a very inconsiderable quantity of air, and that in a phlogificated state. On becoming suddenly greenish, however, it yielded in six days forty-four cubic inches and a quarter of purer air than had been before produced.

Suspecting that the quantity of pure air might depend on the comparative quantity of surface, an hair of silk and one of poplar cotton were examined with a microscope, and found to be as 1000 to 3468. Whilst thirty grains of the cotton presented a surface of 6600 square inches, the like quantity of silk exhibited no more than 476. Hence the produce of air from the two substances was neither in proportion to their weights nor their surfaces. It appeared also, that the quality of the air produced at first was considerably inferior to that yielded some time afterwards. In order to ascertain the times at which air of the best quality was produced, &c. several experiments were made. In some of them, the water had acquired a faint greenish cast; but the colour of that with the cotton was deepest. On examining with a microscope, it was found to contain a great number of animalcules exceedingly small, and nearly of an oval figure; that with the silk contained them likewise, but not in such numbers:

numbers: however, in all cases in which the water acquired a greenish hue, they never failed to exist, so as to render it probable, that, from their presence alone, the colour of the water in the first instance universally arose.

To determine a point which appeared by no means decided, viz. what share the substances employed had in producing air, and whether any other which presented a large surface, and attracted air from water, would not do as well, the experiment was repeated with a quantity of *spun glass*, and the result was, that, the globe being exposed in the sun, air-bubbles began almost instantly to make their appearance on the surface, and in four hours 0.77 of a cubic inch of air was procured; after which, not a single globule more was produced, though the globe was exposed for a whole week in sunshine weather. Hence it appears that something more than mere surface was wanted to produce dephlogificated air from water by means of the sun's light.

To determine the quantity and quality of air produced by means of the heat and light of the sun from water alone, a large glass, containing 455 cubic inches, was filled with fresh spring water, inverted, and exposed for twenty-eight days. Another jar was also filled with water from a pond in which many aquatic plants were growing, and exposed in the same way. The latter yielded air in pretty large quantities on the third day, and continued to do so till the fourteenth; the former little or none till the fourteenth, when it began to emit air, and continued to do so till the twenty-second. On removing the air produced, that from the spring water was fourteen inches in quantity, and 138 in quality (taking the quality of atmospheric air at 100); but, from the pond water, thirty-one and a half in quantity, and 252 in quality. The colour of the water remaining unchanged, the thickness of the glass vessel was thought an objection. The experiment therefore was repeated in a thin conical jar containing 344 inches, and exposed twenty-one days to the sun. Little air was furnished till the seventh day, when, a fine slimy sediment of green matter beginning to be formed, air was furnished in pretty large quantities till the eighteenth, when it entirely ceased. The whole amounted to forty cubic inches, and the quality 213.

The opinion of Dr. Ingenhousz, that the dephlogificated air was *elaborated* in the vessels of the plant, appeared exceedingly doubtful to the ingenious author of these experiments: for, besides that many other substances, in which no elaboration takes place, cause the water to yield dephlogificated air as well as plants, and even in much greater quantities, and of a more eminent quality; the circumstances of the leaves of a vegetable, which, accustomed to grow in air, are separated from its stem and confined in water, are so unnatural, that it is difficult to conceive they can perform the same functions in such different situations.

Fresh healthy leaves furnish air only for a short time, and, after a day or two, change colour and cease to yield any. This has been conceived to arise from the death of the plant: and from hence it has been inferred, with some degree of plausibility, not only that the leaves actually retain their vegetative powers for some time after being separated from their stock; but that it was in consequence of the exertion of those powers, that the air yielded in the experiment was produced. But though the leaves, exposed in water to the action of light, actually do cease to furnish air after a certain time, yet they *regain* this power after a short interval, when they furnish (or rather cause the water to furnish) more and better air than at first; which can hardly be accounted for upon the supposition that the air is elaborated in the vessels of the plant. A confirmation of this doctrine has resulted from various experiments; and thus we see, that nature is provided with abundant means of supplying that pure part of the atmosphere which is subject to such continual waste. No doubt the light of the sun produces vital air from water

as well as from vegetables, and even the waters of the ocean contribute towards this salutary purpose.

As dephlogificated air may possibly answer a valuable purpose in medicine, a cheap method of procuring it is suggested by Mr. Cavallo, who proposes to distil it from nitre with a strong heat; but the experiments already related point out an easier method.

Properties of Dephlogificated Air. This kind of air possesses some of, though not all, the properties of common air. Those in which it excels, are the support of flame and of animal life. It is equally elastic, or rather more so than common air; as it likewise exceeds it a little in specific gravity, the proportion betwixt it and common air being that of 160 to 152. In dephlogificated air, the flame of a candle not only grows larger, but becomes exceedingly bright; and burns with a crackling noise, as if the air contained some combustible matter, at the same time that the wax or tallow wastes surprisingly fast. The heat of the flame is in proportion to its light. If a bladder full of dephlogificated air be pricked with a pin, the stream of air will augment the heat of a candle to such a degree, that if any small bits of metal be placed on a piece of charcoal, and held in the apex of the flame, they will almost instantly be melted.

On mixing dephlogificated and inflammable air together, an explosion takes place as on mixing common and inflammable air, but with much greater violence. If an ounce vial, which for this purpose should be very strong, be filled with a little more than one-third of dephlogificated, and the rest inflammable, air, and the flame of a candle presented to its mouth, it will explode nearly as loud as a small pistol. All phlogistic processes are promoted much better by dephlogificated than common air. Dr. Priestley put a quantity of pyrophorus into a small jar, and threw in dephlogificated air. It always occasioned a vehement accension, like the flashing of gunpowder, and the air was greatly diminished.

It has been, almost throughout all ages, believed, that combustion in every instance diminished common air, or reduced it to a smaller volume: but the late experiments of M. Lavoisier have shewn, that this is a mistake; and that in ordinary processes, attended with the production of fixed and phlogificated air, the quantity of vapour produced is equivalent to that absorbed, or otherwise made to disappear, during the operation. With dephlogificated air the case is very different. M. Lavoisier having introduced a burning candle into a glass jar filled with very pure air obtained from calcined mercury, a great heat took place; which at first expelled a small quantity of the air; but afterwards, when the candle was extinguished, it was found that two-thirds of the bulk of air employed had been converted into fixed air, or a quantity of this kind of air equivalent to the former had been produced. The remainder, after taking up the fixed air by caustic alkali, was still as pure as before. In the common processes, he observes, that not more than one-tenth of the air employed is converted into fixed air. In this experiment, the superior gravity of fixed air, and the consequent condensation of the other, must undoubtedly have produced some diminution in the volume of air, though M. Lavoisier does not take notice of it. In other cases, however, the diminution is much more perceptible. Mr. Scheele having introduced a piece of phosphorus into seven ounce-measures of this kind of air, stopped the mouth of the bottle, and set fire to the phosphorus within: the vial broke in pieces, as soon as the flame was extinguished, by the pressure of the external air. A stronger vial being used, and opened afterwards under water, the fluid rushed into it in such a manner as almost to fill it entirely. This extraordinary diminution was also demonstrated by filling a matras with dephlogificated air, and inverting it over a vial containing an effervescing mixture of vitriolic acid and iron-filings plunged into a vessel of hot water, and furnished with a slender tube reaching above the surface.

face of the vessel. The inflammable air, issuing from the orifice of the small tube, was set on fire previous to the inversion of the matrafs, and the mouth of the latter immersed in the water; on which that fluid soon began to rise, and continued to do so till seven-eighths of the vessel were full. In cases of slow combustion, where common air is diminished and phlogificated, the dephlogificated kind was found to be almost entirely destroyed.

The purity of dephlogificated air is ascertained by its degree of diminution with nitrous air; which is to be considered as a phlogistic process. Very great differences are perceived in this respect; and, according to the quantity of diminution, the air is said to be two, three, or four, times better than common air. It is not yet accurately determined how far this proportionable purity extends. Dr. Priestley mentions some extracted from red lead five times as pure as common air. Another quantity produced from a solution of mercury in nitrous acid, was so pure, that one measure of it mixed with two of nitrous air, which had been obtained in the first part of the same process, occupied only 0.03 of a measure. On the whole, he is inclined to think, that, were it possible to make both the dephlogificated and nitrous air in the greatest purity, and then to mix them in some exact proportion, the aerial form of them both would be destroyed, the whole quantity seeming to disappear, as in the mixture of alkaline and acid air. Yet, notwithstanding its great purity, the best dephlogificated air is capable of being contaminated by some of the processes which affect the atmosphere. Dr. Priestley found $\frac{1}{10}$ consumed by a quantity of clean dry nails, which had remained in it nine months, though without being rusted. The effects of combustion have already been mentioned, as producing a great quantity of pure fixed air; but putrefaction and animal respiration probably contaminate it as in atmospheric air. Mr. Cavallo informs us, that, when an animal is confined in dephlogificated air till it dies, that air is not so bad but that it will still be capable of diminution by nitrous air; which seems to shew, that dephlogificated air is somewhat different from pure common air; or that common air is originally different from dephlogificated air lowered by the addition of phlogiston. It is certainly very remarkable; and sometimes a quantity of dephlogificated air, after having been breathed by an animal till it died, will appear by the nitrous test to be even better than common air. When the experiment is performed over lime-water (to absorb the fixed air produced in respiration), the diminution by a mixture of nitrous air is less than it would otherwise be; but it is still diminished much more than common air after an animal has died in it; which seems to intimate, that the death of the animal in dephlogificated air is principally owing to the fixed air formed by the act of respiration.

Dephlogificated air is much inferior to that of the common atmosphere in supporting vegetable life. This has been ascertained by the experiments of Dr. Priestley, Mr. Fontana, Mr. Scheele, Dr. Ingenhousz, &c. Dr. Priestley took three sprigs of mint, and introduced them into different jars of dephlogificated air, common air, and air which had been phlogificated with nitrous air several months before. The plant in phlogificated air grew much better than that in common air; while that in dephlogificated air had a sickly appearance. It was found, however, that, though the plant in phlogificated air had grown so well, the air was not sensibly improved by it, whilst the dephlogificated air was injured by the plant.

Composition of Dephlogificated Air.—When Dr. Priestley first discovered the existence of this fluid, he imagined it was composed of the nitrous acid and earth, with as much phlogiston as was necessary to its elasticity; and that the common atmosphere had as much more as was required to bring it into the mean condition in which we find it. His experiments however were opposed by others made by Lavoisier; who insisted, that, when a solution of mercury was carefully distilled, the metal was obtained in full quanti-

ty, or with scarcely any loss, notwithstanding the dephlogificated air produced. Having put two ounces and one drachm of mercury into red precipitate, and afterwards revived it, a very few grains of the metal were lost. Mr. Fontana repeated the experiment often, losing less than a grain. The vessel he used had a neck of about two feet long; and he particularly remarks, that, in order to succeed in this experiment, the fire should be managed with very great dexterity; for, if that be too strong, part of the precipitate will be volatilized.

These experiments were opposed by others made by Dr. Priestley; but still the quantity of mercury lost, or rather the proportion of it to that of the metal employed, was always various, and the difference not very small; whence Mr. Cavallo and others, with great appearance of reason, conclude, that the true reason of any perceptible loss was the strong heat made use of in the distillation, and consequently that there is no reason to suppose that any earth exists in dephlogificated air. The next question was, Whether any of the nitrous acid existed in dephlogificated air? That it contains none in a proper state of acidity, is indeed evident from many decisive experiments; but an idea was naturally entertained, that in the formation of dephlogificated air the nitrous acid was decomposed, and part of it entered into the composition of the aerial fluid. This gave rise to the theories of Mr. Lavoisier and Mr. Kirwan, which are noticed under the article ACID; as also the experiments of Mr. Watt, which tended to shew that no nitrous acid was destroyed in the composition of dephlogificated air.

On calcining metals in dephlogificated air, very singular phenomena are observed, which seem to throw great light upon the composition of this fluid. "One of the most simple of all phlogistic processes (says Dr. Priestley) is that in which metals are melted in dephlogificated air. I therefore began with this, with a view to ascertain whether any water be produced when the air is made to disappear in it. Accordingly, into a glass-vessel, containing seven ounce-measures of pretty pure dephlogificated air, I introduced a quantity of thin iron-turnings. I then fired the iron by means of a burning lens, and presently reduced the seven ounce-measures to 0.65 of a measure; but I found no more water after this process than I imagined it had not been possible for me to exclude, as it bore no proportion to the air which had disappeared. Examining the residuum of the air, I found one-fifth of it to be fixed air; and, when I tried the purity of that which remained by the test of nitrous air, it did not appear that any phlogificated air had been produced in the process: for though it was more impure than I suppose the air with which I began the experiment must have been, it was not more so than the phlogificated air of the seven ounce-measures which had not been affected by the process, and which must have been contained in the residuum, would necessarily make it. In this case, one measure of this residuum, and two of nitrous air, occupied the space of 0.32 of a measure. In another, ten ounce-measures of dephlogificated air were reduced to 0.8 of a measure; and by washing in lime-water to 0.38 of a measure. In another experiment, $7\frac{1}{2}$ ounce-measures of dephlogificated air were reduced to half an ounce-measure, of which one-fifth was fixed air, and the residuum was quite as pure as the air with which I began the experiment; the test with nitrous air, in the proportions above-mentioned, giving 0.4 in both cases."

From these experiments the doctor was led to the discovery, that the dephlogificated air had actually been imbibed by the melted iron, in the same manner as inflammable air had been imbibed by the melted calces of metals in his former experiments. In the first instance, about twelve ounce-measures of dephlogificated air had disappeared, and the iron had gained six grains in weight. On repeating the experiment, other quantities of iron, treated in the same manner, gained an addition of weight, always very nearly that of the air which had disappeared.

Dr. Priestley now proceeded to try the effect of fusing iron

iron in the open air by means of a burning lens, and he presently found that it saturated itself with pure air from the atmosphere. "I always found (says he) that it had gained weight in the proportion of $7\frac{1}{2}$ to twenty-four. The same was the effect when I melted steel. But I have reason to think, that with a greater degree of heat than I could apply, the iron might have imbibed more than even one-third of its original weight." On attempting to revive the calx of iron in inflammable air, a very unexpected appearance took place. Having put a piece of iron saturated with pure air into a vessel filled with inflammable air confined by water, the inflammable air disappeared and the metal was revived; but on weighing it, $2\frac{1}{2}$ grains out of $11\frac{1}{2}$ had been lost, besides the $7\frac{1}{2}$ ounce-measures of inflammable air which had vanished. Considering all these circumstances, the doctor had now no doubt that the two kinds of air had united, and formed either fixed air or water; and, with a view to determine this point, he repeated the experiment in a vessel where the inflammable air was confined by mercury, both the vessel and mercury having been previously made as dry as possible. In these circumstances he had no sooner begun to heat the iron, than the air was perceived to diminish, and at the same time the inside of the vessel to become cloudy, with particles of dew that covered almost the whole of it. These particles by degrees gathered into drops, and ran down. On collecting this water by means of a piece of filtering paper, he found it as nearly as possible of the same weight with that which had been lost by the iron; and also that the quantity of inflammable air which had disappeared was about double that of the dephlogificated air set loose in the operation. Thus, at one time, a piece of this slag absorbed $5\frac{1}{2}$ ounce-measures of inflammable air, while it lost the weight of about three ounce-measures of dephlogificated air, and the water collected weighed two grains. Another time a piece of slag lost 1.5 grains, and the water produced was 1.7 grains. In a third case, where $6\frac{1}{2}$ ounce-measures of inflammable air were reduced to 0.92 of a measure, the iron had lost the weight 3.3 ounce-measures of dephlogificated air, or nearly two grains.

The doctor, having succeeded so well with iron, next tried the calx of copper, and found water produced in the inflammable air in the same manner. On using precipitate *per se*, he found no more water than might be supposed to have been contained as an extraneous substance either in the inflammable air, or in the red precipitate. With iron, however, the case was vastly different. As he had formerly satisfied himself that inflammable air always contains a portion of water, and also that when it has been some time confined by water it imbibes more, he repeated the experiment with inflammable air received in a vessel of dry mercury; but in this case the water was produced, to appearance, as copiously as before. "Indeed (says he) the quantity of water produced, so greatly exceeding the weight of all the inflammable air, is sufficient to prove that it must have had some other source than any constituent part of that air, or the whole of it, together with the water contained in it, without taking into consideration the corresponding loss of weight in the iron.

"I must here observe, that the iron slag which I had treated in this manner, and which had thereby lost the weight which it had acquired in dephlogificated air, became perfect iron as at first, and was then capable of being melted by the burning lens again; so that the same piece of iron would serve for these experiments as long as the operator should choose. It was evident, therefore, that, if the iron had lost its phlogiston in the preceding fusion, it had acquired it again from the inflammable air which it had absorbed; and I do not see how the experiment can be accounted for in any other way." These experiments certainly throw some light on the composition of dephlogificated air; and others made by Mr. Cavendish, Dr. Priestley, and the French chemists, upon water, have a similar tendency. From all of them it is concluded by the most

celebrated philosophers and chemists, that dephlogificated air is one of the constituent and elementary parts of water, inflammable air being the other.

From the experiments made to ascertain this important fact, an account of which may be found in the Philosophical Transactions, Mr. Cavendish draws the following conclusions. He says—"There seem two ways by which the production of the nitrous acid may be explained: first, by supposing that dephlogificated air contains a little nitrous acid, which enters into it as one of its component parts; and that this acid, when the inflammable air is in sufficient proportion, unites to the phlogiston, and is turned into phlogificated air, but does not when the inflammable air is in too small proportion; and, secondly, by supposing that there is no nitrous acid mixed with or entering into the composition of dephlogificated air; but that, when the air is in sufficient proportion, part of the dephlogificated air with which it is debased is, by the strong affinity of phlogiston to dephlogificated air, deprived of its phlogiston, and turned into nitrous acid; whereas, when the dephlogificated air is not more than sufficient to consume the inflammable air, none then remains to deprive the phlogificated air of its phlogiston, and turn it into acid. If the latter explanation be true, I think we must allow that dephlogificated air is in reality nothing but *dephlogificated water*, or water deprived of its phlogiston; or, in other words, that water consists of dephlogificated air united to phlogiston. On the other hand, if the former explanation be true, we must suppose that dephlogificated air consists of water united to a little nitrous acid, and deprived of its phlogiston; but still the nitrous acid in it must only make a very small part of the whole, as it is found that the phlogificated air into which it is converted is very small in comparison of the dephlogificated air. I think the second of these explanations seems much the more likely; as it was found that the acid in the condensed liquor was of the nitrous kind, not only when the dephlogificated air was prepared from nitrous acid, but when procured from plants or turbith mineral. Another strong argument in favour of this opinion is, that dephlogificated air yields no nitrous acid when phlogificated by liver of sulphur; for if this air contains nitrous acid, and yields it when phlogificated by explosion with inflammable air, it is very extraordinary that it should not do so by other means. But what forms a stronger, and, I think, almost decisive, argument in favour of this explanation, is, that, when the dephlogificated air is very pure, the condensed liquor is made much more strongly acid by mixing the air to be exploded with a little phlogificated air."

The whole of Dr. Priestley's opinions on the component parts of this kind of air, are summed up thus—"The only kind of air that is now thought to be properly elementary, and to consist of a simple substance, is dephlogificated air; with the addition at least of the principle of heat, concerning which we know very little; and, as it is not probable that this adds any thing to the *weight* of bodies, it can hardly be called an *element* in their composition. Dephlogificated air appears to be one of the elements of water, of fixed air, of all the acids, and many other substances, which, till lately, have been thought to be simple."

The experiments of the French philosophers were of the same nature with those of Mr. Cavendish, but conducted on a larger scale. The inference drawn from them was the same with that already mentioned, viz. that dephlogificated and inflammable air in all cases are the two constituent parts of water. This opinion is also adopted by Mr. Kirwan in his *Treatise on Phlogiston*.

Notwithstanding these positive conclusions, however, by some of the most respectable men in this country, the evidences adduced have been unsatisfactory to some French chemists, who maintain, that Messrs. Cavendish, Priestley, and Kirwan, are totally mistaken with regard to the production of water from dephlogificated and inflammable air; and contend that the water obtained had previously existed in the air, and was not originally produced in the

the operation. The fact, indeed, becomes somewhat dubious from some experiments related by Dr. Priestley himself, and of which we shall now proceed to give an account.

One consequence of the hypothesis in question is evident, that, if water really be *produced* by the deflagration of either dephlogisticated or common air with inflammable air, the quantity of liquid obtained ought to increase in proportion to the quantity of the two airs consumed, and that without any limitation. This, however, is not the case; and Dr. Priestley describes as the greatest difficulty he ever met, with regard to the preceding theory, his never having been able to procure any water when he revived red precipitate in inflammable air; or at least not more than might have been supposed to exist in the inflammable air as an extraneous substance.—“The difficulty (says he) with respect to what becomes of the two kinds of air, was not lessened by the attempts which I made to collect all that I could from repeated decompositions of inflammable and dephlogisticated air in a close vessel. As I had produced water in this process when no more than a single explosion was made at a time, I thought that, by continuing to make explosions in the same vessel, the water would not fail to accumulate till any quantity might be collected; and I intended to have collected a considerable part of an ounce. And, as I should know exactly what quantity of air I decomposed, I had no doubt of being able to ascertain the proportion that the water and air bore to each other. With this view a mixture was made of a large quantity of air, $\frac{1}{2}$ dephlogisticated, and $\frac{3}{4}$ inflammable, from iron and oil of vitriol. But, though I had a sensible quantity of water at the first explosion (in each of which between four and five ounce-measures of the mixture of air were used), I was surprised to perceive no very sensible increase of the quantity of water on repeating the explosions. Having therefore expended forty-eight ounce-measures of the mixture, the process was discontinued; and, collecting the water with all the care that I could, I found no more than three grains, when there ought to have been 11.”—In this process, the inside of the vessel was always very black after each explosion: and there issued from the mouth of it a dense vapour, which the doctor took some pains to collect and examine, but without effect.

“That water, in great quantities, (says he,) is sometimes produced from burning inflammable and dephlogisticated air, is evident from the experiments of Messrs. Cavendish and Lavoisier. I have also frequently collected considerable quantities of water in this way, though never quite so much as the weight of the two kinds of air decomposed. My apparatus for this purpose was the following: Into the mouth of a large glass balloon I introduced a tube, from the orifice of which there continually issued inflammable air from a vessel containing iron and oil of vitriol. This, being lighted, continued to burn like a candle. Presently after the lighting of it, the inside of the balloon always became cloudy, and the moisture soon gathered in drops, and settled in the lower part of the balloon. To catch what might issue in the form of vapour, in the current of air through the balloon, I placed a glass tube in which I always found some water condensed. It is very possible, however, that in both these modes of experiment the water may be converted into a kind of vapour very different from steam, and capable of being conveyed a great way through air, or even water, without condensation along with the air with which it is mixed; and on this account it may not be possible, in either of these modes, to collect *all* the water into which the two kinds of air may be converted. The nature of this kind of vapour into which water may be changed, and which is not readily condensed by cold, is very little understood, but well deserves the attention of philosophers.”

That the water collected in the balloon comes from the decomposition of the air, and not from the fresh air circulating through it, was evident from placing balls of hot iron in the place of the flame, and finding, that, though

the balloon was as much heated by them as by the flame of the burning of the inflammable air, and consequently there must have been the same current of the external air through it, no moisture was found in the balloon.

Of Phlogisticated Air.

The universal opinion in favour of the existence of that principle named *phlogiston*, first suggested by Stahl, gave rise, on the appearance of Dr. Priestley's discoveries, to a theory, concerning the action of this substance upon air and other bodies. As it has been observed, that air was diminished, in some cases at least, by burning, universally by respiration, and by some other processes, it was imagined, that phlogiston was a body of such a singular nature, that, when mixed with air, it always diminished, instead of enlarging, its bulk, as might be more naturally expected from the addition of any vapour whatever. It was also supposed by some, that phlogiston was not only entirely devoid of gravity, but that it was a principle of *positive levity*; so that the *absolute* weight of bodies was diminished by an union with it, and augmented when it was expelled, though their *specific* gravity was diminished. Various other surprising properties were attributed to phlogiston; such as that of giving elasticity to air, of constituting flame by a *chemical combination* with air, &c. Its emission into the atmosphere was supposed to be always attended with a diminution of air; and, therefore, all processes in which air was diminished and become noxious, such as that by liver of sulphur, a mixture of iron-filings and brimstone, &c. were called *phlogistic processes*. Respiration of animals was taken into the same account; but neither in this, nor in combustion, was it allowed that any kind of vital spirit was absorbed by the blood, or separated from the air by the burning body. On the contrary, it was strenuously argued, that all this was performed by the *emission* of phlogiston from the lungs or the inflamed substance, which depraved the air, and diminished it in bulk; and, as all air was supposed to contain phlogiston, it was likewise imagined, that in all cases, where air was mended, as by the growing of vegetables, or agitation in water, the emendation was accomplished, not by the emission of any thing into the atmosphere, but by the mere absorption of phlogiston. In other respects this substance was thought to be an exceedingly powerful principle in nature; the light of the sun itself and the electric fluid being said to be modifications of it, the different kinds of airs to be *phlogistic vapours*, &c. so that the whole system of nature seemed ready to be absorbed by it at once.

The formidable powers of this principle were first checked by Lavoisier, though the latter erred equally on the contrary side; and, not content with keeping the phlogistic principle within due bounds, would needs deny its existence altogether. We accordingly find in a Treatise published in 1782, he first impugns Dr. Priestley's theory of respiration, and denies that “the respiration of animals has the property of phlogisticating air in a manner similar to what is effected by the calcination of metals and many other chemical processes; and that it ceases not to be respirable till the instant when it becomes surcharged, or at least saturated, with phlogiston.”

In order to disprove this assertion, he introduced four ounces of mercury to fifty cubic inches of common air, proposing to calcine the metal by keeping it for twelve days in a heat almost equal to that which is necessary to make it boil. After the expiration of the appointed time, forty-five grains of precipitate *per se* were formed, and the air in the vessel was diminished about one-eighth of its volume. In this state it did not precipitate lime-water; but instantly extinguished candles, and killed animals immersed in it; no longer affording any red vapours, or being diminished by mixture with nitrous air. On distilling the precipitate produced, about as much dephlogisticated air was obtained as had been left by the common air in the calcination; and, by recombining this with the noxious air left in the vessel, he re-composed a fluid nearly of the same

same goodness with common air. Hence he draws the following conclusions:—1. That five-sixths of the air we breathe are mephitic, or incapable of supporting the respiration of animals, or the inflammation or combustion of bodies. 2. That the surplus, or only one-fifth of the volume of atmospheric air, is respirable. 3. That, in the calcination of mercury, this metallic substance absorbs the falubrious part, leaving only the mephitic portion of the air. 4. That by re-uniting these two portions which had been separated, we can recompound air similar to that of the atmosphere.

To determine the effects of respiration upon air, a live sparrow was placed under a glass receiver, filled with common air and inverted in mercury, containing thirty-one cubic inches. In a quarter of an hour it became agitated, and in fifty-five minutes died convulsed. Notwithstanding the heat of the animal, which necessarily, at first, rarefied the air in the receiver, there was a sensible diminution of its bulk; which, at the end of fifteen minutes, amounted to one-fortieth; but, instead of increasing afterwards, the diminution became something less in about half an hour; and, when the animal was dead, and the air in the receiver had recovered the temperature of the room where the experiment was made, the diminution did not appear to exceed one-sixtieth part. This air, which had been respired by the sparrow, though in many respects similar to that in which the mercury had been calcined, differed from it in this respect, that it precipitated lime-water, and, by introducing caustic fixed alkali to it, was reduced one-sixth in bulk by the absorption of fixed air; after which it appeared exactly the same with that produced by the calcination of mercury or other metals; and atmospheric air was recombined by mixing this with pure dephlogisticated air in the proportions already mentioned.

It appears from the experiments of Scheele and many other chemists, that the doctrine of phlogiston has been carried too far by our British philosophers, and that the air consists of two kinds of fluids; one friendly in the highest degree to animal life; the other altogether unfit for it. These two appear incapable of being converted directly into one another by any process, natural or artificial: for, though both are destructible, yet they are always converted into other substances; from which, indeed, either the one or the other may be extracted at pleasure.

The strongest arguments in favour of the transmutation of phlogisticated air into that of a purer kind, were drawn from the purification of noxious air by vegetation, and by agitation in water. In the former case, however, as has been observed, this seeming purification is no other than an exchange of the one air for the other; the vegetables absorbing the phlogisticated, and emitting the dephlogisticated air in its stead. With respect to the agitation in water, matters remained more dubious till the discovery made by Dr. Priestley, of the emission of pure air from the latter, and of the possibility of air within a jar being influenced by the atmosphere through a body of water twelve inches in depth. These remarkable facts were illustrated by the following experiments:—1. About three ounce-measures of air, phlogisticated by nitrous air, were agitated for a quarter of an hour in a vessel containing twenty ounces of water, which had been boiled for several hours, and which was still very warm. By this process it became diminished one-sixth, and considerably improved in quality. The next day the remainder was agitated for another quarter of an hour, and the water which was boiled at the same time, when it was also diminished in quantity and improved in quality. 2. An equal quantity of air, phlogisticated by means of iron-filings and brimstone, being agitated for twenty minutes, was diminished by one-fifth, and improved so far that a candle would burn in it. 3. After expelling all the air he could from a quantity of water by boiling, he put to it, in separate vials, air that had been phlogisticated with iron-filings and brimstone, as well as that which the heat had

expelled, leaving them with their mouths in water, and agitating them occasionally. On examining the vials in about two months, he found both the air that was confined by water, and that which had been expelled by heat, completely phlogisticated. 4. That water does imbibe the purer part of the atmosphere, in preference to that which is impure, is evident, he says, from an examination of it: for, if the water be clear, and free from any thing that is putrescent, the air expelled from it by heat is generally of the standard of one; whereas that of the atmosphere, when the nitrous air is the purest, is about 1.2.

Phlogisticated air is equally invisible with common air, and something more elastic. It is fatal to animal life, and friendly to that of vegetables. It seems to exist originally, in very large quantity, in our atmosphere, from whence it may be separated by combustion, by respiration, by putrefaction, and by every species of phlogistic process. Any other species of air may be converted into this by means of fire, dephlogisticated air alone excepted. Phlogisticated air is now generally believed to be a combination of the nitrous acid with phlogiston; and that, in its gradual progress towards this, which is its ultimate stage, it first assumes the character of phlogisticated nitrous acid; then of nitrous air, in which it readily parts with its phlogiston to the atmosphere, or rather to the dephlogisticated part of it; and, lastly, it becomes phlogisticated air, in which the union betwixt the principles is so strong, that it cannot be broken by simple exposure to dephlogisticated air without heat; though the experiments of Mr. Cavendish shew, that this may be done by means of the electric spark, which produces the most violent heat we can imagine.

It had been frequently observed, that common atmospheric air was always diminished by taking the electric spark in it; and this diminution was supposed to be occasioned by the phlogistication of the air, and separation of its fixed part; in consequence of which it was urged, that lime-water is precipitated by taking the electric spark over it in a small quantity of air. Mr. Cavendish, however, who has carefully examined this subject, denies that any fixed air is produced in this manner: and, by a set of very curious experiments, published in the 75th volume of the Philosophical Transactions, has clearly shewn that nitrous acid, and not fixed air, is the product of this operation.

As in some former experiments Mr. Cavendish had found, that, by deflagrating nitre with charcoal, the whole of the acid was converted into phlogisticated air, he concluded that this kind of air is nothing else than nitrous acid united to phlogiston; according to which, it ought to be converted into nitrous acid by being deprived of its phlogiston. "But (says he) as dephlogisticated air is only water deprived of phlogiston, it is plain, that adding dephlogisticated air to a body is equivalent to depriving it of phlogiston, and adding water to it; and therefore phlogisticated air ought also to be reduced to nitrous acid by being made to unite or form a chemical combination with dephlogisticated air; only the acid thus formed will be more dilute than if the phlogisticated air were simply deprived of phlogiston.

"This being premised, we may safely conclude, that, in the present experiments, the phlogisticated air was enabled, by means of the electrical spark, to unite to, or form a chemical combination with, the dephlogisticated air, and was thereby reduced to nitrous acid, which united to the soap-leys, and formed a solution of nitre; for, in these experiments, the two airs actually disappeared, and nitrous acid was formed in their room: and, as it has been shewn, from other circumstances, that phlogisticated air must form nitrous acid when combined with dephlogisticated air, the above-mentioned opinion seems to be sufficiently established. And a further confirmation is, that no diminution of air is perceived when the electric spark is passed either through pure dephlogisticated or, through perfectly phlogisticated air; which indicates a necessity for the combination

bination of the two, in order to produce nitrous acid. It was also found, by the last experiment, that the quantity of nitre produced was the same that would have been obtained from the soap-leys, had they been saturated with nitrous acid; which shews that the production of the nitre was not owing to any decomposition of the soap-leys.

"As far as the experiments hitherto published extend, we scarcely know more of the nature of the phlogificated part of the atmosphere, than that it is not diminished by lime-water, caustic alkalies, or nitrous air; that it is unfit to support fire, or maintain life in animals; and that its specific gravity is not much less than that of common air: so that, though the nitrous acid, by being united to phlogiston, is converted into air possessed of these properties; and, consequently, though it was reasonable to suppose, that part at least of the phlogificated air of the atmosphere consists of this acid united to phlogiston; yet it might be fairly doubted whether the whole is of this kind, or whether there are not, in reality, many different substances confounded by us under the name of phlogificated air. I therefore made an experiment to determine whether the whole of a given portion of the atmosphere could be reduced to nitrous acid, or whether there was not a part of a quite different nature from the rest, which would refuse to undergo that change. For this purpose, I diminished a mixture of dephlogificated and common air, till it was reduced to a small part of its original bulk; after which some dephlogificated air was added, and the spark continued till no further diminution took place. Having by these means condensed as much as I could of the phlogificated air, I let up some solution of liver of sulphur to absorb the dephlogificated air; after which only a small bubble of air remained unabsorbed, which certainly was not more than $\frac{1}{120}$ th of the bulk of the phlogificated air let up into the tube; so that, if there is any part of the phlogificated air of our atmosphere which differs from the rest, and cannot be reduced to nitrous acid, we may safely conclude that it is not more than $\frac{1}{120}$ th part of the whole."

Though these experiments had shewn, that the chief cause of this diminution of air is the conversion of the phlogificated kind into nitrous acid, it seemed not unlikely, that, when any liquor containing inflammable matter was in contact with the air in the tube, some of this matter might be burnt by the spark, and thereby diminish the air. In order to determine this, the electric spark was passed through dephlogificated air included between different liquors; and the result of the experiments was, that when dephlogificated air, containing only one-twentieth part of its bulk of phlogificated air, was confined between short columns of soap-leys, and the spark passed through it till no farther diminution could be perceived, the air lost $\frac{43}{200}$ ths of its bulk; which is not a greater diminution than might very likely proceed from the decomposition of the small quantity of phlogificated air contained in it, as the dephlogificated air might be easily mixed with a small quantity of common air while putting into the tube. When the same dephlogificated air was confined between columns of distilled water, the diminution was rather greater than before, and a white powder was formed on the surface of the quicksilver beneath: the reason of which, in all probability, was, that the acid produced in the operation corroded the quicksilver, and formed the powder; and that the nitrous air produced by that corrosion united to the dephlogificated air, and caused a greater diminution than would otherwise have taken place. When a solution of litmus was used instead of distilled water, the solution soon acquired a red colour; which grew paler and paler as the spark was continued, till it became quite colourless and transparent. The air was diminished by almost one-half, and might perhaps have been further diminished had the spark been continued. When lime-water was let up into the tube, a cloud was formed, and the air was further diminished by about

one-fifth; the remainder was good dephlogificated air. In this experiment, therefore, the litmus was, if not burnt, at least decomposed, so as to lose entirely its purple colour, and to yield fixed air; so that, though soap-leys cannot be decomposed by this process, yet the solution of litmus can, and so very likely might the solutions of many other substances. But there is nothing in any of these experiments which favours the opinion of the air being at all diminished by means of phlogiston communicated to it by the electric spark.

Of Fixed Air.

The discovery of this kind of air is as old as Van Helmont, who gave it the name of *gas silvestre*, from its being emitted in great quantity by burning charcoal. Subsequent discoveries shewed, that a fluid of the same kind was plentifully produced by fermenting liquors, by almost every kind of combustion, and was also naturally generated, in vast quantity, in mines and coal-pits, where it is known by the name of the *choak-damp*; that it exists in a concrete state in alkaline salts, chalk, limestone, the shells of marine animals, magnesia alba, &c. in a very large proportion, constituting one-half, and sometimes more, of their weight; and that it might always be extracted from the atmosphere, in unlimited quantity, by exposing certain substances to it. This fluid, being found so manifestly acid, has now obtained the name of *aerial acid*.

Fixed air is the heaviest of all permanently-elastic fluids, excepting those derived from the mineral acids. Mr. Kirwan determines it to be to common air as 1500 to 1000, the barometer being at 29.85, the thermometer at sixty-four, and the fixed air being extracted from calcareous spar by marine acid, whose specific gravity was 1.0145. When combined with calcareous earth, it is prodigiously concentrated; and, were it possible to exist by itself in that state, it would be the heaviest body known, gold and platinum excepted. To prove this, Mr. K. first ascertained the specific gravity of a piece of white marble; then expelled the fixed air from a known weight of it finely powdered, by means of diluted vitriolic acid; the bulk and weight of the obtained fixed air being ascertained. Next, he calcined a known quantity of the same sort of marble, by keeping it in a white heat for the space of fourteen hours; after which, being weighed again, and from the weight lost by this calcination, the weight of the fixed air, which must have escaped from it according to the above-mentioned experiment, being subtracted, the remainder is the weight of water contained in the marble; from which experiments it appears, that 100 grains of the marble contained 32.42 grains of fixed air, 11.66 grains of water, and 56.92 grains of pure calcareous earth.

"I next (says he) proceeded to discover the specific gravity of the lime. Into a brass box, which weighed 607.65 grains, and in the bottom of which a small hole was drilled, I stuffed as much as possible of the finely-powdered lime, and then screwed the cover on, and weighed it both in air and in water. When immersed in the latter, a considerable quantity of common air was expelled; when this ceased, I weighed it. The result of this experiment is as follows:

	Grains.
Weight of the box in air	607.65
Its loss of weight in water	73.75
Weight of the box and lime in air	1043.5
Weight of the lime singly in air	435.85
Loss of weight of the box and lime in water	256.5
Loss of weight of the lime singly	182.3

"Hence, dividing the absolute weight of the lime by its loss in water, its specific gravity was found to be 2.3908.

"From these data I deduced the specific gravity of fixed air in its fixed state; for 100 grains of marble consist of 55.92 of earth, 32.42 of fixed air, and 11.66 of water; and the specific gravity of the marble is 2.717. Now, the specific gravity of the fixed air, in its fixed state, is as its absolute weight, divided by its loss of weight in water;

ter; and its loss of weight in water is as the loss of 100 grains of marble, *minus* the losses of the pure calcareous earth and the water.

$$\text{Loss of 100 grs. of marble} = \frac{100}{2.717} = 36.8 \text{ grs.}$$

$$\text{Loss of 55.92 grs. of calcareous earth} = \frac{55.92}{2.39} = 23.39 \text{ grs.}$$

$$\text{Loss of 11.66 grs. of water} = \frac{11.66}{1.75} = 6.66 \text{ grs.}$$

$$\begin{aligned} \text{"Then the loss of the fixed air } 36.8 - 35.05 &= 1.75; \\ \text{consequently its specific gravity is } \frac{32.42}{1.75} &= 18.52." \end{aligned}$$

Fixed air differs considerably from other airs. Its acidity is manifest to the taste, and still more from its neutralising alkalies, so as to form crystals of a neutral or acidulous salt. It has a considerable power in checking the putrefaction of animal substances; though in this case it acts only by absorbing the putrid effluvia already emitted from the body, and becomes itself offensive while it sweetens the other. When taken into the lungs, it is equally poisonous with any other noxious air, and extinguishes flame as effectually; but, when mixed with dephlogisticated air, it may be inspired without danger, and even in its pure state may be copiously swallowed to effect the cure of diseases, whence it has now become an article of the *Materia Medica*. As an acid, it stands in the lowest rank, being expelled from alkalies by every other; though it separates oils, sulphur, and the colouring matter of Prussian blue, from the substances with which they are combined.

The compound nature of fixed air, and the principles from which it is formed, were first discovered by Mr. Kirwan; but Dr. Priestley was not convinced by the proofs he adduced, till after making some experiments of his own. The first was, by firing shavings of iron in dephlogisticated air; when he observed a considerable residuum of fixed air, though that in the receiver had been of the purest dephlogisticated kind, and iron could only have yielded inflammable air. The hypothesis of Mr. K. was still further confirmed by an experiment in which iron-filings, which could only have yielded inflammable air, were mixed with red precipitate, which is known to yield only pure dephlogisticated air. On heating these in a glass retort, they gave a great quantity of fixed air, in some portions of which nineteen-twentieths were absorbed by lime-water, and the residuum was inflammable; but when the red precipitate was mixed with powdered charcoal, which had been found to yield only inflammable air, the fixed air produced from it was so pure that only one-tenth part remained unabsorbed by water, which is as pure as that generally prepared from chalk and oil of vitriol. In some of these experiments it appeared, that three ounce-measures of dephlogisticated air went to the composition of two of fixed air: for one ounce of red precipitate gave sixty ounce-measures of dephlogisticated air; and, when mixed with two ounces of iron-filings, it gave about forty ounce-measures of fixed air that were actually absorbed by water, besides a residuum that was inflammable. The same proportion was obtained when half the quantity of materials was employed; but, on using an ounce of each, only twenty ounce-measures of fixed air, including the residuum, could be got.

In considering this subject farther, it occurred to Dr. Priestley, that his experiments, in which charcoal was used, lay open to an objection, that, since dry wood and imperfectly-made charcoal yield fixed air, it might be said that all the elements of fixed air are contained in charcoal. In order, therefore, to expel all the fixed air from charcoal, he made a quantity of it from dry oak, and, pounding it while hot, instantly mixed four measures of it with

one of red precipitate, and, putting them into an earthen retort, got, with a heat no greater than what was sufficient to revive the mercury, a large quantity of air, half of which was fixed. Afterwards the proportion of fixed air was less, and at last no fixed air at all was obtained; but, as the residuum was worse than the common atmosphere, he is thence inclined to believe, notwithstanding Mr. Cavendish's experiments, that phlogisticated air may be composed of phlogiston and dephlogisticated air. In another experiment he found a better proportion of charcoal and red precipitate. This was by mixing one ounce of precipitate with the same quantity of perfect charcoal hot from the retort in which it was made. Putting these into a coated retort, he expelled from them, by a strong heat, about thirty ounce-measures of air, the whole of which was the purest fixed air, leaving only about one-fortieth part unabsorbed by water, and this almost perfectly phlogisticated.

Having recollected that formerly he had obtained fixed air from nitrous acid and charcoal, he repeated the experiment with some of the same charcoal which had then been used; when fixed air was obtained, in the quantity sometimes only of one-fifth, and sometimes of one-half; to the formation of which he supposed the dephlogisticated air produced by heating the nitrous acid must have contributed. On account of the objections, however, which might be made to the use of charcoal, he next employed iron, which was liable to nothing of this kind; and on mixing an ounce of it with an ounce of charcoal, and then heating them in a glass retort, he obtained twenty ounce-measures of air, of which one-seventh remained unabsorbed by water. The residuum was of the standard of 1.52, but slightly inflammable. Repeating the experiment with half an ounce of iron-filings, he got twenty-six ounce-measures of air, of which the first part was pretty pure, but afterwards one-tenth remained unabsorbed by water; but, on mixing one ounce of precipitate with two ounces of filings, he got about forty ounce-measures of air, of the first portions of which only one-twentieth was unabsorbed by water, though towards the conclusion the residuum was greater. In this process he got in all thirty-six ounce-measures of pure fixed air, completely absorbed by water, besides about four other ounce-measures, which, he supposes, might have been absorbed in receiving the air, and transferring it into other vessels.

Fixed air was also produced from red precipitate mixed with brass-filings, with zinc, from turbithe-mineral with iron-filings, and from the black powder into which mercury mixed with lead is easily converted. In this last case the doctor supposes, that the fixed air was produced from the dephlogisticated kind absorbed by the metals and the phlogiston of the lead; and this is confirmed by an observation, that the fixed air always comes first in the process, when the phlogiston is most readily separated, but afterwards the produce becomes quite pure and dephlogisticated. In attempting, however, to increase the quantity of fixed air by heating this black powder in dephlogisticated air, he found only an augmentation of the quantity of dephlogisticated air, and that of the purest kind.

"Perhaps (says he) as decisive a proof as any of the real production of fixed air from phlogiston and dephlogisticated air, may be drawn from the experiments in which I always found a quantity of it when I burned sulphur in dephlogisticated air. In one of these experiments, to which I gave particular attention, six ounce-measures and a half of the dephlogisticated air were reduced to about two ounce-measures, and one-fifth of this was fixed air. When both the vitriolic acid and fixed air produced by this operation were absorbed by water, the remainder was very pure dephlogisticated air.

"I had always concluded, that no fixed air could be procured by the decomposition of inflammable air which had been produced by mineral acids, because I had not been able to do it with that which I had got by means of vitriolic

vitriolic acid; but I learned from Mr. Methrie, that this is peculiar to the vitriolic acid, the remains of which, diffused through the inflammable air procured by it, he conjectures, may actually decompose the fixed air produced in the process. For, as I have hinted before, when the inflammable air is produced from iron by means of spirit of salt, there is a very perceivable quantity of fixed air when it is united with dephlogisticated air. When I decomposed these two kinds of air in equal quantities, they were reduced to about 0.5 of a measure, and of this not more than about one-fortieth part was fixed air. This experiment ought, however, to be added to the other proofs of fixed air being produced by the union of dephlogisticated air and phlogiston.

"The last instance which I shall mention of the generation of fixed air from phlogiston and dephlogisticated air, is of a much more striking nature than any that I have yet recited. Having made what I call *charcoal of copper*, by passing the vapour of spirit of wine over copper that was red-hot, I heated a piece of it in different kinds of air. In common air, observing neither increase nor decrease in the quantity, I concluded, perhaps too hastily, that no change was made in it; for, when I repeated the experiment in dephlogisticated air, the charcoal burned very intensely; and, when part of it was consumed, (which, like common charcoal in the same process, was done without leaving any sensible residuum,) I found that no heat which I could apply afterwards had any farther effect on what was left of the charcoal. Concluding, therefore, that some change must be made in the quality of the air, I examined it, and found about nine-tenths to be the purest fixed air; and the residuum was such as would have been made by separating the absolutely-pure part of the dephlogisticated air, leaving all the impurities behind. Having ascertained this fact, I repeated the experiment, weighing the piece of charcoal very carefully before and after the process; and then found, that by the loss of one grain of charcoal, I reduced four ounce-measures of dephlogisticated air till one-ninth only remained unabsorbed by water; and again, with the loss of a grain and a half of the charcoal, I reduced six measures and a half of dephlogisticated air till five measures and a half were pure fixed air. In this process there was a diminution of bulk after the experiment, as might have been expected from the change of the air into one of a heavier kind, by means of a substance or principle that could not add much to the weight of it. In one of the experiments, 4.3 ounce-measures of dephlogisticated air were reduced about one-thirtieth part of the whole; and, in this case, when the fixed air was separated by water, there was a residuum of 0.75 of a measure of the standard of 1.0 , whereas the dephlogisticated air, before the experiment, had been of the standard of 0.2 .

"That dephlogisticated air actually enters into the composition of the fixed air, in this experiment, is evident from the weight of the latter, which far exceeds that of the charcoal dispersed in the process. For, in this last experiment, the weight of the fixed air produced was 4.95 grains. Consequently, supposing the charcoal to be wholly phlogiston, as it is very nearly so, fixed air may be said to consist of 3.45 parts of dephlogisticated air, and 1.5 of phlogiston; so that the dephlogisticated air is more than three times the proportion of phlogiston in it. I must not conclude, however, without observing, that, in one experiment, I never failed to produce fixed air; though it is not easy to see how one of its supposed elements, viz. dephlogisticated air, could enter into it. This is by heating iron in vitriolic acid air. In one of these experiments, four ounce-measures of the vitriolic acid air were reduced to 0.65 of an ounce-measure; and of the quantity lost three measures and a half were fixed air absorbed by lime-water, and the remainder weakly inflammable."

Pure fixed air is remarkably altered by the electric spark. Dr. Priestley, having taken the electric spark for about two hours in a small quantity of fixed air, found

that one-fourth of it remained immiscible with water; though, before it, only one-twentieth part had remained unabsorbed. The inside of the tube had become very black; which, in similar experiments with vitriolic acid air, he had observed to arise from the adhesion of a small quantity of mercury superaturated with phlogiston. Pursuing this experiment, by taking the electric spark three hours in a small quantity of fixed air, he observed that it was first increased, and then diminished about one-eighth of the whole; the inside of the tube being very black on the upper part, and below the mercury very yellow, for the space of one-fourth of an inch all round the tube; but this space had been above the mercury in the beginning of the operation. One third of the air remained unabsorbed by water; but so impure, that the standard of it was 1.8 , or almost completely phlogisticated. Varying the process, by using water impregnated with fixed air instead of mercury, the quantity of air was much augmented by that which came from the water; but thus the far greater part of it was incapable of being absorbed by lime-water; and, on this occasion he observed, that water impregnated with fixed air is a much worse conductor of electricity than the same fluid impregnated with mineral acids. On still varying the circumstances of the experiment, by using common water instead of that which had absorbed fixed air, he found that the quality of the residuum was evidently better than that of the original fixed air.

In order to discover whether the heat or light of the electric spark were the circumstances which effected the change, the doctor threw a strong light, by means of a lens, for some hours, on a quantity of pounded glass confined in some fixed air; but these and other trials proved unsatisfactory, though the quantity of air was increased after the operation. By heating iron, however, in fixed air, part of it was evidently converted into phlogisticated air. On heating turnings of malleable iron for some time in fixed air, one-tenth part of it was rendered immiscible with water; and, on repeating the process with the remainder, there was a residuum of one-fourth of the whole. There was also a small addition to the quantity of air after the first part of the process, but none after the second; nor could he, after a third and fourth process, render more than one-fourth immiscible with water. In two experiments, the residuum was inflammable, and burned with a blue flame.

With regard to the quantity of fixed air which may be expelled from different substances, Dr. Priestley observes, that from seven ounces of whiting, the purest calcareous substance we are acquainted with, he expelled by heat 630 ounce-measures of air; by which means the whiting was reduced to four ounces. One-third of this was somewhat phlogisticated, the standard being 1.36 and 1.38 . Repeating the experiment, he obtained 440 ounce-measures of air from six ounces of whiting; about half of which was fixed air, and the remainder of the standard of 1.4 . On moistening some calcined whiting with water impregnated with vitriolic acid air, he obtained ninety ounce-measures; of which the first portions were three-fourths fixed air, and the standard of the residuum 1.5 ; the latter had less fixed air, and the standard of the residuum was 1.44 . The whiting was rendered black and hard, but became soft and white with spirit of salt. Three ounces and a quarter of lime fallen in the air yielded 375 ounce-measures; of which about one-fifth was fixed air, and the standard of the residuum 1.4 . Four ounces of white lead had yielded 240 measures of air when the retort melted. The residuum of the first process was one-third, the standard 1.36 ; and of the last the standard was 1.28 , that with the common atmosphere being 1.23 . Two ounces and three-quarters of wood-ashes yielded, in a very strong heat, 430 ounce-measures of air; of the first portion of which one-tenth, of the second one-third; and of the third one-half, was fixed air. The standard of the residuum of the first portion was 1.6 ; and of the second 1.7 .

It extinguished a candle; so that the air came properly from the ashes, and not from any remaining particles of the charcoal mixed with them. After the process, the ashes weighed 839 grains; but, by exposure to the air for one day, the weight was increased to 842 grains; and, perhaps, with more heat than before, yielded fifty ounce-measures of air; of which about one-eighth was fixed air, and the standard of the residuum 1.38 and 1.41. A candle burned in this residuum, and the ashes were reduced to 789½ grains. Dr. Priestley afterwards subjected Homberg's pyrophorus to similar trials, and the results proved highly interesting, though they afforded no general conclusion.

Inflammable Air.

We owe the knowledge of the existence, and of some remarkable properties, of this air, to Mr. Cavendish, by whom they were first published in 1767. Its effects, however, had long before been fatally experienced by miners; in whose subterraneous habitations it is often collected in such quantities as to produce the most dreadful effects. It is produced in abundance from putrid animal and vegetable substances; and, in general, by all those which part with their phlogiston easily.

Being much lighter than common air, it always rises to the top of those places where it is generated; so that it cannot be confined except in some vaulted place, but always strives to ascend and mix with the atmosphere. By itself it will instantly put an end to animal life; but, mixed with atmospherical air, it may be breathed in much greater quantity than fixed air. Its great inflammability in this state, however, renders it very dangerous to bring lights, or even to strike a flint with steel, in places where it abounds. Yet this only happens when inflammable air is mixed with common atmospherical or with dephlogisticated air; in which latter case, the explosion is by many degrees more violent; but pure inflammable air extinguishes flame as effectually as fixed or phlogisticated air.

But, besides subterraneous places, this kind of air is found in ditches; over the surface of putrid waters; in burying-grounds; in all places where putrid animal and vegetable matters are accumulated. In hot climates, where putrefaction is most prevalent, if the mud at the bottom of a pond be well stirred, and a lighted candle brought to the surface of the water, a flame will instantly spread a considerable way over the water, from the ascension of the inflammable air. In colder climates, though the generation of inflammable air is not so plentiful, it may be easily collected in a jar filled with water, and inverted over a pond, the mud at the bottom being stirred with a stick.

The meteors and *ignes fatui*, which are seen in warm climates, have been supposed nothing more than streams of inflammable air fired in the atmosphere by electric explosions; but these appearances are accounted for in a more satisfactory way. There is hardly any inflammable substance out of which this air may not be extracted, yet the fluids which go by the general name of inflammable air, have scarcely any other property in common, besides those of inflammability, and being specifically lighter than atmospherical air. It is, however, necessary to make a proper distinction between an inflammable gas, properly so called, and that which is evidently made by combining an inflammable substance with common air; which being easily separated leaves that fluid in the state it was before. By heat alone, a considerable quantity of this kind of air may be extracted from most inflammable substances, and even from some of the metals. Dr. Priestley obtained it from a vast number of substances, by distilling them in a gun-barrel, to the extremity of which was luted a tobacco-pipe, with a flaccid bladder tied on the end. He observes, that the heat must be suddenly applied, in order to get a considerable quantity of air from these substances. "Notwithstanding (says he) the same care be taken in luting, and in every other respect, fix, or even ten, times

more air may be got by a sudden heat than by a slow one, though the heat that is last applied be as intense as that which was applied suddenly. In a trial of the metallic calces he had no success.

In the infancy of his experiments, Dr. Priestley imagined, that the inflammable air produced in this way came only from the metal; while Lavoisier, on the other hand, attempted to prove that it proceeded almost exclusively from the water. The method which the latter had followed, was to send the steam of boiling water through a red-hot iron tube; in doing which the intense heat acquired by the water occasioned the production of a great quantity of inflammable air. Dr. Priestley repeated his experiments not only with water, but with other fluids. Sending the vapour of two ounces of spirit of wine through a red-hot earthen tube, he obtained 1900 ounce-measures of inflammable air, which burned with a white lambent flame. It contained no fixed air; and thirty ounce-measures of it weighed eight grains less than an equal quantity of common air. He collected also 0.35 of an ounce-measure of water. In this experiment the weight of the water collected was 168 grains, of the inflammable air 633 grains, and that of the spirit of wine originally was 821 grains; so that as little was lost in the process as could be expected. Repeating the experiment with vitriolic ether, an ounce of it treated in the same manner in an earthen tube almost filled with pieces of broken earthen retorts and crucibles, one-tenth part of an ounce of water was collected, and 740 ounce-measures of inflammable air were procured, without any mixture of fixed air, burning with a white lambent flame like that of wood, and not exploding with dephlogisticated air. Twenty-nine ounce-measures of this weighed five grains less than an equal quantity of common air. Vapour of spirit of turpentine yielded inflammable air mixed with much black smoke, which soon collected on the surface of the water in the receiver. The smell of this air was exceedingly offensive, and its flame was much less luminous than that of the former. Its specific gravity was the same with that of the air procured from spirit of wine. Olive oil yielded a considerable quantity of air on being mixed with calcined whiting; the first portions burning with a large white flame, and the last with a lambent blue one.

In extracting air from solid substances, the steam of water was always necessary; and thus inflammable air was produced from a great number of different ones. From sulphur treated in this manner in an earthen tube, inflammable air was obtained of a nature similar to that from oil of vitriol and iron. From arsenic the produce was one-seventh of fixed air; but all the rest strongly inflammable, with a smell scarcely distinguishable from that of phosphorus. Twenty ounce-measures of this air weighed four grains and a half less than an equal quantity of common air. Both these experiments, however, were very troublesome, on account of the volatility of the matters, which sublimed and choked up the tubes. From two ounces of scales of iron, or *fining cinder*, which he has found to be the same thing, Dr. Priestley obtained 580 ounce-measures of air; one-tenth of the first part of which was fixed air, but afterwards it was all inflammable. Forty ounce-measures of this air weighed two grains more than an equal quantity of common air. From charcoal exposed to the red-hot steam of water, inflammable air was procured in great quantities. From ninety-four grains of perfect charcoal, that is, prepared with a strong heat so as to expel all fixed air from it, and 240 ounces of water, 840 ounce-measures of air were obtained, one-fifth part of which was fixed air; and the inflammable part appeared likewise, by decomposition, to have a quantity of fixed air intimately combined with it. Three ounces of bones burnt black, and treated in this manner in a copper-tube, yielded 840 ounce-measures of air; the water expended being 268 grains, and the bones losing 110 grains of their weight. This air, he observes, differs considerably from that of any other kind of inflammable

air; being in several respects a medium betwixt the air procured from charcoal and that from iron. It contains about one-fourth of its bulk of uncombined fixed air, but not quite one-tenth intimately combined with the remainder. The water that came over was blue, and pretty strongly alkaline; owing to the volatile alkali not having been totally expelled by the heat which had reduced the bones to blacknefs.

A variety of substances, said not to contain any phlogiston, were subjected to the same process, but without yielding any inflammable air. The experiments with iron, however, were the most satisfactory, as being subject to less variation than those with charcoal; and clearly evincing, that the air in the process does not come from the water alone, but from the iron also; or, as Dr. Priestley says, "only from the iron;" the weight of water expended, deducting the weight of air produced, being found in the addition of weight in the iron as nearly as could be expected in experiments of this kind. The quantity of inflammable air that may be procured by steam from any given quantity of iron, the doctor states thus: "960 grains of iron, when dissolved in acids, will yield about 800 ounce-measures of air; but, treated in this manner, it yielded 1054 measures, and then the iron had gained 329 grains in weight."

Inflammable air having been at first produced only from metals by means of acids, it was then supposed that part of the acid necessarily enters into its composition; but, as this hypothesis was proved to be ill grounded by the most decisive experiments, we shall not take up the reader's time farther than by quoting Dr. Priestley's concluding remarks on the subject:—"With respect to inflammable air (says he) I have observed, that when sufficient care is taken to free it from any acid vapour that may be accidentally contained in it, it is not in the smallest degree affected by a mixture of alkaline air. On the whole, therefore, I have at present no doubt, but that pure inflammable air, though it certainly contains water, does not necessarily contain any acid: yet an acid vapour may be easily diffused through it, and may perhaps, in many cases, be obstinately retained by it, as no kind of air seems to be capable of so great a variety of impregnations as inflammable air is."

We are indebted to Mr. Cavendish for the fact that water is necessary to the production of inflammable air, and to Dr. Priestley for the discovery that charcoal is perfectly destructible, or decomposed, *in vacuo*, and, by the heat of a burning lens, almost convertible into inflammable air; nothing remaining besides an exceedingly small quantity of white ashes, which are scarcely visible. The great weight of ashes produced by burning wood in the open air arises from what they attract from the atmosphere. The air got in this manner is wholly inflammable, and without containing the least particle of fixed air; but, in order to this, the charcoal must be made with such a heat as will expel all the fixed air from the wood; and it must be continued till it yield inflammable air only, which, in an earthen retort, is soon produced. Wood or charcoal is even perfectly destructible, that is, resolvable into inflammable air, in a good earthen retort, and a fire that would about melt iron. An ounce of charcoal made from oak generally gives about five ounce-measures of inflammable air in twelve minutes.

The proofs of the agency of water, in the production of inflammable air, Dr. Priestley communicates in the following words:—"Apprised of the influence of unperceived moisture in the production of inflammable air, and willing to ascertain it to my perfect satisfaction, I began with filling a gun-barrel with iron-filings in their common state, without taking any particular precaution to dry them, and I found that they gave air as they had been used to do, and continued to do so many hours: I even got ten ounce-measures of inflammable air from two ounces of iron-filings in a coated glass retort: at length, however, the production of inflammable air from the gun-barrel

ceased; but, on putting water to it, the air was produced again; and a few repetitions of the experiment convinced me, that I had been too precipitate in concluding that inflammable air is pure phlogiston. I then repeated the experiment with the charcoal, making the receiver the stand on which I placed the charcoal, and the charcoal itself as dry and hot as possible, and using cement instead of wet leather, in order to exclude the air. In these circumstances, I was not able, with the advantage of a good sun, and an excellent burning lens, to decompose quite so much as two grains of the piece of charcoal which gave me ten ounce-measures of inflammable air; and this, I imagine, was effected by means of so much moisture as was deposited from the air in its state of rarefaction, and before it could be drawn from the receiver. To the production of this kind of inflammable air, therefore, I was now convinced that water is as essential as to that from iron."

Of inflammable airs the doctor observes, that the difference most commonly perceived is, that some of them burn with a lambent flame, white, yellow, or sometimes blue; while another kind always burns with an explosion, making more or less of a report when a lighted candle is dipped into it. The inflammable air extracted from metals by means of acids is of this last kind; and that from wood, coal, or other inflammable substances, by means of heat, belongs to the former. It has also been observed, that these kinds of inflammable air have different specific gravities; the purest, or that which is extracted from iron, &c. being about ten times as light as common air; but some of the other kinds not more than twice as light.—This difference was for some time attributed to a quantity of fixed air intimately combined with the heavier kinds, so that it could not be discovered by lime-water, while the lightest contained no fixed air at all. In order to ascertain this point, he had recourse to decomposition; which was performed by mixing with the inflammable air to be tried, an equal quantity of common or dephlogisticated air, and then confining them in a strong glass vessel previously filled either with water or mercury; making afterwards an electric spark in some part of the mixture by means of wires inserted through the sides of the vessel, and nearly meeting within it. Thus he supposed that he might be able to determine the quantity of combined fixed air, and likewise the relative quantity of phlogiston contained in each of them. The former appeared by washing the air with lime-water after the explosion, and observing how much of them was absorbed; and the latter by examining the residuum with the test of nitrous air, and observing the purity of it. Finding, however, that in some cases more fixed air was found after the explosion than could have been contained in the inflammable air, he was thence led to observe the generation of fixed air from the principles mentioned on another occasion.

In prosecuting this subject, it was found that one measure of inflammable air produced by steam from metals, and one of dephlogisticated air, such as by mixture with two measures of nitrous air was reduced to 0.72 of a measure, were reduced by explosion to 0.6 of a measure; the residuum, by an equal quantity of nitrous air, was reduced to 0.87. With the same dephlogisticated air, the inflammable air from fining-cinder and charcoal was reduced only to 1.85 of a measure; but by washing in lime-water, to 1.2. The residuum examined by nitrous air appeared to be of the standard of 0.9. In another process, the diminution after the explosion was to 1.55, and that after washing in lime-water to 0.65, of a measure; in a third by explosion, to 1.6, and by washing to 0.66; and in a fourth the first diminution was to 1.6, and the second to 0.6. In this last experiment there was a generation of an entire measure of fixed air; and that this had not been contained originally in any latent state in the original fluid, was evident from the specific gravity of the inflammable air made use of. This, indeed, was one of the heaviest kinds of the fluid: but forty ounce-measures of it weighed only two grains more than an equal bulk of common air; whereas,

had all the fixed air found in the residuum been contained in the original air, it must have been at least one half heavier. "Indeed (says the doctor) if any quantity of inflammable air, of about the same specific gravity with common air (which is the case with that species of it I am now considering), yield so much as seven-tenths of its bulk of fixed air in consequence of its explosion with dephlogisticated air, it is a proof that at least part of that fixed air was generated in the process, because seven-tenths of such fixed air would weigh more than the whole measure of inflammable air."

Numerous experiments, evincing still farther the generation of fixed air in the decomposition of inflammable air, are described by Dr. Priestley, and with various results, according to the processes used, and the different substances employed in procuring the latter. From the whole of them it was evident, that at least part of the fixed air found after the explosion was produced by its means. But the following seem proofs no less convincing that fixed air may be converted into the inflammable kind, or at least that the elements of fixed air may remain in inflammable air in such a manner as to be imperceptible. On heating in an earthen retort a quantity of flaked lime, which had long been kept close corked in a bottle, it gave air, of which one-fifth was generally fixed air; but in the gun-barrel the same lime yielded no fixed air, but a great quantity of inflammable air of the explosive kind, like that which is got from iron alone by means of water. As this total disappearance of the fixed air appeared extraordinary, the doctor was induced to repeat it several times with all possible care: and the following was the result of his experiments: Three ounces of flaked lime, which had for some time been exposed to the open air, heated in an earthen tube, yielded fourteen ounce-measures of air, of which only two and a half remained unabsorbed by water; the residuum was slightly inflammable, but not perfectly phlogisticated. Three ounces of the same lime, heated in a gun-barrel, gave twenty ounce-measures of air, all of which was inflammable, and no part fixed. It was expected, however, that the fixed air would have appeared on the decomposition of this inflammable air with the dephlogisticated kind: but after this process it appeared to be exactly such inflammable air as is procured from metals by the mineral acids, or by steam; the diminution of the two kinds of air being exactly the same: and, though some fixed air was found in the residuum, it was no more than is usually met with in the decomposition of inflammable air procured by means of spirit of salt.—Supposing that the two kinds of air might incorporate, when one of them was generated within the other, a gun-barrel was filled with fixed air, and the closed end of it put into a hot fire. Inflammable air was instantly produced; but, when the fixed air was separated from it, it burned like inflammable air with which no other kind had ever been mixed.

On heating iron-turnings in five ounce-measures of fixed air, the quantity of it was increased about one ounce-measure, and there remained one and $\frac{3}{4}$ unabsorbed by water. The experiment was repeated with the same result; and it was farther observed, that, though the inflammable air procured in this manner did not appear by the test of lime-water to contain any fixed air, yet, when it was decomposed by firing it with an equal quantity of dephlogisticated air, the residuum contained one-third of fixed air. The diminution was to 1.45. Hence the doctor conjectures, that though, in some cases, the fixed air appears to be generated by the decomposition of dephlogisticated and inflammable air, yet that inflammable air, when thus produced in contact with fixed air, may combine with it, so as to be properly contained in it, and in such a manner that it cannot be discovered by lime-water.

Inflammable air, when produced in the driest way possible, is exceedingly light, as has been already observed; but Dr. Priestley has found, that, by standing on water, a very considerable increase is made in its specific gravity; so that, from being ten or twelve times lighter than at-

mospherical air, it soon becomes only seven times lighter. This great propensity to unite with water is also taken notice of by Mr. Kirwan; who tells us, that the bulk of inflammable air obtained over water with the assistance of heat towards the end, was one-eighth greater than when produced over mercury; but that the weight of it in the former case was only eight or nine times less than common air.—"From eighty-five cubic inches of inflammable air obtained over water, I extracted," says he, "by oil of vitriol exposed to it for fifty-five hours, two grains of water; and, though undoubtedly there is an error in all these experiments, yet there can be little doubt but this inflammable air contained one-half its weight of water. The inflammable air, by the subtraction of its water, lost its smell, but continued as inflammable as ever; and therefore there is no reason to think that it was decomposed, or that water is any way essential to it."

This conclusion is directly contrary to that of Dr. Priestley, that water is an essential ingredient in the composition of inflammable air; nor do the experiments of the latter seem to have had any weight with him. On the other hand, Dr. P. informs us, that "inflammable air seems now to consist of water and inflammable air; which, however, seems extraordinary, as the two substances are hereby made to involve each other; one of the constituent parts of water being inflammable air, and one of the constituent parts of inflammable air being water; and therefore, if the experiments would favour it (but I do not see that they do so), it would be more natural to suppose, that water, like fixed air, consists of phlogiston and dephlogisticated air, in some different mode of combination."

"There is an astonishing variety in the different kinds of inflammable air, the cause of which is very imperfectly known. The lightest, and therefore probably the purest, kind, seems to consist of phlogiston and water only. But it is probable that oil, and that of different kinds, may be held in solution in several of them, and be the reason of their burning with a lambent flame, and also of their being so readily resolved into fixed air when they are decomposed by dephlogisticated air; though why this should be the case I cannot imagine."

"When inflammable and dephlogisticated air are burned together, the weight of the water produced is never, I believe, found quite equal to that of both kinds of air. May not the light, therefore, emitted from the flame, be part of the phlogiston of the inflammable air united to the principle of heat? And, as light accompanies the electric spark, may not this also be the real occasion of some phlogistic matter, though it is not easy to find the source of it."

The French chemists, who deny the existence of phlogiston, are of opinion, that inflammable air is a simple un-compounded element. See PHLOGISTON.

It has been proved by experiment, that inflammable air is absorbed by water in considerable quantity, and that, by the application of heat, it may be expelled again in equal quantity. Plants in general grow tolerably well in inflammable air, and the willow plant has been observed to absorb great quantities of it. Its inflammability is not diminished by the putrefaction of animal substances, nor does their putrefaction seem to be retarded by it. Animals confined in it are killed almost as soon as in fixed air: but insects, which can live a considerable time in phlogisticated air, live also a considerable time in this. The Abbé Fontana, having filled a large bladder with inflammable air, began to breathe it. The first inspiration produced a great oppression in his lungs, the second made him look very pale, and the third was scarcely accomplished when he fell on his knees through weakness. Birds and small quadrupeds, inclosed in small vessels of this air, died after a very few inspirations. Lastly, inflammable air possesses a smaller share of refractive power than common air: as appears from Mr. Wurtz's experiment with an hollow triangular prism filled with it.

The inflammability of this air has given occasion to various projects, such as lamps, &c. which may be lighted

by the electric spark. Very pretty artificial fires are also made, with glass tubes bent in various directions, and pierced with a great number of small apertures. The inflammable gas is pressed forward into these tubes, from a bladder, and the inflammable air, issuing out of all the small apertures, is set on fire by a lighted taper. None of these contrivances, however, has proved of any use; and the scheme of Mr. Volta, for substituting its explosive force instead of gunpowder, is found insufficient.

Sulphurated Inflammable Air.

This was discovered by Dr. Priestley at the time he was engaged in transmitting steam through red-hot tubes containing some solid material. Having treated manganese in this manner, by stopping one end of the heated tube with a cork before the steam was applied, he received forty ounce-measures of air, of which one-sixth was fixed air, and the rest of the standard of 1.7, lambently inflammable. Having then opened the other end of the tube in order to admit the steam, air was produced more copiously than before. Of fifty ounces of this air, one-seventh was fixed, and the rest, of the standard of 1.8, explosively inflammable. The last portions were very turbid; and the smell, especially that of the last portion, was very sulphureous, tinging the water of a very dark colour, by depositing in it a quantity of blackish water. However, the air itself became presently transparent; but on looking at the jar in about ten minutes after, it was quite black and opaque; so that nothing could be seen in the inside of it. Filling afterwards another jar with the same kind of air, in order to observe the progress of this uncommon phenomenon, he found, that when the water was well subsided, black specks began to appear in different places, and, extending themselves in all directions, at length joined each other, till the whole jar was become perfectly black, and the glass opaque. When this was done, he transferred the air into another jar; and it soon produced a similar effect upon this, though it never became so black as the jar in which it had been first received. It also frequently happened, that only the lower part of the jar would become black, as if the matter with which it was loaded had kept subsiding, though invisibly, in the mass of air, and occupied only the lower regions, leaving the upper part entirely free from it. On exposing to the open air the vessels thus turned black, the colour presently disappeared, and a yellow or brown incrustation was left upon it.—Other specimens of manganese produced no air of this kind; but iron that had been melted in vitriolic acid air yielded it readily. Dissolving this with a considerable quantity of fresh metal in diluted vitriolic acid, he found that the water in which the air was received became very black, and deposited more sediment than in the experiment with manganese. On burning a quantity of it, this kind of air appeared to contain some vitriolic acid; but, on decomposing it with dephlogisticated air, the diminution was exactly the same as when common inflammable and dephlogisticated air were used; only there was a small quantity of fixed air produced, which is never the case with common inflammable air from vitriolic acid and iron.

Of Alkaline Air.

This was first procured by Dr. Priestley, who obtained it by mixing one part of pounded sal-ammoniac with three parts of flaked lime. When pure, it is instantly fatal to animal life, and extinguishes flame; though, when mixed with atmospheric air, it is slightly inflammable. A candle dipped into this air is extinguished; but, just before the flame goes out, it is enlarged by another flame of a pale yellow, and sometimes a weak flame spreads for a considerable way, or even through the whole body of the alkaline air. Electric sparks taken in it appear of a red colour, augment its bulk, and by degrees turn the whole into inflammable air. It is readily absorbed by water, and dissolves ice almost as fast as a hot fire. On confining some water impregnated with alkaline air in a glass tube,

and exposing it to a strong heat for some days, a white pellicle or incrustation formed on its surface. Bits of linen, charcoal, and sponge, admitted into alkaline air, diminished it, and acquired a very pungent smell; especially the sponge, a bit of which about the size of an hazle-nut absorbed an ounce-measure. It is remarkable that copper, which is so easily corroded by the common volatile alkalies, is not affected by alkaline air. Its specific gravity Mr. Kirwan determines to be to that of common air as 600 to 1000; though this differs considerably according to the moisture it contains.

In prosecuting his experiments on alkaline air, Dr. Priestley concluded that it contains phlogiston, both from its being convertible into inflammable air by electric explosions, and likewise from its reviving the calces of metals. In attempting to ascertain the proportion of lead revived in alkaline air, he found six grains of lead in three ounce-measures, sixteen and a half in three and a half measures, thirteen in two and a half, and twelve in three and three quarters; but the experiment on which he laid the greatest stress, was that in which twenty-six grains and a half of lead were revived in seven and a half ounce-measures of alkaline air. In this proportion, 100 ounce-measures of alkaline air would revive 352 grains of lead; but an equal quantity of inflammable air from iron would have revived 480 grains of metal. This deficiency appeared somewhat surprising, since alkaline air is resolved into more than twice its bulk of the inflammable kind; though possibly inflammable air from iron may contain more phlogiston than that into which alkaline air is resolvable.—On heating red precipitate in alkaline air, the mercury was revived as in other cases, and a considerable quantity of water produced, though none appeared on reviving it with common inflammable air.

In examining the phenomena which attend the conversion of alkaline air into the inflammable kind, the doctor was induced to believe that it was occasioned by heat alone, without the concurrence of light. The effects of the former were first perceived on heating some ochre of iron in alkaline air; when, though the matter turned black, as in an incipient reduction of the metal, he found a considerable increase of quantity, instead of decrease, in the air, as he had expected; and, on examining the quality of it, he found that it contained no fixed air, but was entirely inflammable. In all his experiments, however, with a burning-glass, as a strong light was concerned, he heated a quantity of alkaline air in a green glass retort, receiving in a glass tube, filled with water, all the air that could be expelled from it by heat. At first it was all absorbed by the water, being merely alkaline air expelled by the rarefaction; but, when the bulb of the retort became red-hot, he found that the bubbles driven out were not wholly absorbed, and at last none of them were so. These were altogether inflammable; so that no doubt remained of the change being produced by heat alone, without any intervention of light.

It was farther observed, that, whenever the alkaline air was changed into inflammable by means of bits of retorts or crucibles containing clay, they always became black during the process. He therefore supposed, that something might be deposited from the air upon the clay. "Indeed (says he), if this was not the case, I do not see why the clay should become black; though, perhaps, part of the same phlogiston which forms the inflammable air may be attracted by the red-hot clay, without there being any proper decomposition of the air. That this is the case seems probable from an experiment in which I used porcelain instead of common earthen ware; which did not become black in the process, though inflammable air was produced."

In some of Dr. Priestley's experiments, he had observed that iron which had long rusted in nitrous air gave out a strong smell of volatile alkali. This extraordinary phenomenon, however, was only perceived where the nitrous air and iron had been in contact for a very long time; but he

he found that it was much sooner produced by making use of a weak solution of copper; by putting iron into which, he obtained that species of nitrous air, called *dephlogistated*.

Of Nitrous Air.

This kind of air is plentifully obtained in all cases where the nitrous acid is combined with phlogiston. Thus, when it is mixed with metals, or animal or vegetable substances, nitrous air is produced in great quantities; but very sparingly when treated with metallic calces, earths, or other matters, which are said to contain little or no phlogiston. All the metals, except gold, platina, and regulus of antimony, which are not soluble in the pure nitrous acid, yield nitrous air on being treated with it; and, even from these, when dissolved in aqua regia, some quantity of this air may be obtained. Every metal, however, does not yield it in equal quantity, with equal facility, or equally good. Silver, copper, iron, brass, bismuth or nickel, when put into nitrous acid, yield this air in considerable quantity. Mercury yields it but slowly without the application of heat, though no great degree of it is necessary. Copper and iron, especially the latter, require the acid to be cautiously applied on account of the violent emission of fumes. Gold, platina, and regulus of antimony, when put in aqua regia, yield nitrous air pretty readily; but lead yields it in smaller proportion than any other metal; and zinc does the same among the semi-metals, the elastic fluid produced from it being mostly phlogisticated air.

In the production of this kind of air, great differences are perceived by a diversity in the strength of the acid. Thus, if we dissolve copper in strong nitrous acid, no nitrous air is produced, though the same materials will yield air in great quantity by the mere affusion of water to dilute the acid. This is very properly explained by Doctor Priestley, from the property that the nitrous acid has of attracting phlogiston, which is evident from what happens in the solution of mercury. When strong spirit of nitre is poured upon this metal, the solution soon begins, and is very rapid, yet not a single bubble of elastic fluid is produced; but in a short time the acid next to the mercury is changed of an orange-colour, which is an indication of its having acquired phlogiston, probably from the nitrous air which is decomposed the moment it is formed, and before its particles are united into visible bubbles. The bubbles of air indeed break through the coloured acid, but they disappear the moment they come in contact with the pale-coloured acid. As soon as the whole quantity of acid has assumed the orange-colour, nitrous air escapes from it in considerable quantity; but the mixture of water deprives the acid of its power of decomposing nitrous air. The strong and pale-coloured nitrous acid ought to be diluted with at least two or three parts of water to one of the acid, for the easy production of nitrous air from copper and mercury. For common experiments, except the latter be used, no other degree of heat is necessary than that produced by the effervescence.

Nitrous air is equally as invisible as common air, except at first, when it is somewhat coloured, owing to a little superfluous nitrous acid, or to some earthy particles carried up with it. Its smell resembles that of nitrous acid, or, indeed, is the very same; because, in passing through the common air to our nostrils, it is decomposed, and converted into nitrous acid. The same is to be said of its taste; though M. Fontana, who tasted it without any contact of external air, affirms that it has no taste whatever. Though nitrous air extinguishes flame, it may be brought into such a state that a candle will burn in it with an enlarged flame; and it becomes what Dr. Priestley calls *dephlogistated nitrous air*, of which hereafter.

Nitrous air is the most fatal of any to animal life. Even insects, which can bear phlogisticated and inflammable air, generally die the moment they are put into it. Frogs, snails, and other animals which do not respire very fre-

quently, die in a few minutes, and seldom recover even when taken out of this noxious fluid before they are dead. Plants perish very soon in nitrous air, and even in common air saturated with nitrous air; but Dr. Priestley informs us of one instance to the contrary, where the superfluous nitrous air was let out under water, so that no part of it was decomposed in contact with the water.

By agitation in nitrous air, water may be made to imbibe one-tenth of its bulk; and afterwards the nitrous air may be expelled again by boiling, though not in the same quantity as it was absorbed; but for this purpose the water should be previously deprived of its air. Dr. Priestley obtained about one-fourth part, sufficiently pure, and without any mixture of fixed air. Nitrous air is absorbed by strong vitriolic acid nearly in the same quantity as by water; the acid acquiring a purple colour, by reason of the phlogiston contained in the air. The strong nitrous acid absorbs it in great quantity; and becomes smoking, orange-coloured, and afterwards green, on account of the phlogiston contained in it. Marine acid imbibes but a small quantity, and very slowly, acquiring at the same time a light-blue colour. Both nitrous air and common air phlogisticated by it are meliorated by agitation in nitrous acid.

Nitrous air is absorbed in considerable quantity by the concentrated vegetable acid. A solution of vitriolated iron imbibes it in much greater quantity than water, and acquires a black colour; which, however, soon goes off by exposure to the common air. Its taste also becomes acid. Very little is absorbed by caustic alkalies. Olive-oil slowly absorbs a considerable quantity, but oil of turpentine much more. By a little agitation, it will imbibe more than ten times its quantity of nitrous air; acquiring at the same time a yellowish or orange colour, and becoming a little glutinous. The part not absorbed appears to be converted into phlogisticated air. Ether and spirit of wine absorb it very quickly, but no nitrous air is obtained by the application of heat after they have absorbed it. It is greatly diminished by oil of turpentine, liver of sulphur, and pyrophorus; all of which leave it in a phlogisticated state. It is also diminished and phlogisticated by being kept in a bladder, alternately exposed to moisture and dryness. Nitrous acid air has the same effect.

One of the most remarkable properties of nitrous air is its diminution with dephlogisticated air; by which means it becomes a test of the quantity of that kind of air contained in the atmosphere. With pure dephlogisticated air, the diminution is almost to nothing, at the same time that some quantity of nitrous acid is reproduced by the decomposition of the nitrous air; but, as our atmosphere is always mixed with a considerable quantity of phlogisticated air, on which nitrous air has no effect, the diminution in this case is never so considerable. Upon this principle the *Eudiometer* is constructed.

Another very remarkable property of nitrous air is its strong antiseptic power; inasmuch that animal matter may be preserved by it for many months. It becomes however very offensive both to the nostrils and palate, though the smell is not altogether that of putrefaction. The specific gravity of nitrous air, as well as of other kinds, has been ascertained by Mr. Kirwan. As it corrodes metals, he endeavoured to find its weight by comparing the loss sustained by the materials which produce it. Thus he found, that fourteen grains of the materials produced 38.74 inches of nitrous air; and, consequently, by proper calculation, that the specific gravity of nitrous air is to that of atmospheric air as 1195 to 1000.

With regard to its constituent principles, all those who regard phlogiston as a distinct substance have believed, that the former is a compound of nitrous acid and phlogiston. By the opposite party, it is supposed to be a substance entirely simple, and one of the constituent parts of the nitrous acid. This opinion seems in part now to be entertained by Dr. Priestley himself, notwithstanding his former sentiments on the subject. "I had no doubt on

this subject (says he) until I read the work of Mr. Metherie; who asserts, that nitrous air contains no proper nitrous acid, but only one of the elements of it; the other being dephlogisticated air, which had before been considered by M. Lavoisier as the principle of all acidity. Among other observations in support of his assertion, Mr. Metherie has the following:—1. Nitrous air burnt together with inflammable air produces no nitrous acid. 2. Though nitrous air be obtained from a solution of mercury in the nitrous acid, almost all the acid is found in the solution. 3. Nitrous air absorbed by marine acid does not make aqua regia. 4. He is of opinion, that a small portion of the nitrous acid, being decomposed, furnishes a pure air, so altered, that, uniting with inflammable air, it changes it into nitrous air. To ascertain the matter more fully, the doctor proceeded to try various experiments on the decomposition of nitrous air, particularly that of burning Homberg's pyrophorus; but without success, or obtaining the smallest particle of nitrous acid.—His conclusions from the whole are these: Water seems to be a necessary ingredient in nitrous as well as inflammable air; at least, without a quantity of water, nitrous air cannot be formed. For example, copper will be dissolved in strong nitrous acid without producing any nitrous air, just as iron may be dissolved in concentrated vitriolic acid without producing inflammable air.

"That nothing is necessary to the formation of nitrous air besides phlogisticated nitrous acid and water, is evident from the production of it by the impregnation of pure water with phlogisticated nitrous vapour formed by the rapid solution of bismuth. Nitrous air is also produced by pouring a highly-coloured or phlogisticated nitrous acid into pure water, in which no metal or earthy matter is any way concerned.

"I have formerly observed, how readily nitrous air is diminished by taking the electric spark in it. This experiment I have frequently repeated, in order more particularly to ascertain the quantity and quality of the residuum. In one experiment, the electric spark was taken in a quantity of nitrous air till it could be no more diminished, when it was reduced in bulk in the proportion of ten and a half to twenty-four. Letting it stand all night upon the mercury, it was increased in the proportion of eleven and a quarter to twenty-four; seemingly by the acid uniting to the mercury and generating more nitrous air, since it had that smell. No water appeared after the process; and the water admitted to it acquired no acid taste, but an astringent one like that of water impregnated with nitrous air. There was a white powder formed, as in the former experiments. To try if it were possible to make water imbibed the acid from the nitrous air, the electric spark was taken in it, with a small quantity of water over the mercury. But even this water did not acquire any acid taste, but only an astringent one."

The doctor concludes this subject with a conjecture, that the phlogiston, and neither the heat nor light of the electric spark, contributes to the decomposition of the nitrous air.

Of Dephlogisticated Nitrous Air.

This species of air differs from common nitrous air in being able to support flame, though it still continues fatal to animal life. Common nitrous air may be converted into the dephlogisticated. When zinc is dissolved in nitrous acid, if the air be taken at different times, that which comes about the latter end of the process will be of this kind, and not only support the burning of a candle, but cause the flame to enlarge greatly by the addition of a weaker and blueish flame round the former; and this with a crackling noise, as if the candle were burning in dephlogisticated air. It may also be obtained in procuring nitrous air from iron, though this metal is uncertain: but tin yields a considerable quantity of it. By exposing iron to nitrous air, it may be so far dephlogisticated as to

admit a candle to burn in it, but the experiments made with that metal have proved remarkably uncertain and inconclusive.

In describing the component parts of this kind of air, Dr. Priestley observes, that water is absolutely necessary to its composition, or rather to the decomposition of the common nitrous air by iron. He had decomposed it before, either by previously filling the vessels that were to contain the nitrous air with water or with mercury; though it had always required a much longer time when the latter was made use of. The reason of its being formed at all in this last way, was a small quantity of moisture adhering to the inside of the vessel containing the mercury.

To try the influence of water, he put a number of very clean small needles into a vial, and, filling it up with mercury, introduced the nitrous air: but it continued six or eight months without alteration. Introducing a few drops of water, a diminution of about one-third of the air took place, and the remainder appeared to be phlogisticated. In another experiment with iron-shavings, one-half was absorbed, and the remainder supported the flame of a candle better than common air, though a mouse died in it; and yet this air had continued several months in the same state with regard to its quantity and quality.

Though this kind of air is produced by the contact of iron and nitrous air, the doctor had never been able to ascertain the quantity of nitrous air which a given quantity of iron can decompose; and, though iron soon becomes so much affected by this process that it crumbles into powder, it still seems equally capable of decomposing a fresh quantity. Having made a comparative experiment, by putting together one quantity of nitrous air with fresh iron and another with rust, he found that in both the air was diminished to about one-third, and a candle burned in both equally well; but neither of them had the properties of fresh nitrous air in any degree.

As the process for obtaining dephlogisticated nitrous air by means of iron is very tedious, the doctor endeavoured to find another which might be attended with less inconvenience. This he accomplished by dissolving turnings of iron in a dilute solution of copper in nitrous acid (the same that remains after the production of nitrous air), mixing it again with an equal quantity of water. Without this precaution, he tells us, that, though the iron will at first be acted upon very slowly, yet the mixture will at length grow so hot as actually to boil, and the process will be exceedingly troublesome: however, it will be necessary, previous to any attempt to dissolve the iron, to heat the solution of copper, in order to expel all the nitrous air and superfluous nitrous acid. Without this precaution a quantity of common nitrous air will be produced.

Water absorbs dephlogisticated nitrous air almost as readily as fixed air; taking up about one-half its bulk of air. After being thus saturated, the whole quantity of dephlogisticated nitrous air may be expelled pure by heat. It resembles fixed air also in this farther property, that all the air which has been actually incorporated with the water will not be imbibed by water again. But the proportion of this part is three or four times greater than the corresponding part of fixed air; and is also much more phlogisticated. Water very soon parts with it on being exposed to the atmosphere. Neither acid nor alkali can be discovered in it. Its specific gravity is less than that of common air. On heating red precipitate in it, pure dephlogisticated air was produced without affecting, or being affected by, the nitrous air. Malleable iron occasioned the quantity of it to be enlarged, and the whole phlogisticated, without any mixture of fixed air. By heating bits of clean crucibles or retorts in this kind of air, it seemed to approach in quality to common atmospherical air. By the electric spark it became immiscible with water, and was brought to the standard of 1.45; so that there seemed to be no doubt of its being respirable. Yet this kind of air, though a candle burns so well in it, will

not kindle pyrophorus, though the nitrous air from which it is produced instantly sets it on fire.

Of Vitriolic, Nitrous, Marine, and other, Acid Airs.

Of Vitriolic Acid Air. This is always a combination of vitriolic acid with phlogiston, and consequently may be produced from any mixture of that acid in its highly concentrated state with phlogistic matter. Hence all the metals yield it, gold and platina excepted, on boiling them with strong vitriolic acid, which itself will produce it when rendered black by any phlogistic matter. To expel this kind of air the flame of a candle is sufficient. It is the heaviest of all except fluor acid air, being to common air as 2265 to 1000. Dr. Priestley asserts, that a quantity of vitriolic acid thus impregnated with phlogiston will yield many times more air than an equal quantity of the strongest spirit of salt. When the vitriolic acid air is produced in great plenty, the top of the vial in which it is generated is commonly filled with white vapours. The air has also the same appearance as it is transmitted through the glass tube; and it is sometimes discolourable in the recipient. It is most equably produced by using strong vitriolic acid and charcoal; but the production of this kind of air is mostly attended with that of inflammable, and sometimes fixed or phlogisticated, air. With ether about one-half of the first produce is inflammable; but the quantity lessens as the process goes on. Copper, silver, and lead, when heated in vitriolic acid, yield the purest vitriolic acid air; but lead yields only a small quantity, and requires a great heat. It is procured in the greatest abundance from the fumes of burning sulphur, and is then called the *volatile vitriolic* or *sulphureous acid*.

Of Nitrous Acid Air. This is the pure nitrous acid by itself, without any addition of phlogiston. It is procured by heating the strong spirit of nitre in a vial, and receiving the vapour in glass vessels filled with quicksilver. It is difficult, or rather impossible, to preserve it for a length of time, by means of any fluid. Water absorbs it immediately, and quicksilver is corroded, and produces nitrous air.

The most remarkable property of this vapour is, that its colour may be more or less heightened by the mere circumstance of heat; the intensity of colour diminishing as it becomes cool. "It seems probable (says Dr. Priestley), that if this vapour was not confined, but had room to expand itself, it would become colourless with heat. This at least is the case when it is combined with water. The phenomena I refer to are very common in the processes for making dephlogisticated air, in which I first observed them. But the same things are observable in the process for producing any other kind of air in which much spirit of nitre is made use of; and likewise constantly in the common process for making spirit of nitre itself. It is, that, when the heat is moderate, the vapour within the glass tube or retort is red; but that, as the heat increases, it becomes transparent." The doctor having observed that red lead impregnated with nitrous vapour lost its red colour and became white, "I put (says he) a small quantity of this white minium into a glass tube closed at one end; then, holding it to the fire, make it emit the red vapour till the whole tube is filled with it; and, having the other end of the drawn out ready for closing, as soon as the vapour begins to issue out of that end I apply my blow-pipe and seal it. By this means I conclude that the tube is filled with a pure red vapour, without any mixture of nitrous air, and perhaps common air also."

Of Marine Acid Air. The marine acid, by heat, may be resolved into a permanently-elastic and transparent invisible vapour, which, not acting on quicksilver, is more easily preserved than nitrous acid air. It is easily and cheaply obtained by filling a vial, fitted with a glass tube and stopper, with common salt, and then pouring a small quantity of vitriolic acid upon it; which, by the assistance of heat, will disengage the acid principle, or the marine acid air, from the salt. A vial thus prepared will suffice,

for common experiments, many weeks; especially if fresh vitriolic acid be occasionally put to it. It only requires a little more heat at the last than at the first. After all the air is expelled, it is so weak as barely to corrode iron. The gas itself is to common air as five to three; a cubic inch weighing 0.654 grains. It is very fatal to animal life, but less so than pure nitrous air. On dipping a candle into it, the flame is extinguished; but the moment before it goes out, and when it is afterwards lighted again, it burns with a green or light-blue flame, like that of common salt thrown into a fire. Its diminution by the electric spark is barely perceptible. Ice is dissolved by it as fast as by a red-hot iron. It is partly absorbed by almost every substance containing phlogiston, and the remaining part becomes inflammable. Oil of olives absorbs it very slowly, and oil of turpentine very fast; by which they both become almost black, and the remainder of the air is inflammable. Essential oil of mint absorbs marine air pretty fast, becoming brown, consistent, and so heavy as to sink in water; and its smell is in great measure altered. Ether absorbs it very fast, the mixture becoming first turbid, then yellow, and at last brown. The air over the ether is strongly inflammable. A small bit of phosphorus smoked and gave light in this acid air; and the elastic fluid was but little diminished in twelve hours. About four-fifths of the gas were absorbed by water, and the rest was inflammable. This change was also effected by a number of other substances; some of which, however, required a considerable time to produce their effect.

Of Fluor Acid Air. Mr. Scheele first obtained this kind of air by distilling the spar called fluor with vitriolic acid. Dr. Priestley, who made several experiments upon the subject, was of opinion that this new acid was only the vitriolic disguised by its connection with the fluor. He even supposed that he had produced it by pouring vitriolic acid on other phosphoric spars: both these opinions, however, he has now retracted, and believes the fluor acid to be one of a peculiar kind. Its most remarkable property is the great attraction it has for siliceous earth, so that it even corrodes and makes holes in the retorts, in which it is distilled. Some curious etchings on glass have been performed by it.

Of the Vegetable and another Acid Air. By the help of heat alone, the concentrated vegetable acid emits a permanently-elastic and aerial fluid. This has the properties of the acid of vinegar; but, like it, is weaker than the mineral acid airs, though similar in its general characters. Water imbibes it as readily as any of the other acid airs; olive-oil absorbs it in considerable quantity, losing at the same time its yellowish colour. Common air is phlogisticated by it, as by the liquid vegetable acid. As the vegetable acid, however, from which this air had been obtained, was distilled with oil of vitriol, it may rather be vitriolic than vegetable acid air.

A new kind of acid air was obtained by Dr. Priestley from distilling to dryness a solution of gold in marine acid impregnated with nitrous acid vapour, which makes the best kind of aqua regia. The produce was an acid air partaking both of the nature of the nitrous and marine acids; but more of the latter, as it extinguished a candle, which exhibited a most beautiful deep blue flame, and on being dipped into the same jar went out more than twenty times successively, making a very pleasing experiment. The quantity of this acid air is very great; and the residuum sometimes dephlogisticated, sometimes phlogisticated, and at other times nitrous, air.

To the article CHEMISTRY we refer for other particulars relative to the different kinds of air here spoken of.

Of Hepatic Air.

This species of air was first obtained by Mr. Bergman, from an ore of zinc called *Pseudogalena nigra Dannemorensis*. It was produced, but in small quantity, from vitriolic acid poured on this mineral. Spirit of salt yielded it in much larger quantity; but nitrous acid produced only
nitrous

nitrous air. Marine acid poured on hepar sulphuris extricates it however in vast quantity. It is also produced naturally from putrefying matter. The smell of the pure gas is intolerable; and it has a disagreeable effect on silver, lead, copper, &c. which it renders quite black. It is suddenly fatal to animal life, turns syrup of violets green, and is inflammable, burning with a very light blue flame. It is decomposed by vitriolic and nitrous air, by dephlogificated air, and by the contact with atmospheric air, in which case it deposits a small quantity of sulphur; being indeed, as is supposed by Mr. Bergman and Mr. Kirwan, no other than sulphur in an aerial form. Its specific gravity, compared with atmospheric air, is as 1106 to 1000. It combines readily with water, and gives the smell to the sulphureous medicinal waters. Its great attraction for some of the metals and their calces makes it the basis of some kinds of SYMPATHETIC INK.

Of Atmospherical Air.

As the two component parts of our atmosphere, viz. dephlogificated and phlogificated air, have already been treated of, little remains to be determined, except the proportion in which they exist in the common air. Mr. Scheele constructed an eudiometer, with which he examined the goodness of the common air in Stockholm every day for a whole year, and found the diminution never to exceed $\frac{10}{30}$, nor to fall short of $\frac{8}{33}$; so that upon a medium it may be estimated at $\frac{9}{35}$. During the months of January and February it was $\frac{9}{33}$. The 23d of March it was $\frac{8}{33}$, though the cold increased, and the barometer stood higher. The 19th of April it was $\frac{10}{33}$, though the barometer and thermometer did not vary, and so stood till the 21st. In May and June it stood between $\frac{9}{33}$ and $\frac{10}{33}$. The 30th of July it stood at $\frac{10}{33}$. From the 3d to the 15th of September at $\frac{9}{33}$. The 6th of October at $\frac{10}{33}$, during a high storm; but after it stood between $\frac{8}{33}$ and $\frac{9}{33}$, till the 4th of November, when it fell to $\frac{8}{33}$, and continued between $\frac{8}{33}$ and $\frac{9}{33}$ to the 20th, when it rose to $\frac{9}{33}$. The 21st it fell to $\frac{8}{33}$, and stood between $\frac{8}{33}$ and $\frac{9}{33}$ till the 8th of December, when it rose to $\frac{9}{33}$; and from thence to the 31st it stood between $\frac{8}{33}$ and $\frac{9}{33}$.

As the pure dephlogificated part of the atmosphere is consumed by phlogistic processes, such as that of fermenting brimstone and iron-filings, which formed the materials of this eudiometer, it must be considered as an exact test of the proportion of dephlogificated air contained in the atmosphere. The small variation in the quantity shews, that the processes in nature which destroy this air are nearly balanced by those which produce it; though it must appear surprising, that both these fluids, so extremely different, should be produced at all seasons of the year in a proportion nearly equal; nor is it less surprising that two fluids of unequal specific gravity should remain incorporated together without any tendency to separate, which it is certain they never do, either in the atmosphere itself, or when confined in vessels in any quantity whatever.

As phlogificated air is somewhat lighter than dephlogificated, it will hardly be supposed, that the upper parts of the air contain a greater proportion of dephlogificated air than those near the earth, which however is proved by the eudiometer.

Of the Artificial Production of Airs of different Kinds.

Fixed Air, or Aërial Acid. The artificial methods of producing this are principally three, viz. by fermentation, by heat, and by acids.

By fermentation. When vegetable or animal substances, especially the former, are fermented, they yield a great quantity of fixed air. In breweries, on the surface of the fermenting liquor, there is always a stratum of fixed air reaching as high as the edge of the vat. The case is the same whatever substance it is that undergoes the vinous fermentation, though the quantity of fixed air produced is not the same in all cases, nor even in the same substance at different times. From forty-two cubic inches of beer

Dr. Hales obtained 639 cubic inches of air in thirteen days. From a quantity of sugar undergoing the vinous fermentation, Mr. Cavendish obtained so much fixed air, that out of 100 parts of the former fifty-seven appeared to have been volatilized and converted into fixed air. As the briskness and agreeable pungent acidulous taste of all fermented liquors depends on the quantity of fixed air remaining in them, whenever they become vapid and flat, we are able to restore their flavour by impregnating them again with fixed air, either naturally or artificially produced.

Dr. Priestley made several experiments in order to determine the quantity of fixed air contained in several sorts of wine, and found that

1½ oz. measure of	Madeira	contained of pure fixed air	$\left\{ \begin{array}{l} \frac{1}{100} \\ \frac{2}{8} \\ \frac{1}{4} \\ \frac{1}{12} \\ \frac{1}{20} \\ 2 \text{ oz. measures,} \\ 3\frac{1}{2} \text{ ditto.} \end{array} \right\}$	of an ounce measure.
	Port of six years old			
	Hock of five years			
	Barrelled claret			
	Tokay of 16 years			
	Champaigne of 2 years			
	Bottled cyder 12 years			

During the acetous fermentation also, liquors emit a vapour, great part of which is fixed air, though the nature of its other component parts has not yet been thoroughly ascertained.

Fixed air is likewise produced, though in no great quantity, by putrefaction. In this case, however, a great part of the elastic fluid consists of inflammable and phlogificated air, and the fixed air itself seems to be intimately connected with a putrid offensive effluvia. The elastic fluid produced by vegetables putrifying in a moderate degree of heat, is almost all fixed air. These yield almost all the permanently-elastic fluid in a few days, but animal bodies continue to emit it for several weeks.

By heat. In every combustion, except that of sulphur or of metals, a quantity of fixed air is generated. During its extrication from atmospherical air, the latter is supposed to be considerably diminished; but Lavoisier and Scheele have now rendered that opinion doubtful. If charcoal be burned by a lens when contained in a glass receiver inverted in water, after the apparatus is cooled, the water will have mounted a small way into the receiver. The diminution, however, is limited, and depends on several circumstances. Dr. Hales has observed, that in equal receivers, the air suffers a greater diminution by burning large candles than small ones; and likewise that, when equal candles are made use of, the diminution is greater in small than in large receivers. The cause of this phenomenon probably is, that the air contained in the receiver cannot all come into contact with the flame of the candle; whence, as soon as the air which is nearest the flame becomes contaminated, the candle is extinguished. This diminution has been stated by different philosophers in different degrees. M. Lavoisier has observed, that by the combustion of phosphorus, air may be diminished of about one-fifth or one-sixth. This accurate philosopher has also observed, that the acid of phosphorus thus formed acquires the weight lost by the diminished air; finding that about three inches of air were absorbed by every one grain of phosphorus, when the experiment was tried with a receiver inverted in water; but, when in quicksilver, the absorption was constantly between $2\frac{1}{4}$ and $2\frac{3}{4}$ inches for each grain. Mr. Cavalló often repeated the experiment of burning phosphorus in a glass tube inverted in water, by applying the closed part of the tube, wherein the phosphorus was contained, to a pretty strong fire, when he always observed that the utmost diminution of the inclosed air effected by this means was full one-fifth.

In these experiments of burning combustible bodies in a quantity of air, and measuring the diminution, we should be aware of two causes of mistake, viz. the absorption of air by the coaly residuum of the burned matter, which sometimes is very considerable, or by the fluid in which the receiver is inverted, and the production of elastic flu-

id from the burning substances; thus gunpowder generates a great quantity of elastic fluid when inflamed, &c.

Even the electric spark separates fixed air from common atmospheric air; for when a number of these sparks are taken in a small quantity of common air over lime-water, a diminution will take place, the lime will be precipitated, and, if we put a blue vegetable juice instead of the lime-water, it will be turned red by the acidity of the fixed air deposited upon it.

The calcination of metals, as already observed, phlogisticates, and consequently diminishes, common air; but does not produce any fixed air, since the lime-water, over which the calcination is made, does not become turbid; and, when metallic calces are exposed to a sufficient heat, they generally yield some fixed air: so that it seems the fixed air which is formed in the act of the calcination of metals is absorbed by the calx. Some fixed air may be obtained from red lead, by no greater degree of heat than that of the flame of a candle applied to the vial that holds it.

The calcareous earths, when acted upon by acids, yield a vast quantity of fixed air. Dr. Priestley, in his experiments on the production of dephlogisticated air from various substances, when moistened with nitrous acid, and afterwards exposed to a sufficient degree of heat, generally found that some fixed air was produced together with the dephlogisticated air; but often obtained fixed air only, without any dephlogisticated air being mixed with it, or fixed and nitrous air together. But in those experiments he mostly used a gun-barrel, so that, as he justly observes, the iron might have contributed to the formation of the fixed air. In fact, when he tried substances of the same sort, first in a gun-barrel and then in glass vessels, he obtained more fixed air in the former than in the latter case.

Most minerals contain fixed air, which may be extracted to a certain degree by means of heat. Mr. Krenger, from a greenish fusible spar, which was luminous in the dark, obtained a permanently-elastic fluid, which, like fixed air, crystallized a solution of fixed alkali. The malachite also contains a vast quantity of fixed air, as pure as that extracted from chalk by vitriolic acid. From almost every metallic ore and earthy mineral some fixed air may be obtained, as well from chalk, lime-stone, marble, marine-shells, fixed and volatile alkali, and from magnesia, by means of a violent fire, or of acids.

By acids. Calcareous substances produce abundance of fixed air, especially when acted upon by any of the strongest acids, such as the vitriolic, which is both the cheapest and fittest for the purpose. The phenomena attending the production of fixed air from calcareous substances, &c. are the following:—1. When mixed with acids, they effervesce; and produce a permanently-elastic fluid, namely, fixed air. 2. They retain the fixed air very obstinately; so that a strong fire is necessary to expel it from magnesia, and the strongest is not sufficient to expel it entirely, either from fixed alkalies or calcareous earths. When these substances are treated with acids, they yield their fixed air, because they have a stronger attraction to those acids than to the fixed air. 3. Calcareous earths, which are insoluble in water, when deprived of the fixed air become soluble in it. Thus lime-stone is not, but lime (viz. lime-stone deprived of its fixed air) is, soluble in water. And, if substances deprived of their fixed air are put in a situation to recover it, they again become insoluble in water. 4. Alkalies, both fixed and volatile, when deprived of their fixed air, become more caustic, and more powerful solvents, incapable of crystallization, and of effervescing with acids. But if to those alkalies, and also earths rendered more caustic, their fixed air be restored, they acquire at once all the properties they had before, viz. they become more mild, effervesce with acids, recover their weight, &c. Dr. Black, to whose accurate and satisfactory experiments on this subject chemistry is greatly indebted, gives the epithet of *mild* to those substances when combined with fixed air, and of *caustic* when deprived of it; as caustic calcareous earth, caustic fixed alkali, &c.

VOL. I. No. 11.

Easy Methods of obtaining Fixable Air for occasional Experiments, &c.

By fermentation. Mix together equal parts of brown sugar and good yeast of beer, to which add about twice the bulk of water. This mixture being put into a vial, to which a bent tube with a cork may be adapted, will yield a considerable quantity of fixed air, which may be received into a vial filled with quicksilver or water, as in the following process.

By acids. Let a glass tube be bent, and fix a cork to one of its extremities, so as to fit the neck of a common vial. Fill a similar vial, or any glass receiver, with water, and invert it in a basin about half filled with water. Next put some chalk or marble, grossly powdered, into the bottle, so as to fill about a fourth of it, and add water enough to cover the chalk; then pour in as much vitriolic acid as will make about one-fifth of the whole fluid. Apply immediately the cork, with the tube, to the bottle, and let the extremity of the tube pass through the water of the basin into the neck of the bottle, which must be kept up with the hand, or other convenient support, as it cannot rest upon the bottom of the basin. The mixture in the bottle will immediately begin to effervesce and grow hot, and the fixed air will be copiously emitted, and passing through the bent tube, and afterwards through the water, will ascend to the top of the inverted bottle. In proportion as the elastic fluid collects, the water will gradually descend, and at last be quite expelled, and the bottle thus filled with fixed air may be corked under water, and kept for use. That fixed air will extinguish flame may be easily proved by passing a lighted taper into any open jar in which it is contained; and that it is very freely absorbed by water will appear on tasting that through which the bubbles have arisen in the above process. The flavour will be brisk and agreeably acidulous. In this state, too, it changes the blue infusion of some vegetable substances into red; so that, if a weak solution of heliotrope be mixed with it, the liquor acquires a reddish appearance. It also corrodes iron, and some other metals, much more easily than common water. But the greatest and most useful property of this acidulated water, or water impregnated with fixed air, is its being a powerful antiseptic. As most of the mineral waters are medicinal principally on account of their being thus impregnated, and also containing some small portion of metal or salt dissolved; they may be imitated by impregnating common water with fixed air, and then adding that quantity of salt or of metal, that, by analysis, the original mineral waters are found to contain. For these purposes, indeed, a well-contrived glass apparatus is sold in the shops.

Fixed air has long been considered a very powerful remedy in putrid diseases. Sir John Pringle and Dr. Macbride have shewn experimentally, that fixed air is discharged by such substances as form our common food; and both ascribe the preservation of the body from putrefaction in a great measure to the fixed air, which in digestion is disengaged from the aliment, and incorporates with the fluids of the body.

The same property also renders it useful for several economical purposes. Mr. Henry found, that fixed air can preserve fruit for a considerable time; and Dr. Macbride observes, that not only good meat was preserved incorrupt for a considerable time, when exposed to fixed air, but that the putrefaction of substances actually putrid was impeded by this means; and even that those substances were restored from the putrescent to the sound state. Milk acquires an acidulous taste by being impregnated with fixed air, and is thereby preserved for some days; which affords a very easy expedient of preserving milk in those places where it cannot be had new very often.

To produce Inflammable Air. The process for making this sort of gas may be conducted in the same way as for fixed air, only substituting for the chalk about the same proportion of iron filings or grossly powdered zinc. If the

T t

capacity

capacity of the bottle which contains this air be nearly equal to four ounce-measures, and the flame of a candle be applied to its mouth, it will burn quietly for about half a minute, the flame gradually descending lower and lower, in proportion as the inflammable gas is consumed. Hence we see, that inflammable air, like all other combustible substances, burns only when in contact with common air; so that, if the bottle be closed, the flame is put out immediately, because the air is intercepted. But, if the inflammable air be put in such a situation as to expose a very great surface to the common air, it is plain, that by this means its combustion will be accelerated, so as to go off with an explosion, caused by the sudden rarefaction of the air. This circumstance has given occasion to the very entertaining experiment with what has been called the electrical pistol. This instrument consists of a hollow brass ball with a narrow mouth, into which a mixture of inflammable and atmospheric air is introduced, and the mouth of the pistol afterwards corked very firmly. Through the end immediately opposite to the mouth, a glass tube is passed, and through that a piece of wire, which, being bent downwards, approaches within a straw's breadth of the inner surface of the ball. Along this wire an electric spark is conveyed, which, setting the inflammable air on fire, occasions a loud explosion, and forces the cork out of the mouth of the pistol with considerable violence.

By taking electric sparks in any kind of oil, spirit of wine, ether, or spirit of sal ammoniac, Dr. Priestley obtained inflammable air. The oil, or other liquor, was confined in a glass tube by quicksilver, and a wire was cemented in the upper part of the tube, through which the sparks, being sent, went to the quicksilver through the oil. After a few sparks had been taken, a quantity of inflammable air was generated. This elastic fluid does not lose its inflammability by being passed several times from one vessel into another through water.—Alkaline air, by taking electric explosions in it, is changed into inflammable air.

If iron is put into a strong vitriolic acid, the quantity of elastic fluid produced is very little, except heat be applied. But this elastic fluid is vitriolic acid air, mixed with a small proportion only of inflammable air, which is always less when the acid is more concentrated.—Zinc, treated after the same manner, produces the like effects, except that it gives more elastic fluid, without the application of heat, than iron does; and the greatest part of the produced elastic fluid is inflammable.—In order to obtain the greatest quantity of inflammable air from iron or zinc, the vitriolic acid must be diluted with five or six parts of water. Dr. Priestley found, that eleven grains of iron yielded eight and a quarter ounce-measures of inflammable air. According to Mr. Cavendish, one ounce of zinc, dissolved either in the vitriolic or marine acid, yields a quantity of inflammable air equal to the bulk of 356 ounces of water; one ounce of iron, dissolved by means of vitriolic acid, yields a quantity of inflammable air equal to the bulk of 412 ounces of water; and one ounce of tin yields half as much inflammable air as iron does.—The solutions of iron, tin, copper, lead, and zinc, in the marine acid, produce marine acid air, and inflammable air, but in various quantities. The proportion of the former to the latter is as one to eight in iron, as one to six in tin, as three to one in copper and lead, and as one to ten in zinc. Regulus of antimony, dissolved in marine acid, with the application of heat, yields a small quantity of elastic fluid, which is weakly inflammable.

Dr. Priestley obtained inflammable air, not only by dissolving various substances in marine acid, but also by exposing divers bodies to marine acid air, which is probably the purest part of the marine acid. Having admitted iron filings to this acid air, they were dissolved by it pretty fast; half of the elastic fluid disappeared, and the rest was rendered unabsorbable by water, and inflammable. The same effect was produced by almost every substance which contains phlogiston.—It seems in fact, as if this acid air, having a great affinity with phlogiston, separates it from

all those substances which contain it even in small quantity and from that combination becomes inflammable.

By means of nitrous acid, inflammable air may be obtained from various substances containing phlogiston; but it is always mixed with nitrous air, and sometimes also with fixed and common or phlogisticated air. If two parts of spirit of wine, mixed with one part of nitrous acid, are put into a vial with a ground stopple and tube, and the flame of a candle be applied to it, so as to heat it gradually, the inflammable air will be produced very readily; the inflammability of which is, however, not very permanent, for by a little washing in water it may be annihilated.

To produce Nitrous Air. This permanently-elastic fluid is never found naturally, like fixed or inflammable air; but is entirely artificial.—Silver, copper, brass, iron, mercury, bismuth, nickel, &c. when mixed with nitrous acid, yield nitrous air in great quantity. Some of them, especially mercury, require the aid of heat; for some, the flame of a candle applied to the vial is sufficient: but others, especially copper and iron, do not want any heat. Gold, platinum, and regulus of antimony, when put in aqua regia, yield nitrous air pretty readily. Among the metals, lead yields it in the smallest quantity. Among the semi-metals, zinc gives the weakest nitrous air, when dissolved in nitrous acid. The elastic fluid produced from it is mostly phlogisticated air. From four pennyweights and seventeen grains of zinc, dissolved in spirit of nitre diluted with an equal quantity of water, Dr. Priestley obtained about twelve ounce-measures of very weak nitrous air. He also obtained nitrous air even from some flowers of zinc.

The quantity of nitrous air that may be obtained from metals is difficult to ascertain, on account of the necessary diversity of the strength of the acid, the peculiar nature of the metal, and the method of performing the experiments. The following table of the produce of nitrous air from various metals is taken from Dr. Priestley, who nevertheless intimates that it is far from being accurate.

dwt.	grs.		
6	0	of silver yielded	17½ ounce-measures.
5	19	of quicksilver,	4½
1	2½	of copper,	14½
2	0	of brass.	21
0	20	of iron,	16
1	5	of bismuth,	6
0	12	of nickel,	4

The degree of strength of the acid occasions great diversity in the production of nitrous air. Copper dissolved in strong nitrous acid will not produce the least quantity of nitrous air; but, when dissolved in nitrous acid diluted with two or three parts of water, it produces a great quantity.

For the generality of experiments, no degree of external heat is required, except mercury be used. Copper or brass, in flat scales, two or three grains in weight, and about a quarter of a square inch in surface, when dissolving in diluted nitrous acid, yields nitrous air very equably; but, if iron be used, the pieces of it should be larger and fewer; in short, it should present a much less surface to the diluted acid; otherwise the increase of heat in the process, and the rapid production of elastic fluid, render the operation both difficult and hazardous.

As nitrous air is most used to try the goodness of respirable air, it is of great consequence to make it always of one uniform degree of purity. Accordingly, brass yields nitrous air of a more uniform quality than iron: copper excels brass; but pure mercury is still superior to copper: and indeed this is the metal which, considering its nature, uniformity of substance, and easy solution, is upon the whole the most useful for this purpose.

To make Nitrous Air. The whole process is the same as that described for *Fixed Air*. Fill about one third of the bottle with copper, brass, or quicksilver, then add as much water as will cover the metal filings, or in proportion if quicksilver is used; and lastly, the nitrous acid, in quantity

ity about one-third, or half of the water. The air will then pass through the tube into the inverted bottle, as in other instances.

In order to observe the property this elastic fluid possesses of diminishing the bulk of common air, let a glass tube, closed at one end, and about nine inches long, be filled with, and inverted in, water; then take an half-ounce vial, and, plunging it under the inverted tube, let all the air enter and go to the top of it, the water subsiding accordingly. Let a mark be made, by sticking a bit of wax on the tube, just opposite to the surface of the water, which will mark how much of the tube is filled by that given measure of air. Repeat this four or five times, marking the tube as the water descends each time. Now, if three measures of common air be conveyed into this tube, when filled with water and inverted, they will fill a space of it as far as the third mark. The same thing will happen if three measures of nitrous instead of common air be put into it; but if two measures of common air and one measure of nitrous air, or one measure of the former and two of the latter, be successively introduced, they will fill a space much shorter than the third mark. The moment these two kinds of air come in contact, a reddish cloud is perceived, which soon vanishes; and the water, which at first nearly reached the third mark, rises gradually into the tube, and becomes stationary after about two or three minutes; which shews that the diminution is effected gradually. See EUDIO-METER.

To procure Dephlogificated Air. The easiest way of procuring this air is to put some red-lead into the apparatus, together with some strong vitriolic acid, but without any water. Let the red-lead fill about a quarter of the bottle, and the vitriolic acid be about the same quantity; then apply the bent tube to the bottle, and proceed as above. Without heat, however, this mixture will not give any dephlogificated air, or but an inconsiderable quantity; for which reason the flame of a wax-taper must be applied under the bottom of the bottle. In this manner the red-lead will yield a quantity of elastic fluid, the greatest part of it dephlogificated air, but not the whole, a portion of fixed air being generated at the same time. In order to separate the fixed air, the inverted bottle, as the air is emitted from the red-lead, must be shaken in the basin for impregnating water with fixed air; by which means the water will absorb the whole quantity of fixed air, and leave the dephlogificated air in a pure state.

Animals will live much longer in this kind of air than in an equal quantity of common air; whence it is supposed that the breathing of it must contribute to longevity much more than the common atmosphere. Dr. Priestley however conjectures, that dephlogificated air might perhaps wear out the system much sooner than common air, in the same manner as it consumes fuel much faster than common air. In Cavallo's Treatise on Air, it is said that "a man makes in general about fifteen inspirations in a minute, and takes in about thirty cubic inches of aerial fluid. But the air which has been once inspired is not thereby much injured, and it may be respired again and again; so that, upon a very moderate calculation, and as appears from experiments often repeated, we may safely assert, that a person can breathe 400 cubic inches of good ordinary atmospheric air, at least thirty times, without any inconvenience, i. e. it would serve for two minutes; after which the air, though much depraved, is still in a state of being breathed, but then it would occasion some uneasiness. Now, supposing the dephlogificated air employed to be four times more pure than common air, 400 cubic inches of dephlogificated air would serve for at least 120 respirations, or eight minutes.

"But supposing that thirty inches of common air are completely phlogificated by a single inspiration, and changed for such as is quite fresh, which indeed is the case in common respiration, then 450 cubic inches of common air will be requisite for one minute's respiration, and 27,000 for one hour; and, as dephlogificated air is supposed to

be four times as good, the same quantity of it will serve for four hours. Indeed, if we could depend on the assertions of Mr. Fontana, that by adding lime-water to absorb the fixed air produced by respiration, an animal can live thirty times as long as without it, no doubt a much smaller quantity would serve."

But this cannot be true; because, though the fixed air should be absorbed as soon as produced, the remaining quantity would still be contaminated by phlogiston. Nay, Dr. Priestley, who repeated Fontana's experiments, asserts, that animals *will not* live longer in dephlogificated air when in contact with lime-water, than when no lime-water is used. How a difference so enormous can take place, between philosophers in other respects so accurate, we cannot determine. It is plain, however, that if 27,000 inches of common air are necessary for a person in one hour, the same quantity of dephlogificated air cannot be breathed longer than four hours, nor even so long with any real advantage. Mr. Cavallo indeed allows only 12,000 inches for four hours; but, though this might sustain life, it would not be superior to the atmosphere, and perhaps much less salubrious.

A very ready method of procuring dephlogificated air in large quantity, is by means of nitre; which must be put into a retort or other vessel, so as to fill half or nearly three quarters of its belly; then a bent glass tube is luted to the neck of the earthen vessel, in such a manner as not to let any elastic fluid escape. The best lute or cement for this is a mixture of whiting and drying oil. The retort being put into the furnace, must be surrounded with lighted charcoal, which is to be renewed as it wastes, and the belly of the retort must be kept quite red, or rather white-hot, for three hours at least. The air is then to be received into large glass jars, as usual. The retorts made of those metals which are usually employed for this purpose, viz. iron and copper, phlogificate the air as soon as produced. The expence at present necessary in London for the production of 12,000 cubic inches of dephlogificated air (viz. the price of one pound of nitre, of an earthen retort or other vessel, and of charcoal), amounts to about 4s. or 4s. 6d.

Another method of preparing dephlogificated air is by blowing common air through melted nitre. In this process the phlogiston of the atmosphere is consumed, by detonating with the acid of the nitre, and therefore issues much more pure than before. This method appears at first much easier than the former; but, as it is impossible to mix atmospheric air so exactly with the melted nitre that their particles may come uniformly in contact with each other, it is plain the former method must be preferable; not to mention that the nitre will be apt to concrete into lumps by the cold blast.

To procure Vitriolic Acid Air. Some concentrated vitriolic acid must be put into the bottle, along with some substance capable of furnishing phlogiston. Olive-oil answers very well. The acid should be about three or four times as much as the oil, and both together should fill about one-third or half of the bottle. The elastic fluid may then be produced by applying the flame of a wax taper, as directed above.

To procure Marine Acid Air. Put some common salt into the bottle, so as to fill about one-fourth part of it, and upon this pour a small quantity of concentrated vitriolic acid; then apply the bent tube, and pass the air through quicksilver into the receiver.

To procure Nitrous Acid Air. This may be obtained from heated nitrous acid, the vapour of which acquires a permanent elasticity. The great difficulty, however, is to find a fluid capable of confining this acid air during the process, as its being absorbed by water is one of the properties by which it differs from nitrous air. It acts upon quicksilver, and also upon oils; and hence its examination cannot but be very imperfect. When water has absorbed a good quantity of this elastic fluid, it acquires the properties of nitrous acid; and, when heated, it yields a large quantity

quantity of nitrous air, viz. a quantity many times greater than that which water is wont to imbibe of it by agitation, or by any known means. When nitrous acid is combined with essential oils, a considerable effervescence and heat are produced, nearly as when the nitrous acid itself is poured upon those oils.

Fluor Acid Air. Put some of those minerals called *fluors*, or *fusible spars*, pulverized, into the bottle, and upon it pour some concentrated vitriolic acid; then adapt the bent tube, &c. The fluor acid air is at first produced

without the help of heat; but in a short time it will be necessary to apply the flame of a candle to the bottle, by which means a considerable quantity of this elastic fluid is obtained.

Alkaline Air. Let the usual bottle be about half filled with volatile spirit of sal ammoniac; and, after applying the bent tube, &c. let the flame of a candle be brought under the bottle, by which means the alkaline air will be produced copiously.

A E R

A E R

AEROMANCY, *f.* [from *αἰρ* and *μαντις*.] A species of divination performed by means of air, wind, &c. See **DIVINATION**.

AEROMETRY, *f.* [from *αἰρ* and *μετρον*.] The science of measuring the air. It comprehends not only the doctrine of the air itself, considered as a fluid body; but also its pressure, elasticity, rarefaction, and condensation. But the term is at present not much in use, this branch of natural philosophy being more frequently called pneumatics. See **PNEUMATICS**.

AERONAUT, *f.* a person who attends and guides an air-balloon. See **AEROSTATION** and **AIR-BALLOON**.

AERONAUTICA, *f.* [from *αἰρ*, and *ναυικος*, derived from *ναυς*, ship.] The art of sailing in a vessel or machine through the atmosphere, sustained as a ship in the sea.

AEROPHOBIA, *f.* [from *αἰρ*, air, and *φοβος*, fear.] According to Cælius Aurelianus, some phrenetic patients are afraid of a lucid, and others of an obscure, air, and these he calls aerophobi. So that,

AEROPHOBIA, *f.* is a symptom of the phrenitis.

AEROPHYLACEA, *f.* a term used by naturalists for caverns or reservoirs of air, supposed to exist in the bowels of the earth. Kircher speaks much of aerophylacea, or huge caverns, replete with air, disposed under ground; from whence, through numerous occult passages, that element is conveyed either to subterraneous receptacles of water, which, according to him, are hereby raised into springs or rivers, or into the funds of subterraneous fire, which are hereby fed and kept alive for the reparation of metals, minerals, and the like.

AEROSCOPY, *f.* [*αἰρ* and *σκοπεω*.] The observation of the air.

AEROSIS, *f.* an imaginary resolution of the blood into vapour, supposed necessary to the support of the vital spirits, and said to be brought about by the ventilation of the air during inspiration, in the manner that the flame of fuel is kindled by blowing it.

A E R O S T A T I O N

Is a science but very lately introduced into public notice. The word, in its primitive sense, denotes the science of suspending weights in the air; but, in its modern acceptance, it signifies *aërial navigation*, or the art of navigating through the atmosphere. Hence also the machines which are employed for this purpose are called *aerostats*, or *aerostatic machines*; and, from their globular shape, *air-balloons*.

The romances of almost every nation have recorded instances of persons being carried through the air, both by the agency of spirits and by mechanical inventions; but, till the time of the celebrated Lord Bacon, no rational principle appears ever to have been thought of by which this might be accomplished. Before that time, indeed, Friar Bacon had written upon the subject; and many had been of opinion, that, by means of artificial wings, fixed to the arms or legs, a man might fly as well as a bird: but these opinions were thoroughly refuted by Borelli in his Treatise *De Motu Animalium*, where, from a comparison between the power of the muscles which move the wings of a bird, and those which move the arms of a man, he demonstrates that the latter are utterly insufficient to strike the air with such force as to raise him from the ground. It cannot be denied, however, that wings of this kind, if properly constructed, and dexterously managed, might be sufficient to break the fall of a human body from an high place, so that some adventurers in this way might

possibly come off with safety; though by far the greatest number of those who have rashly adopted such schemes, have either lost their lives or limbs in the attempt.

In the year 1672, Bishop Wilkins published a Treatise, intitled, "The Discovery of the New World;" in which he mentions, though in a very indistinct and confused manner, the two principles on which the air is navigable; quoting, from Albertus de Saxonia and Francis Mendoca, "that the air is in some part of it navigable; and upon this static principle, any brass or iron vessel (suppose a kettle), whose substance is much heavier than that of water, yet being filled with the lighter air, it will swim upon it and not sink. So suppose a cup or wooden vessel upon the outward borders of this elementary air, the capacity of it being filled with fire, or rather ethereal air, it must necessarily, upon the same ground, remain swimming there, and of itself can no more fall than an empty ship can sink." This idea, however, he did not by any means pursue, but rested his hopes entirely upon mechanical motions, to be accomplished by the mere strength of a man, or by springs, &c. and which have been demonstrated incapable of answering any useful purpose.

The only person who brought his scheme of flying to any kind of rational principle was the Jesuit Francis Lana, cotemporary with Bishop Wilkins. He, being acquainted with the real weight of the atmosphere, justly concluded, that, if a globular vessel were exhausted of air, it would weigh

weigh less than before; and, considering that the solid contents of vessels increase in much greater proportion than their surfaces, he supposed that a metalline vessel might be made so large, that, when emptied of its air, it would be able not only to raise itself in the atmosphere, but to carry up passengers along with it; and he made a number of calculations necessary for putting the project in execution. But, though the theory was here unexceptionable, the means proposed were certainly insufficient to accomplish the end: for a vessel of copper, made so thin as was necessary to make it float in the atmosphere, would be utterly unable to resist the external pressure; which being demonstrated by those skilled in mechanics, no attempt was made on that principle.

In the year 1709, however, as we were informed by a letter published in France in 1784, a Portuguese projector, Friar Guffman, applied to the king for encouragement to his invention of a flying machine. The principle on which this was constructed, if indeed it had any principle, seems to have been that of the paper kite. The machine was constructed in form of a bird, and contained several tubes through which the wind was to pass, in order to fill a kind of sails, which were to elevate it; and, when the wind was deficient, the same effect was to be performed by means of bellows concealed within the body of the machine. The ascent was also to be promoted by the electric attraction of pieces of amber placed in the top, and by two spheres inclosing magnets in the same situation.

These childish inventions shew the low state of science at that time in Portugal, especially as the king, in order to encourage him to farther exertions in such an useful invention, granted him the first vacant place in his college of Barcelos or Santarem, with the first professorship in the university of Coimbra, and an annual pension of 600,000 reis during his life. Of this De Guffman, it is also related, that, in the year 1736, he made a wicker basket of about seven or eight feet diameter, and covered with paper, which raised itself about 200 feet in the air, and the effect was generally attributed to witchcraft.

In the year 1766, Mr. Henry Cavendish ascertained the weight and other properties of inflammable air, determining it to be at least seven times lighter than common air. Soon after which, it occurred to Dr. Black, that, perhaps a thin bag filled with inflammable air might be buoyed up by the common atmosphere; and he thought of having the allantois of a calf prepared for this purpose: but his other avocations prevented him from prosecuting the experiment. The same thought occurred some years afterwards to Mr. Cavallo; and he has the honour of being the first who made experiments on the subject. He first tried bladders; but the thinnest of these, however well scraped and prepared, were found too heavy. He then tried Chinese paper; but that proved so permeable, that the vapour passed through it like water through a sieve. His experiments, therefore, made in the year 1782, proceeded no farther than blowing up soap-bubbles with inflammable air, which ascended rapidly to the ceiling, and broke against it.

But while the discovery of the art of aerostation seemed thus on the point of being made in Britain, it was all at once announced in France, and that from a quarter whence nothing of the kind was to have been expected. Two brothers, Stephen and John Montgolfier, natives of Annonay, and masters of a considerable paper-manufactory there, had turned their thoughts towards this project as early as the middle of the year 1782. The idea was first suggested by the natural ascent of the smoke and clouds in the atmosphere; and their design was to form an artificial cloud, by inclosing the smoke in a bag, and making it carry up the covering along with it. Towards the middle of November that year, the experiment was made at Avignon, with a fine silk bag of a parallelopiped shape. By applying burning paper to the lower aperture, the air was rarefied, and the bag ascended in the atmosphere, and

struck rapidly against the ceiling. On repeating the experiment in the open air, it rose to the height of about seventy feet.

An experiment on a more enlarged scale was now projected; and a new machine, containing about 650 cubic feet, was made, which broke the cords that confined it, and rose to the height of about 600 feet. Another of thirty-five feet in diameter rose about 1000 feet high, and fell to the ground three quarters of a mile from the place where it ascended. A public exhibition was next made on the fifth of June, 1783, at Annonay, where a vast number of spectators assembled. An immense bag of linen, lined with paper, and containing upwards of 23,000 cubic feet, was found to have a power of lifting about 500lbs. including its own weight. The operation was begun by burning chopped straw and wool under the aperture of the machine, which immediately began to swell; and after being set at liberty ascended into the atmosphere. In ten minutes it had ascended 6000 feet; and, when its force was exhausted, it fell to the ground at the distance of 7663 feet from the place from whence it set out.

Soon after this, one of the brothers arrived at Paris, where he was invited by the academy of sciences to repeat his experiments at their expense. In consequence of this invitation, he constructed, in a garden in the Faubourg of St. Germain, a large balloon on an elliptical form. In a preliminary experiment, this machine lifted up from the ground eight persons who held it, and would have carried them all off if more had not immediately come to their assistance. Next day the experiment was repeated in presence of the members of the academy; the machine was filled by the combustion of fifty pounds of straw made up in small bundles, upon which about twelve pounds of chopped wool were thrown at intervals. The usual success attended this exhibition. The machine soon swelled; endeavoured to ascend; and immediately after sustained itself in the air, together with the charge of between 400 and 500 pounds weight. It was evident that it would have ascended to a great height; but, as it was designed to repeat the experiment before the king and royal family at Versailles, the cords by which it was tied down were not cut. But, in consequence of a violent rain and wind which happened at this time, the machine was so far damaged, that it became necessary to prepare a new one for the time that it had been determined to honour the experiment with the royal presence; and such expedition was used, that this vast machine, of near sixty feet in height, and forty-three in diameter, was made, painted with water-colours both within and without, and finely decorated, in no more than four days and four nights. Along with this machine was sent a wicker-cage, containing a sheep, a cock, and a duck, which were the first animals ever sent through the atmosphere. The full success of the experiment was prevented by a violent gust of wind which tore the cloth in two places near the top before it ascended. However, it rose to the height of 1440 feet; and, after remaining in the air about eight minutes, fell to the ground at the distance of 10,200 feet from the place of its setting out. The animals were not in the least hurt.

The great power of these aerostatic machines, and their very gradual descent in falling to the ground, had originally shewed that they were capable of transporting people through the air with all imaginable safety; and this was further confirmed by the experiment already mentioned. As M. Montgolfier, therefore, proposed to make a new aerostatic machine of a firmer and better construction than the former, M. Pilatre de Rozier offered himself to be the first aerial adventurer.

This new machine was constructed in a garden in the Faubourg of St. Antoine. It was of an oval shape, about forty-eight feet in diameter, and seventy-four in height; elegantly painted on the outside with the signs of the zodiac, cyphers of the king's name, and other ornaments. A proper gallery, grate, &c. were appended in the manner afterwards described; so that it was easy for the

the person who ascended to supply the fire with fuel, and thus keep up the machine as long as he pleased. The weight of the whole apparatus was upwards of 1600lbs. The experiment was performed on the 15th of October, 1785. M. Pilatre having placed himself in the gallery, the machine was inflated, and permitted to ascend to the height of eighty-four feet, where he kept it afloat for about four minutes and a half; after which it descended very gently: and such was its tendency to ascend, that it rebounded to a considerable height after touching the ground. Two days after, he repeated the experiment with the same success as before; but, the wind being strong, the machine did not sustain itself so well as formerly. On repeating the experiment in calmer weather, he ascended to the height of 210 feet. His next ascent was 262 feet; and, in the descent, a gust of wind having blown the machine over some large trees of an adjoining garden, M. Pilatre suddenly extricated himself from so dangerous a situation, by throwing straw and chopped wool on the fire, which raised him at once to a sufficient height. On descending again, he once more raised himself to a proper height by throwing straw on the fire. Some time after, he ascended in company with M. Girond de Vilette to the height of 330 feet; hovering over Paris at least nine minutes in sight of all the inhabitants, and the machine keeping all the while perfectly steady.

These experiments had shewn, that the aerostatic machines might be raised or lowered at the pleasure of the persons who ascended: they had likewise discovered, that the keeping them fast with the ropes was no advantage; but, on the contrary, this was attended with inconvenience and hazard. On the 21st of November, 1783, therefore, M. Pilatre determined to undertake an aerial voyage in which the machine should be fully set at liberty. Every thing being got in readiness, the balloon was filled in a few minutes; and M. Pilatre placed himself in the gallery, counterpoised by the Marquis d'Arlandes, who occupied the other side. It was intended to make some preliminary experiments on the ascending power of the machine: but the violence of the wind prevented this from being done, and even damaged the balloon essentially; so that it would have been entirely destroyed had not timely assistance been given. The extraordinary exertions of the workmen, however, repaired it again in two hours, and the adventurers set out. They met with no inconvenience during their voyage, which lasted about twenty-five minutes; during which time they had passed over a space of above five miles. From the account given by the Marquis d'Arlandes, it appears, that they met with several different currents of air; the effect of which was, to give a very sensible shock to the machine, and the direction of the motion seemed to be from the upper part downwards. It appears also, that they were in some danger of having the balloon burnt altogether; as the marquis observed several round holes made by the fire in the lower part of it, which alarmed him considerably, and indeed not without reason. However, the progress of the fire was easily stopped by the application of a wet sponge, and all appearance of danger ceased in a very short time.

This voyage of M. Pilatre and the Marquis d'Arlandes may be said to conclude the history of those aerostatic machines which are elevated by means of fire; for, though many other attempts have been made upon the same principle, most of them have either proved unsuccessful, or were of little consequence. They have therefore given place to the other kind, filled with inflammable air; which, by reason of its smaller specific gravity, is both more manageable, and capable of performing voyages of greater length, as it does not require to be supplied with fuel like the others. This was invented a very short time after the discovery had been made by M. Montgolfier. This gentleman had indeed designed to keep his method in some degree a secret from the world; but, as it could not be concealed, that a bag filled with any kind of fluid lighter than the common atmosphere would rise in it, in-

flammable air was naturally thought of as a proper succedaneum for the rarefied air of M. Montgolfier. The first experiment was made by two brothers, Messrs. Roberts, and M. Charles, a professor of experimental philosophy. The bag which contained the gas was composed of lute-string, varnished over with a solution of the elastic gum called *caoutchouc*; and that with which they made their first essay was only about thirteen English feet in diameter. Many difficulties occurred in filling it with the inflammable air, chiefly owing to their ignorance of the proper apparatus; inasmuch, that, after a whole day's labour from nine in the morning, they had got the balloon only one third part full. Next morning they were surprised to find that it had fully inflated of itself during the night: but, upon inquiry, it was found, that they had inadvertently left open a stop-cock connected with the balloon, by which the common air, gaining access, had mixed itself with the inflammable air; forming a compound still lighter than the common atmosphere, but not sufficiently light to answer the purposes of aerostation. Thus they were obliged to renew their operation; and, by six o'clock in the evening of the next day, they found the machine considerably lighter than the common air; and, in an hour after, it made a considerable effort to ascend. The public exhibition, however, had been announced only for the third day after; so that the balloon was allowed to remain in an inflated state for a whole day; during which they found it had lost a power of ascent equal to about three pounds, being one-seventh part of the whole. When it was at last set at liberty, after having been well filled with inflammable air, it was thirty-five pounds lighter than an equal bulk of common air. It remained in the atmosphere only three quarters of an hour, during which it had traversed fifteen miles. Its sudden descent was supposed to have been owing to a rupture which had taken place when it ascended into the higher regions of the atmosphere.

The success of this experiment, and the aerial voyage made by Messrs. Rozier and Arlandes, naturally suggested the idea of undertaking something of the same kind with a balloon filled with inflammable air. The machine used on this occasion was formed of gores of silk, covered over with a varnish made of *caoutchouc*, of a spherical figure, and measuring twenty-seven feet and a half in diameter. A net was spread over the upper hemisphere, and was fastened to an hoop which passed round the middle of the balloon. To this a sort of car, or rather boat, was suspended by ropes, in such a manner as to hang a few feet below the lower part of the balloon; and, in order to prevent the bursting of the machine, a valve was placed in it; by opening of which some of the inflammable air might be occasionally let out. A long silken pipe communicated with the balloon, by means of which it was filled. The boat was made of basket-work, covered with painted linen, and beautifully ornamented; being eight feet long, four broad, and three and a half deep; its weight 130 pounds. At this time, however, as at the former, they met with great difficulties in filling the machine with inflammable air, owing to their ignorance of the most proper apparatus. But at last, all obstacles being removed, the two adventurers took their seats at three quarters after one in the afternoon of the first of December, 1783. Persons skilled in the mathematics were conveniently stationed with proper instruments to calculate the height, velocity, &c. of the balloon. The weight of the whole apparatus, including that of the two adventurers, was found to be 604½ pounds, and the power of ascent when they set out was twenty pounds; so that the whole difference betwixt the weight of this balloon and an equal bulk of common air was 624 pounds. But the weight of common atmosphere displaced by the inflammable gas was calculated to be 77½ pounds, so that there remains 147 for the weight of the latter; and this calculation makes it only five times and a quarter lighter than common air.

At the time the balloon left the ground, the thermometer stood at 9° of Fahrenheit's scale, and the quick-

silver in the barometer at 30.18 inches; and, by means of the power of ascent with which they left the ground, the balloon rose till the mercury fell to twenty-seven inches, from which they calculated their height to be about 600 yards. By throwing out ballast occasionally as they found the machine descending by the escape of some of the inflammable air, they found it practicable to keep at pretty near the same distance from the earth during the rest of their voyage; the quicksilver fluctuating between 27.0 and 27.65 inches, and the thermometer between 53° and 57°, the whole time. They continued in the air for the space of an hour and three quarters, when they alighted at the distance of twenty-seven miles from Paris; having suffered no inconvenience during their voyage, nor experienced any contrary currents of air, as had been felt by Messrs. Pilatre and Arlandes. As the balloon still retained a great quantity of inflammable gas, M. Charles determined to take another voyage by himself. M. Robert accordingly got out of the boat, which was thus lightened by 130 pounds, and of consequence the acrostatic machine now had nearly as much power of ascent. Thus he was carried up with such velocity, that in twenty minutes he was almost 9000 feet high, and entirely out of sight of terrestrial objects. At the moment of his parting with the ground, the globe had been rather flaccid; but it soon began to swell, and the inflammable air escaped from it in great quantity through the silken tube. He also frequently drew the valve, that it might be the more freely emitted, and the balloon effectually prevented from bursting. The inflammable gas, being considerably warmer than the external air, diffused itself all round, and was felt like a warm atmosphere; but in ten minutes the thermometer indicated a variation of temperature as great as that between the warmth of spring and the ordinary cold of winter. His fingers were benumbed by the cold, and he felt a violent pain in his right ear and jaw, which he ascribed to the dilatation of the air in these organs as well as to the external cold. The beauty of the prospect which he now enjoyed, however, made amends for these inconveniences. At his departure the sun was set on the valleys; but the height to which M. Charles was got in the atmosphere rendered him again visible, though only for a short time. He saw, for a few seconds, vapours rising from the valleys and rivers. The clouds seemed to ascend from the earth, and collect one upon the other, still preserving their usual form; only their colour was grey and monotonous for want of sufficient light in the atmosphere. By the light of the moon he perceived that the machine was turning round with him in the air; and he observed that there were contrary currents which brought him back again. He observed also, with surprise, the effects of the wind, and that the streamers of his banners pointed upwards; which, he says, could not be the effect either of his ascent or descent, as he was moving horizontally at the time. At last, recollecting his promise of returning to his friends in half an hour, he pulled the valve, and accelerated his descent. When within 200 feet of the earth, he threw out two or three pounds of ballast, which rendered the balloon again stationary; but, in a little time afterwards, he gently alighted in a field about three miles distant from the place whence he set out; though, by making allowances for all the turnings and windings of the voyage, he supposes that he had gone through nine miles at least. By the calculations of M. de Maumier, he rose at this time not less than 10,500 feet high; a height somewhat greater than that of Mount *Ætna*. A small balloon, which had been sent off before the two brothers set out on their voyage, took a direction opposite to that of the large one, having met with an opposite current of air, probably at a much greater height.

The subsequent aerial voyages differ so little from that just now related, that any particular description of them seems to be superfluous. It had occurred to M. Charles, however, in his last flight, that there might be a possibility of directing the machine in the atmosphere; and this

was soon attempted by M. Jean Pierre Blanchard, a gentleman who had, for several years before, amused himself with endeavours to fly by mechanical means, though he had never succeeded in the undertaking. As soon as the discovery of the acrostatic machines was announced, however, he resolved to add the wings of his former machine to a balloon, and made no doubt that it would then be in his power to direct himself through the air at pleasure. In his first attempt he was frustrated by the impetuosity of a young gentleman, who insisted, right or wrong, on ascending along with him. In the scuffle which ensued on this occasion, the wings and other apparatus were entirely destroyed; so that M. Blanchard was obliged to commit himself to the direction of the wind; and in another attempt it was found, that all the strength he could apply to the wings was scarcely sufficient to counteract the impression of the wind in any degree. In his voyage, he found his balloon, at a certain period, acted upon by two contrary winds; but, on throwing out four pounds of ballast, he ascended to a place where he met with the same current he had at setting out from the earth. His account of the sensations he felt during this voyage was somewhat different from that of M. Charles; having, in one part of it, found the atmosphere very warm, in another cold; and having once found himself very hungry, and at another time almost overcome by a propensity to sleep. The height to which he arose, as measured by several observations with mathematical instruments, was thought to be very little less than 10,000 feet; and he remained in the atmosphere an hour and a quarter.

The attempts of M. Blanchard to direct his machine through the atmosphere were repeated in the month of April, 1784, by Messrs. Morveau and Bertrand, at Dijon, who raised themselves in an inflammable air-balloon to the height, as it was thought, of 13,000 feet; passing through a space of eighteen miles in an hour and twenty-five minutes. M. Morveau had prepared a kind of oars for directing the machine through the air; but they were damaged by a gust of wind, so that only two of them remained serviceable; by working these, however, they were able to produce a sensible effect on the motion of the machine.

In a third aerial voyage performed by M. Blanchard, he seemed to produce some effect by the agitation of his wings, both in ascending, descending, moving sideways, and even in some measure against the wind; however, this is supposed, with some probability, to have been a mistake, as, in all his succeeding voyages, the effects of his machinery could not be perceived.

The success of Messrs. Charles and Robert in their former experiments encouraged them soon to repeat them, with the addition of some machinery to direct their course. Having enlarged their former balloon to an oblong spheroid, forty-six feet and three-quarters long and twenty-seven and a half in diameter, they made it to float with its longest part parallel to the horizon. The wings were made in the shape of an umbrella without the handle, to the top of which a stick was fastened parallel to the aperture of the umbrella. Five of these were disposed round the boat, which was near seventeen feet in length. The balloon was filled in three hours, and, with the addition of 450 pounds of ballast, remained in *equilibrium* with the atmosphere. About noon, on the 19th of September, 1784, they began to ascend very gently in consequence of throwing out twenty-four pounds of ballast, but were soon obliged to throw out eight pounds more in order to avoid running against some trees. Thus they rose to the height of 1400 feet, when they perceived some thunder-clouds near the horizon. On this they ascended and descended, to avoid the danger, as the wind blew directly towards the threatening clouds; but, from the height of 600 feet to that of 4200 above the surface of the earth, the current was quite uniform and in one direction. During their voyage they lost one of their oars; but found, that by means of those which remained they considerably accelerated

accelerated their course. From the account of their voyage, it would seem that they had passed safely through the thunder-clouds; as we are informed, that, about forty minutes after three, they heard a loud clap of thunder; and, three minutes after, another much louder; at which time the thermometer sunk from 77° to 59° . This sudden cold, occasioned by the approach of the clouds, condensed the inflammable air so that the balloon descended very low, and they were obliged to throw out forty pounds of ballast; yet, on examining the heat of the air within the balloon, they found it to be 104° , when that of the external atmosphere was only 63° . When they had got so high that the mercury in the barometer stood only at 23.94 inches, they found themselves becalmed; so that the machine did not go even at the rate of two feet in a second, though it had before gone at the rate of twenty-four feet in a second. On this they determined to try the effect of their oars to the utmost; and, by working them for thirty-five minutes, and, marking the shadow of the balloon on the ground, they found, in that time, that they had described the segment of an ellipsis whose longest diameter was 6000 feet. After having travelled about 150 miles, they descended, only on account of the approach of night, having still 200 pounds of ballast left.

Their conclusion, with regard to the effect of their wings, is as follows:—"Those experiments shew, that far from going against the wind, as is said by some persons to be possible in a certain manner, and some aeronauts pretend to have actually done, we only obtained, by means of two oars, a deviation of twenty-two degrees: it is certain, however, that if we could have used our four oars we might have deviated about forty degrees from the direction of the wind, and, as our machine would have been capable of carrying seven persons, it would have been easy for five persons to have gone, and to have put in action eight oars, by means of which a deviation of about eighty degrees would have been obtained.

"We had already observed (say they), that, if we did not deviate more than twenty-two degrees, it was because the wind carried us at the rate of twenty-four miles an hour; and it is natural to judge, that, if the wind had been twice as strong as it was, we should not have deviated more than one-half of what we actually did; and, on the contrary, if the wind had been only half as strong, our deviation would have been proportionably greater."

Having thus related all that has been done with regard to the conducting of aerostatic machines through the atmosphere, we shall now relate the attempts that have been made to lessen their expence, by falling upon some contrivance to ascend without throwing out ballast, and to descend without losing any of the inflammable air. The first attempt of this kind was made by the Duke de Chartres; who, on the 15th of July, 1784, ascended with the two brothers, Charles and Robert, from the Park of St. Cloud. The balloon was of an oblong form, made to ascend with its longest diameter horizontally, and measured fifty-five feet in length and twenty-four in breadth. It contained within it a smaller balloon filled with common air; by blowing into which with a pair of bellows, and thus throwing in a considerable quantity of common air, it was supposed that the machine would become sufficiently heavy to descend, especially as, by the inflation of the internal bag, the inflammable air in the external one would be condensed into a smaller space, and thus become specifically heavier. The voyage, however, was attended with such circumstances as rendered it impossible to know what would have been the event of the scheme. The power of ascent with which they set out, seems to have been very great; as, in three minutes after parting with the ground, they were lost in the clouds, and involved in such a dense vapour that they could see neither the sky nor the earth. In this situation they seemed to be attacked by a whirlwind, which, besides turning the balloon three times round from right to left, shocked and beat it so about, that they were rendered incapable of using any of the means pro-

posed for directing their course, and the silk stuff of which the helm had been composed was even torn away. No scene can be conceived more terrible than that in which they were now involved. An immense ocean of shapeless clouds rolled one upon another below them, and seemed to prevent any return to the earth, which still continued invisible, while the agitation of the balloon became greater every moment. In this extremity they cut the cords which held the interior balloon, and of consequence it fell down upon the aperture of the tube that came from the large balloon into the boat, and stopped it up. They were then driven upwards by a gust of wind from below, which carried them to the top of that stormy vapour in which they had been involved. They now saw the sun without a cloud; but the heat of his rays, with the diminished density of the atmosphere, had such an effect on the inflammable air, that the balloon seemed every moment ready to burst. To prevent this they introduced a stick through the tube, in order to push away the inner balloon from its aperture; but the expansion of the inflammable air pushed it so close, that all attempts of this kind proved ineffectual. It was now, however, become absolutely necessary to give vent to a very considerable quantity of the inflammable air; for which purpose the Duke de Chartres himself bored two holes in the balloon, which tore open for the length of seven or eight feet. On this they descended with great rapidity; and would have fallen into a lake, had they not hastily thrown out sixty pounds of ballast, which enabled them just to reach the water's edge.

The success of the scheme for raising or lowering aerostatic machines by means of bags filled with common air being thus rendered dubious, another method was thought of. This was to put a small aerostatic machine with rarefied air under an inflammable-air balloon, but at such a distance that the inflammable air of the latter might be perfectly out of the reach of the fire used for inflating the former; and thus, by increasing or diminishing the fire in the small machine, the absolute weight of the whole would be considerably diminished or augmented. This scheme was unhappily put in execution by the celebrated M. Pilatre de Rozier, and another gentleman named M. Romaine. Their inflammable-air balloon was about thirty-seven feet in diameter, and the power of the rarefied-air one was equivalent to about sixty pounds. They ascended without any appearance of danger or sinister accident; but had not been long in the atmosphere when the inflammable-air balloon was seen to swell very considerably, at the same time that the aeronauts were observed, by means of telescopes, very anxious to get down, and busied in pulling the valve and opening the appendages to the balloon in order to facilitate the escape of as much inflammable air as possible. A short time after this the whole machine was on fire, when they had then attained the height of about three quarters of a mile from the ground. No explosion was heard; and the silk which composed the air-balloon continued expanded, and seemed to resist the atmosphere, for about a minute; after which it collapsed, and the remains of the apparatus descended along with the two unfortunate travellers so rapidly, that both of them were killed. M. Pilatre seemed to have been dead before he came to the ground; but M. Romaine was alive when some persons came up to the place where he lay, though he expired immediately after.

These are the most remarkable attempts that have been made to improve the science of aerostation; though a great number of other expeditions through the atmosphere have taken place. But of all the voyages which had been hitherto projected or put in execution, the most daring was that of M. Blanchard and Dr. Jeffries across the Straits of Dover, which separate England from France. This took place on the 7th of January, 1785, being a clear frosty morning, with a wind, barely perceptible, at N. N. W. The operation of filling the balloon began at ten o'clock, and, at three quarters after twelve, every thing was ready

AEROSTATION.

1. Montgolfier's Balloon. 2. Blanchard's. 3. Charles & Robert's. 4. Lunardi's.
5. Baldwin's View over the City of Chester from Lunardi's Balloon.

ready for their departure. At one o'clock M. Blanchard desired the boat to be pushed off, which now stood only two feet distant from that precipice so finely described by Shakespeare in his tragedy of King Lear. As the balloon was scarcely sufficient to carry two, they were obliged to throw out all their ballast except three bags of ten pounds each; when they at last rose gently, though making very little way on account of there being so little wind. At a quarter after one o'clock, the barometer, which on the cliff stood at 29.7 inches, was now fallen to 27.3, and the weather proved fine and warm. They had now a most beautiful prospect of the south coast of England, and were able to count thirty-seven villages upon it. After passing over several vessels, they found that the balloon, at fifty minutes after one, was descending, on which they threw out a sack and a half of ballast; but, as they saw that it still descended, and that with much greater velocity than before, they now threw out all the ballast. This still proving ineffectual, they next threw out a parcel of books they carried along with them, which made the balloon ascend, when they were about midway betwixt France and England. At a quarter past two, finding themselves again descending, they threw away the remainder of their books, and, ten minutes after, they had a most enchanting prospect of the French coast. Still, however, the machine descended; and, as they had now no more ballast, they were fain to throw away their provisions for eating, the wings of their boat, and every other moveable they could easily spare. "We threw away (says Dr. Jeffries) our only bottle, which, in its descent, cast out a steam like smoke, with a rushing noise; and, when it struck the water, we heard and felt the shock very perceptibly on our car and balloon." All this proving insufficient to stop the descent of the balloon, they next threw out their anchors and cords, and at last stripped off their clothes, fastening themselves to certain slings, and intending to cut away the boat as their last resource. They had now the satisfaction, however, to find that they were rising; and, as they passed over the high lands between Cape Blanc and Calais, the machine rose very fast, and carried them to a greater height than they had been at any former part of their voyage. They descended safely among some trees in the forest of Guignes, where there was just opening enough to admit them.

It would be tedious as well as unnecessary to recount all the other aerial voyages that have been performed in this and other countries; we shall therefore conclude with an account of the ingenious Mr. Baldwin's excursion from Chester.

On the 8th of September, 1785, at forty minutes past one, P. M. Mr. Baldwin ascended from Chester in M. Lunardi's balloon. After travelling, in a variety of different directions, he first alighted, at twenty-eight minutes after three, about twelve miles from Chester, in the neighbourhood of Frodsham; then, re-ascending and pursuing his excursion, he finally landed at Rixton Moss, five miles N. N. E. of Wavington, and twenty-five miles from Chester. Mr. Baldwin has published his Observations and Remarks made during his voyage, and the following are some of the most important and curious:—"The sensation of ascending is compared to that of a strong pressure from the bottom of the car upwards against the soles of his feet. At the distance of what appeared to him seven miles from the earth, though by the barometer scarcely a mile and a half, he had a grand and most enchanting view of the city of Chester and its adjacent places below. The river Dee appeared of a red colour; the city very diminutive; and the town entirely blue. The whole appeared a perfect plain, the highest building having no apparent height, but reduced all to the same level, and the whole terrestrial prospect appeared like a coloured map. Just after his first ascent, being in a well-watered and maritime part of the country, he observed a remarkable and regular tendency of the balloon towards the sea; but shortly after, rising into another current of air, he escaped

the danger: this upper current, he says, was visible to him at the time of his ascent, by a lofty sound stratum of clouds flying in a safe direction. The perspective appearance of things to him was very remarkable. The lowest bed of vapour that first appeared as cloud was pure white, in detached fleeces, increasing as they rose: they presently coalesced, and formed, as he expresses it, a sea of cotton, tufting here and there by the action of the air in the undisturbed part of the clouds. The whole became an extended white floor of cloud, the upper surface being smooth and even. Above this white floor he observed, at great and unequal distances, a vast assemblage of thunder-clouds, each parcel consisting of whole acres in the densest form: he compares their form and appearance to the smoke of pieces of ordnance, which had consolidated as it were into masses of snow, and penetrated through the upper surface or white floor of common clouds, there remaining visible and at rest. Some clouds had motions in slow and various directions, forming an appearance truly stupendous and majestic. He endeavours to convey some idea of the scene by a figure in the annexed plate of aerostation, which represents a circular view he had from the car of the balloon, himself being over the centre of the view, looking down on the white floor of clouds, and seeing the city of Chester through an opening, which discovered the landscape below, limited by surrounding vapour to less than two miles in diameter. The breadth of the outer margin defines his apparent height in the balloon (viz. four miles) above the white floor of clouds. Mr. Baldwin also gives a curious description of his tracing the shadow of the balloon over tops of volumes of clouds. At first it was small, in shape and size like an egg; but soon increased to the magnitude of the sun's disc, still growing larger, and attended with a most captivating appearance of an iris encircling the whole shadow at some distance round it, the colours of which were remarkably brilliant. The regions did not feel colder, but rather warmer, than below. The sun was hottest to him when the balloon was stationary. The discharge of a cannon, when the balloon was at a considerable height, was distinctly heard by the aeronaut; and a discharge from the same piece, when at the height of thirty yards, so disturbed him as to oblige him for safety to lay hold firmly of the cords of the balloon. At a considerable height he poured down a pint bottle-full of water; and, as the air did not oppose a resistance sufficient to break the stream into small drops, it mostly fell down in large drops. In the course of the balloon's track it was found much affected by the water (a circumstance observed in former aerial voyages). At one time the direction of the balloon kept continually over the water, going directly towards the sea, so much as to endanger the aeronaut; the mouth of the balloon was opened, and he in two minutes descended into an under-current blowing from the sea: he kept descending, and landed at Bellair Farm in Rinsley, twelve miles from Chester. Here he lightened his car by thirty-one pounds, and, instantly re-ascending, was carried into the anterior part of the country, performing a number of different manœuvres. At his greatest altitude he found his respiration free and easy. Several bladders which he had along with him cracked and expanded very considerably. Clouds and land, as before, appeared on the same level. By way of experiment, he tried the upper valve two or three times, the neck of the balloon being close; and remarked, that the escape of the gas was attended with a growling noise like millstones, but not near so loud. Again, round the shadow of the balloon, on the clouds, he observed the iris. A variety of other circumstances and appearances he met with, is fancifully described; and at fifty-three minutes after three he finally landed."

The frequency of aerial voyages, accompanied with particular details of trifling and uninteresting circumstances, and apparently made with a view to promote the interest of particular persons, regardless of any advance-

ment in knowledge, have now sunk the science of aerostation so low in the opinion of most people, that, before giving any account of the most proper method of constructing these machines, it may seem necessary to premise something concerning the uses to which they may possibly be applied. These, according to Mr. Cavallo, are the following.

"The small balloons, especially those made of paper, and raised by means of spirit of wine, may serve to explore the direction of the winds in the upper regions of the atmosphere, particularly when it is a calm below: they may serve for signals in various circumstances, in which no other means can be used; and letters or other small things may be easily sent by them, as for instance from ships that cannot safely land on account of storms, from besieged places, islands, or the like. The larger aerostatic machines may answer all the above-mentioned purposes in a better manner; and they may, besides, be used as a help to a person who wants to ascend a mountain, a precipice, or to cross a river; and perhaps one of those machines, tied to a boat by a long rope, may be, in some cases, a better sort of sail than any that is used at present. The largest sort of machines, which can take up one or more men, may evidently be subservient to various æconomical and philosophical purposes. Their conveying people from place to place with great swiftness, and without trouble, may be of essential use, even if the art of guiding them in a direction different from that of the wind should never be discovered. By means of those machines the shape of certain seas and lands may be better ascertained; men may ascend to the tops of mountains they never visited before; they may be carried over marshy and dangerous grounds; they may by that means come out of a besieged place, or an island; and they may, in hot climates, ascend to a cold region of the atmosphere, either to refresh themselves, or to observe the ice, which is never seen below; and in short, they may be thus taken to several places, to which human art hitherto knew of no conveyance.

"The philosophical uses, to which these machines may be subservient, are numerous indeed; and it may be sufficient to say, that hardly any thing which passes in the atmosphere is known with precision, and that principally for want of a method of ascending into it. The formation of rain, of thunder-storms, of vapours, hail, snow, and meteors in general, require to be attentively examined and ascertained. The action of the barometer, the refraction and temperature of the air in various regions, the descent of bodies, the propagation of sound, &c. are subjects which all require a series of observations and experiments, the performance of which could never have been properly expected before the discovery of aerostatic machines."

To those uses we may add the gratification of curiosity and pleasure as a very strong inducement to the practice of an art, in which, with any tolerable degree of caution, there appears not to be the smallest danger. Every one who has tried the experiment testifies, that the beauty of the prospect afforded by an ascent, or the pleasure of being conveyed through the atmosphere, cannot be exceeded. No one has felt the least of that giddiness consequent upon looking from the top of a very high building or of a precipice, nor have they any of the sickness arising from the motion of a vessel at sea. Many have been carried by balloons at the rate of thirty, forty, or even fifty, miles an hour, without feeling the least inconvenience, or even agitation of the wind; the reason of which is, that, as the machine moves with nearly the velocity of the wind itself, they are always in a calm, and without uneasiness. Some have apprehended danger from the electricity of the atmosphere; and have thought that a stroke of lightning, or the smallest electric spark, happening near a balloon, might set fire to the inflammable air, and destroy both the machine and the adventurers. Mr. Cavallo has suggested several considerations for diminishing apprehensions of this kind. Balloons have been already raised in every season of the year, and even when thunder has been heard, with-

out injury. In case of danger, the aeronauts may either descend to the earth, or ascend above the region of the clouds and thunder-storms. Besides, as balloons are formed of materials that are not conductors of electricity, they are not likely to receive strokes, especially as by being encompassed with air they stand insulated. Moreover, inflammable air by itself, or unmixed with a certain quantity of common air, will not burn; so that, if an electric spark should happen to pass through the balloon, it would not set fire to the inflammable air unless a hole were made in the covering.

The general principles of aerostation are so little different from those of hydrostatics, that it may seem superfluous to insist much upon them. It is a fact universally known, that when a body is immersed in any fluid, if its weight be less than an equal bulk of that fluid, it will rise to the surface; but, if heavier, it will sink; and, if equal, it will remain in the place where it is left. For this reason smoke ascends into the atmosphere, and heated air in that which is colder. The ascent of the latter is shewn in a very easy and satisfactory manner by bringing a red-hot iron under one of the scales of a balance, by which the latter is instantly made to ascend; for, as soon as the red-hot iron is brought under the scale, the hot air being lighter than that which is colder, ascends, and strikes the bottom, which is thus impelled upwards, and the opposite scale descends, as if a weight had been put into it.

Upon this simple principle depends the whole theory of aerostation; for it is the same thing whether we render the air lighter by introducing a quantity of heat into it, or inclosing a quantity of gas specifically lighter than the common atmosphere in a certain space; both will ascend, and for the same reason. A cubic foot of air, by the most accurate experiments, has been found to weigh about 554 grains, and to be expanded by every degree of heat, marked on Fahrenheit's thermometer, about $\frac{1}{500}$ part of the whole. By heating a quantity of air, therefore, to 500 degrees of Fahrenheit, we shall just double its bulk when the thermometer stands at fifty-four in the open air, and in the same proportion we shall diminish its weight; and if such a quantity of this hot air be inclosed in a bag, that the excess of the weight of an equal bulk of common air weighs more than the bag with the air contained in it, both the bag and air will rise into the atmosphere, and continue to do so until they arrive at a place where the external air is naturally so much rarefied that the weight becomes equal; and here the whole will float.

The power of hot air in raising weights, or rather that by which it is itself impelled upwards, may be shewn in the following manner: Roll up a sheet of paper into a conical form, and, by thrusting a pin into it, prevent it from unrolling. Fasten it by its apex under one of the scales of a balance by means of a thread, and, having properly counterpoised it by weights, put it into the opposite scale; apply the flame of a candle underneath, you will instantly perceive the cone to arise, and it will not be brought into equilibrium with the other but by a much greater weight than those who have never seen the experiment would believe. If we try this experiment with more accuracy, by getting proper receptacles made which contain determinate quantities of air, we shall find that the power of the heat depends much more on the capacity of the bag which contains it than could well be supposed. Thus, let a cubical receptacle be made of a small wooden frame covered with paper capable of containing one foot of air, and let the power of a candle be tried with this as above directed for the paper cone. It will then be found that a certain weight may be raised; but a much greater one will be raised by having a receptacle of the same kind which contains two cubic feet; a still greater by one of three feet; a yet greater by one of four feet, &c. and this even though the very same candle be made use of; nor is it known to what extent even the power of this small flame might be carried.

From these experiments it appears, that in the aerostatic

tic machines constructed on Montgolfier's plan, it must be an advantage to have them as large as possible; because a smaller quantity of fire will then have a greater effect in raising them, and the danger from that element, which in this kind of machines is chiefly to be dreaded, will be in a great measure avoided. On this subject it may be remarked, that as the cubical contents as a globe, or any other figure of which balloons are made, increase much more rapidly than their surfaces, there must ultimately be a degree of magnitude at which the smallest imaginable heat would raise any weight whatever. Thus, supposing any aerostatic machine capable of containing 500 cubic feet, and the air within it to be only one degree hotter than the external atmosphere; the tendency of this machine to rise, even without the application of artificial heat, would be near an ounce. Let its capacity be increased sixteen times; and the tendency to rise will be equivalent to a pound, though this may be done without making the machine sixteen times heavier than before. It is certain, however, that all aerostatic machines have a tendency to produce or preserve heat within them, which would by no means be imagined by those who have not made the experiment. When Messrs. Charles and Robert made their longest aerial voyage of 150 miles, they had the curiosity to try the temperature of the air within their balloon, in comparison with that of the external atmosphere; and at this time they found, that, when the external atmosphere was 63° , the thermometer within the balloon stood at 104° . Such a difference of temperature must have given a machine of the magnitude which carried them a considerable ascending power independent of any other cause, as it amounted to forty-one grains on every cubic foot; and therefore in a machine containing 50,000 such feet would have been almost 200 pounds. Hence we may easily account for what happened at Dijon, and is recorded by Mr. Morveau. "A balloon, intended to be filled with inflammable air, being completed, was, by way of trial, filled with common air, and in that state exposed to the atmosphere. Now it was observed, and indeed a similar observation had been made before, that the air within the balloon was much hotter than the circumambient air: the thermometer in the former stood at 120° ; whereas in the latter, even when the sun shone upon it, the thermometer stood at 84° . This shewed a considerable degree of rarefaction within the balloon; and consequently it was suspected, that, by means of this rarefaction alone, especially if it were to increase a little, the balloon might ascend. On the 30th of May, about noon, the wind, being rather strong, agitated the balloon so that two men were employed to take care of it; but, notwithstanding all their endeavours, it escaped from its confinement; and, lifting up about sixty-five pounds weight of cords, equatorial circle, &c. rose many feet high, and, passing over some houses, went to the distance of 250 yards, where at length it was properly secured."

This difference between the external and internal heat, being so very considerable, must have a great influence upon aerostatic machines, and will undoubtedly influence those filled with inflammable air as well as the other kind. Nor is it unlikely, that the short time which many aerial voyagers have been able to continue in the atmosphere may have been owing to the want of a method of preserving this internal heat. It may naturally be supposed, and indeed it has always been found, that balloons, in passing through the higher regions of the atmosphere, acquire a very considerable quantity of moisture; not only from the rain or snow they sometimes meet with, but even from the dew and vapour which condense upon them. On this an evaporation will instantly take place; and, as it is the property of this operation to produce a very violent cold, the internal heat of the balloon must be soon exhausted in such a manner as to make it become specifically heavier than the common atmosphere, and consequently descend in a much shorter time than it would have done by the mere loss of air. To this in all probability we are to ascribe the de-

scant of the balloon which carried Messrs. Blanchard and Jeffries; and which seemed so extraordinary to many people, that they were obliged to have recourse to an imaginary attraction in the waters of the ocean, in order to solve the phenomenon. This supposition is rejected by Mr. Cavallo; who explains the matter, by remarking, that, in two former voyages made with the same machine, it could not long support two men in the atmosphere; so that we had no occasion to wonder at its weakness on this occasion. "As for its rising higher (says he) just when it got over the land, that may be easily accounted for. In the first place, the travellers threw out their clothes just about that time; secondly, in consequence of the wind's then increasing, the balloon travelled at a much greater rate than it had done whilst over the sea; which increase of velocity lessened its tendency to descend: besides which, the vicissitudes of heat and cold may produce a very considerable effect; for, if we suppose that the air over the land was colder than that over the sea, the balloon, coming into the latter from the former, continued to be hotter than the circumambient air for some time after; and consequently, it was comparatively much lighter when in the cold air over the land than when in the hotter air over the sea; hence it floated easier in the former than it did in the latter case."

It seems indeed very probable, that there was something uncommon in the case of M. Blanchard's balloon while passing over the sea; for, as it rose higher after reaching the land than in any former period of the voyage, and likewise carried them to the distance over land more than half of that which they had passed over water, we can scarcely avoid supposing, that it had a tendency to descend when over the water more than when over land, independent of any loss of air. Now, it does not appear that the air over the sea is at all warmer than that above land; on the contrary, there is every reason to believe, that the superior reflective power of the land renders the atmosphere above it warmer than the sea can do: but it is very natural to suppose, that the air above the sea is more moist than that above land; and consequently, by letting fall its moisture upon the balloon must have occasioned an evaporation that would deprive the machine of its internal heat, which it would partly recover after it entered the warmer and drier atmosphere over land.

We shall now proceed to the construction of aerostatic machines; of which the smaller are only for amusement, or some slight experiments, and are very easily made. As in all of them, however, it is of the utmost consequence to have the weight as little as possible, the shape becomes an object of great consideration. For this purpose a spherical figure has been mathematically demonstrated to be the best; as capable of containing a greater quantity under a smaller surface than any other. Thus a perfect sphere contains less surface in proportion to its solidity than a spheroid; a spheroid less than a cylinder; the latter less than a cube; and a cube still less than a parallelopiped. In all cases, therefore, where we can fill the whole capacity of the balloon with air equally light, the spherical figure is undoubtedly to be preferred; and this holds good with regard to all inflammable-air balloons, whether their size be great or small; but in the rarefied-air ones, where the under part must necessarily be much colder than the upper, the globular shape seems not so proper. An inverted cone, or truncated pyramid, with the smaller part undermost, seems then to be most proper, as it allows the heated air (which has a great tendency to expand as well as to ascend) to collect in the wide part at the top, while the useless surface in the lower part, and which, in any other figure, would contain only the colder and heavier air, is thus thrown aside. In fact it has been found, that aerostatic machines, raised by means of rarefied air, when made of the shape of a parallelopiped, or even one deviating still more from the shape of a globe, have answered the purpose as well as they could have been supposed to do, had ever so much care been taken in forming them.

them exactly to that shape. The very first machine made by M. Montgolfier was in form of a parallelopiped; and, though it contained only forty cubic feet, shewed a very considerable power of ascent. A very large one, seventy four feet high, which M. Montgolfier had designed to exhibit before the royal family, had the middle part of it prismatic for about the height of twenty-five feet; its top was a pyramid of twenty-nine feet; and its lower part was a truncated cone of near twenty feet. It weighed 1000 pounds; and, notwithstanding its shape, in a very short time manifested a power of ascent equal to 500 pounds. Another aerostatic machine of a small size, but of the figure of a parallelopiped, being suffered to ascend with thirty sheets of oiled paper fixed in a wire frame, and set on fire, rose to a great height, and in twenty-two minutes could not be seen. It seems therefore, that, with regard to the shape of these machines, it is by no means necessary to adhere rigidly to that of a sphere; but that any oblong form answers very well.

For experimental purposes, both the inflammable and rarefied air-balloons may be made of paper; the former being made of that kind called *thin post*, varnished over with linseed-oil; the latter either of that or any other kind, without varnish. In order to avoid the danger of burning, however, it has been proposed to impregnate the paper of which these small rarefied-air balloons are made with solution of sal-ammoniac, allum, or some other salt; but this does not seem to be necessary. Those filled with inflammable air have been made of gold-beaters skin or peeled bladders; but the cheaper material of paper is undoubtedly preferable.

For aerostatic machines of a larger size, the material universally employed is varnished silk; and, for those of the rarefied-air kind, linen painted over with some size colour, or lined with paper. The best varnish for an inflammable-air balloon is that made with bird-lime, and recommended by Mr. Faujas de Saint-Fond, in a treatise published on the subject. The following is his method of preparing it: "Take one pound of bird-lime, put it into a new proper earthen pot that can resist the fire, and let it boil gently for about one hour, viz. till it ceases to crackle; or, which is the same thing, till it is so far boiled, as that a drop of it being let fall upon the fire will burn: then pour upon it a pound of spirit of turpentine, stirring it at the same time with a wooden spatula, and keeping the pot at a good distance from the flame, lest the vapour of this essential oil should take fire. After this, let it boil for about six minutes longer; then pour upon the whole three pounds of boiling oil of nuts, linseed, or poppy, rendered drying by means of litharge; stir it well, let it boil for a quarter of an hour longer, and the varnish is made. After it has rested for twenty-four hours, and the sediment has gone to the bottom, decant it into another pot; and, when you want to use it, warm, and apply it with a flat brush upon the silk stuff, whilst that is kept well stretched. One coat of it may be sufficient; but, if two are necessary, it will be proper to give one on each side of the silk, and to let them dry in the open air while the silk remains extended."

Mr. Cavallo gives the following method of preparing this varnish, which he prefers to that of M. de St. Fond:—"In order to render linseed-oil drying, boil it with two ounces of saccharum saturni and three ounces of litharge, for every pint of oil, till the oil has dissolved them, which will be accomplished in half an hour; then put a pound of bird-lime and half a pint of the drying oil into a pot (iron or copper pots are the safest for this purpose), the capacity of which may be equal to about one gallon, and let it boil very gently over a slow charcoal fire till the bird-lime ceases to crackle, which will be in about half or three quarters of an hour; then pour upon it two pints and a half more of drying oil, and let it boil for one hour longer, stirring it very frequently with an iron or wooden spatula. As the varnish, whilst boiling, and especially when it is nearly done, swells very much, care should be had to re-

move, in those cases, the pot from the fire, and to replace it when the varnish subsides, otherwise it will boil over. Whilst the stuff is boiling, the operator should, from time to time, examine whether the varnish has boiled enough; which is thus known:—Take some of it upon the blade of a knife, and then, after rubbing the blade of another knife upon it, separate the knives; and when, on this separation, the varnish begins to form threads between the two, you may conclude that it is done; and, without losing time, it must be removed from the fire. When it is almost, though not quite, cold, add about an equal quantity of spirit of turpentine: mix it well together, and let it rest till the next day; when, having warmed it a little, strain and bottle it. If it is too thick, add some more spirit of turpentine. When this varnish is laid upon the silk, the stuff should be made perfectly dry, and stretched; so that the varnish, which ought to be used lukewarm, may fill up the pores of the stuff. The varnish should be laid once very thin upon one side of the stuff; and, about twelve hours after, two other coats of it should be laid on, one on each side; and, twenty-four hours after, the silk may be used, though, in cold weather, it may be left to dry some time longer."

Much has been said in France of their elastic gum-varnish, and its composition kept a secret; but Mr. Baldwin, after many expensive trials, declares to the world what he considers as the secret; and it is merely this: "Take any quantity of caoutchouc, as two ounces averdupois; cut it into small bits with a pair of scissors; put a strong iron ladle (like that used by plumbers) over a common pitcoal or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much below a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear, or it will evaporate without flame: the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds or one quart of the best drying oil (or of raw linseed-oil, which, together with a few drops of neat's-foot oil, has stood a month, or not so long, on a lump of quick-lime, to make it more or less drying), is to be put into the melted caoutchouc, and stirred till hot, and the whole poured into a glazed vessel, through a coarse gauze or fine sieve. When settled and clear, which will be in a few minutes, it will be fit for use either hot or cold." Mr. Baldwin is not at liberty, he observes, to publish the art of laying on the varnish; but says, that it consists in making no intestine motion in the varnish, which would create minute bubbles; that therefore brushes are improper. Mr. Blanchard's method of making elastic gum-varnish for the silk of a balloon, is the following: "Dissolve elastic gum (caoutchouc) cut small in five times its weight of spirit of turpentine, by keeping them some days together; then boil one ounce of this solution in eight ounces of drying linseed-oil for a few minutes; lastly, strain it. It must be used warm." The pieces of silk for the balloon must be cut out of a proper size, according to the dimensions, after the varnish is sufficiently dry. They may be joined by laying about half an inch of the edge of one piece over the edge of the other, and sewing them by a double stitching. Mr. Blanchard uses expeditiously the following method. He lays about half an inch of the edge of one piece flat over the edge of the other, and passes a hot iron over it; in doing which a piece of paper ought to be laid both under and over the silk. The joining may be rendered more secure by running it with a silk thread, and sticking a ribband over it. The ribbands laid over seams may be stuck with common glue, provided the varnish of the silk is properly dried. When the glue is quite dry, the ribbands should be varnished over, to prevent their being unglued by the rain.

The best method of cutting the pieces of silk that are to form a balloon, is to describe a pattern of wood or stiff card-paper, and then to cut the silk upon it. In cutting the pieces after such pattern, care should be taken to leave them about three-quarters of an inch all round larger than the pattern, which will be taken up by the seams in joining.

To the upper part of the balloon there should be adapted, and well fitted in, a valve opening inwards; to which should be fastened a string passing through a hole made in a small piece of round wood fixed in the lowest part of the balloon opposite to the valve, the end of this string fastened in the car below, so that the aeronaut may open the valve when occasion requires. The action of this valve is effected by a round brass plate, having a round hole about two or three inches diameter, covered on both sides with strong smooth leather. On the inside there is a shutter of brass, covered with leather, which serves to close the hole, being about two inches larger in diameter than the hole. It is fastened to the leather of the plate, and by a spring, which need not be very strong, it is kept against the hole. The elasticity of the gas itself will help to keep it shut. To this shutter the string is fastened, by which it is occasionally opened for the escape of the gas. A small string or other security should be fixed to the shutter and the plate, so as not to admit the shutter to be opened beyond a certain safe distance. To the lower part of the balloon two pipes should be fixed, made of the same stuff as the envelope; six inches diameter for a balloon of thirty feet, and proportionably larger for balloons of a greater capacity. They must be long enough for the car. For balloons of eighteen feet and less diameter, one neck or pipe will be sufficient. These pipes are the apertures through which the inflammable gas is introduced into the balloon.

The car or boat is best made of wicker-work, covered with leather, and well painted or varnished over; and the proper method of suspending it, is by ropes proceeding from the net which goes over the balloon. This net should be formed to the shape of the balloon, and fall down to the middle of it, with various cords proceeding from it to the circumference of a circle about two feet below the balloon; and from that circle other ropes should go to the edge of the boat. This circle may be made of wood, or of several pieces of slender cane bound together. The meshes of the net may be small at top, against which part of the balloon the inflammable air exerts the greatest force; and increase in size as they recede from the top. A hoop has sometimes been applied round the middle of the balloon to fasten the net. This, though not absolutely necessary, is best made of pieces of cane bound together, and covered with leather.

With regard to the rarefied-air machines, Mr. Cavallo recommends first to soak the cloth in a solution of sal ammoniac and common size, using one pound of each to every gallon of water; and, when the cloth is quite dry, to paint it over in the inside with some earthy colour, and strong fire or glue. When this paint has dried perfectly, it will then be proper to varnish it with oily varnish, which might dry before it could penetrate quite through the cloth. Simple drying linseed oil will answer the purpose as well as any, provided it be not very fluid.

It now only remains to give some account of the method by which aerostatic machines may be filled with their proper gas, in order to give them their power of ascending into the atmosphere; and here we are enabled to determine with much greater precision concerning the inflammable air-balloons than the others. With regard to them, a primary consideration is, the most proper method of procuring the inflammable air. It may be obtained in various ways, as has been shewn under the article AEROLGY. But the most advantageous methods are, by applying acids to certain metals; by exposing animal, vegetable, and some mineral, substances, in a close vessel to a

strong fire; or by transmitting the vapour of certain fluids through red-hot tubes.

In the first of these methods, iron, zinc, and vitriolic acid, are the materials most generally used. The vitriolic acid must be diluted by five or six parts of water. Iron may be expected to yield in the common way 1700 times its own bulk of gas; or one cubic foot of inflammable air to be produced by four ounces and a half of iron, the like weight of oil of vitriol, and twenty-two ounces and a half of water. Six ounces of zinc, an equal weight of oil of vitriol, and thirty ounces of water, are necessary for producing the same quantity of gas. It is more proper to use the turnings or chippings of great pieces of iron, as of cannon, &c. than the filings of that metal, because the heat attending the effervescence will be diminished; and the diluted acid will pass more readily through the interstices of the turnings when they are heaped together, than through the filings, which stick closer to one another. The weight of the inflammable air thus obtained by means of acid of vitriol, is, in the common way of procuring it, generally one-seventh part of the weight of common air; but, with the necessary precautions for philosophical experiments, less than one-tenth of the weight of common air. Two other sorts of elastic fluids are sometimes generated with the inflammable air. These may be separated from it by passing the inflammable air through water in which quick-lime has been dissolved. The water will absorb these fluids, cool the inflammable air, and prevent its over-heating the balloon when introduced into it.

Inflammable air may be obtained at a much cheaper rate by the action of fire on various substances; but the gas which these yield is not so light as that produced by the effervescence of acids and metals. The substances proper to be used in this way are, pit-coal, asphaltum, amber, rock-oil, and other minerals; wood, and especially oak, camphor-oil, spirit of wine, ether, and animal substances, which yield air in different degrees, and of various specific gravities; but pit-coal is the preferable substance. A pound of this exposed to a red heat yields about three cubic feet of inflammable air, which, whether it be passed through water or not, weighs about one-fourth of the weight of common air. Dr. Priestley found that animal or vegetable substances will yield six or seven times more inflammable air when the fire is suddenly increased than when it is gently raised, though it be afterwards made very strong. Mr. Cavallo observes, that the various substances above enumerated generally yield all their inflammable air in about one hour's time. The general method is, to inclose the substances in iron or earthen vessels, and thus expose them to a strong fire sufficient to make the vessels red-hot: the inflammable air proceeding from the aperture of the vessel is received into a tube or refrigeratory, and, passing through the tube or worm, is at last collected in a balloon or other vessel. A gun-barrel has often been used for essays of this kind. The substance is put into it so as to fill six or eight inches of its lowest part, the remainder filled with dry sand: a tube, adapted to the mouth of the barrel, is brought into a basin of water under an inverted receiver; and, the part of the barrel containing the substance being put into the fire and made red-hot, the inflammable air is collected in the inverted receiver. As the gun-barrel cannot serve for producing a large quantity of inflammable air, Mr. Cavallo recommends, as the most advantageous shape, the following contrivance:—Let the vessel be made of clay, or rather of iron, in the shape of a Florence flask, somewhat larger, and whose neck is longer and larger. Put the substance to be used into this vessel, so as to fill about four-fifths or less of its cavity. If the substance is of such a nature as to swell much by the action of the fire, lute a tube of brass, or first a brass and then a leaden tube, to the neck of the vessel; and let the end of the tube be rounded, so that going into the water of a tub, it may

terminate under a fort of inverted vessel, to the upper aperture of which the balloon is adapted. Things thus prepared, if the lower part of the vessel be put into the fire, and made red-hot, the inflammable air produced will come out of the tube, and, passing through the water, will at last enter into the balloon. Previous to the operation, as a considerable quantity of common air remains in the inverted vessel, which it is more proper to expel, the vessel should have a stop-cock, through which the common air may be sucked out, and the water ascend as high as the stop-cock. Care must be taken that the fire used in this process be at a sufficient distance, otherwise it may happen to fire the inflammable air.

Another method of obtaining inflammable air was lately discovered by M. Lavoisier, and also by Dr. Priestley. M. Lavoisier made the steam of boiling water pass through the barrel of a gun, kept red-hot by burning coals. Dr. Priestley uses, instead of the gun-barrel, a tube of red-hot brass, upon which the steam of water has no effect, and which he fills with the pieces of iron which are separated in the boring of cannon. By this method he obtains an inflammable air, the specific gravity of which is to that of common air as one to thirteen. In this method, not yet indeed reduced to general practice, a tube about three-quarters of an inch in diameter, and about three feet long, is filled with iron-turnings; then the neck of a retort, or close boiler, is luted to one of its ends, and the worm of a refrigeratory is adapted to its other extremity. The middle part of the tube is then surrounded with burning coals, so as to keep about one foot in length of it red-hot, and a fire is always made under the retort or boiler sufficient to make the water boil with vehemence. In this process a considerable quantity of inflammable air comes out of the worm of the refrigeratory. It is said that iron yields one half more air by this means than by the action of vitriolic acid.

For filling large balloons, a greater apparatus is necessary; and the only materials that can, with any certainty of success, be employed for producing the proper gas, are, oil of vitriol, and iron filings or turnings.

It has indeed been recommended to use zinc instead of iron-filings, because white vitriol, the salt produced by the union of the vitriolic acid and zinc, is much more valuable than the green fort produced by the union of the same acid with iron. But though this is undoubtedly the case, it will as certainly be found, upon trial, that the superior price of the zinc will be more than an equivalent for all the advantage that can be derived from the additional price of the white vitriol. For a balloon of thirty feet diameter, Mr. Cavallo recommends 3900 pounds of iron-turnings, as much oil of vitriol, and 19,500 pounds of water. These proportions, however, appear too great with respect to the acid and metal, and too little with respect to the water. Oil of vitriol will not exert its power upon iron unless it be diluted with five or six times its quantity of water; in which case, a much smaller quantity of both acid and metal will serve. M. Lunardi, who from the number of his voyages had certainly much practical knowledge in aerostation, filled his balloon with about 2000 pounds of iron, as much vitriolic acid, and 12,000 pounds of water. The iron was placed in his vessels in layers, with straw between them, in order to increase the surface. His apparatus was not materially different from that of Mr. Cavallo, and is represented in the plate, where there are two tubs, about three feet in diameter and nearly two feet deep, inverted in large tubs filled with water. In the bottom of each of the inverted tubs a hole is made, and a tube of tin adapted, which is about seven inches in diameter, and seven or eight long. To these tubes the silken ones of the balloon are tied. Round each of the tubs, five, six, or more, strong casks are placed; in the top of each two holes are made, and to one of these holes a tin tube is adapted, and so shaped, that, passing through the water, it may terminate with its aperture under the inverted tub. The other hole of these casks serves for

the introduction of materials, and is stopped with a wooden plug. When the balloon is to be filled, put the net over it, and let it be suspended in the centre; and, having expelled all the common air from it, let the silken tubes be fastened round the tin ones, and, the materials being put into the casks, the inflammable air, passing into the balloon, will soon disengage, and render it capable of supporting itself; after which the rope may be slipped off. As the balloon continues to be filled, the net is adjusted properly round it, and the boat, being placed between the two sets of casks, is fastened to the hoop, with every thing else that is required to be sent up, as ballast, instruments, &c. At last, when the balloon is little more than three-quarters full, the silken tubes are separated from the tin ones of the inverted tubs, and, their extremities being tied up, are placed in the boat. Lastly, the aeronauts being seated in the boat, the lateral ropes are slipped off, and the machine is abandoned to the air. This apparatus was at last reduced by M. Lunardi to its utmost simplicity, by using only two large casks, and suffering the vapour to go into the balloon without passing through water. Thus his balloon was filled in less than half an hour, when, by the former method, it had required two hours at least. The sinking of his casks in the ground was also an additional convenience, as it created no confusion, and rendered the materials much more easily conveyed into them.

With regard to the rarefied-air balloons, the method of filling them is as follows:—A scaffold, the breadth of which is at least two-thirds of the diameter of the machine, is elevated about six or eight feet above the ground. From the middle of it descends a well, rising about two or three feet above it, and reaching to the ground, furnished with a door or two, through which the fire in the well is supplied with fuel. The well should be constructed of brick or of plastered wood, and its diameter should be somewhat less than that of the machine. On each side of the scaffold are erected two masts, each of which has a pulley at the top, and rendered firm by means of ropes. The machine to be filled is to be placed on the scaffold, with its neck round the aperture of the well. The rope, passing over the pulleys of the two masts, serves, by pulling its two ends, to lift the balloon about fifteen feet or more above the scaffold. The machine is kept steady, and held down, whilst filling, by ropes passing through loops or holes about its equator; and these ropes may easily be disengaged from the machine, by slipping them through the loops when it is able to sustain itself. The proper combustibles to be lighted in the well, are those which burn quick and clear, rather than such as produce much smoke; because it is hot air, and not smoke, that is required to be introduced into the machine. Small wood and straw have been found to be very fit for this purpose. Mr. Cavallo observes, as the result of many experiments with small machines, that spirits of wine are upon the whole the best combustible; but its price may prevent its being used for large machines. As the current of hot air ascends, the machine will soon dilate, and lift itself above the scaffold and gallery which was covered by it. The passengers, fuel, instruments, &c. are then placed in the gallery. When the machine makes efforts to ascend, its aperture must be brought, by means of the ropes annexed to it, towards the side of the well a little above the scaffold; the fire-place is then suspended in it, the fire lighted in the grate, and, the lateral ropes being slipped off, the machine is abandoned to the air. It has been determined by accurate experiments, that only one-third of the common air can be expelled from these large machines; and therefore the ascending power of the rarefied air in them can be estimated as only equal to half an ounce avoirdupois for every cubic foot.

The conduct of balloons, when constructed, filled, and actually ascending in the atmosphere, is an object of great importance in the practice of aerostation. The method generally used for elevating or lowering the balloons with rarefied air, has been the increase or diminution of the fire;

fire; and this is entirely at the command of the aeronaut, as long as he has any fuel in the gallery. The inflammable-air balloons have been generally raised or lowered by diminishing the weight in the boat, or by letting out some of the gas through the valve: but the alternate escape of the air in descending, and discharge of the ballast for ascending, will by degrees render the machine incapable of floating; for in the air it is impossible to supply the loss of ballast, and very difficult to supply that of inflammable air. These balloons will also rise or fall by means of the rarefaction or condensation of the inclosed air, occasioned by heat and cold. It has been proposed to aid a balloon in its alternate motion of ascent and descent, by annexing to it a vessel of common air, which might be condensed for lowering the machine, and rarefied again, by expelling part of it, for raising the machine. But a vessel adapted to this purpose must be very strong; and, after all, the assistance afforded by it would not be very considerable. M. Maunier, in order to attain this end, proposes to inclose one balloon filled with common air in another filled with inflammable air; as the balloon ascends, the inflammable air is dilated, and of course compresses the internal balloon containing the common air; and, by diminishing its quantity, lessens its weight. If it should be necessary to supply this loss, he says it may be easily done by a pair of bellows fixed in the gallery. Others have proposed to annex a small machine with rarefied air to an

inflammable-air balloon by ropes, at such a distance that the fire of the former might not affect the inflammable air of the latter: the whole apparatus, thus combined, of balloons formed on the two principles of heated and inflammable air, might be raised or lowered by merely increasing or diminishing the fire in the lower balloon.

Wings or oars are the only means of this sort that have been used with some success; and, as Mr. Cavallo observes, they seem to be capable of considerable improvement. Although great effects are not to be expected from them, when the machine goes at a great rate, the best methods of moving those wings are by the human strength applied similarly to the oars of a waterman. They may be made in general of silk stretched between wires, tubes, or sticks; and, when used, must be turned edgewise when they are moved in the direction in which the machine is intended to be impelled, but flat in the opposite direction. Other contrivances have been made to direct aerostatic machines, but they have mostly been invented to effect a power upon them as upon a ship. It appears, however, that they can have no effect when a machine is only moved by the wind alone, because the circumambient air is at rest in respect to the machine. The case is quite different with a vessel at sea, because the water on which it floats stands still while the vessel goes on; but it must be time and experience that can realise the expectations suggested by these contrivances.

Æ S

-AERSHOT, a town in the Netherlands, in the duchy of Brabant, and capital of the duchy of Aerthot. It is seated on the river Demur, ten miles east of Malines or Mechlin, and eight north of Louvain. Lat. 51. 15. N. lon. 5. 4. E.

ÆRUGINOUS, *adj.* an epithet given to such things as resemble or partake of the nature of the rust of copper. In medicine, the word is often applied to what is discharged by vomitings of this colour, and also to the bile.

ÆRUGO, *f.* in natural history, properly signifies the rust of copper, whether natural or artificial. The former is found about copper-mines, and the latter, called *verdegrijs*, made by corroding copper-plates with acids. See *VERDEGRIS*.

ÆRUSCATORES, *f.* in antiquity, a kind of strolling beggars, not unlike gypsies, who drew money from the credulous by fortune-telling, &c. It was also a denomination given to griping exactors, or collectors of the revenue. The Galli, or priests of Cybele, were called *æruscatores magnæ matris*; and *μυρταρυφισται*, on account of their begging or collecting alms in the streets.

ÆS UXORIUM, *f.* in antiquity, a sum paid by bachelors, as a penalty for living single to old age. This tax for not marrying seems to have been first imposed in the year of Rome 350, under the censorship of M. Furius Camillus and M. Posthumus.

ÆS PER ET LIBRAM was a formula in the Roman law, whereby purchases and sales are ratified. Originally the phrase seems to have been only used in speaking of things sold by weight, or by the scales; but it afterwards was used on other occasions.

ÆS FLAVUM, yellow copper; among the Romans, an appellation given to the coarser kinds of brass.

ÆS CALDARIUM, a term used by the German mineralists, for a substance which sometimes occurs to those who work upon cobalt, and is used for the making the fine blue colour called *smalt*.

ÆS USTRUM, a chemical preparation, made of thin leaves of copper, sulphur, and nitre, placed *stratum super stratum* in a crucible, and set in a charcoal fire till all the

Æ S C

sulphur is consumed; after which, the copper is taken out of the crucible, and reduced to powder. Some quench the leaves of copper in vinegar, and repeat the calcination. Its principal use is in colouring glass, to which it gives a beautiful tincture. It was formerly used in surgery, for destroying fungous flesh. If the burnt copper is made red-hot, and quenched in the oil nine times, then powdered, it takes the name of *saffron of copper*.

ÆSCHINES, a Socratic philosopher, the son of Charinus, a sausage-maker. He was continually with Socrates; which occasioned this philosopher to say, that the sausage-maker's son was the only person who knew how to pay a proper regard to him. It is said that poverty obliged him to go to Sicily to Dionysius the Tyrant; and that he met with great contempt from Plato, but was extremely well received by Aristippus; to whom he shewed some of his dialogues, and received from him a handsome reward. He would not venture to profess philosophy at Athens, Plato and Aristippus being in such high esteem; but he set up a school to maintain himself. He afterwards wrote orations for the Forum. Phrynichus, in Photius, ranks him amongst the best orators, and mentions his orations as the standard of the pure Attic style. Hermogenes has also spoken very highly of him. He also wrote several Dialogues, of which there are only three extant: 1. Concerning Virtue, whether it can be taught. 2. Eryxias, or Erasistratus; concerning Riches, whether they are good. 3. Axiochus; concerning Death, whether it is to be feared. M. Le Clerc has given a Latin translation of them, with notes and several dissertations, intitled *Sylva Philologica*.

ÆSCHYLUS, the tragic poet, was born at Athens. Authors differ in regard to the time of his birth, some placing it in the 65th, others in the 70th, Olympiad; but, according to Stanly, who relies on the Arundelian marbles, he was born in the 63d Olympiad. He was the son of Euphorion, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathion, and the sea-fight of Salamis, at which engagements Æschylus was likewise present. In this last action, accord-

ing to Diodorus Siculus, Aminias, the younger of the three brothers, commanded a squadron of ships, and behaved with so much conduct and bravery, that he sunk the admiral of the Persian fleet, and signalized himself above all the Athenians. To this brother our poet was, upon a particular occasion, obliged for saving his life. Ælian relates, that Æschylus being charged by the Athenians with certain blasphemous expressions in some of his pieces, was accused of impiety, and condemned to be stoned to death: they were just going to put the sentence in execution, when, Aminias, with a happy presence of mind, throwing aside his cloak, shewed his arm without a hand, which he had lost at the sea-fight of Salamis in defence of his country. This sight made such an impression on the judges, that, touched with the remembrance of his valour, and with the friendship he shewed for his brother, they pardoned Æschylus. He wrote a great number of tragedies, of which there are but seven remaining: and, notwithstanding the sharp censures of some critics, he must be allowed to have been the father of the tragic art. In the time of Theopis, there was no public theatre to act upon; the strollers driving about from place to place in a cart. Æschylus furnished his actors with masks, and dressed them suitably to their characters. He likewise introduced the buskin, to make them appear more like heroes. The ancients gave Æschylus also the praise of having been the first who removed murders and shocking fights from the eyes of the spectators. M. Le Fevre has observed, that Æschylus never represented women in love in his tragedies; which, he says, was not suited to his genius; but, in representing a woman transported with fury, he was incomparable. He was killed in the sixty-ninth year of his age, by an eagle letting fall a tortoise on his head as he was walking in the fields. He had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; and the tragedians of the country performed plays and theatrical exercises at his tomb. The best edition of his Plays is that of London, 1663, fol. with a Latin translation and a learned commentary by Thomas Stanley.

ÆSCHYNOMENE, *f.* [αἰσχynomαι, Gr. on account of its retreating from the touch.] In botany, a genus of the diadelphia decandria class, ranking in the natural order of papilionaceæ or leguminosæ. The generic characters are—*Calyx*: perianthium one-leaved, bell-shaped, subbilabiate; lips equal, upper bifid, lower three-toothed. *Corolla*: papilionaceous; banner subcordate, scarcely gaping, large; wings subovate, obtuse, shorter than the banner; keel lunate, acuminate, the length of the wings. *Stamina*: filaments ten, single and nine-cleft; antheræ small. *Pistillum*: germ oblong, villous, columnar; style subulate, rising; stigmas simple, rather obtuse. *Pericarpium*: legume long, flat, jointed, rough, one-celled, opening at the truncate joints. *Seeds*: solitary, between the joints, kidney-shaped.—*Essential Character*. *Calyx* bilabiate; legume with truncate one-seeded joints.

Species. 1. *Æschynomene grandiflora*, or great-flowered æschynomene: stem aborescent, flowers very large, legumes siliform. This is a shrub from ten to fifteen feet in height. It is a native of the East Indies, and is cultivated in gardens in Jamaica. By the French it is called *Pois du Duc de Choiseul*. The seeds are agreeable to domestic birds.

2. *Æschynomene arborea*, or arborescent æschynomene: stem arborescent, smooth, joints of the legumes semicordate, smooth. This species grows to the height of six or seven feet, with a single stem; the leaves are smooth, and come out towards the top of the stalk, forming there a sort of head; they are composed of many pinnas, placed alternately on the mid-rib. The flowers come out from the wings of the leaves, two or three together, are of a copper-colour and large.

3. *Æschynomene coccinea*, or scarlet-flowered æschynomene: stem aborescent, leaves pinnate; leaflets numerous, linear, obtuse, dusky; legumes compressed, equal. This

is a smaller and lower tree than the first sort; but the head and leaves are more dense. It is a native of the East Indies, and of the islands Otaheite and Huaheine in the South Seas.

4. *Æschynomene aspera*, or rough-stalked æschynomene: stem herbaceous, rugged; joints of the legumes rugged in the middle. It rises to the height of four or five feet, with a single herbaceous stem. A native of the East Indies.

5. *Æschynomene Americana*, or hairy æschynomene: stem herbaceous, hispid; joints of the legumes semicordate; leaflets acuminate, bractes ciliate. This species is somewhat sensitive; during the night, and at the approach of rain, the leaves fold together. It is a native of Jamaica, on the south side of the island, in dry pastures.

6. *Æschynomene Indica*, or Indian æschynomene: stem herbaceous, smooth; legumes smooth, swelling on one side, obtuse; leaflets obtuse. Is a native of the East Indies.

7. *Æschynomene Seseban*, or Egyptian æschynomene: stem herbaceous, smooth; legumes cylindric, equal; leaflets obtuse. This species was cultivated in 1680, in the Oxford botanic garden; and flowers in July and August; but it is a native of Egypt.

8. *Æschynomene pumila*, or dwarf æschynomene: stem herbaceous, smooth; legumes ferrate on one side, rough in the middle; leaflets acuminate. A native of the East Indies.

9. *Æschynomene sensitiva*: stem shrubby, smooth; leaflets obtuse; legumes smooth and even, obtuse; stipules acute deciduous. This species is a native of the West Indies.

10. *Æschynomene heterophylla*: stem shrubby, lower leaves ternate ovate, upper pinnate roundish. Native of Northern Cochinchina.

11. *Æschynomene lagenaria*: stem herbaceous, leaflets obtuse in several pairs, legumes muricate. The sheath of the stamens in this species is cleft towards the keel, and not towards the banner, as usual in papilionaceous flowers. The stem, being spongy and elastic, is used for stopping bottles in a country where there are no corks. Native of Cochinchina, in marshy places.

12. *Æschynomene cannabina*: stem herbaceous, leaflets obtuse acuminate, peduncles solitary, legumes compressed smooth and even. Native of the East Indies. Treated as hemp, it may be used for the same purposes.

Propagation and Culture. The first sort is with difficulty preserved through the winter in this country. The seedling plants should be brought forward on a hot-bed, and then plunged into the bark-bed in the stove, where, if they be tenderly treated, they will live through the winter, and flower the summer following. The second, third, and seventh, may in like manner be preserved thro' the winter in a warm stove, and will flower early in the following summer, and their seeds will ripen in the autumn. The other sorts usually flower in July, and their seeds ripen in October. As their stalks are succulent, they must be kept dry in winter, otherwise they are very subject to rot. They should be plunged into the tan-bed; for, when put into a dry stove, the fibres of their roots soon grow dry, and their leaves hang and fade, which shews their want of moisture; but, when they have water given them, it causes the tender fibres of their roots to perish, and the plants soon after decay. The fourth, fifth, sixth, and eighth, species, are annual, and therefore must be brought forward like the first, early in the year, otherwise they will not perfect their seeds. All the sorts are propagated by seeds, which should be sown on a hot-bed early in the spring; and, when the plants have strength enough to be removed, they should be put each into a separate small pot, filled with light earth, and plunged into a fresh hot-bed, to bring them forward; and, as they advance in their growth, they should be shifted into larger pots, but great care should be taken not to over-pot them, for, if the pots be too large, the plants will not thrive.

ÆSCULAPIUS,

ÆSCULAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic; by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolitus, who had been torn in pieces by his own horses, killed him with a thunder-bolt. According to Cicero, there were three deities of this name: the first, the son of Apollo, worshipped in Arcadia, who invented the probe, and bandages for wounds; the second, the brother of Mercury, killed by lightning; and the third, the son of Arisippus and Arinoe, who first taught the art of tooth-drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phalians represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Trica, a city in Ionia, and the isle of Coos; in all which votive tablets were hung up, shewing the diseases cured by his assistance. But his most famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSCULUS, *f. [æfea, food, Lat.]* In botany, a genus of the heptandria monogynia class, of the natural order of trihilata. The generic characters are—Calyx: perianth one-leaved, ventricose, small, five-toothed. Corolla: petals five, roundish, plaited and waving about the edge, flat, spreading, claws narrow, inserted into the calyx, irregularly coloured. Stamina: filaments subulate, the length of the corolla, declining. Antheræ ascending. Pistillum: germ roundish, ending in a subulate style. Stigma acuminate. Pericarpium: capsule leathery, roundish, three-celled, three-valved. Seeds: two, subglobular.—*Essential Character.* Calyx, one-leaved, five-toothed, ventricose. Corolla, five-petalled, irregularly coloured, inserted into the calyx. Capsule, three-celled.

Species. 1. *Æsculus hippocastanum*, or common horse chestnut: the flowers with seven stamens: leaves digitate with seven entire leaflets: capsules prickly. The common horse chestnut is sufficiently known by the beautiful parabolic form in which the branches are disposed, when the tree stands singly: by its digitate leaves, composed of seven leaflets, serrate about the edge, the middle one largest, the outer ones smallest: and by its handsome, upright, pyramidal thyrses of white flowers, variegated with yellow or red towards the centre. Some of these, towards the top of the thyrses, are imperfect and abortive. The capsule, or nut, as it is commonly called, is divided internally into three cells according to Linnæus; but into two only, as others affirm. This tree was in much greater esteem for avenues and walks formerly than at present. It is come into disrepute, because the leaves decay early in the summer, so that it occasions a litter in gardens and plantations, from July till they are all fallen; but, notwithstanding this inconvenience, the tree has great merit, for it affords a noble shade very early; and, during the time of its flowering, no tree has more beauty, for the extremities of the branches are terminated by fine spikes of flowers, so that every part of the tree seems covered with them, and, being intermixed with the large digitate leaves, they make a noble appearance. There is however another inconvenience to which this beautiful tree is subject, namely, that it does not well resist stormy winds. In the old way of planting these trees in avenues, great part of their beauty was lost; for, when their branches meet, fewer flowers are produced, and most of these are hid from sight; their leaves will also decay much sooner in close plantations than in single trees; the great beauty of them is to stand singly upon lawns, or in parks, where their fruit will be of use to the deer, who are very fond of them. In such situations,

especially when they can be placed so as to terminate a view, there is not a finer object than they afford during their season of flowering, which is in May; and, when the weather is moderate, they will continue in beauty near a month. In the opinion of Mr. Gilpin, the horse chestnut is a heavy disagreeable tree. It forms its foliage generally in a round mass, with little appearance of those breaks which contribute to give an airiness and lightness, at least a richness and variety, to the whole mass of foliage. This tree is however chiefly admired for its flower, which in itself is beautiful: but the whole tree together in flower is a glaring object, totally unharmonious, and unpicturesque. In some situations indeed, and among a profusion of other wood, a single horse chestnut or two, in bloom, may be beautiful. As it forms an admirable shade, it may be of use too in thickening distant scenery; or in screening an object near at hand: for there is no species of foliage, however heavy, nor any species of bloom, however glaring, which may not be brought, by some proper contrast, to produce a good effect. Few trees make a greater progress than this. I have known some raised from nuts, which in twelve or fourteen years were large enough to shade two or three chairs under the spread of their branches, and were covered with flowers. There are many old trees now standing, which, having been planted singly, are grown to a large size, their heads forming a fine natural parabola. I have measured some of them, whose branches have extended more than thirty feet, and their heads have been so close as to afford a perfect shade in the hottest seasons. These were planted in 1679; so that, although they are of quick growth, yet they are not of short duration. As the wood is of little value, this tree should not however be propagated in too great plenty; but a few of them only placed at proper distances in parks, for ornament, and for the deer, who keep much about them in windy weather, watching the falling of the nuts, and greedily devouring them as they fall. In Turkey, the nuts are ground, and mixed with the provender for their horses, especially those which are troubled with coughs or are broken winded. Hanbury affirms, that swine will fatten on them; while others on the contrary assert that they are so bitter, that even hogs will not eat them, either raw, boiled, or baked. Haller relates, that sheep have been fed with the nuts whole, and have done very well with them: and that poultry have been kept with them boiled. He also observes, that, having a saponaceous quality, they may be used to spare soap in washing: and that the bark of the tree has been given in Italy, not without success, in intermittent fevers. This bark has also been used with good success in dying several sorts of yellow colours. The timber, though of inferior quality, does not merit the character that Mr. Miller gives of it, namely, that it is not fit even for burning, nor any other use that he knows of. Mr. Boutcher, though he affirms that the timber, except for fuel, answers no valuable purpose; yet allows that for pipes, to convey water under ground, it will last longer than many harder woods. Dr. Hunter informs us, that it is chiefly used by the turner, and in the north is worth about sixpence a foot. And Mr. Hanbury not only admits it to be useful for most sorts of turners' ware, but that, as the tree grows to a great magnitude, it sells at such a price as to make it well worth the planting for the sake of the timber. He prescribes the felling to be performed in November or December. The horse chestnut was brought from the northern parts of Asia into Europe about the year 1550, and was sent to Vienna about the year 1558. From Vienna it migrated into Italy and France: but it came to us from the Levant immediately. Gerard, in his Herbal, speaks of it only as a foreign tree. In Johnson's edition of the same work, it is said,—"Horse chestnut groweth in Italy, and in sundry places of the east countries: it is now growing with Mr. Tradescant at South Lambeth." Parkinson says: "our Christian world had first the knowledge of it from Constantinople." The same author places the horse chestnut in his orchard, as a fruit-

tree, between the walnut and mulberry. How little it was then known, (in 1629,) may be inferred from his saying not only that it is of a greater and more pleasant aspect, for the fair leaves, but also of as good use for the fruit, which is of a sweet taste, roasted and eaten, as the ordinary sort. He also describes and figures the corolla with four petals. This tree does not seem to have been so common even at the beginning of the present century as it is now. Mr. Houghton (1700) mentions some at Sir William Ashhurst's at Highgate, and especially at the bishop of London's at Fulham. Those now standing at Chelsea-college were then very young. There was also a very fine one in the post-house garden near Old-freet, and another not far from the ice-house under the shadow of the Observatory in Greenwich-park.

2. *Æsculus flava*, or yellow-flowered horse chestnut: leaves digitate, with five leaflets; the laminas of the corolla cordate-roundish; the claws twice the length of the calyx. This species is a native of North-Carolina. It flowers in May and June.

3. *Æsculus pavia*, or scarlet horse chestnut: flowers with eight stamens: leaves digitate with five or six serrate leaflets; capsules smooth, laminas of the corolla obovate, claws the length of the calyx. This species rises to the height of twenty feet, but does not spread its branches to any great extent. They appear in June, and are sometimes succeeded by fruit in England; but the seeds rarely ripen here. It grows naturally in Brazil, Carolina, Florida, Japan, and several parts of the east; and was cultivated here in 1712.

Propagation and Culture. The common horse chestnut is propagated by sowing the nuts; the best time for doing this is early in the spring; but the nuts should be preserved in sand during the winter, otherwise they are apt to grow mouldy and rot. They may indeed be put into the ground in autumn, but then they will be in danger of rotting, if the winter should prove very wet, as also of being disturbed and eaten by vermin. Others however affirm, that, if they are kept till spring, many will miscarry. When the nuts succeed, and have a proper soil, the plants will shoot near a foot the first summer; so that, where they grow pretty close together, it will be proper to transplant them the following autumn, or February and March, planting them in rows at three feet distance, and one foot asunder in the rows: in this nursery they may remain two years, by which time they will be fit to plant where they are designed to be continued; for the younger these trees are planted out, the larger they will grow. But there are many who will object to their being planted out young in parks, because they will require a fence to secure them against cattle, which will also be necessary whatever size they are when planted; and, if large, they must be well staked to prevent their being displaced by strong winds: and, when we consider how much faster a young tree will grow than one which is removed at a greater age, there can be no excuse for planting large trees. The horse chestnut requires little care in the management, is never injured by cold in our climate, and will thrive in moist soils and situations: but in a sandy loam it makes the greatest progress; and, if the soil be inclining to moisture, the leaves will continue in verdure much longer than in very dry ground. When these trees are transplanted, their roots should be preserved as entire as possible, for they do not succeed well when torn or cut; nor should any of the branches be shortened, for there is scarcely any tree which will not bear amputation better than this; so that, when any branches are by accident broken, they should be cut off close to the stem, that the wound may heal over. There is, something very singular in the growth of this tree, which is that the whole shoot is completed in less than three weeks after the buds are opened, in which time I have measured shoots a foot and half long, with their leaves fully expanded: and no sooner are the flowers fallen, than the buds for the succeeding year are formed, which continue swelling till autumn, at which time the folding co-

vers are spread over with a thick tenacious juice, serving to defend the tender buds from the frost and rain in winter; but, upon the first return of warmth in the spring, this melts and runs off, leaving the bud at liberty to extend. This juice is never so far hardened as to injure the tender buds, which are always formed at the extremity of the former year's shoot; a plain direction not to shorten them, for, by so doing, the future shoots are entirely cut off.

There are varieties of this tree in the nurseries, both with gold and silver striped leaves. These are increased by layers, and by budding or ingrafting them upon stocks of the common sort.

The third species may also be propagated by the nuts, which must be procured from the countries where the trees naturally grow. They should be sown in pots early in the spring; and the pots must be plunged into a moderate hot-bed to forward their growth: toward the end of May, the pots should be plunged into the ground in a south-east border, and in dry weather the plants should be duly watered, that they may acquire strength by the autumn, when it will be very proper to screen the plants from early frosts which often pinch the top buds, and occasion their decay in the winter; for, while the plants are young, they are impatient of frosts, but, when they have obtained strength, it seldom hurts them: the spring following, the plants should be carefully separated and planted at the distance of a foot from each other, in a sheltered situation; and the following winter, when it proves cold; it will be proper to cover the plants with some light covering. After the second winter they will require no farther sheltering. Others think it sufficient to sow the nuts on a warm border, in a rich, loose, sweet, mould; to remove them the succeeding spring to a situation and soil of the same quality, where they may remain three years, when they will have acquired strength enough for any situation not too much exposed. The common method practised by nurserymen, who propagate this tree for sale, is to graft or bud it upon stocks of the common horse chestnut; but, as the stock greatly outgrows the bud or graft, the trees make a bad appearance, nor do they last long.

ÆSOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Cræsus the last king of Lydia. As to genius and abilities, he was greatly indebted to nature; but in other respects not so fortunate, being born a slave and extremely deformed. St. Jerom, speaking of him, says, "he was unfortunate in his birth, condition in life, and death;" hinting thereby at his deformity, servile state, and tragical end. His great genius, however, enabled him to support his misfortunes; and, in order to alleviate the hardships of servitude, he composed those entertaining and instructive Fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several, particularly Quintilian, who seems to think that Hesiod was the first author of fables. Æsop, however, certainly improved this art to a very great degree; and hence it is that he has been accounted the author of this sort of productions:

Æsopus auctor quam materiam reperit,
Hanc ego pollivi versibus senariis.

Phad. Prol. ad lib. i.

If any thoughts in these iambics shine,
Th' invention's Æsop's, and the verse is mine.

The first master whom Æsop served, was one Carasius Demarchus, an inhabitant of Athens; and there in all probability he acquired his purity in the Greek tongue. After him he had several masters; and at length came under a philosopher named Idmon or Iadmon, who enfranchised him. After he had recovered his liberty, he soon acquired a great reputation amongst the Greeks; so that, according to Meziriac, the report of his wisdom having reached Cræsus, he sent to enquire after him, and engaged him in his service. He travelled through Greece, according

According to the same author; whether for his own pleasure, or upon the affairs of Croesus, is uncertain; and, passing by Athens soon after Pisistratus had usurped the sovereign power, and, finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. The images made use of by Æsop are certainly very happy inventions to instruct mankind; they possess all that is necessary to perfect a precept, having a mixture of the useful with the agreeable. "Æsop the fabulist (says Aulus Gellius) was deservedly esteemed wise, since he did not, after the manner of the philosophers, rigidly and imperiously dictate such things as were proper to be advised and persuaded; but, framing entertaining and agreeable apologues, he thereby charms and captivates the human mind." Æsop was put to death at Delphi. Plutarch tells us, that he came there with a great quantity of gold and silver, being ordered by Croesus to offer a sacrifice to Apollo, and to give a considerable sum to each inhabitant: but, a quarrel arising betwixt him and the Delphians, he sent back the money to Croesus; for he thought those for whom the prince designed it had rendered themselves unworthy of it. The inhabitants of Delphi contrived an accusation of sacrilege against him; and, pretending they had convicted him, threw him headlong from a rock. For this cruelty and injustice, we are told they were visited with famine and pestilence; and, consulting the oracle, they received for answer, that the god designed this as a punishment for their treatment of Æsop: they endeavoured to make an atonement, by raising a pyramid to his honour.

ÆSOP (Clodius), a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were contemporaries, and the best performers who ever appeared upon the Roman stage, the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction to perfect his action. Æsop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost above 800*l*. this dish, we are told, was filled with singing and speaking birds, some of which cost near 50*l*. The delight which Æsop took in this sort of birds proceeded, as Mr. Bayle observes, from the expense. He did not make a dish of them because they could speak, according to the refinement of Pliny upon this circumstance, this motive being only by accident; but because of their extraordinary price. If there had been any birds that could not speak, and yet more scarce and dear than these, he would have procured such for his table. Æsop's son was no less luxurious than his father, for he dissolved pearls for his guests to swallow. Some speak of this as a common practice of his; but others mention his falling into this excess only on a particular day, when he was treating his friends. Horace speaks only of one pearl of great value, which he dissolved in vinegar, and drank. Æsop, notwithstanding his expences, is said to have died worth above 160,000*l*. When he was upon the stage, he entered into his part to such a degree, as sometimes to be seized with a perfect ecstasy. Plutarch mentions it as reported of him, that, whilst he was representing Atreus deliberating how he should revenge himself on Thyestes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot.

ÆSTIMATIO CAPITIS, *f.* a term met with in old law-books for a fine anciently paid for offences committed against persons of quality, according to their several degrees.

ÆSTUARIA, *f.* in geography, denotes an arm of the sea which runs a good way within land: Such is the Bristol Channel, and many of the Friths of Scotland.

ÆSTUARIES, *f.* in ancient baths, were secret passages from the hypocaustum into the chambers.

ÆSTUARY, *f.* among physicians, a vapour-bath, or any other instrument for conveying heat to the body.

ÆSYMNIUM, in antiquity, a monument erected to the memory of the heroes, by Æsymnus the Megarean.

He, consulting the oracle in what manner the Megareans might be most happily governed, was answered, "If they held consultation with the more numerous:" whom he taking for the dead, built the said monument, and a senate-house that took within its compass the monument; imagining that thus the dead would assist at their consultations.

ÆTATE PROBANDA, *f.* was a writ that lay to enquire, whether the king's tenant holding *in capite* by knight's service, was of full age to receive his lands into his own hands. It was directed to the escheator of the county, but is now disused, since wards and liveries were by statute taken away.

ÆETH, or ATH, a strong little town in the Austrian Netherlands and province of Hainault, situated on the river Dender, about twenty miles S. W. of Brussels.

ÆTHALIA, or ILUA, now Elba; an island on the coast of Etruria, in compass an hundred miles, abounding in iron.

ÆTHIOPIA. See ETHIOPIA.

ÆTHIOPIIS, *f.* in botany. See SALVIA.

ÆTHUSA, *f.* [*αἰθουσα*, beggarly.] In botany, a genus of the pentandria digynia class, ranking in the natural order of umbellatæ or umbelliferæ. The generic characters are—Calyx: umbel universal spreading, the rays gradually shortening towards the middle: partial also spreading but small; involucre universal none, partial placed on the outside, only consisting of three very long, linear, pendulous leaflets; proper perianthium scarcely observable. Corolla: universal nearly uniform, with all the floscules fertile: partial has the petals bent in, heart-shaped and unequal. Stamina: filaments simple with roundish antheræ. Pistillum: germ inferior; styles reflex with obtuse stigmas; fruit roundish, streaked, bipartite. Seeds: two, roundish, streaked, except on a third part of the surface, which is plane.—*Essential Character.* Partial involucre halved, three-leaved, pendulous; fruit streaked.

Species. 1. *Æthusa cynapium*, or common fool's parsley: leaves conform. Fool's parsley, called also lesser hemlock, is a very common weed in kitchen gardens, and in a slight degree poisonous. It is easily distinguished when in flower (July and August) from true parsley and chervil, by the three narrow pendent folioles or leaflets of the involucre, placed on the outer part only of the umbel; whereas those of the partial umbels in chervil surround them entirely, growing equally on every side: and, as to parsley, it has only a few short leaflets fine almost as hairs, and distributed indifferently at the base of both umbels. Fool's parsley is a much humbler plant than either of the others. They can only be confounded in a very young state, and even then the leaves may be observed to have a different form, a darker hue, and, on being bruised, to emit in a slight degree a disagreeable venomous smell. The safest way to avoid all doubt is to cultivate the curled parsley. Most cattle eat it: but it is said to be noxious to geese.

2. *Æthusa buniis*, or coriander-leaved fool's parsley: radical leaves pinnate, cauline manifold-setaceous. This species is perennial, and it is a native of the Pyrennees.

3. *Æthusa meum*, or spignel, mew, or bawd-money: all the leaves manifold-setaceous. This is also a perennial plant, rising a foot and a half high, with channelled stalks, terminated by an umbel of flowers, that are white with a little tincture of green, and are succeeded by oblong smooth seeds. The leaves are much branched, and composed of fine capillary leaflets, set close, and of a deep green. The old name of this species is meum, but it stood in the genus *athananta* in Linnæus's Works, till the fourteenth edition of the *Systema Naturæ*. It grows wild in the mountains of Switzerland, Germany, Austria, Carniola, Italy, and Spain. Also in the high pastures of Westmoreland, Cumberland, Lancashire, and Merionethshire. The roots and seeds are aromatic and acrid: they are recommended as carminatives and stomachics; in the stone, stoppage of urine, and all uterine disorders; sometimes they are given to cure tertians. Spignel is an ingredient

in theriaca and mithridate, and appears to be of the same nature with lovage.

4. *Æthusa fatua*, or fine-leaved fool's parsley: all the leaves many-parted-fetaceous, leaflets subverticillate, stem many-leaved, sheaths of the petioles narrow, universal involucre many-leaved. It is not known where this is a native, but it was introduced here in 1781, by M. Thouin; and flowers in August and September.

Propagation and Culture. Fool's parsley is an annual, and may easily be kept down in gardens, by not suffering it to seed, which it does abundantly. The third and fourth sorts are hardy perennial plants, and may be increased, either by parting the roots at Michaelmas, or by sowing the seeds soon after they are ripe: the plants should have a shady situation and moist soil. The seeds ripen in July and August. The second sort may be propagated by seeds like the foregoing. It flowers in July.

AETIANS, in church-history, a branch of Arians who maintained, that the Son and Holy Ghost are in all things dissimilar to the Father. See **AETIUS**.

ÆTIOLOGY, *f.* is that part of Pathology which is employed in exploring the causes of diseases.

ÆTION, a celebrated painter, who has left us an excellent picture of Roxana and Alexander, which he exhibited at the Olympic games: it represents a magnificent chamber, where Roxana is sitting on a bed of a most splendid appearance, which is rendered still more brilliant by her beauty. She looks downwards, in a kind of confusion, being struck with the presence of Alexander standing before her. A number of little Cupids flutter about, some holding up the curtain, as if to shew Roxana to the prince, whilst others are busied in undressing the lady; some pull Alexander by the cloak, who appears like a young bashful bridegroom, and present him to his mistresses: he lays his crown at her feet, being accompanied by Ephestion, who holds a torch in his hand, and leans upon a youth who represents Hymen. Several other little Cupids are represented playing with his arms; some carry his lance, stooping under so heavy a weight; others bear along his buckler, upon which one of them is seated, whom the rest carry in triumph; another lies in ambush in his armour, waiting to frighten the rest as they pass by. This picture gained Ætion so much reputation, that the president of the games gave him his daughter in marriage.

ÆTITES, or **EAGLE-STONE**, *f.* in natural history, a flinty or crusted stone, hollow within, and containing a nucleus, which, on shaking, rattles within. It was formerly in repute for several extraordinary magical as well as medical powers; such as preventing abortion, discovering thieves, and other ridiculous properties. The word is formed from *ætes*, "eagle;" the popular tradition being, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from being rotten. It is found in several parts: near Trevous in France, one can scarcely dig a few feet, without finding considerable strata or beds of the coarser or ferruginous kind. They are originally soft, and of the colour of yellow oaker. But the finest and most valued of all the eagle-stones, are accidental states of one or other of our common pebbles.

AETIUS, one of the most zealous defenders of Arianism, was born in Syria, and flourished about the year 336. After being servant to a grammarian, of whom he learned grammar and logic, he was ordained deacon, and at length bishop, by Eudoxus patriarch of Constantinople. St. Epiphanius has preserved forty-seven of his propositions against the Trinity. His followers were called **AETIANS**.

AETIUS, a famous physician, born at Amida in Mesopotamia, and the author of a work intitled *Tetrabiblos*, which is a collection from the writings of those physicians who went before him. He lived, according to Dr. Freind, at the end of the fifth or the beginning of the sixth century.

AETIUS, governor of Gallia Narbonensis in the reign

of Valentinian III. forced the Franks who were passing into Gaul to repass the Rhine. He defeated the Goths; and routed Attila king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, killed him in 454 with his own hand, under the pretence that he had permitted the invasion of the Huns, after Attila's defeat.

ÆTNA. See **ETNA**.

ÆTOLARCHA, *f.* in Grecian antiquity, the principal magistrate or governor of the Ætolians.

AFAR, *adv.* [from *a* for *at*, and *far*.] At a great distance. To or from a great distance. *From afar*; from a distant place. *Afar off*; remotely distant.—We hear better when we hold our breath than contrary; inasmuch as in listening to attain a sound *afar off*, men hold their breath. *Bacon*.

AFEARD, *part. adj.* [from *to fear*, for *to fright*, with *a* redundant.] Frighted; terrified; afraid. It has the particle *of* before the object of fear. It is now obsolete.—Fear is described by Spencer to ride in armour, at the clashing whereof he looks *afraid of* himself.

AFER, *f.* [Lat.] The south-west wind.

AFFER (Domitius), a famous orator, born at Nisinas, flourished under Tiberius and the three succeeding emperors. Quintilian makes frequent mention of him; and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. Quintilian, in his youth, cultivated the friendship of Domitius very assiduously. He tells us that his pleadings abounded with pleasant stories, and that there were public collections of his witty sayings, some of which he quotes. Domitius was once in great danger from an inscription he put upon a statue erected by him in honour of Caligula, wherein he declared that this prince was a second time consul at the age of twenty-seven. This he intended as an encomium, but Caligula taking it as a sarcasm upon his youth, and his infringement of the laws, raised a process against him, and pleaded himself in person. Domitius, instead of making a defence, repeated part of the emperor's speech with the highest marks of admiration; after which he fell upon his knees, and, begging pardon, declared, that he dreaded more the eloquence of Caligula than his imperial power. This piece of flattery succeeded so well, that the emperor not only pardoned, but also raised him to the consulship. *Afer* died in the reign of Nero, A. D. 59.

AFFA, a weight used on the Gold Coast of Guinea. It is equal to an ounce, and half of it is called *eggeba*. Most of the blacks on the Gold Coast give these names to those weights.

AFFABILITY, *f.* [affabilité, Fr. *affabilitas*, Lat.] The quality of being affable; easiness of manners; courteousness; civility; condescension. It is commonly used of superiors.—All instances of charity, sweetness of conversation, *affability*, admonition, all significations of tenderness, care, and watchfulness, must be expressed towards children. *Taylor*.

AFFABLE, *adj.* [affable, Fr. *affabilis*, Lat.] Easy of manners, accostable; courteous; complaisant. It is used of superiors. It is applied to the external appearance; benign; mild; favourable.—Augustus appeared, looking round him with a serene and *affable* countenance upon all the writers of his age. *Tatler*.

AFFABLENESS, *f.* Courtesy; affability.

AFFABLY, *adv.* In an affable manner; courteously; civilly.

AFFABROUS, *adj.* [affabre, Fr.] Skillfully made; complete; finished in a workman-like manner.

AFFABULATION, *f.* [affabulatio, Lat.] The moral of a fable.

AFFAIR, *f.* [affaire, Fr.] Business; something to be managed or transacted. It is used for both private and public matters.

To AFFEAR, *v. n.* [from *affier*, Fr.] To confirm; to give sanction to; to establish: an old term of law.

AFFECT,

AFFECT, *f.* Affection; passion; sensation. Quality; circumstance.—It seemeth that, as the feet have a sympathy with the head, so the wrists have a sympathy with the heart; we see the *affects* and passions of the heart and spirits are notably disclosed by the pulse. *Bacon*.—This is only the antiquated word for *affection*.

To **AFFECT**, *v. a.* [*affecter*, Fr. *afficio*, *affectum*, Lat.] To act upon; to produce effects in any other thing. To move the passions.—As a thinking man cannot but be very much *affected* with the idea of his appearing in the presence of that Being, whom none can see and live; he must be much more *affected*, when he considers, that this Being, whom he appears before, will examine the actions of his life, and reward or punish him accordingly. *Addison*.—To aim at; to endeavour after: spoken of persons. To tend to; to endeavour after: spoken of things.—The drops of every fluid *affect* a round figure, by the mutual attraction of their parts; as the globe of the earth and sea *affects* a round figure, by the mutual attraction of its parts by gravity. *Newton*.—To be fond of; to be pleased with; to love; to regard with fondness. To make a show of something; to study the appearance of any thing; with some degree of hypocrisy. To imitate in an unnatural and constrained manner. To convict of some crime; to attain with guilt: a phrase merely juridical.—By the civil law, if a dowry with a wife be promised and not paid, the husband is not obliged to allow her alimony. But, if her parents shall become insolvent by some misfortune, she shall have alimony, unless you can *affect* them with fraud, in promising what they knew they were not able to perform. *Allyffe*.

AFFECTATION, *f.* [*affectatio*, Lat.] Fondness; high degree of liking; commonly with some degree of culpability. An artificial show; an elaborate appearance; a false pretence.—It has been, from age to age, an *affectation* to love the pleasure of solitude, among those who cannot possibly be supposed qualified for passing life in that manner. *Spectator*.

AFFECTED, *part. adj.* Moved; touched with affection; internally disposed or inclined. Studied with overmuch care, or with hypocritical appearance. In a personal sense, full of affectation: as, An *affected* lady.—These antic, lipping, *affected*, phantasies, these new tuners of accents. *Shakespeare*.

AFFECTEDLY, *adv.* In an affected manner; hypocritically; with more appearance than reality. Studiously; with laboured intention.—Some mispersuasions concerning the divine attributes tend to the corrupting men's manners, as if they were designed and *affectedly* chosen for that purpose.

AFFECTEDNESS, *f.* The quality of being affected, or of making false appearances.

AFFECTION, *f.* [*affection*, Fr. *affectio*, Lat.] The state of being affected by any cause or agent. This general sense is little in use. Passion of any kind.—*Affections*, as joy, grief, fear, and anger, with such like, being, as it were, the sundry fashions and forms of appetite, can neither rise at the conceit of a thing indifferent, nor yet choose but rise at the sight of some things. *Hooker*.—Love; kindness; good will to some persons: often with *to* or *to-wards* before the person. Good-will to any object; zeal; passionate regard.—Let not the mind of a student be under the influence of warm *affection* to things of sense, when he comes to the search of truth. *Watts*.—State of the mind, in general. Quality; property. State of the body, as acted upon by any cause.—It seemed to be a venereal gonorrhœa, and others thought it arose from some scorbutical *affection*. *Wifeman*.—Lively representation in painting.—*Affection* is the lively representation of any passion whatsoever, as if the figures stood not upon a cloth or board, but as if they were acting upon a stage. *Wotton*.—It is used by Shakespeare sometimes for *affection*.

AFFECTION, among physicians, signifies the same as disease. Thus the *hysteric affection* is the same with the hysteric disease.

AFFECTIONATE, *adj.* [*affectionné*, Fr. from *affection*.] Full of affection; strongly moved; warm; zealous. Strongly inclined to; disposed to; with the particle *to*. Fond; benevolent; tender.—When we reflect on all this *affectionate* care of Providence for our happiness, with what wonder must we observe the little effect it has on men! *Rogers*.

AFFECTIONATELY, *adv.* In an affectionate manner; fondly; tenderly; benevolently.

AFFECTIONATENESS, *f.* The quality or state of being affectionate; fondness; tenderness; good-will; benevolence.

AFFECTIONED, *adj.* Affected; conceited. This sense is now obsolete.—An *affectioned* ass that cons state without book, and utters it by great swaths. *Shakespeare*.—Inclined; mentally disposed.—Be kindly *affectioned* one to another. *Rom. xii. 10*.

AFFECTUOUSLY, *adv.* In an affecting manner.

AFFECTIVE, *adj.* That which affects; that which strongly touches. It is generally used for painful.—Pain is so uneasy a sentiment, that very little of it is enough to corrupt every enjoyment; and the effect God intends this variety of ungrateful and *affective* sentiments should have on us, is to reclaim our affections from this valley of tears. *Rogers*.

AFFECTUOSITY, *f.* Passionateness.

AFFECTUOUS, *adj.* Full of passion; as, An *affectuous* speech. A word little used.

To **AFFERE**, *v. a.* [*affier*, Fr.] A law-term, signifying to confirm.

AFFERORS, *f.* [from *affeurer*, Fr. to tax.] In law, are those in the court-leet or court-baron that settle and moderate the fines and amercements imposed on such persons as have committed faults for which no express penalty is prescribed by statute. The persons nominated to this office affirm upon their oaths what penalty they think in conscience ought to be inflicted upon the offenders.

AFFETUOSO, or **CON AFFETTO**, *adj.* in the Italian music, intimates that the part to which it is added ought to be played in a tender moving way, and consequently rather slow than fast.

AFFIANCE, *f.* [*affiance*, from *affier*, Fr.] A marriage-contract. Trust in general; confidence; secure reliance. Trust in the divine promises and protection. To this sense it is now almost confined.—There can be no surer way to success, than by disclaiming all confidence in ourselves, and referring the events of things to God with an implicit *affiance*. *Atterbury*.

AFFIANCE, in law, is the plighting of troth between a man and a woman upon their agreement of marriage; and signifies as much as *fidem dare*, to pledge one's faith or fidelity. *Litt. sec. 39*.

To **AFFIANCE**, *v. a.* To betroth; to bind any one by promise to marriage. To give confidence:

Stranger! whoe'er thou art, securely rest
Affianc'd in my faith, a friendly guest.

Pope.

AFFIANCER, *f.* He that makes a contract of marriage between two parties.

AFFIDATION, or **AFFIDATURE**, *f.* [from *affido*, Lat.] Mutual contract; mutual oath of fidelity.

AFFIDAVIT, *f.* in law, is an oath in writing; sworn before some person who hath authority to take it. The plaintiff or defendant may make affidavit in a cause depending, but it will not be admitted in evidence at the trial, but is only admitted upon motion. Affidavits ought to set forth the matter of fact only, which the party intends to prove by his affidavit; and not to declare the merits of the cause, of which the court is to judge. An affidavit regularly ought to be before the judges of the court wherein the cause is depending; but, by the statute 29 Car. II. c. 5. the judges of the courts of King's Bench, Common Pleas, and Exchequer, may grant commissions to persons in the country to take affidavits concerning any matter depending in the respective courts, in like manner

as may be done by masters extraordinary of the court of Chancery. When an affidavit hath been read in court, it ought to be filed, that the other party may see it and take a copy of it.

AFFIED, *part. adj.* [from the verb *affy*, derived from *affido*, Lat. Bracton using the phrase *affidare mulieres*.] Joined by contract; affianced.

AFFILIATION, *f.* [from *ad* and *filius*, Lat.] In writers of the middle age, the same with adoption; the act of taking a son. Among the ancient Gauls it was performed with military ceremonies.

AFFINAGE, *f.* [*affinage*, Fr.] The act of refining metals by the cupel.

AFFINED, *adj.* [from *affinis*, Lat.]—Joined by affinity to another; related to another.

AFFINITY, *f.* [*affinité*, Fr. from *affinis*, Lat.] Among civilians, implies a relation contracted by marriage; in contradistinction to consanguinity, or relation by blood. Affinity does not found any real kinship; it is no more than a kind of fiction, introduced on account of the close relation between husband and wife. It is even said to cease when the cause of it ceases: hence a woman, who is not capable of being a witness for her husband's brother during his life-time, is allowed as a witness when a widow, by reason the affinity is dissolved. Yet, with regard to the contracting marriage, affinity is not dissolved by death, though it be in every thing else. In Lev. xviii. ver. 7. et seq. we find that there were several degrees of affinity, wherein marriage was prohibited by the law of Moses. But these cases are not to be proposed as examples: because in some they were authorised by necessity; in others by custom; and the law as yet was not in being. If some other examples have existed, either before or since the law, the scripture expressly disapproves of them, as Reuben's incest with Bala his father's concubine, and the action of Ammon with his sister Tamar; and that of Herod-Antipas, who married Herodias his sister-in-law, his brother Philip's wife, while her husband was yet living.

AFFINITY is also used to denote conformity or agreement. Thus we say, the affinity of languages, the affinity of words, the affinity of sounds, &c.

AFFINITY, or ELECTIVE ATTRACTION, are terms used by modern chemists to express that peculiar propensity which different species of matter have to unite and combine with certain other bodies exclusively, or in preference to any other connexion.

The power, in bodies on which their various transpositions and combinations depend, and which is called their affinity, is a term like the Newtonian attraction, which is designed to express not the cause but the effect. When an acid spontaneously quits a metal to unite with an alkali, it is said that it hath a greater affinity to the alkali than to the metal; this is only to say in other words, that it will unite with the alkali in preference to the metal.

The doctrine of the affinities of bodies is of very extensive use in the chemical pharmacy; for, as several processes are founded on it, so if an error happens, and thereby the medicine proves unfit for its intended use, it may be rendered applicable to other purposes, by such transpositions of their component parts as are pointed out by the knowledge of their affinities. Combinations and separations that are chemical, depend on elective attraction. See **CHEMISTRY**.

AFFION, *f.* an Arabian name of opium; also of an electary in which opium is a part of the composition.

To AFFIRM, *v. n.* [*affirmo*, Lat.] To declare; to tell confidently: opposed to the word *deny*.

To AFFIRM, *v. a.* To declare positively; as, *To affirm a fact.* To ratify or approve a former law, or judgment: opposed to *reverse* or *repeal*.—The house of peers hath a power of judicature in some cases, properly to examine, and then to *affirm*; or, if there be cause, to reverse the judgments which have been given in the court of king's bench. *Bacon*.—In this sense we say, *To affirm the truth.*

AFFIRMABLE, *adj.* That which may be affirmed.—

Those attributes and conceptions that were applicable and *affirmable* of him when present, are now *affirmable* and applicable to him, though past. *Hale*.

AFFIRMANCE, *f.* Confirmation: opposed to *repeal*.—This statute did but restore an ancient statute, which was itself also made but in *affirmance* of the common law. *Bacon*.

AFFIRMANT, *f.* The person that affirms; a declarer.

AFFIRMATION, *f.* [*affirmatio*, Lat.] The act of affirming or declaring: opposed to *negation* or *denial*. The position affirmed. Confirmation: opposed to *repeal*.

AFFIRMATION, in law, is an indulgence allowed to the people called Quakers, who, in cases where an oath is required from others, may make a solemn affirmation of the truth: and, if they make a false affirmation, they are subject to the penalties of perjury. But their affirmation is not allowed in any criminal cause, nor shall they by virtue hereof be allowed to serve on any juries, or to bear any office or place of profit in the government. 7 & 8 Wm. c. 34. 8 Geo. c. 6. 22 Geo. II. c. 46.

AFFIRMATIVE, *adj.* That which affirms, opposed to *negative*; in which sense we use the *affirmative* absolutely, that is, the *affirmative position*. That which can or may be affirmed: a sense used chiefly in science.—As in algebra, where *affirmative* quantities vanish or cease, there negative ones begin; so in mechanics, where attraction ceases, there a repulsive virtue ought to succeed. *Newton*.—Applied to persons, he who has the habit of affirming with vehemence; positive; dogmatical.

AFFIRMATIVELY, *adv.* In an affirmative manner; on the positive side; not negatively.

AFFIRMER, *f.* The person that affirms.

To AFFIX, *v. a.* [*affigo*, *affixum*, Lat.] To unite to the end, or *à posteriori*; to subjoin.—If men constantly *affixed* applause and disgrace where they ought, the principle of shame would have a very good influence on public conduct; though on secret villanies it lays no restraint. *Rogers*.—To connect consequentially. Simply to fasten or fix. Obsolete.

AFFIX, *f.* [*affixum*, Lat.] In grammar, a participle added at the close of a word, either to diversify its form or alter its signification. We meet with *affixes* in the Saxon, the German, and other northern languages; but more especially in the Hebrew, and other oriental tongues. The Hebrew *affixes* are single syllables, frequently single letters, subjoined to nouns and verbs; and contribute not a little to the brevity of that language. The oriental languages are much the same as to the *radicals*, and differ chiefly from each other as to *affixes* and *prefixes*.

AFFIXION, *f.* The act of affixing. The state of being affixed.

AFFLATION, *f.* [*afflo*, *afflatum*, Lat.] The act of breathing upon any thing.

AFFLATUS, *f.* [from *ad*, to, and *flare*, Lat. to blow.] It literally denotes a blast of wind, breath or vapour, striking with force against another body. Naturalists sometimes speak of the *afflatus* of serpents. Tully uses the word figuratively, for a divine inspiration; in which sense, he ascribes all great and eminent accomplishments to a divine *afflatus*. The Pythian priestesses being placed on a tripod or perforated stool, over a holy cave, received the divine *afflatus*, as a late author expresses it, in her belly; and, being thus inspired, fell into agitations, like a phrenetic; during which she pronounced, in hollow groans and broken sentences, the will of the deity. This *afflatus* is supposed, by some, to have been a subterraneous fume, or exhalation, wherewith the priestesses was literally inspired. Accordingly, it had the effects of a real physical disease; the paroxysm of which was so vehement, that Plutarch observes it sometimes proved mortal. Van Dale supposes the pretended enthusiasm of the Pythia to have arisen from the fumes of aromatics.

To AFFLICT, *v. a.* [*afflicto*, *afflictum*, Lat.] To put to pain; to grieve; to torment. The passive, *to be afflicted*, has often *at* before the casual noun; *by* is likewise proper.—The

—The mother was so *afflicted* at the loss of a fine boy, who was her only son, that she died of grief of it. *Addison*.

AFFLICTEDNESS, *f.* The state of affliction, or of being afflicted; sorrowfulness; grief.

AFFLICTER, *f.* The person that afflicts.

AFFLICTION, *f.* [*afflictio*, Lat.] The cause of pain or sorrow; calamity. The state of sorrowfulness; misery: opposed to *joy* and *prosperity*.—Some virtues are only seen in *affliction*, and some in *prosperity*. *Addison*.

Though affliction is not itself a disease, it produces many, for whatever excites envy, anger, or hatred, produces diseases from tense fibres; as whatever excites fear, grief, joy, or delight, begets diseases from relaxation.

AFFLICTIVE, *adj.* That which causes affliction; painful; tormenting:

Restless Proserpine—

—On the spacious land and liquid main

Spreads slow disease, and darts *afflictive* pain. *Prior*.

AFFLUENCE, *f.* [*affluence*, Fr. *affluentia*, Lat.] The act of flowing to any place; concurrence. It is almost always used figuratively.—I shall not relate the *affluence* of young nobles from hence into Spain, after the voice of our prince being there had been noised. *Wotton*.—Exuberance of riches; stream of wealth; plenty:

Let joy or ease, let *affluence* or content,
And the gay conscience of a life well spent,
Calm ev'ry thought, inspirit ev'ry grace.

Pope.

AFFLUENCY, *f.* The same with **AFFLUENCE**.

AFFLUENT, *adj.* [*affluent*, Fr. *affluens*, Lat.] Flowing to any part. Abundant; exuberant; wealthy.

AFFLUENTNESS, *f.* The quality of being affluent.

AFFLUX, *f.* [*affluxus*, Lat.] The act of flowing to some place; affluence. That which flows to another place.—The cause hereof cannot be a supply by procreations; ergo, it must be by new *affluxes* to London out of the country. *Graunt*.

AFFLUXION, *f.* [*affluxio*, Lat.] The act of flowing to a particular place. That which flows from one place to another.

AFFORAGE, *f.* in the French customs, was a duty paid to the lord of a district, for permission to sell wine or other liquors within his seignory. Afforage was also used for the rate or price of provisions laid and fixed by the provost or sheriffs of Paris.

TO AFFORD, *v. a.* [*affourer*, *affourager*, Fr.] To yield or produce; as, The soil *affords* grain; The trees *afford* fruits. This seems to be the primitive signification. To grant, to confer any thing; generally in a good sense, and sometimes in a bad, but less properly. To be able to sell. It is used always with reference to some certain price; as, I can *afford* this for less than the other. To be able to bear expences; as, Traders can *afford* more finery in peace than war.

TO AFFOREST, *v. a.* [*afforestare*, Lat.] To turn ground into a forest.—It appeareth, by Charta de Foresta, that he *afforested* many woods and wastes, to the grievance of the subject, which by that law were disafforested. *Davies*.

AFFORESTING, *f.* [*afforestatio*, Lat.] The turning ground into a forest. The Conqueror, and his successors, continued afforesting the lands of the subject for many reigns; till the grievance became so notorious, that the people of all degrees and denominations were brought to sue for relief; which was at length obtained, and commissions were granted to survey and perambulate the forest, and separate all the new-afforested lands, and reconvert them to the uses of their proprietors, under the name and quality of *purlieu* or *pouralle land*.

TO AFFRANCHISE, *v. a.* [*affrancher*, Fr.] To make free.

TO AFFRAY, *v. a.* [*effrayer*, or *effriger*, Fr. which *Ménage* derives from *fragor*; perhaps it comes from *frigus*.] To fright; to terrify; to strike with fear. This word is not now in use.

AFFRAY, or **AFFRAYMENT**, *f.* A tumultuous assault of one or more persons upon others. A battle: in this sense it is written *fray*. Tumult; confusion.

In law, an affray is the fighting of two or more persons in some public place, to the terror of his majesty's subjects: for, if the fighting be in private, it is no affray, but an assault. 4 *Blackll.* 145.

Affrays may be suppressed by any private person present, who is justifiable in endeavouring to part the combatants, whatever consequence may ensue. But more especially the constable, or other like officer, is bound to keep the peace; and for that purpose may break open doors to suppress an affray, or apprehend the affrayers; and may carry them either before a justice, or imprison them by his own authority for a convenient time, till the heat be over.

It is said, that no quarrelsome or threatening words whatever shall amount to an affray; and that no one can justify laying his hands on those who shall barely quarrel with angry words, without coming to blows; yet it seemeth that the constable may, at the request of the party threatened, carry the person who threatens to beat him before a justice, in order to find sureties. 1 *Haw.* 135.

Also it is certain, that it is a very high offence to challenge another, either by word or letter, to fight a duel, or to be the messenger of such a challenge; or even barely to endeavour to provoke another to send a challenge or to fight, as by dispersing letters to that purpose, full of reflections, and insinuating a desire to fight. *Id.*

All affrays in general are punishable by fine and imprisonment. 1 *Haw.* 138.

AFFRICTION, *f.* [*affriccio*, Lat.] The act of rubbing one thing upon another.—I have divers times observed, in wearing silver-hilted swords, that, if they rubbed upon my clothes, if they were of a light-coloured cloth, the *affriccion* would quickly blacken them; and, congruously hereunto, I have found pens blackened almost all over, when I had awhile carried them about me in a silver case. *Boyle*.

TO AFFRIGHT, *v. a.* To affect with fear; to terrify. It generally implies a sudden impression of fear:

Thy name *affrights* me, in whose sound is death.

Shakespeare.

It is used in the passive, sometimes with *at* before the thing feared.—Thou shalt not be *affrighted* at them: for the Lord thy God is among you. *Deut.* vii. 21.—Sometimes with the particle *with* before the thing feared:

As one *affright*

With hellish fiends, or furies mad uproar,
He then arose.

Spencer.

AFFRIGHT, *f.* Terror; fear. This word is chiefly poetical:

Wide was his parish, not contracted close
In streets, but here and there a straggling house;
Yet still he was at hand, without request,
To serve the sick, to succour the distressed;
Tempting, on foot, alone, without *affright*,
The dangers of a dark tempestuous night.

Dryden.

The cause of fear; a terrible object; dreadful appearance:

The war at hand appears with more *affright*,
And rises ev'ry moment to the sight.

Dryden.

AFFRIGHTFUL, *adj.* Full of affright or terror; terrible; dreadful.

AFFRIGHTMENT, *f.* The impression of fear; terror. The state of fearfulness.—Passionate words or blows from the tutor, fill the child's mind with terror and *affrightment*; which immediately takes it wholly up, and leaves no room for other impression. *Locke*.

TO AFFRONT, *v. a.* [*affronter*, Fr. that is, *ad frontem stare*; *ad frontem contumeliam allidere*, to insult a man to his face.] To meet face to face; to encounter. This seems the genuine and original sense of the word, which was formerly indifferent to good or ill. To meet, in an hostile manner, front to front. To offer an open insult; to offend.

fend avowedly. With respect to this sense, it is observed by Cervantes, that, if a man strikes another on the back, and then runs away, the person so struck is injured, but not affronted; an affront always implying a justification of the act.

AFFRONT, f. Open opposition; encounter: a sense not frequent, though regularly deducible from the derivation. Insult offered to the face; contemptuous or rude treatment; contumely.—There is nothing which we receive with so much reluctance as advice: we look upon the man who gives it us, as offering an *affront* to our understanding, and treating us like children or idiots. *Addison*.—Outrage; act of contempt, in a more general sense. Disgrace; shame. This sense is rather peculiar to the Scottish dialect.

AFFRONTER, f. The person that affronts.

AFFRONTING, part. adj. That which has the quality of affronting; contumelious.—Among words which signify the same principal ideas, some are clean and decent, others unclean; some are kind, others are *affronting* and reproachful, because of the secondary idea which custom has affixed to them. *Watts*.

To AFFUSE, v. a. [*affundo, effusum, Lat.*] To pour one thing upon another.—I poured acid liquors, to try if they contained any volatile salt or spirit, which would probably have discovered itself, by making an ebullition with the *affused* liquor. *Boyle*.

AFFUSION, f. [*affusio, Lat.*] The act of pouring one thing upon another.

Dr. Grew gives several experiments of the luctation arising from the affusion of divers menstrooms on all sorts of bodies. Divines and church-historians speak of baptism by affusion; which amounts to much the same with what we now call *sprinkling*.

To AFFY, v. a. [*affier, Fr. affidare mulierem, Bracton.*] To betroth in order to marriage:

Wedded be thou to the hags of hell,
For daring to *affy* a mighty lord
Unto the daughter of a worthless king. *Shakespeare*.

To AFFY, v. n. To put confidence in; to put trust in; to confide. Not in use.

AFGHANS, the general name of a people in Persia, who, under the late Kouli Khan, subverted the Persian monarchy.

AFIELD, adv. [from *a* and *field*.] To the field:

Afield I went, amid the morning dew,
To milk my kine, for so should housewives do. *Gay*.

AFLAT, adv. [from *a* and *flat*.] Level with the ground.—When you would have many new roots of fruit-trees, take a low tree, and bow it, and lay all his branches *aflat* upon the ground, and cast earth upon them; and every twig will take root. *Bacon*.

AFLOAT, adv. [from *a* and *float*.] Floating; born up in the water; not sinking: in a figurative sense, within view; in motion:

There is a tide in the affairs of men,
Which, taken at the flood, leads on to fortune;
Omitted, all the voyage of their life
Is bound in shallows and in miseries.
On such a full sea are we now *afloat*;
And we must take the current when it serves,
Or lose our ventures. *Shakespeare*.

AFOOT, adv. [from *a* and *foot*.] On foot; not on horseback. In action; as, *A design is afoot*. In motion.

AFORE, prep. [from *a* and *fore*.] Not behind; as, He held the shield *afore*: not in use. Before; nearer in place to any thing: as, He stood *afore* him. Sooner in time.—If your diligence be not speedy, I shall be there *afore* you. *Shakespeare*.

AFORE, adv. In time foregone or past. First in the way. In front; in the fore-part:

Approaching nigh, he reared high *afore*
His body monstrous, horrible, and vast.

Spencer.

AFOREGOING, part. adj. [from *afore* and *going*.] Going before.

AFOREHAND, adv. [from *afore* and *hand*.] By a previous provision. Provided; prepared; previously fitted.—For it will be said, that in the former times whereof we have spoken, Spain was not so mighty as now it is; and England, on the other side, was more *aforehand* in all matters of power. *Bacon*.

AFOREMENTIONED, adj. [from *afore* and *mentioned*.] Mentioned before.—Among the nine other parts, five are not in a condition to give alms or relief to those *aforementioned*; being very near reduced themselves to the same miserable condition. *Addison*.

AFORENAMED, adj. [from *afore* and *named*.] Named before.—Imitate something of circular form, in which, as in all other *aforenamed* proportions, you shall help yourself by the diameter. *Peacham*.

AFORESAID, adj. [from *afore* and *said*.] Said before.—It need not go for repetition, if we resume again that which we said in the *aforesaid* experiment. *Bacon*.

AFORETIME, adv. [from *afore* and *time*.] In time past.—O thou that art waxen old in wickedness, now thy sins which thou hast committed *aforetime* are come to light. *Susanna*.

AFFRAID, part. adj. [from the verb *affray*: it should therefore properly be written with *ff*.] Struck with fear; terrified; fearful. It has the particle *of* before the object of fear:

There, loathing life, and yet *of* death *afraid*,
In anguish of her spirit, thus she pray'd.

Dryden.

AFRESH, adv. [from *a* and *fresh*.] Anew; again, after intermission.—When once we have attained ideas, they may be excited *afresh* by the use of words. *Watts*.

AFRANIUS, a Latin poet, who wrote comedies in imitation of Menander, commended by Tully and Quintilian. He lived in the 170th Olympiad.

AFRICA, [according to Bochart, from a Punic word, signifying Ears of Corn;] one of the four great divisions, by the moderns called quarters, of the world, and one of the three called by the Greeks *Ἡμεραι*, or continents. By them it was also called Libya.

Africa lies south of Europe, and west of Asia. It is bounded on the north by the Mediterranean, which separates it from the former: on the north-east by the Red Sea, which divides it from Asia, and to which it is attached by a neck of land called the Isthmus of Suez, about sixty miles over, separating the Mediterranean from the Red Sea. On the west, south, and east, it is bounded by the main ocean: so that it is properly a vast peninsula, bearing some faint resemblance of a pyramid, the base of which is the northern part, running along the shores of the Mediterranean; and the top of the pyramid, the base of which is the southern part, running along the shores of the Mediterranean; and the top of the pyramid is the most southerly point, called the Cape of Good Hope. Its greatest length from north to south is 4300 miles; and its greatest breadth from east to west is 3500 miles; reaching from lat. 37° N. to 35° S. and from lon. 170° W. to 50° E.

Though a great part of this continent hath been in all ages unknown both to Europeans and Asiatics, its situation is more favourable than either Europe or Asia for maintaining an intercourse with other nations. It stands, as it were, in the centre of the three other quarters of the globe; and has thereby a much nearer communication with Europe, Asia, and America, than any one of these has with another. For, 1. It is opposite to Europe in the Mediterranean, for almost 1000 miles in a line from east to west; the distance seldom 100 miles, never 100 leagues, and sometimes not above twenty leagues: 2. It is opposite to Asia for all the length of the Red Sea, the distance

sometimes not exceeding five leagues, seldom fifty. 3. Its coast for the length of about 2000 miles lies opposite to America at the distance of from 500 to 700 leagues, including the islands: whereas America, unless where it may be a *terra incognita*, is no where nearer Europe than 1000 leagues; and Asia, than 2500. It is, however, the misfortune of Africa, that, though it has 10,000 miles of sea-coast, with noble, large, deep, rivers, it should be inhabited by barbarous or savage nations. At the mouths of many of its rivers are the most excellent harbours, deep, safe, calm, and sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandise. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful, as well convenient, within itself, seems to be almost entirely neglected, not only by the natives, who are quite unsolicitous of reaping the benefits which nature has provided for them, but also by the more civilized Europeans who are settled in it, particularly the Portuguese.

As the equator divides this continent almost in the middle, the far greatest part of it is within the tropics; and of consequence the heat in some places is almost insupportable by Europeans, it being there greatly increased by vast deserts of burning sand.

It cannot be doubted, however, that, were the country well cultivated, it would be extremely fertile; and would produce, in great abundance, not only the necessaries, but also the luxuries, of life. It has been asserted, that the sugars of Barbadoes and Jamaica, as also the ginger, rice, cotton, pepper, pimento, cocoa, indigo, &c. of these islands, would thrive in Africa to as much perfection as where they are now produced. Nor can it be doubted, that the East-Indian spices, the tea of China and Japan, the coffee of Mocha, &c. would all thrive in some parts of the African coast; as this continent has the advantage of feeling no cold, the climate being either very warm or very temperate.

From what has been said, the reader cannot expect to find here a variety of climates. In many parts of Africa snow never falls in the plains, and it seldom lies but on the tops of the high mountains. The natives, in these scorching regions, would as soon expect that marble should melt and flow in liquid streams, as that water, by freezing, should lose its fluidity, be arrested by the cold, and, ceasing to flow, become like the solid rock.

That the geography of Africa (observes Major Rennell) has made a slower progress towards improvement than that of every other part of the world, during the last and the present century, is to be attributed more to natural causes than to an absolute want of attention on the part of geography. Formed by the Creator with a contour and surface totally unlike the other continents, its interior parts elude all nautic research; whilst the wars and commerce in which Europeans have taken part, have been confined to very circumscribed parts of its borders. To the lovers of adventure and novelty, Africa displays a most ample field; but the qualification of local manners, and in some degree of habits, must in this case be super-added to that of language; and this unquestionably renders the undertaking more arduous than that of an ordinary tour.

"Africa stands alone in a geographical view. Penetrated by no inland seas, like the Mediterranean, Baltic, or Hudson's Bay; nor overspread with extensive lakes, like those of North America; nor having, in common with the other continents, rivers running from the centre to the extremities; but, on the contrary, its regions separated from each other by the least practicable of all boundaries, and deserts of such formidable extent, as to threaten those who traverse them with the most horrible of all deaths, that arising from thirst! Placed in such circumstances, can we be surprised either at our ignorance of its

interior part, or of the tardy progress of civilization in it? Possibly the difficulty of conveying merchandise to the coasts, under the above circumstances, may have given rise to the traffic in men, a commodity that can transport itself! But, laying this out of the question, as an abstract speculation, there can be little doubt but that the progress of civilization amongst the Africans has been as slow as can be conceived in any situation: and it has also happened, that the destined instruments of their civilization have remained in a proportionable degree of ignorance concerning the nature of the country.

"Nothing can evince the low state of the African geography, more than M. d'Anville's having had recourse to the works of Ptolemy and Edrisi, to compose the interior part of his map of Africa (1749). It is well known that those authors wrote in the second and, in the twelfth centuries of our æra. Most of the positions in the inland part of the great body of Africa are derived from Edrisi; and it is wonderful how nearly some of the positions agree with those furnished by the latest observations. Such was the transcendent judgment of D'Anville, in combining the scanty notices that are furnished by the Nubian geographer!

"But the public are not to expect, even under an improved system of African geography, that the interior part of that continent will exhibit an aspect similar to the others; rich in variety; each region assuming a distinct character. On the contrary, it will be meagre and vacant in the extreme. The dreary expanses of desert which often surround the habitable spots, forbid the appearance of the usual proportion of towns; and the paucity of rivers, added to their being either absorbed or evaporated, instead of being conducted in flowing lines to the ocean, will give a singular cast to its hydrography; the direction of their courses being, moreover, equivocal, through the want of that information which a communication with the sea usually affords at a glance.

"The society for promoting the discovery of the interior parts of Africa has been fortunate in collecting much geographical information in so early a stage of the African researches; and there is little doubt but that, in a few years, all the great features of this continent (within the reach of their enquiries) may be known and described. But, to accomplish this, it will be necessary that intelligent Europeans should trace some of the principal routes; as well to apportion the distances, as to establish some kind of criterion for the parole information derived from the natives. As yet, in the wide extent of near thirty degrees on a meridian, between Benin and Tripoli, not one celestial observation has been taken to determine the latitude."

Whatever may be the case with the internal parts of Africa, it is certain that its coasts are well watered with many very considerable rivers. The Nile and the Niger may be reckoned among the largest in any part of the world, America excepted. The first discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia. See NILE.—The Niger is said to fall into the Atlantic or Western Ocean at Senegal, after a course of 2800 miles. But this is extremely difficult, if not impossible, to ascertain; for, according to Mr. Lucas's communications to the African Association, both the rise and termination of the Niger are unknown, but the course is from east to west. So great is its rapidity, that no vessel can ascend its stream: and such is the want of skill, or such the absence of commercial inducements among the nations who inhabit its borders, that even with the current neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds accommodations for the passage of himself and of his goods; but even there, though the ferrymen, by the indulgence of the sultan of Cahna, are exempted from all taxes, the boat which conveys the merchandise is nothing more than an ill-constructed raft, for the planks are fastened to the timbers with ropes, and the interstices are closed, both within and without, by a plaster of tough clay, of which a large provision is always carried

ried on the raft, for the purpose of excluding the stream wherever its entrance is observed. The depth of the river at the place of passage, which is more than an hundred miles to the south of the city of Cashna, the capital of the empire of that name, is estimated at twenty-three or twenty-four feet English. Its width is such, that, even at the island of Gongoo, where the ferrymen reside, the sound of the loudest voice from the northern shore is scarcely heard; and, at Tombuctou, where the name of *Gnewa*, or black, is given to the stream, the width is described as being that of the Thames at Westminster. In the rainy season it swells above its banks, and not only floods the adjacent lands, but often sweeps before it the cattle and cottages of the short-sighted or too confident inhabitants. That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprise the traveller; but much greater is his astonishment, when he finds that even the food which the bounty of the stream affords, is uselessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish, with which the river abounds, are left in undisturbed possession of its waters.

Both these rivers annually overflow their banks, fertilizing by that means the countries through which they pass. The Gambia and Senegal rivers are only branches of the Niger.

The most considerable mountains in Africa are the Atlas, a ridge extending from the Western Ocean (to which it gives the name of Atlantic Ocean) as far as Egypt. It had its name from the king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit; on which account the poets represent him as bearing the heavens on his shoulders. The mountains of the Moon, extending themselves between Abyssinia and Monomotapa, are still higher than those of Atlas. Those of Sierra Leona, or the mountains of the Lions, which divide Nigritia from Guinea, and extend as far as Ethiopia. These were styled by the ancients the mountains of God, on account of their being subject to thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, rises about two miles high in the form of a sugar-loaf, and is situated on an island of the same name near the coast.

The most noted capes or promontories in this country are, Cape Verd, so called, because the land is always covered with green trees and mossy ground, and it is the most westerly point of the continent of Africa. The Cape of Good Hope, so denominated by the Portuguese, when they first went round it in 1498, and discovered the passage to Asia. It is the southern extremity of Africa, in the country of the Hottentots, and is the general rendezvous of ships of every nation who trade to India, being about half way from Europe.—There is but one strait in Africa, which is called Babel-Mandel, and joins the Red Sea with the Indian Ocean.

To what we have already said concerning the produce of Africa, we may add, that no part of the world abounds with gold and silver in a greater degree. Here are also a prodigious number of elephants; and it is surprising, that neither the ancient nor modern Europeans, notwithstanding their extravagant and insatiable thirst after gold and silver, should have endeavoured to establish themselves in a country much nearer to them than either America or the East Indies; and where the objects of their desire are found in equal, if not greater, plenty.

Next to gold and silver, copper is the most valuable metal; and on this continent it is found in great plenty, in so much that the mountains of Atlas above-mentioned are said to be all composed of copper ore.

Only a small part of this continent was known to the ancients, viz. the kingdom of Egypt, and the northern coast, comprehending little more than what is now known by the name of Barbary. It was divided into *Africa Propria*, and *Africa Interior*. *Africa Propria* comprehended

only the Carthaginian territories. *Africa Interior* comprehended all other nations to the southward of those territories, or those at a greater distance from Rome. The only kingdoms, however, with which the Romans had any connection, were the Numidians, the Mauritians, and the Gætuli. All these, as well as Egypt, were swallowed up by that enormous power, and reduced to the condition of Roman provinces. But the Romans never seem to have penetrated beyond the tropic of Cancer. There appears, indeed, to have been some intercourse between them and the Ethiopians: but the latter always preserved their liberty; and we find their queen Candace mentioned in the times of the Apostles, when the Roman power was at its highest pitch.

Between the tropic of cancer and the equinoctial line, a multitude of savage nations were supposed to have their residence, known by the names of Melanogætuli, Nigritæ, Blemmyes, Dolopes, Astacuri, Lotophagi, Ichthyophagi, Elephantophagi, &c. (which are taken notice of, as well as the others already mentioned, under their proper names); but that Africa was a peninsula, seems to have been totally unknown both to the Europeans and Asiatics for many ages. It is probable, indeed, that some of the Phenicians, and their offspring the Carthaginians, were not so ignorant; as they carried navigation to a much greater height than either the Greeks or Romans: but their discoveries were all concealed with the greatest care, lest other nations should reap the benefit of them; and, accordingly we can now find no authentic accounts concerning them. The navigation round Africa, in particular, is recorded by the Greek and Roman writers rather as a strange amusing tale than as a real transaction; and, as neither the progress of the Phenician and Carthaginian discoveries, nor the extent of their navigation, were communicated to the rest of mankind, all memorials of their extraordinary skill in naval affairs seem in a great measure to have perished, when the maritime power of the former was annihilated by Alexander's conquest of Tyre, and the empire of the latter was overturned by the Romans.

That the peninsula of Africa, however, was in reality failed round by the Phenicians, we have on indisputable authority; for some of that nation undertook the voyage, at the command of Necho king of Egypt, about 604 years before the Christian æra. They sailed from a port in the Red Sea, and after three years returned by the Mediterranean: and the very objections that were made to the veracity of their accounts at that time, are unanswerable proofs to us that this voyage was really accomplished. They pretended, that, having sailed for some time, the sun became more and more vertical, after which he appeared in the north, and seemed to recede from them: that, as they returned, the sun gradually seemed to move southwards; and, after becoming vertical once more, appeared then in the south side of them as before they set out. This, which we know must certainly have been the case, was deemed incredible at that time, and universal ignorance concerning the extent of this continent prevailed till the fifteenth century. The first attempts towards attaining a knowledge of Africa was made by the Portuguese, in 1412. Notwithstanding their vicinity, they had never ventured beyond Cape Non, situated in about lat. 27° N. which had received its name from a supposed impossibility of passing it. This year they proceeded one hundred and sixty miles farther, to Cape Bojador; which stretching a considerable way into the Atlantic Ocean, with rocky cliffs, appeared so dreadful to the navigators, that they returned without any attempt to pass it. In an attempt to double this formidable cape, they discovered the Madeira Islands, in 1419; but Cape Bojador continued to be the boundary of their continental discoveries till 1433, when they penetrated within the tropics, and in a few years discovered the river Senegal, Cape de Verd, and the islands which lie off that promontory. In 1449, the western islands, called the Azores, were discovered: and, in 1471, they first penetrated beyond the line; and were surprised

surprised to find, that the torrid zone, contrary to the opinion of the ancients, who imagined it to be burnt up with heat, was not only habitable, but fertile and populous. In 1484, they proceeded 1500 miles beyond the line; so that they began to entertain hopes of finding that way a passage to the East Indies: and, two years afterwards, the Cape of Good Hope was discovered by Bartholomew de Diaz; but it was not till the year 1497, that the Portuguese, under Vazquez de Gama, actually doubled this cape, and discovered the true shape of the continent. Thus the coasts of Africa were made perfectly known; and probably the knowledge concerning its interior parts would have been much greater than it is, had not the general attention been called off from this continent by the discovery of America, in 1492.

The Romans for a long time maintained their power in Africa: but, in the year 426, Bonifacius, supreme governor of all the Roman dominions in this quarter, being compelled to revolt by the treachery of another general called Aetius, and finding himself unable to contend with the whole strength of the Roman empire, called in Genferic king of the Vandals to his aid; who thereupon abandoned the provinces he had seized in Europe, and passed over into Africa. Bonifacius, however, being soon after reconciled to his empress, Placidia, endeavoured in vain to persuade the Vandals to retire. Hereupon a war ensued, in which the barbarians proved victorious, and quickly over-ran all the Roman provinces in Africa. In the year 435, a peace was concluded; when Numidia and some other countries were ceded to the Vandals, who soon after seized all the rest. These barbarians did not long enjoy their ill-gotten possessions: for, about the year 533, Belisarius drove them out, annexing the provinces to the eastern empire; and, in 647, the Saracens having conquered Mesopotamia, Egypt (which anciently was not included in the meaning of the word Africa), Phenicia, Arabia, and Palestine, broke like a torrent into Africa, which they quickly subdued. Their vast empire being, anno 936, divided into seven kingdoms, the African states retained their independency long after the others were subdued by the Turks: but, in the beginning of the sixteenth century, being afraid of falling under the yoke of Spain, they invited the Turks to their assistance, who first protected, and then enslaved, them. They still continue in a kind of dependence on the Ottoman empire. They are not, however, properly speaking, the *subjects* of the Grand Signior, but call him their *protector*, paying him an annual tribute. On the coasts, the natives are almost all addicted to piracy; and, with such success have they carried on their employment, that the greatest powers in Europe are become their tributaries, in order to procure liberty to trade on the Mediterranean.

Concerning even those states which are nearest to Europe, very little is known: but the interior nations are scarcely known by name; nor do almost any two of the most learned moderns agree in their division of Africa into kingdoms; and the reason is, that scarcely any traveller hath ever penetrated into these inhospitable regions. According to the best accounts, concerning those regions of Africa lying beyond Egypt and Barbary, they are divided in the following manner:—On the western coast, to the south of Barbary, lie the kingdoms of Bildulgerid, Zaara, Negroland, Loango, Congo, Angola, Benguela, and Terra de Natal. On the eastern coast, beyond Egypt, are those of Nubia, Adel, Ajan, Zanguebar (between these two a huge desert is interposed), Monomotapa, and So-fola. In the interior parts the kingdoms of Lower Ethiopia, Abex, Monemuge, and Matanan, are mentioned. The southernmost part, called Caffraria, is well known for the habitation of the Hottentots.

In many material circumstances, the inhabitants of this extensive continent agree with each other. If we except the people of Abyssinia, who are tawny, and who profess a mixture of Christianity, Judaism, and Paganism, they are all of a black complexion. In their religion, except

on the sea-coasts, which have been visited and settled by strangers, they are Pagans; and the form of government is every where monarchical. Few princes, however, possess a very extensive jurisdiction; for, as the natives of this part of Africa are grossly ignorant in all the arts of utility or refinement, they are little acquainted with one another; and generally united in small societies, each governed by its own prince. In Abyssinia, indeed, as well as in Congo, Loango, and Angola, we are told of powerful monarchs; but, on examination, it is found that the authority of these princes stands on a precarious footing, each tribe or separate body of their subjects being under the influence of a petty chieftain of their own, styled *Negus*, to whose commands, however contrary to those of the Negafcha Negafcht, or king of kings, they are always ready to submit.

The fertility of a country so prodigiously extensive, might be supposed more various than we find it is: in fact, there is no medium in this part of Africa with regard to the advantages of soil; it is either perfectly barren, or extremely fertile. This arises from the intense heat of the sun; which, where it meets with sufficient moisture, produces the utmost luxuriance; and, in those countries where there are few rivers, reduces the surface of the earth to a barren sand. Of this sort are the countries of Anian and Zaara; which, for want of water, and consequently of all other necessities, are reduced to perfect deserts, as the name of the latter denotes. In those countries, on the other hand, where there is plenty of water, and particularly where the rivers overflow the land part of the year, as in Abyssinia, the productions of nature, both of the animal and vegetable kinds, are found in the highest perfection and greatest abundance. The countries of Mandingo, Ethiopia, Congo, Angola, Batua, Truticui, Monomotapa, Cafati, and Mehenemugi, are extremely rich in gold and silver. The baser metals, likewise, are found in these and many other parts of Africa. But the persons of the natives make the most considerable article in the traffic of this miserable quarter of the globe.

On the Guinea or western coast, the English trade to James Fort; and other settlements near and up the river Gambia; where they exchange their woollen and linen manufactures, their hardware, and spirituous liquors, for the persons of the natives. By the treaty of peace in 1783, the river of Senegal, with its dependencies, were given up to France. Gold and ivory, next to the slave-trade, form the principal branches of African commerce. These are carried on from the same coast, where the Dutch and French, as well as the English, have long had their settlements for this purpose.

The Portuguese are in possession of the east and west coast of Africa, from the tropic of Capricorn to the Equator; which immense tract they became masters of by their successive attempts and happy discovery and navigation of the Cape of Good Hope. From the coast of Zanguebar, on the eastern side, they trade not only for the articles above-mentioned, but likewise for several others; as sen-na, aloes, civet, ambergris, and frankincense. The Dutch had settlements towards the southern part of the continent, in the country called Caffraria, or the land of the Hottentots, particularly Cape Town, which is well fortified; but, while this article was in the press, (Nov. 1795,) news is said to have arrived that they were totally dispossessed by the English, who hold these settlements in trust for the stadtholder.

The Portuguese, being sovereigns of the greatest part of the coast, have a number of black princes their tributaries. There are some independent princes who have extensive dominions; particularly the kings of Dahome and Widah, the most noted of any for the infamous slave-trade. Upwards of 200 years have the European nations traded with Africa in human flesh; and encouraged in the Negro countries wars, rapine, desolation, and murder, that the West-India islands might be supplied with that commodity. The annual exportation of poor creatures from

from Africa for slaves hath exceeded 100,000; numbers of whom are driven down like sheep, perhaps near 1000 miles from the sea-coast, who are generally inhabitants of villages that have been surrounded in the night by armed force, and carried off to be sold to our traders. Nor do our planters, who purchase them, use any pains to instruct them in religion, to make them amends for the oppression thus exercised on them. It is said they are unnaturally averse to every thing that tends to it; yet the Portuguese, French, and Spaniards, in their settlements, succeed in their attempts to instruct them, as much to the advantage of the commerce as of religion. It is for the sake of Christianity, and the advantages accompanying it, that English slaves embrace every occasion of deserting to the settlements of these nations. See SLAVE-TRADE.

The inhabitants of this continent, with respect to religion, may be divided into three sorts, viz. Pagans, Mahometans, and Christians. The first are the most numerous, possessing the greatest part of the country, from the tropic of Cancer to the Cape of Good Hope, and they are generally black. The Mahometans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary coast. The people of Abyssinia, or the Upper Ethiopia, are for the most part denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews, on the north of Africa, who manage all the little trade that part of the country enjoys.

There are scarcely any two nations, or indeed any two of the learned, that agree in the modern divisions of Africa, as has been before observed; and therefore we must acknowledge our ignorance of the true bounds, and even the names, of several of the inland nations, which may still be reckoned among the unknown and undiscovered parts of the world.

AFRICAN ASSOCIATION, is a society that was lately established by subscription for the purpose of making discoveries in the interior parts of Africa. See the preceding article.

AFRICAN BLADDER-NUT, *f.* in botany. See ROYENA.

AFRICAN COMPANY, a society of merchants, established by king Charles II. for trading to Africa; which trade is now laid open to all his majesty's subjects, paying 10 per cent. for maintaining the forts.

AFRICAN FLEA-BANE, *f.* in botany. See TARCHONANTHUS.

AFRICAN MARYGOLD, *f.* in botany. See TAGETES.

AFRICAN RAGWORT, *f.* in botany. See OTHONNA.

AFRICANUS (Julius), an excellent historian of the third century, the author of a chronicle which was greatly esteemed, and in which he reckons 5500 years from the creation of the world to Julius Cæsar. This work, of which we have now no more than what is to be found in Eusebius, ended at the 221st year of the vulgar æra. Africanus also wrote a letter to Origen on the History of Sufanna, which he reckoned supposititious; and we have still a letter of his to Aristides, in which he reconciles the seeming contradictions in the two genealogies of Christ, recorded by St. Matthew and St. Luke.

AFRONT, *adv.* [from *a* and *front*.] In front; in direct opposition to the face.—These four came all *afront*, and mainly thrust at me. *Shakespeare*.

AFSLAGERS, *f.* persons appointed by the burgomasters of Amsterdam to preside over the public sales made in that city. They must always have a clerk of the secretary's office with them, to take an account of the sale. They correspond to our brokers, or auctioneers.

AFT, *f.* in sea-language, the same with ABAFT.

AFTER, *prep.* [after, Sax.] Following in place. It is commonly applied to words of motion; as, He came *after*, and stood *behind* him. It is opposed to *before*:

What says Lord Warwick, shall we *after* them?—

—*After* them! nay, *before* them, if we can. *Shakespeare*.

In pursuit of.—*After* whom is the king of Israel come out? *After* whom dost thou pursue? *After* a dead dog, *after* a flea? 1 Sam. xxiv. 14.—*Behind*. This is not a common use.—Sometimes I placed the third prism *after* a second, and sometimes also a fourth *after* a third, by all which the image might be often refracted sideways. *Newton*.—*Posterior* in time.—We shall examine the ways of conveyance of the sovereignty of Adam to princes that were to reign *after* him. *Locke*.—According to.—He that thinketh Spain our over-match, is no good mint-man, but takes greatness of kingdoms according to bulk and currency, and not *after* their intrinsic value. *Bacon*.—In imitation of.—There are, among the old Roman statues, several of Venus, in different postures and habits; as there are many particular figures of her made *after* the same design. *Addison*.

AFTER, *adv.* In succeeding time. It is used of time mentioned as succeeding some other. So we cannot say, I shall be happy *after*, but *hereafter*; but we say, I was at first made miserable by the loss, but was *after* happier. Following another.—Let go thy hold, when a great wheel runs down a hill, lest it break thy neck with following it; but the great one that goes upward, let him draw thee *after*. *Shakespeare*.—*After* is compounded with many words, but almost always in its genuine and primitive signification; some, which occurred, will follow, by which others may be explained.

AFTER ACCEPTATION, *f.* [from *after* and *acceptation*.] A sense afterwards, not at first admitted:

'Tis true, some doctors in a scantier space,
I mean, in each apart, contract the place?
Some, who to greater length extend the line,
The church's *after* acceptance join.

Dryden.

AFTERAGES, *f.* [from *after* and *ages*.] Successive times; posterity. Of this word I have found no singular; but see not why it might not be said, This will be done in some *afterage*. *Johnson*.

AFTER ALL, *prep.* When all has been taken into the view; when there remains nothing more to be added; at last; in fine; in conclusion; upon the whole; at the most.—But, *after all*, if they have any merit, it is to be attributed to some good old authors, whose works I study. *Pope*.

AFTERBIRTH, *f.* [from *after* and *birth*.] The membrane in which the birth was involved, which is brought away *after*; the secundine. See MIDWIFERY.

AFTERCLAP, *f.* [from *after* and *clap*.] Unexpected events happening after an affair is supposed to be at an end. It is commonly taken in an ill sense.

AFTERCOST, *f.* [from *after* and *cost*.] The latter charges; the expences incurred after the original plan is executed.—You must take care to carry off the land-floods and streams, before you attempt draining; lest your *after-cost* and labour prove unsuccessful. *Mortimer*.

AFTERCROP, *f.* [from *after* and *crop*.] The second crop or harvest of the same year.—*Aftercrops* I think neither good for the land, nor yet the hay good for the cattle. *Mortimer*.

AFTER-DINNER, *f.* [from *after* and *dinner*.] The hour passing just after dinner, which is generally allowed to indulgence and amusement.

AFTER-ENDEAVOUR, *f.* [from *after* and *endeavour*.] Endeavours made after the first effort or endeavour.—There is no reason why the found of a pipe should leave traces in their brains, which, not first, but by their *after-endeavours*, should produce the like sounds. *Locke*.

AFTER-ENQUIRY, *f.* [from *after* and *enquiry*.] Enquiry made after the fact committed, or after life.—You must either be directed by some that take upon them to know, or take upon yourself that, which, I am sure, you do not know, or lump the *after-enquiry* on your pencil. *Shakespeare*.

To AFTEREYE, *v. a.* [from *after* and *eye*.] To keep one in view; to follow in view. This is not in use.

AFTERGAME, *f.* [from *after* and *game*.] The scheme which may be laid, or the expedients which are practised;
after

after the original design has miscarried; methods taken after the first turn of affairs:

Our first design, my friend, has prov'd abortive;
Still there remains an *aftergame* to play. *Addison.*

AFTER-HOURS, *f.* [from *after* and *hours.*] The hours that succeed:

So smile the heav'n's upon this holy act,
That *after-hours* with sorrow chide us not. *Shakespeare.*

AFTER-LIVER, *f.* [from *after* and *live.*] He that lives in succeeding times.

AFTER-LOVE, *f.* [from *after* and *love.*] The second or later love:

If but the first, how heinous e'er it be,
To win thy *after-love*, I pardon thee. *Shakespeare.*

AFTERMATH, *f.* [from *after* and *math*, from *mow.*] The latter math; the second crop of grass, mown in the autumn.

AFTERNOON, *f.* [from *after* and *noon.*] The time from the meridian to the evening:

A beauty-waning and distressed widow,
E'en in the *afternoon* of her best days,
Made prize and purchase of his wanton eye. *Shakespeare.*

AFTERPAINS, *f.* [from *after* and *pain.*] The pains after birth, by which women are delivered of the secundine.

AFTERPART, *f.* [from *after* and *part.*] The latter part.—The flexibility of the former part of a man's age, not yet grown up to be headstrong, makes it more governable and safe; and, in the *afterpart*, reason and foresight begin a little to take place, and mind a man of his safety and improvement. *Locke.*

AFTERPROOF, *f.* [from *after* and *proof.*] Evidence posterior to the thing in question. Qualities known by subsequent experience.

AFTER-SWARMS, *f.* [from *after* and *swarm.*] In the management of bees, are those which leave the hive some time after the first has swarmed. See BEE.

AFTERTASTE, *f.* [from *after* and *taste.*] A taste remaining upon the tongue after the draught, which was not perceived in the act of drinking.

AFTERTHOUGHT, *f.* [from *after* and *thought.*] Reflections after the act; expedients formed too late. It is not properly to be used for *secondthought*.

AFTER-TIMES, *f.* [from *after* and *time.*] Succeeding times:

You promis'd once, a progeny divine
Of Romans, rising from the Trojan line,
In *after-times* should hold the world in awe,
And to the land and ocean give the law. *Dryden.*

AFTERTOSSING, *f.* [from *after* and *tofs.*] The motion of the sea after a storm.—Confusions and tumults are only the impotent remains of an unnatural rebellion, and are no more than the *aftertossings* of a sea when the storm is laid. *Addison.*

AFTERWARD, *adv.* [from *after* and *ward*, Sax.] In succeeding time; sometimes written *afterwards*, but less properly.

AFTERWIT, *f.* [from *after* and *wit*] The contrivance of expedients after the occasion of using them is past.—There is no recalling what's gone and past; so that *afterwit* comes too late, when the mischief is done. *L'Es-trange.*

AFTER-WRATH, *f.* [from *after* and *wrath.*] Anger when the provocation seems past.

AFWESTAD, a large copper-work belonging to the crown of Sweden, which lies on the Dala, in the province of Dalecarlia, in Sweden. It appears like a town, and has its own church. Here they make copper-plates; and have a mint for small silver coin, and was a royal post-office. Lat. 58. 10. N. lon. 14. 10. W.

AFWIOWARA, a village of Lapland, among the

mountains, under Norway. It has a bailiwick and a court of law. Lat. 69. 20. N. lon. 26. 12. E.

AGA, *f.* in the Turkish language, a great lord or commander. Hence the aga of the Janissaries is the commander in chief of that corps; as the general of horse is denominated *spahiclar aga*. The aga of the Janissaries is an officer of great importance. He is the only person who is allowed to appear before the Grand Seignior without his arms across his breast in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio: the title aga is given to them all, whether in employment or out. This title is also given to all such men without employ, and especially to wealthy landholders.

We find also agas in other countries. The chief officers under the khan of Tartary are called by this name. And, among the Algerines, we read of agas chosen from among the *boluk bashis* (the first rank of military officers), and sent to govern in the chief towns and garrisons of that state. The aga of Algiers is the president of the divan or senate. For some years, the aga was the supreme officer, and governed the state in the place of bashaw, whose power dwindled to a shadow. But the soldiery rising against the *boluk bashis*, or agas, massacred most of them, and transferred the sovereign power to the calif, with the title of *dey* or king.

AGADES, a kingdom and city of Negroland in Africa. It lies nearly under the tropic of Cancer, between Gubur and Cano. The town stands on a river that falls into the Niger; it is walled, and the king's palace is in the midst of it. The king has a retinue, who serve as a guard. The inhabitants consist of merchants and artificers. Those that inhabit the fields are shepherds or herdsmen, whose cottages are made of boughs, and are carried about from place to place on the back of oxen, to fix on the spot where they intend to feed their cattle. The houses in the city are stately, and built after the Barbary fashion. This kingdom is well watered; and there is great plenty of grass, cattle, fenna, and manna. The prevailing religion is the Mahometan, but very loosely professed. Lat. 26. 10. N. lon. 9. 10. E.

AGAIN, *adv.* [*agen*, Sax.] A second time; once more; marking the repetition of the same thing.—The poor remnant of human seed, which remained in their mountains, peopled their country *again* slowly, by little and little. *Bacon*.—On the other hand; marking some opposition or contrariety.—His wit increased upon the occasion; and so much the more, if the occasion were sharpened with danger. *Again*, whether it were the shortness of his foresight, or the strength of his will, certain it is, that the perpetual trouble of his fortunes could not have been without defects in his nature. *Bacon*.—On another part; marking a transition to some new consideration:

Behold yon mountain's hoary height,
Made higher with new mounts of snow;

Again, behold the winter's weight
Oppress the lab'ring woods below.

Dryden.

In return, noting re-action, or reciprocal action; as, His fortune worked upon his nature, and his nature *again* upon his fortune. Back; in retribution. In return for any thing; in recompence.—That he hath given will he pay *again*. *Prov.* xix. 27.—In order of rank or succession; marking distribution. Besides; in any other time or place.—They have the Walloons, who are tall soldiers; yet that is but a spot of ground. But, on the other side, there is not in the world *again* such a spring and seminary of brave military people, as in England, Scotland, and Ireland. *Bacon*.—Twice as much; marking the same quantity once repeated:

There are whom heav'n has blest with store of wit,
Yet want as much *again* to manage it;
For wit and judgment ever are at strife,
Tho' meant each other's aid, like man and wife. *Pope.*

Again.

Again and again; with frequent repetition; often.—This is not to be obtained by one or two hasty readings: it must be repeated *again and again*, with a close attention to the tenor of the discourse. *Locke*.—In opposition; by way of resistance.—Who art thou that answerest *again*? *Rom. ix. 20*.—Back; as, returning from some message.—Bring us word *again* which way we shall go. *Deut. i. 22*.

AGAINST, *prep.* [*ægeon, ongeond*, Sax.] In opposition to any person.—And he will be a wild man; his hand will be *against* every man, and every man's hand *against* him. *Gen. xvi. 12*.—Contrary; opposite, in general.—Men often say a thing is *against* their conscience, when really it is not. *Swift*.—In contradiction to any opinion.—After all that can be said *against* a thing, this will still be true, that many things possibly are, which we know not of. *Tillotson*.—With contrary motion or tendency: used of material action.—The kite being a bird of prey, and therefore hot, delighteth in the fresh air; and many times flieth *against* the wind, as trouts and salmon swim *against* the stream. *Bacon*.—Contrary to rule or law. Opposite to in place. To the hurt of another. In provision for; in expectation of. This last mode of speaking probably had its original from the idea of making provision *against*, or in opposition to, a time of misfortune, but by degrees acquired a neutral sense. It sometimes has the case elliptically suppressed, as, *Against* he comes, that is, *Against the time* when he comes.

AGALAXY, *f.* [from α and $\gamma\alpha\lambda\alpha$, Gr.] A defect of milk in child-bed. Hence the epithet $\alpha\gamma\alpha\lambda\alpha\kappa\iota\alpha$, given by Hippocrates to a lying-in woman that hath no milk.

AGALLOCHA, *f.* in botany. See EXCOECARIA.

AGALMATA, *f.* in antiquity, a term originally used to signify any kind of ornaments in a temple; but afterwards for the statues only, as being most conspicuous.

AGAMEMNON, the son of Atreus by Eope, was captain-general of the Trojan expedition. It was foretold to him by Cassandra, that his wife Clytemnestra would be his death: yet he returned to her; and accordingly was slain by Aegisthus, who had gained upon his wife in his absence, and by her means got the government into his own hands.

AGAMENTICUS, a mountain of North America, in the province of Main, in lat. 43. 16. It is a noted landmark for sailors, and about eight miles from the sea.

AGAN, a Ladrona island, where Magellan, in search of the Molucca islands, was assassinated.

AGANIPPE, in antiquity, a fountain of Bœotia at mount Helicon, on the borders between Phocis and Bœotia, sacred to the Muses, and running into the river Permessus. Ovid seems to make *Aganippe* and *Hippocrene* the same. Solinus more truly distinguishes them, and ascribes the blending them to poetical licence.

AGANIPPIDES, *f.* in ancient poetry, a designation given to the Muses, from a fountain of mount Helicon, called **AGANIPPE**.

AGAPANTHUS, *f.* [$\alpha\gamma\alpha\pi\alpha\nu\theta\omicron\varsigma$, Gr. a delightful flower.] In botany, a genus of the hexandria monogynia class, in the natural order of lilia or liliaceæ. The generic characters are—Calyx: spathe common gaping at the side. Corolla: one-petalled, funnel-shaped, regular; tube cornered, as if composed of six claws; border six-parted, parts oblong, spreading. Stamina: filaments six, inserted into the throat, shorter than the corolla, declinate; antheræ kidney-shaped, incumbent. Pistillum: germ superior, oblong, three-cornered; style filiform, length of the filaments, declinate; stigma simple. Pericarpium: capsule oblong, three-fided, three-celled, three-valved; valves navicular, with contrary dissepiment. Seeds: numerous, oblong, compressed, enlarged with a membrane.—*Essential Character*. Corolla inferior, funnel-shaped, hexapetaloid, regular.

The root of the agapanthus umbellatus, or African blue lily, is composed of many thick fleshy fibres, diverging from the same head, striking deep into the ground, and putting out many smaller fibres, which are white and

fleshy: from the same head arises a cluster of leaves surrounding each other at the base, so as to form a kind of herbaceous stalk about three inches high, from which the leaves spread only two ways, appearing flat the other two. The leaves of this plant are thick, succulent, about a foot long, and near an inch broad, compressed, and of a dark green. Between these comes out the flower-stalk, from two to three feet in height, round, as large as a man's little finger, naked to the top, where it supports a large head or umbel of blue flowers, inclosed in a sheath, which splits into two parts, and is bent back. Each flower stands on a pedicel about an inch long. The petals are blunt, and waved on their edges. The umbel being large, the flowers numerous, and of a bright blue colour, make a fine appearance. They come out at the end of August, or the beginning of September, and frequently continue in beauty till spring. It is a native of the Cape of Good Hope, from whence it was brought to the gardens in Holland. In 1692, it was cultivated in the royal garden at Hampton-Court.

Propagation and Culture. This plant is propagated by offsets, which come out from the side of the old plants, and may be taken off the latter end of June, at which time these plants are in their greatest state of rest; when the plants should be turned out of the pots, and the earth carefully cleared away from the roots, that the fibres of the offsets may be better distinguished, which should be separated from those of the old roots, being careful not to break their heads. But, where they adhere so closely to the old plant as not to be so separated, they must be cut off with a knife, taking great care not to wound or break the roots of either the offsets or the parent plant. When these are parted, they should be planted each into a separate pot, filled with light kitchen-garden earth, and placed in a shady situation, where they may enjoy the morning sun, giving them a little water twice a week, if the weather proves dry; but they must not have too much wet, especially at this season, when they are almost inactive; for, as the roots are fleshy and succulent, they are apt to rot with great moisture. In about five weeks time the offsets will have put out new roots, when the pots may be removed to a more sunny situation, and then they may have a little more water, which will strengthen their flowering; but it must not be given too liberally, for the reasons before stated. In September they will put out their flower-stalks, and toward the end of that month the flowers will begin to open, when, if the weather should not be good, they should be removed under shelter, to prevent the flowers from being injured by frost or too much wet; but they should have as much free air as possible, otherwise the flowers will be pale-coloured and weak. Toward the end of October they should be removed into the greenhouse, and placed where they may enjoy as much free air as possible, and not be over-hung by other plants; and, during the winter, they may have a little water once a week or oftener in mild weather, but in the frost they should be kept dry. This plant only requires protection from frost and moisture; it should not therefore have any artificial warmth in winter, and must be placed in the open air in summer.

AGAPE, *adv.* [from α and $\gamma\alpha\pi\epsilon$.] Staring with eagerness; as, a bird gapes for meat:

In himself was all his state;
More solemn than the tedious pomp that waits
On princes, when their rich retinue long
Of horses led, and grooms besmeared with gold,
Dazzles the crowd, and sets them all *agape*. *Milton*.

AGAPE, *f.* in ecclesiastical history, the love-feast, or feast of charity, of the primitive Christians; when a liberal contribution was made by the rich to feed the poor. The word is Greek, $\alpha\gamma\alpha\pi\epsilon$, and signifies *love*. These love-feasts, during the three first centuries, were held in the church without scandal or offence; but, in after-times, the heathens began to tax them with impurity. This at length

length gave occasion to their reformation; but, notwithstanding this precaution, the abuses committed occasioned their abolition at the council of Carthage, in the year 397.

AGAPETÆ, in ecclesiastical history, a name given to certain virgins and widows, who, in the ancient church, associated themselves with, and attended on, ecclesiastics, out of a motive of piety and charity.—In those days, women were instituted DEACONESSES; and, in the fervour of the primitive piety, there was nothing scandalous in such societies; but they afterwards degenerated into libertinism, and were at length suppressed.

AGARD (Arthur), a learned English antiquarian, born at Toston in Derbyshire in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held forty-five years, gave him great opportunities of acquiring skill in that study. Similarity of taste brought him acquainted with Sir Robert Cotton, and other learned men, who associated themselves under the name of *The Society of Antiquarians*, of which society Mr. Agard was a conspicuous member. He made the doomday-book his peculiar study; and composed a work purposely to explain it, under the title of *Traſtatus de uſu et obſcurioribus verbis libri de Domeſday*: he also compiled a book for the service of his successors, which he deposited with the keepers of the king's receipt, as a proper index for succeeding officers. All the rest of his collections, containing at least twenty volumes, he bequeathed to Sir Robert Cotton; and died in 1615.

AGARIC, *f.* [*agaricum*, Lat.] A drug of use in physic, and the dying trade. It is divided into male and female; the male is used only in dying, the female in medicine: the male grows on oaks, the female on larches.—There are two excrescences which grow upon trees, both of them in the nature of mushrooms; the one the Romans call *boletus*, which groweth upon the roots of oaks, and was one of the dainties of their table; the other is medicinal, that is called *agaric*, which groweth upon the tops of oaks; though it be affirmed by some, that it groweth also at the roots. *Bacon*.

AGARICUS, *f.* [*Agaria*, a city of Sarmatia.] In botany, a genus of the cryptogamia fungi. The generic characters are—Pileus or cap with gills underneath. Gills: differing in substance from the rest of the plant, composed of two laminas. Seeds: in the gills.

Species. In the thirteenth edition of Linnæus's *Systema Vegetabilium*, we have no more than twenty-seven species of agaricus. In the fourteenth by Murray there are only thirty-five. Micheli on the contrary has given 634. In the third edition of Ray's *Synopsis* are fifty-seven species, fourteen of which are added by Dillenius. Gleditsch reduces the agarici to thirty-two species, but informs us that there are 120 more, involved in much obscurity. Haller describes 134; and Scopoli 114, of which eleven only have Linnæus's names. Mr. Hudson enumerates forty-six; and Mr. Lightfoot accurately describes twenty, in his *Flora Scotica*. Allione enumerates eighty-two. But in the third part of Dr. Withering's *Botanical Arrangement*, the number of British species ascertained and described amounts to 213. Out of all these, one only has been selected for cultivation in our gardens; namely:—

Agaricus campestris, the common mushroom, or champignon, which is thus described: gills crowded, irregular, pink changing to liver-colour; cap convex, white to brown; stem white, cylindrical; eurtain white. This species is esteemed the best and most savoury of the genus, and is in much request for the table in England. It is eaten fresh either stewed or broiled; and preserved either as a pickle or in powder. The sauce vulgarly called catch-up is made from its juice with salt and spices. The wild mushrooms, from fresh undunged pastures, are more delicate than those which are raised on artificial beds; the flesh of the latter being less tender: those who are much accustomed to them, can immediately tell the difference by their smell. Mr. Miller is of a different opinion, proba-

bly because the cultivated ones are more slightly, and may be collected in a proper state for eating more easily: they are firmer and better for pickling.

The agaricus georgii of Linnæus much resembles this, but is far inferior to it in flavour, though not poisonous, as generally supposed. It is very common: the cap turns yellow, but the gills are always white.

The agaricus procerus, or tall mushroom, which is common in woods and dry hilly pastures, is sometimes exposed to sale in Covent-garden market. It may be easily distinguished from the genuine sort by the sponginess of its flesh; and from all others by its tallness, its bulbous base, its large volva or ruffle, and the flakiness or scaly texture of its spongy cap: the gills are numerous, brittle, and whitish.

Agaricus cæfareus, or imperial agaric, is the most splendid of all the species. It is common in Italy, and is brought to the markets there for sale. The ancient Romans esteemed it one of the greatest luxuries of the table. Having been made the vehicle for poison to Claudius Cæsar, by his wife Agrippina, it has been celebrated by Juvenal and Martial. It was first found wild in this country in Red-Rock plantation, Edgbaston, by Dr. Withering's daughter, on the sixth of July, 1791.

Agaricus orcadæ of Bolton and Withering is very different from all these. It is a small pale brown, or rather buff-coloured, mushroom, very common in dry pastures, particularly in the fairy rings. It is also found in woods and hedges; but in such situations the flavour is inferior. Those from dry pastures have a very pleasant smell, and a most luscious flavour, either stewed alone, or in ragouts, hashes, &c. I have eaten them in great quantities, above forty years, without the least injury, nor did I ever perceive any thing of that toughness like leather, which is so much complained of, except in very dry weather, or when they are in too advanced a state: they should be gathered young, early in a morning, and there is some nicety in dressing them. This sort makes excellent catchup, and is admirable in the form of powder. It is in season during September and October, but may be dried so as to be in use for the table all the winter. Dr. Withering is satisfied that the circles in pasture fields, called fairy rings, are caused by the growth of this agaric. Where the ring is brown or almost bare, upon digging up the soil to the depth of two inches, the spawn of the fungus will be found of a greyish white colour; but where the grass has again grown green and rank there is no spawn. These observations have been confirmed by my own experience long since for many years together. I have frequently remarked the same ring to increase in diameter, till a part of it has been cut off by a fence of the inclosure. In many parts of Europe several other sorts are eaten, which we fancy to be poisonous. The nature of this work does not require that we should enter more minutely into the consideration of the agarics. The bare enumeration and description of the species contained in the class cryptogamia, would make a large volume. See FUNGI.

Propagation and Culture of Mushrooms. In order to cultivate mushrooms, if you have no beds in your own or in neighbouring gardens, which produce them, you must look abroad in rich pastures, during the months of August and September, that being the season when they are naturally produced: open the ground about the roots of mushrooms, where you will find the earth very often full of small white knobs, which are the offsets, or young mushrooms; these should be carefully gathered, preserving them in lumps with the earth about them: but, as this spawn cannot be found in the pasture except at the season when mushrooms are naturally produced, you may probably find some in old dung-hills, especially where there has been much litter amongst it, and the wet has not penetrated to rot it; as likewise in old hot beds; shooting out in long strings: or it may be procured by mixing some, long dung from the stable, which has not been thrown on a heap

a heap to ferment, with strong earth, and put under cover to prevent wet getting to it; the more the air is excluded from it, the sooner the spawn will appear; but this must not be laid so close together as to heat, for that will destroy the spawn; in about two months after, the spawn will appear, especially if the heap is closely covered with old thatch, or such litter as has lain long abroad, so as not to ferment; then the beds may be prepared to receive the spawn: these should be made of dung, in which there is good store of litter, but this should not be thrown on a heap to ferment; that dung which has lain spread abroad for a month or longer is best. These beds should be made on dry ground, and the dung laid upon the surface; the width of them at bottom should be about two feet and a half or three feet, the length in proportion to the quantity of mushrooms desired; then lay the dung about a foot thick, covering it about four inches with strong earth. Upon this lay more dung, about ten inches thick; then another layer of earth, still drawing in the sides of the bed, so as to form it like the ridge of a house, which may be done by three layers of dung and as many of earth. When the bed is finished, it should be covered with litter or old thatch, to keep out wet, as also to prevent its drying; in this situation it may remain eight or ten days, by which time the bed will be in a proper temperature of warmth to receive the spawn; for there should only be a moderate warmth in it, great heat destroying the spawn, as will also wet; therefore, when the spawn is found, it should always be kept dry until it is used, for, the drier it is, the better it will take in the bed. The bed being in a proper temperature for the spawn, the covering of litter should be taken off, and the sides of the bed smoothed; then a covering of light rich earth about an inch thick should be laid all over the bed, but this should not be wet; upon this the spawn should be thrust, laying the lumps four or five inches asunder; then gently cover this with the same light earth above half an inch thick, and put the covering of litter over the bed, laying it so thick as to keep out wet, and prevent the bed from drying: when these beds are made in the spring or autumn, as the weather is in those seasons temperate, the spawn will then take much sooner, and the mushrooms will appear perhaps in a month after making; but those beds which are made in summer, when the season is hot, or in winter, when the weather is cold, are much longer before they produce. The great skill in managing these beds is, that of keeping them in a proper degree of moisture, never suffering them to receive too much wet; during the summer season the beds may be uncovered, to receive gentle showers of rain at proper times; and, in long dry seasons the beds should be now and then gently watered, but by no means suffer much wet to come to them; during the winter season they must be kept as dry as possible, and so closely covered as to keep out cold. In frosty or very cold weather, if some warm litter shaken out of a dung-heap is laid on, it will promote the growth of the mushrooms; but this must not be laid next the bed, but a covering of dry litter between the bed and this warm litter; and, as often as the litter is found to decay, it should be renewed with fresh; and, as the cold increases, the covering should be laid so much thicker. If these things are observed, there may be plenty of mushrooms produced all the year; and those produced in beds are much better for the table than any of those which are gathered in the fields. A bed thus managed, if the spawn takes kindly, will continue good for several months, and produce great quantities of mushrooms; from these beds, when they are destroyed, you should take the spawn for a fresh supply, which may be laid up in a dry place until the proper season of using it, which should not be sooner than five or six weeks, that the spawn may have time to dry before it is put into the bed, otherwise it will not succeed well. Sometimes it happens, that beds thus made do not produce any mushrooms till they have lain five or six months, so that beds should not be destroyed, though they do not at first answer expectation; for, I have frequently

known these to have produced great quantities of mushrooms afterward, and to have continued a long time in perfection.

This practice of propagating mushrooms by the spawn, or the white fibrous radicles, which produce tubercles in the manner of potatoes, is the most common. But they may also be increased by the seed. When this method is used, the gills are cut out and put into the beds; or else they are infused in water, and the beds are sprinkled with the infusion. In the same manner any other species of fungus may be cultivated; and experiments have been made on the *boletus* and *phallus* with success.

AGAST, *adj.* [This word, which is usually, by later authors, written *aghaft*, is, not improbably, the true word derived from *agaze*, which has been written *aghaft*, from a mistaken etymology.] Struck with terror; amazed; frightened to astonishment.

AGATE, or ACHAT, *f.* [among the Greeks and Latins, *Αχατης*, and *Achates*, from a river in Sicily, on the banks of which it was first found.] A very extensive genus of the semipellucid gems.

These stones are variegated with veins and clouds, but have no zones like those of the onyx. They are composed of chrysal debased by a large quantity of earth, and not formed, either by repeated incrustations round a central nucleus, or made up of plates laid evenly on one another; but are merely the effect of one simple concretion, and variegated only by the disposition given, by the fluid they were formed in, to their differently-coloured veins or matters.

Agates are arranged according to the different colours of their ground. Of those with a *white* ground there are three species. 1. The *dendrachates moeca stone*, or *aborescent agate*. This seems to be the same with what some authors call the *achates* with rosemary in the middle, and others *achates* with little branches of black leaves. 2. The *dull milky-looking agate*. This, though greatly inferior to the former, is yet a very beautiful stone. It is common on the shores of rivers in the East Indies, and also in Germany and some other parts of Europe. Our lapidaries cut it into counters for card-playing, and other toys of small value. 3. The *lead-coloured agate*, called the *phassachates* by the ancients.

Of the agates with a *reddish* ground there are four species. 1. An impure one of a flesh-coloured white, which is, but of little beauty in comparison with other agates. The admixture of flesh-colour is but very slight; and it is often found without any clouds, veins, or other variegations; but, sometimes it is prettily veined or variegated with spots of irregular figures, having fimbriated edges. It is found in Germany, Italy, and some other parts of Europe; and is wrought into toys of small value, and often into the German gun-flints. It has been sometimes found with evident specimens of the perfect mosses bedded deep in it. 2. That of a pure blood colour, called *hamachates*, or the *bloody agate*, by the ancients. 3. The clouded and spotted agate, of a pale flesh colour, called by the ancients the *carnelian agate*, or *sardachates*. 4. The red lead coloured one, variegated with yellow, called the *coral agate*, or *coralla-achates*, by the ancients.

Of the agates with a *yellowish* ground there are only two known species; the one of the colour of yellow wax, called *cerachates* by the ancients; the other a very elegant stone, of a yellow ground, variegated with white, black, and green, called the *leonina*, and *leontiferes* by the ancients.

Lastly, Of the agates with a *greenish* ground, there is only one known species, called by the ancients *jaspachates*.

Of all these species there are a great many varieties; some of them having upon them natural representations of men and different kinds of animals, &c. These representations are not confined to the agates whose ground is of any particular colour, but are occasionally found on all the different species. Velschius had in his custody a flesh-coloured agate, on one side of which appeared a half-moon in great perfection, represented by a milky semicircle;

cle; on the other side, the phases of *vesper*, or the evening-star: whence he denominated it an *aphrodisian agate*. An agate is mentioned by Kircher, on which was the representation of a heroine armed; and one in the church of St. Mark, in Venice, has the representation of a king's head adorned with a diadem. On another, in the museum of the prince of Gonzaga, was represented the body of a man with all his clothes in a running posture. A still more curious one is mentioned by de Boot, wherein appears a circle struck in brown, as exactly as if done with a pair of compasses, and in the middle of the circle the exact figure of a bishop with a mitre on: but, inverting the stone a little, another figure appears; and, if it is turned yet further, two others appear, the one of a man and the other of a woman. But the most celebrated agate of this kind is that of Pyrrhus, wherein were represented the nine Muses, each with their proper attributes, and Apollo in the middle playing on the harp. In the emperor's cabinet is an oriental agate of a surprising bigness, being fashioned into a cup, whose diameter is an ell abating two inches. In the cavity is found delineated in black specks, B. XRISTOR. s. XXX. Other agates have also been found, representing the numbers 4191, 191; whence they were called *arithmetical agates*, as those representing men or women have obtained the name of *anthropomorphous*.

Great medicinal virtues were formerly attributed to the agate; such as resisting poisons, especially those of the viper, scorpion, and spider; but they are now very justly rejected from medicinal practice.

Agates may be stained artificially with solution of silver in spirit of nitre, and afterwards exposing the part to the sun; and though these artificial colours disappear on laying the stone for a night in aquafortis, yet a knowledge of the practicability of thus staining agates, must render those curious figures above-mentioned strongly suspected of being the work not of nature, but of art. Some account for these phenomena from natural causes. Thus, Kircher, who had seen a stone of this kind in which were depicted the four letters usually inscribed on crucifixes, I. N. R. I. apprehends that some real crucifix had been buried under ground, among stones and other rubbish, where the inscription, happening to be parted from the cross, and to be received among a soft mould or clay susceptible of the impression of the letters, came afterwards to be petrified. In the same manner he supposes the agate of Pyrrhus to have been formed. Others resolve much of the wonder into fancy, and suppose those stones formed in the same manner with the *caméaux* or Florentine stones.

The agate is used for making cups, rings, seals, handles for knives and forks, hilts for swords and hangers, beads to pray with, smelling-boxes, patch-boxes, &c. being cut or sawed with no great difficulty.

Considerable quantities of these stones are still found near the river Achetes in Sicily. There are found in some of these the surprising representations above-mentioned, or others similar to them. By a dexterous management of these natural stains, medals have been produced, which seem master-pieces of nature: for this stone bears the graver well; and, as pieces of all magnitudes are found of it, they make all sorts of work of it. The high altar of the cathedral of Messina is all over encrusted with it. The lapidaries pretend that the Indian agates are finer than the Sicilian; but Father Labat informs us, that in the same quarries, and even in the same block, there are found pieces much finer than others, and these fine pieces are sold for Indian agates in order to enhance their price.

AGATE, among antiquaries, denotes a stone of this kind engraved by art. In this sense, agates make a species of antique gems; in the workmanship whereof we find eminent proofs of the great skill and dexterity of the sculptors. Several agates of exquisite beauty are preserved in the cabinets of the curious; but the facts or histories represented on these antique agates, however well executed, are now become so obscure, and their explications so difficult, that several diverting mistakes and disputes have

arisen among those who undertook to give their true meaning.

The great agate of the apotheosis of Augustus, in the treasury of the holy chapel, when sent from Constantinople to St. Lewis, passed for a triumph of Joseph. An agate, now in the French king's cabinet, had been kept 700 years with great devotion in the Benedictine abbey of St. Evre at Toul, where it passed for St. John the Evangelist carried away by an eagle, and crowned by an angel; but, the Heathenism of it having been lately detected, the religious would no longer give it a place among their relics, but presented it in 1634 to the king. The antiquaries found it to be the apotheosis of Germanicus. In like manner the triumph of Joseph was found to be a representation of Germanicus and Agrippina, under the figures of Ceres and Triptolemus. Another was preserved, from time immemorial, in one of the most ancient churches of France, where it had passed for a representation of Paradise and the fall of man; there being on it two figures representing Adam and Eve, with a tree, a serpent, and a Hebrew inscription round it, taken from the third chapter of Genesis, "The woman saw that the tree was good, &c." The French academists, instead of our first parents, found Jupiter and Minerva represented by the two figures; the inscription was of a modern date, written in a Rabbinical character, very incorrect, and poorly engraven. The prevailing opinion was, that this agate represented simply the worship of Jupiter and Minerva at Athens.

AGATE, is also a name of an instrument used by gold-wire drawers; so called from the agate in the middle of it, which forms its principal part.

AGATHIAS, or, as he calls himself in his epigrams, AGATHIUS, distinguished by the title of Scholasticus, a Greek historian in the 6th century under Justinian. He was born at Myrina, a colony of the ancient Æolians, in Asia the Less, at the mouth of the river Phythicus. He was an advocate at Smyrna. Though he had a taste for poetry, he was yet more famous for his history, which begins with the 26th year of Justinian's reign, where Procopius ends. It was printed in Greek and Latin, with Bonaventure Vulcanius's, at Leyden, 1594, in 4to; and in Paris at the king's printing-office, 1660, in folio.

AGATHO, a tragic and comic poet, disciple to Prodicus and Socrates, applauded in Plato's Dialogues for his virtue and beauty. His first tragedy obtained the prize; and he was crowned in the presence of upwards of 30,000 men, the fourth year of the 90th Olympiad. There is nothing now extant of his, except a few quotations in Aristotle, Athenæus, and others.

AGATHOCLES, the famous tyrant of Sicily, was son of a potter at Reggio. He was a thief, a common soldier, a centurion, a general, and a pirate, all in a regular succession. He defeated the Carthaginians several times in Sicily; and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily; after which he vanquished the Carthaginians again both in Sicily and Africa. But at length having ill-success, and being in arrears with his soldiers, they mutinied, and forced him to fly his camp, and cut the throats of his children, whom he left behind. Recovering himself again, he relieved Corsica, besieged by Cassander; burnt the Macedonian fleet; returned to Sicily; murdered the wives and children of those who had murdered him; afterwards, meeting with the soldiers themselves, he put them all to the sword; and, ravaging the sea-coast of Italy, took the city of Hipponium. He was at length poisoned by his grandson Archagathus, in the seventy-second year of his age, 290 years before Christ, having reigned twenty-eight years.

AGATHOPHYLLUM, *f.* [αγαθος, good, and φυλλον, a leaf.] In botany, a genus of the dodecandria monogynia class. The generic characters are—Calyx: perianthium very small, truncate, entire, permanent. Corolla: petals six, ovate, somewhat villose within, inserted into the calyx. Stamina: filaments twelve, broadish, very short, alternately

alternately placed at the base of the petals and alternately on the calyx; antheræ roundish. Pistillum: germ superior, very small; style very short; stigma pubescent. Pericarpium: drupe somewhat globose, crowned with the calyx. Seed: nut somewhat globose, terminated by a truncate point, half-six-celled; kernel convex, beneath six-lobed, with coriaceous partitions separating the lobes. —*Essential Character.* Calyx superior, very short, toothless: corolla six-petalled, somewhat villose; stamina alternately inserted into the calyx and petals; drupe juiceless, with a half-six-celled nut, and one seed.

The *raïon-yfara* (for it is so called in the Island of Madagascar, the place of its growth) is a large bushy tree, with a pyramidal head like the clove-tree, and a reddish odorous bark; the wood is hard, heavy; white, with some reddish fibres, and has no smell. There is a single fruit at the end of each branch, the size of a large cherry, shaped like a pear, with a roundish body: it consists of a nut divided into six parts, in the same manner as the walnut is into four, covered with a hard coriaceous shell, and that with a thin green shell or bark very closely adhering to it; both these are aromatic; but the nut has an acrid biting taste, which is almost caustic. This tree bears at five or six years' growth, and it flowers in January and February. The fruit is ten months in ripening. The natives of Madagascar gather it before it is ripe, as a spice, for the purpose of seasoning their meat. It has a fine aromatic smell when fresh; and the caustic taste may be abated by keeping it some months; after which it may be thrown into boiling water for four or five minutes, and then dried in the sun. The leaves may be prepared as a spice, in the same manner.

AGATHYRNA, or AGATHYRNUM, AGATHYRSA, or AGATHYRSUM, an ancient town of Sicily, now St. Marco; as old as the war of Troy, being built by Agathyrnus, son of Æolus, on an eminence. The gentillitious name is *Agathyrneus*: or, according to the Roman idiom, *Agathyrnefsis*.

AGAVE, *f.* [*αγανος*, Gr. admirable.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of coronariæ. The generic characters are — Corolla: one-petalled, funnel-shaped; border six-parted, equal, parts lanceolate, erect. Stamina: filaments filiform, erect, longer than the corolla; antheræ linear, shorter than the filaments, versatile. Pistillum: germ oblong, growing thinner towards both ends, inferior; style filiform, the length of the stamens, three-cornered; stigma headed, three-cornered. Pericarpium: capsule oblong, three-cornered, three-celled, three-valved. Seeds: numerous. —*Essential Character.* Corolla erect, superior; filaments longer than the corolla, erect.

Linnaeus has separated this genus from the aloe, because the stamens and style are extended much longer than the corolla, and the corolla rests upon the germ. There is also another difference in the growth of the plants; which is, that all the agaves have their central leaves closely folding over each other, and embracing the flower-stem, which is formed in the centre; so that these never flower until all the leaves are expanded; and, when the flower is past, the plants die. Whereas the flower-stem of the aloe is produced on one side of the centre, annually from the same plant, and the leaves are more expanded than in this genus.

Species. 1. *Agave Americana*, or common American agave: stemless; leaves tooth-thorny. The great American aloe, as it is commonly called, has been long preserved in the English gardens, where, for many years past, there have been several of the plants in flower. When they are vigorous, the stems generally rise upwards of twenty feet high, and branch out on every side, so as to form a kind of pyramid, composed of greenish yellow flowers, which stand erect, and come out in thick clusters at every joint. The seeds do not come to maturity in England. When these plants flower, they make a fine appearance, and continue a long time in beauty, if they

are protected from the cold in autumn; for there will be a succession of new flowers produced, near three months in favourable seasons. It has been generally believed, that this plant does not flower till it is an hundred years old; but this a great mistake, for the time of its flowering depends on its growth; so that in hot countries, where it grows fast and expands many leaves every season, it will flower in a few years; but, in colder climates, where the growth is slow, it will be much longer before it shoots up a stem. Cortusus is said to have been the first European who possessed the great American aloe, and that was in the year 1561. Gerard, in his Herbal of 1597, speaks of it merely from report. In the edition of 1633, by Johnson, it is mentioned, but not said to be in England. Parkinson (Theatr. p. 150, printed in 1649) relates, that it was first brought into Spain, and from thence spread into all quarters. He gives an account of its flowering at Avignon and Rome, but is silent as to its being in the English gardens. It flowered at Paris in 1663 and 1664. Mr. Verisprit, of Lambeth, had one twelve or fifteen feet high, and in flower, (about 1698 or perhaps sooner,) which was then a great rarity here. Two other plants flowered about 1714 at Hampton Court, and one at the duke of Buckingham's, (now the queen's palace,) by St. James's Park. Another flowered at Leipzig in 1700.

Mr. Cowell asserts, that the plant which flowered in his garden, at Hoxton, in 1729, was the first which had been seen in England; those which are mentioned above not being the true great American aloe. Another flowered in 1737, at Eaton Hall, in Cheshire, the seat of Sir Robert Grosvenor, Bart. and there is a plate of it, dedicated to Sir Robert, by his gardener John Fossey. By the inscription on the print, it appears, that it opened the crown for flowering on June 5; the stem-bud appeared the 15th, and grew five inches a-day for some weeks; the flower-branches were perfected in twelve weeks; and then it was at a stand for a month, whilst the flower-buds were forming. The number of flowers was about 1050. Two agaves flowered at Hampton Court in 1743; they were about fifty years old, and their heights were twenty-seven and twenty-four feet. The flower-stem appeared on the third of June, was in perfection the middle of August, and continued blooming to the middle of October. A plant which flowered near Carlsbad in 1754, was twenty-six feet high, and produced twenty-eight branches, which bore above 3000 flowers. Another flowered at Leyden in 1760, and a third in the royal garden at Friedricksborg, in Denmark, which was twenty-two feet high, it had nineteen branches, and more than 4000 flowers. The highest, of which we have seen any account, was one that flowered in the king of Prussia's garden: this was forty feet in height. Two plants blossomed at Smith's Nursery, in Dalton, near Hackney, in September 1790; but they are now scarcely considered as rarities.

Very few of the variety with yellow-edged leaves have yet blossomed. We have an account of one at Sir James Lake's, in Edmonton, which was eighty years old, and the height of the flowering-stem was twenty-one feet. The top bud of the stem appeared on the sixth of June, 1785; it was in full bloom on the twelfth of September; and out of bloom on the nineteenth. One blew in Holland six years earlier, and another at Hampton Court the year before it: there is a print also of these. In the botanic garden at Cambridge, there is a very large variegated agave, which came out of the Sherardian collection, at Eltham, and belonged to Dr. Walker, the founder of the garden. It must therefore be more than sixty years old, and has not yet produced flowers. There are now hedges of the common agave in Spain, Portugal, Sicily, and Calabria: it flourishes also about Naples, between Villafranca and Monaco, and in other parts of Italy.

The leaves of agave are very useful as a succedaneum for soap. For this purpose, after being cut, they are passed between the rollers of a mill with their points foremost; and, the juice being conducted into wide shallow receivers,

A G A V E .

The Great American Aloe.

receivers, through a coarse cloth or strainer, it is exposed to a hot sun, until, the aqueous part being exhaled, it is reduced to a thick consistence. It may then be made up into balls, with the help of lye ashes, and it will lather with salt water as well as fresh. This soap may also be prepared by pounding the leaves in a wooden mortar, and then expressing the juice, which may be brought to a consistence by the sun or by boiling. One gallon of juice thus prepared will yield about one pound of a soft extract. The juice, in both these ways, must be carefully strained, and the extract must never be combined with tallow or other unctuous materials. The leaves are also used for scowering pewter and other kitchen utensils, and floors. The inward spongy substance of the decayed stalk is used for tinder. The fibres of the leaves, separated by bruising and steeping in water, and afterwards beating them, make a strong thread for common uses.

2. *Agave vivipara*, or viviparous or childing agave: stemless; leaves toothed. This species of aloe never grows to a large size; the leaves are seldom more than a foot and a half long, and about two inches and a half broad at the base; it never produces any suckers from the root, and therefore cannot be increased till it flowers.

3. *Agave Virginica*, or Virginian agave: stemless, herbaceous; leaves tooth-thorny. This is so like the first sort, as not to be distinguished from it but by good judges. This sort, however, seldom puts out so many offsets as the common aloe.

4. *Agave lurida*: subcaulescent; leaves tooth-thorny. This also greatly resembles the first.

5. *Agave tuberosa*, or tuberous-rooted agave: caulescent; leaves tooth-thorny. This has never flowered in England. Indeed this and the preceding are doubtful species, their fructification being unknown.

6. *Agave foetida*, or fetid agave: caulescent; leaves quite entire. A plant of this species flowered in the Chelsea garden in the year 1755. The stem began to shoot the beginning of October, and by the end of that month was upwards of ten feet high; by the end of November it was near twenty, and the lower lateral branches were upwards of four feet long, the others decreasing gradually, so as to form a regular pyramid. In December the branches were closely set with flowers; and, in the spring, when the flowers dropped off, they were succeeded by young plants; the flowers putting out roots as they fell into the pots that stood near, thereby became good plants. The old plant presently after died. It was cultivated in 1690, in the royal garden at Hampton Court.

Propagation and Culture. The first and third sorts are hardy. Plants of the former have lived in the open air for some years, in mild seasons; but in severe winters they are always killed, if not sheltered. They are propagated by offsets, which the first sends out in plenty. The third sort generally puts out suckers enough for propagation, though, though not in so great plenty as the first. They should be planted in pots or tubs filled with light sandy earth, and housed in winter with oranges, myrtles, &c. and, during that season, should have but little wet. In the summer they must be placed abroad in the open air, where they may remain till toward the end of October. The Vera-Cruz agave, being a little more tender than these, should be housed before them, and may remain in the green-house a little longer in the spring. The second, fourth, and sixth, never produce offsets or suckers from the root; they cannot, therefore, be increased this way, except when they flower; at which time there will be abundance of them. They may however be increased, by taking off some of the larger roots, when the plants are shifted. The second, fifth, and sixth, with the karatato and rigid agaves, are much more tender than the others, and cannot be preserved through the winter in England, unless they are placed in a warm stove; nor will they thrive if set abroad in summer: therefore they should constantly remain in the stove; observing to let them enjoy a great share of free air in warm weather. They also

require a light sandy earth, and should have little wet in winter; but in summer they may be gently watered twice a week. If they have too much water, it rots their roots, and then their leaves will decay, and insects will infest them. They should be shifted every summer into fresh earth, but must not be put into large pots; for, unless their roots are confined, the plants will not thrive.

To AGAZE, *v. a.* [from *a* and *gaze*, to set a gazing; as, *amaze*, *amuse*, and others.] To strike with amazement; to stupify with sudden terror. The verb is now out of use:

So as they travell'd, so they 'gan espy
An armed knight toward them gallop fast,
That seem'd from some feared foe to fly,
Or other grisly thing that him agast.

Spencer.

AGAZED, *part. adj.* Struck with amazement; terrified to stupidity:

Hundreds he sent to hell, and none durst stand him;

Here, there, and every where, enrag'd he flew:

The French exclaim'd, "The devil was in arms!"

All the whole army stood agazed on him. *Shakespeare.*

AGDE, a city of France, in Lower Languedoc, in the territory of Agadez, with a bishop's see. The diocese is small, but is one of the richest countries in the kingdom. It produces fine wool, wine, oil, corn, and silk. It is seated on the river Eraut, a mile and a quarter from its mouth, where it falls into the gulph of Lyons, and where there is a fort built to guard its entrance. It is well peopled; the houses are built of black stone, and there is an entrance into the city by four gates. The greatest part of the inhabitants are merchants or seamen. The public buildings are but mean; the cathedral is small, and not very handsome; and the bishop's palace is an old building, but convenient. The city is extended along the river, where it forms a little port, wherein small craft may enter: Lat. 43. 19. lon. 3. 20. E.

AGE, *f.* [age, Fr. anciently *eage*, or *aage*; it is deduced by Menage from *atatum*, of *atas*; by Junius, from *aa*, which, in the Teutonic dialects, signified long duration.] Any period of time attributed to something as the whole, or part, of its duration.

Thus, among the ancient poets, this word was used for the space of thirty years; in which sense, *age* amounts to much the same with *generation*. Thus, Nestor is said to have lived *three ages* when he was ninety years old. By the ancient Greek historians, the time elapsed since the beginning of the world is divided into three periods, which they called *ages*. The first reaches from the creation to the deluge, which they called the *obscure* or *uncertain* age, because the history of mankind is altogether uncertain during that period. The second they call the *fabulous* or *heroic* age, because it is the period in which the fabulous exploits of their gods and heroes are said to have been performed. It began with the Ogygian deluge, and continued to the first Olympiad; where the third or *historical* age commenced.

The interval since the first formation of man has been divided by the poets into four *ages*, distinguished by the epithets of *golden*, *silver*, *brazen*, and *iron*. During the *golden* age, Saturn reigned in heaven, and justice and innocence in this lower world. The earth then yielded her productions without culture; men held all things in common, and lived in perfect friendship. This period is supposed to have lasted till the expulsion of Saturn from his kingdom. The *silver* age commenced when men began to deviate from the paths of virtue; and, in consequence of this deviation, their lives became less happy. The *brazen* age commenced on a farther deviation; and the *iron* age took place in consequence of one still greater. A late author, however, reflecting on the barbarism of the first ages, will have the order which the poets assign to the four ages inverted; the first being a time of rudeness and ignorance, more properly denominated an *iron* than a *golden*.

golden age. When cities and states were founded, the *silver age* commenced; and, since arts and sciences, navigation and commerce, have been cultivated, the *golden age* has taken place.

In some ancient northern monuments, the *rocky* or *stony age* corresponds to the *brazen age* of the Greeks. It is called *rocky*, on account of Noah's ark, which rested on mount Ararat; whence men were said to be descended or sprung from mountains: or from Deucalion and Pyrrha restoring the race of mankind, by throwing stones over their heads. The northern poets also style the fourth age of the world the *ashen age*, from a Gothic king Madenis, or Mannus, who on account of his great strength was said to be made of ash, or because in his time people began to make use of weapons made of that wood.

Among the Jews, the duration of the world is also divided into three ages. 1. The *seculum inane*, or *void age*, was the space of time from the creation to Moses. 2. The *present age*, denotes all the space of time from Moses to the coming of Messiah. 3. The *age to come*, denotes the time from the coming of the Messiah to the end of the world.

Various other divisions of the duration of the world into ages have been made by historians. The Sibylline Oracles, written, according to some, by Jews acquainted with the prophecies of the Old Testament, divide the duration of the world into *ten ages*; and, according to Josephus, each age contained six hundred years. It appears, by Virgil's fourth eclogue, and other testimonies, that the age of Augustus was reputed the end of those ten ages, consequently as the period of the world's duration.

By some, the space of time commencing from Constantine, and ending with the taking of Constantinople by the Turks, in the fifteenth century, is called the *middle age*. But others choose rather to date the middle age from the division of the empire made by Theodosius at the close of the fourth century, and extend it to the time of the emperor Maximilian I. in the beginning of the sixteenth century, when the empire was first divided into circles. The *middle* is by some denoted the *barbarous age*, and the latter part of it the *lowest age*. Some divide it into the *non-academical* and *academical ages*. The first includes the space of time from the sixth to the ninth centuries, during which schools or academies were lost in Europe. The second from the ninth century, when schools were restored, and universities established, chiefly by the care of Charlemagne.

The several ages of the world may be reduced to three grand epochs, viz. the *age of the law of nature*, called by the Jews the *void age*, from Adam to Moses; the *age of the Jewish law*, from Moses to Christ; and the *age of grace*, from Christ to the present year.

AGE is also frequently used in the same sense with *century*, to denominate a duration of 100 years.

AGE likewise signifies a certain period of the duration of human life; by some divided into four stages, viz. infancy, youth, manhood, and old age; the first extending to the 14th year, the second to the 23th, the third to the 50th, and the fourth to the end of life: by others divided into infancy, childhood, youth, manhood, and old age.

AGE, in law, is particularly used for those special times which enable persons of both sexes to do certain acts, which before, through want of years and judgment, they are prohibited to do. As for example, a man at twelve years of age ought to take the oath of allegiance to the king; at fourteen, which is his age of discretion, he may consent to marriage, and chuse his guardian; and at twenty-one he may alienate his lands. A woman at nine years of age is dowable, at twelve she may consent to marriage, at fourteen she is of years of discretion and may chuse a guardian, and at twenty-one she may alienate her lands. The age of twenty-one is the full age of man or woman; which enables them to contract and manage for themselves, in respect of their estates: until which time they

cannot act with security to those that deal with them, for their acts are in most cases either void or voidable.

AGE of a HORSE. See HORSE.

AGE of TREES. These after a certain age waste. An oak, at an hundred years old, it is said, ceases to grow. The usual rule for judging of the age of wood, is by the number of circles which appear in the substance of a trunk or stock cut perpendicularly, each circle being supposed the growth of a year; though some reject this method as precarious, alleging, that a simple circle is sometimes the produce of several years; besides that, after a certain age, no new circles are formed.

AGED, *adj.* Old; stricken in years; generally applied to animate beings:

Kindness itself too weak a charm will prove,
To raise the feeble fires of *aged* love.

Prior.

Old; applied to inanimate things. This use is rare, and commonly with some tendency to the *protopopæia*.—The people did not more worship the images of gold and ivory, than they did the groves; and the same Quintilian faith of the *aged oaks*. *Stillingfleet.*

AGEDLY, *adv.* After the manner of an aged person.

AGELNOTH, EGELNOTH, or ÆTHELNOTH, in Latin *Achelnotus*, archbishop of Canterbury, in the reign of Canute the Great, succeeded Livingus in that see in the year 1020. This prelate, furnished the *Good*, was son of earl Agilmer, and, at the time of his election, dean of Canterbury. After his promotion he went to Rome, and received his pall from pope Benedict VIII. In his way thither, as he passed through Pavia, he purchased, for an hundred talents of silver and one of gold, St. Augustin's arm, which was kept there as a relic; and sent it over to England as a present to Leofric earl of Coventry. Upon his return, he is said to have raised the see of Canterbury to its former lustre. He sat seventeen years in the see of Canterbury, and departed this life the 29th of October, 1038.

AGEMA, in Macedonian antiquity, was a body of soldiery, not unlike the Roman legion.

AGEMOGLANS, AGIAMOGLANS, or AZAMOGLANDS, in the Turkish polity, are children purchased from the Tartars, or raised every third year by way of tribute from the Christians tolerated in the Turkish empire. These, after being circumcised and instructed in the religion and language of their tyrannical masters, are taught the exercises of war, till they are of a proper age for carrying arms; and from this corps the janissaries are recruited. With regard to those who are thought unfit for the army, they are employed in the lowest offices of the seraglio.

A similar custom seems to have prevailed at Seringapatam, under Hyder Ali, and Tippoo Saib, who singled out from their English prisoners the best favoured young men, whom they caused to be circumcised, and incorporated in their army, or appointed to menial offices.

AGEN, *adv.* [*agen*, Sax.] Again; in return. This word is now only written in this manner, though it be in reality the true orthography, for the sake of rhyme:

Thus Venus: Thus her son reply'd *agen*;
None of your sisters have we heard or seen. *Dryden.*

AGEN, a city of France, on the river Garonne, the capital of Agenois in Guienne, and the see of a bishop. Though the situation of this place is very convenient for trade and commerce, the inhabitants are so very indolent that there is very little; of which the neighbouring cities take the advantage. It is seated in a pleasant country; but is itself a very mean and disagreeable place, the houses being ill-built, and the streets narrow, crooked, and dirty. Lat. 44. 12. N. lon. 0. 30. E.

AGENCY, *f.* [from *agent*.] The quality of acting; the state of being in action; action. The office of an agent or factor for another; business performed by an agent.

AGENDA,

AGENDA, *f.* among philosophers and divines, signifies the duties which a man lies under an obligation to perform; thus we meet with the agenda of a Christian, or the duties he ought to perform; in opposition to the *credenda*, or things he is to believe.

AGENDA, among merchants, a term sometimes used for a memorandum-book, in which is set down all the business to be transacted during the day, either at home or abroad.

AGENDA, among ecclesiastical writers, denotes the service or office of the church. We meet with *agenda matutina & vespertina*, "morning and evening prayers;" *agenda diet*, "the office of the day," whether feast or fast day; *agenda mortuorum*, called also simply *agenda*, "the service of the dead."

AGENDA, is also applied to certain church-books, compiled by public authority, prescribing the order and manner to be observed by the ministers and people in the principal ceremonies and devotions of the church. In which sense *agenda* amounts to the same with what is otherwise called *ritual*, *liturgy*, *acalouthia*, *missal*, *formulary*, *directory*, &c.

AGENHINE, in our old writers, signifies a guest that has lodged at an inn for three nights, after which time he was accounted one of the family; and, if he offended the king's peace, his host was answerable for him. It is also written *HOGENHINE* and *HOGENHYNE*.

AGENORIA, in mythology, the goddess of courage and industry, as *Vacuna* was of indolence.

AGENT, *adj.* [*agens*, Lat.] That which acts; opposed to *patient*, or that which is acted upon.

AGENT, *f.* An actor: he that acts; he that possesses the faculty of action. A substitute; a deputy; a factor; a person employed to transact the business of another. That which has the power of operating, or producing effects upon another thing:

Heav'n made us *agents* free to good or ill,
And forc'd it not, though he foresaw the will.
Freedom was first bestow'd on human race,
And prescience only held the second place. *Dryden.*

AGENTES IN REBUS, one of the ranks of officers in the court of the Constantinopolitan emperors, whose business was that of a courier and messenger, and also of a general inspector or comptroller of the provinces. In case of plots or disturbances, he was to give early notice thereof to the emperor.

The *agentes in rebus* are by some made synonymous with our postmasters, but their functions were of greater extent. They correspond to what the Greeks call *πρωτοποροι*, and the Latins *veredarii*. There were various degrees of them; as, *tribuni*, *primicerii*, *senatores*, *ducenarii*, *biarchi*, *circitores*, *equestes*, *tyrones*, &c.

AGE PRAYER, *f.* in law, is, where an action is brought against a person under age, for lands which he hath by descent, and he by petition or motion shews the matter to the court, and prays that the action may stay till his full age. See *PAROL DEMURRER*.

AGER, *f.* in Roman antiquity, a certain portion of land allowed to each citizen. See *AGRARIAN LAW*.

AGER PICENUS, or **PICENUM**, a territory of Italy to the south-east of Umbria, reaching from the Apennine to the Adriatic. The people are called *Picentes*, distinct from the *Picentini* on the Tuscan Sea, though called by Greek writers *Πικεντινους*. This name is said to be from the bird *Picus*, under whose conduct they removed from the Sabines, of whom they were a colony.

AGERATUM, *f.* [*αγρῶν*, from *α* and *γρᾶς*, never old, evergreen.] In botany, a genus of the syngenesia polygamia æqualis class, in the natural order of compositæ discoideæ. The generic characters are—Calyx: common oblong, with many lanceolate sub-equal scales. Corolla: compound uniform; corollers hermaphrodite, tubulous, numerous, equal, scarcely longer than the calyx; proper monopetalous, funnel-shaped; border quadrifid spreading.

Stamina: filaments capillary, very short; antheræ cylindric, tubular. Pistillum: germ oblong; style filiform, the length of stamens; stigmas two, very slender, erect. Pericarpium: none; calyx unchanged. Seed: solitary, oblong, angular, crowned with a chaffy, five-leaved, upright, awned, calycle. Receptaculum: naked, convex, very small.—*Essential Character*. Receptaculum naked, down five-awned, calyx oblong sub-equal, corollers quadrifid.

Species. 1. *Ageratum conyzoides*, or hairy *ageratum*: leaves ovate, stem hairy. The leaves are an inch and a half long, and three quarters of an inch broad, resembling those of nettles. It flowers in July and August, and is a native of Africa, the islands of America, and the isle of Tanna in the South Seas. Cultivated in 1714, by the Dukes of Beaufort.

2. *Ageratum ciliare*: leaves ovate, crenate, obtuse; stem smooth. This species is said to be found wild at La Vera Cruz, by Dr. William Houstoun; and does not seem to differ in any thing from the first sort.

Propagation and Culture. The seeds must be sown on a hot-bed in the spring; when the plants are strong enough to remove, they should be transplanted into another moderate hot-bed, observing to water and shade them until they have taken root, after which time they must have a good share of air in warm weather. In June they should be inured to the open air; and toward the middle of the month they may be transplanted into the full ground, where they will begin to flower in July, and continue flowering till the frosts in autumn destroy them. The seeds ripen in September and October; and when any of them scatter upon the ground, if the same earth happens to be put on a hot-bed the following spring, the plants will come up in great plenty; as they frequently do also in the open air, but these will be too late to produce good seeds, unless the summer prove warm.

AGERATUM, *f.* in botany. See *ACHILLEA*, *ATHANASIA*, *CONYZA*, *ERINUS*, *EUPATORIUM*, and *SENECIO*.

AGESILAUS, king of the Lacedæmonians, the son of Archidamus, was raised to the throne notwithstanding the superior claim of Leotychides. As soon as he came to the crown, he advised the Lacedæmonians to be beforehand with the king of Persia, who was making great preparations for war, and to attack him in his own dominions. He was himself chosen for this expedition; and gained so many advantages over the enemy, that, if the league which the Athenians and Thebans formed against the Lacedæmonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Persian empire. He gave up, however, all these triumphs readily, to come to the succour of his country, which he happily relieved by his victory over the allies in Bœotia. He obtained another near Corinth; but, to his great mortification, the Thebans afterward gained several over the Lacedæmonians. These misfortunes at first raised somewhat of a clamour against him. He had been sick during the first advantages which the enemy gained; but, as soon as he was able to act in person, by his valour and prudence he prevented the Thebans from reaping the advantages of their victories; inasmuch, that it was generally believed, had he been in health at the beginning, the Lacedæmonians would have sustained no losses, and that all would have been lost had it not been for his assistance. It cannot be denied that he loved war more than the interest of his country required; for, if he could have lived in peace, he had saved the Lacedæmonians several losses, and they would not have been engaged in many enterprises which in the end contributed much to weaken their power. He died in the third year of the 104th Olympiad, being the 84th year of his age, and 41st year of his reign. Agesilaus would never suffer any picture or sculpture to be made of him, and prohibited it also by his will: this he is supposed to have done from a consciousness of his own deformity; for he was of a short stature, and lame of one

foot, so that strangers used to despise him at the first sight. His fame went before him into Egypt, and there they had formed the highest idea of Agesilaus. When he landed in that country, the people ran in crowds to see him: but, great was their surprise when they saw an ill-dressed, slovenly, mean-looking, little fellow, lying upon the grass: they could not forbear laughing, and applied to him the fable of the mountain in labour. He was, however, the first to jest upon his own person; and such was the gaiety of his temper, and the strength with which he bore the roughest exercises, that these qualities made amends for his corporal defects. Agesilaus was extremely fond of his children, and would often amuse himself by joining in their diversions: one day, when he was surprised riding upon a stick with them, he said to the person who had seen him in this posture, "Forbear talking of it till you are a father."

AGE VITA, *f.* The name of an antidote, rather supposed to be called *jugis vita*, long or continual life. It is a medicated wine, made with galangal root, long and white pepper, fage, ginger, cinnamon, saffron, and cloves, boiled in wine.

AGGA, or **AGGONA**, a British settlement on the gold coast of Guinea. It is situated under the meridian of London, in six degrees of N. lat.

AGGELATION, *f.* [Lat. *glu.*] Concretion of ice.—It is round in hail, and figured in its guttulous descent from the air, growing greater or smaller according to the accretion or pluvius *aggelation* about the fundamental atoms thereof. *Brown.*

AGGENERATION, *f.* [from *ad* and *generatio*, Lat.] The state of growing or uniting to another body.—To make a perfect nutrition, there is required a transmutation of nutriment; now, where this conversion or *aggeneration* is made, there is also required in the aliment a familiarity of matter. *Brown.*

AGGER, *f.* in the ancient military art, a work of fortification, used both for the defence and the attack of towns, camps, &c. In which sense it is the same with what was otherwise called *vallum*, and in later times *aggestum*; and among the moderns *lines*, sometimes *cavaliers*, *terrasses*, &c. The agger was usually a bank, or elevation of earth or other matter, bound and supported with timber; having sometimes turrets on the top, wherein the workmen, engineers, and soldiery, were placed. It was also accompanied with a ditch, which served as its chief defence. The usual materials of which it was made were earth, boughs, fascines, stakes, and even trunks of trees, ropes, &c. variously crossed, and interwoven somewhat in the figure of stars; whence they were called *stellati axes*. Where these were wanting, stones, bricks, and tiles, supplied the office: on some occasions, arms, utensils, pack-saddles, were thrown in to fill it up. We even read of aggers formed of the carcases of the slain; sometimes of dead bones mixed with lime; and even with the heads of slaughtered citizens. For want of due binding, or solid materials, aggers have sometimes tumbled down, with infinite mischief to the men. The besiegers used to carry on a work of this kind nearer and nearer towards the place, till at length they reached the very wall.

The height of the agger was frequently equal to that of the wall of the place. Cæsar tells us of one he made, which was thirty feet high and 330 feet broad.

There were vast aggers made in towns and places on the sea-side, fortified with towers, castles, &c. The wall of Severus, in the north of England, may be considered as a grand agger, to which belong several smaller ones. See **SEVERUS'S WALL**.

AGGER, in ancient writers, denotes the middle part of a military road, raised into a ridge, with a gentle slope on either side, to make a drain for the water, and keep the way dry.—The term is also used for the whole road or military way.—Our *causeways* are the *aggeres calceati* of the Romans.

To AGGERATE, *v. a.* [from *agger*, Lat.] To heap up.

AGGEROSE, *adj.* [from *agger*, Lat.] Full of heaps. **AGGERHUYS**, a city of Norway, capital of the province of the same name. It is subject to Denmark, and situated in E. lon. 28. 35. and N. lat. 59. 30.

AGGERS-HERRED, a district of Christianland and a diocese of Norway. It consists of three juridical places; namely, Ascher, West Barn, and Ager.

To AGGLOMERATE, *v. a.* [*agglomer*, Lat.] To gather up in a ball, as thread. To gather together.

To AGGLOMERATE, *v. n.*

Besides the hard *agglomerating* salts, The spoil of ages, would impervious choke Their secret channels.

Thompson.

AGGLUTINANTS, *f.* in pharmacy, is a general name for all medicines of a glutinous or viscid nature; which, by adhering to the solids, contribute greatly to repair their loss.

To AGGLUTINATE, *v. n.* [from *ad* and *gluten*, glue, Lat.] To unite one part to another; to join together, so as not to fall asunder. It is a word almost appropriated to medicine.—The body has got room enough to grow into its full dimensions, which is performed by the daily ingestion of food that is digested into blood; which being diffused through the body, is *agglutinated* to those parts that were immediately *agglutinated* to the foundation parts of the womb. *Harvey.*

AGGLUTINATION, *f.* Union; cohesion; the act of agglutinating; the state of being agglutinated.

AGGLUTINATIVE, *adj.* That which has the power of procuring agglutination.

To AGGRANDIZE, *v. a.* [*aggrandiser*, Fr.] To make great; to enlarge; to exalt; to improve in power, honour, or rank. It is applied to persons generally, sometimes to things.—If the king should use it no better than the pope did, only to *aggrandize* covetous churchmen, it cannot be called a jewel in his crown. *Ayliffe.*—These furnish us with glorious springs and mediums, to raise and *aggrandize* our conceptions, to warm our souls, to awaken the better passions, and to elevate them even to a divine pitch, for devotional purposes. *Watts.*

AGGRANDIZEMENT, *f.* [*aggrandissement*, Fr.] The state of being aggrandized; the act of aggrandizing.

AGGRANDIZER, *f.* The person that aggrandizes or makes great another.

To AGGRATE, *v. a.* [*aggratare*, Ital.] To please; to treat with civilities: a word not now in use.

To AGGRAVATE, *v. a.* [*aggravare*, Lat.] To make heavy, used only in a metaphorical sense; as, to *aggravate* an accusation, or a punishment. To make any thing worse, by the addition of some particular circumstance, not essential.—This offence, in itself so heinous, was yet in him *aggravated* by the motive thereof, which was not malice or discontent, but an aspiring mind to the crown. *Bacon.*

AGGRAVATION, *f.* The act of aggravating, or making heavy. The act of enlarging to enormity. The extrinsecal circumstances or accidents, which increase the guilt of a crime, or the misery of a calamity.—He, to the sins which he commits, has the *aggravation* superadded of committing them against knowledge, against conscience, against sight of the contrary law. *Hammond.*

AGGREGATE, *adj.* [*aggregatus*, Lat.] Framed by the collection of any particular parts into one mass, body, or system.—The solid reason of one man with unprejudicate apprehensions, begets as firm a belief as the authority or *aggregate* testimony of many hundreds. *Brown.*

AGGREGATE, *f.* The complex, or collective result of the conjunction or acervation of many particulars.—The reason of the far greatest part of mankind, is but an *aggregate* of mistaken phantasms, and, in things not sensible, a constant delusion. *Glanville.*

To **AGGREGATE**, *v. a.* [*aggrego*, Lat.] To collect together; to accumulate; to heap many particulars into one mass.

AGGREGATE in botany, is a term used to express those flowers, which are composed of parts or florets, so united, by means either of the receptacle or calyx, that no one of them can be taken away without destroying the form of the whole. They are opposed to simple flowers, which have no such common part, and are usually divided into seven kinds, viz. the *aggregate*, properly so called, whose receptacle is dilated, and whose florets are supported by footstalks; such are the blue daisy, thrift, or sea-pink, &c. the *compound*; the *umbellati*; the *cymose*; the *amentaceous*; the *glumose*; and the *spadicous*.

AGGREGATION, *f.* Collection, or state of being collected. The collection, or act of collecting, many particulars into one whole. The whole composed by the coagervation of many particulars; an aggregate.

To **AGGRESS**, *v. n.* [*aggredior*, *aggressum*, Lat.] To commit the first act of violence; to begin the quarrel.

—The glorious pair advance
With mingled anger and collected might,

To turn the war, and tell *aggressing* France,
How Britain's sons and Britain's friends can fight. *Prior*.

AGGRESSION, *f.* [*aggressio*, Lat.] The first act of injury; commencement of a quarrel by some act of iniquity.

AGGRESSOR, *f.* The person that first commences hostility; the assaulter or invader, opposed to the *defendant*.

AGGRIEVANCE, *f.* Injury; hardship inflicted; wrong endured.

To **AGGRIEVE**, *v. a.* [from *gravis*, Lat.] To give sorrow, to cause grief; to vex. It is not improbable, that to *grieve* was originally neuter, and *aggrieve* the active. To impose some hardships upon; to harass; to hurt in one's right. This is a kind of juridical sense; and whenever it is used now, it seems to bear some allusion to forms of law.—The landed man finds himself *aggrieved* by the falling of his rents, and the frightening of his fortune; whilst the monied man keeps up his gain, and the merchant thrives and grows rich by trade. *Locke*.

To **AGGROUPE**, *v. a.* [*aggruppare*, Ital.] To bring together into one figure; to crowd together: a term of painting.—Bodies of divers natures, which are *aggrouped* (or combined) together, are agreeable and pleasant to the sight. *Dryden*.

AGHAST, *adj.* [either the participle of *agaze*, and then to be written *agazed*, or *aghaft*, or from *a* and *gaft*, Sax. a ghost; which the present orthography favours; perhaps they were originally different words.] Struck with horror, as at the sight of a spectre; stupified with terror. It is generally applied to the external appearance:

Aghast he wak'd, and, starting from his bed,
Cold sweat in clammy drops his limbs o'erspread. *Dryden*.

AGHER, a town of Ireland, which sends two members to parliament. It is situated in the southern part of Ulster, not far from Clogher.

AGHEUSTIA, [*a*, non, and *γενομαι*, *gusto*.] DEFECT OR LOSS OF TASTE, called also *apogusia*, *apogustis*. Dr. Cullen ranks this as a genus of disease, in the class locales and order dysæsthesiæ. The causes are fever, or palsy, whence he forms two species; the first he calls, **ORGANIC**, arising from some affection in the membrane of the tongue, by which relishing things or those which have some taste are prevented from coming in contact with the nerves: the second, **ATONIC**, arising without any affection of the tongue. Sauvages says the cause of this disease is either in the brain, in the tongue itself, or in the passage of the lingual nerves;—he forms two species—First, **FEBRILIS**, where a suppression of taste accompanies ardent and malignant fevers, on account of the extreme dryness of the tongue, when it wants moisture, grows black and rough like wood; or from the delirium, or comatous state into

which patients sometimes fall.—Second, **PARALYTICA**, when it accompanies a paralysis of the tongue, or some comatous disorder.

AGHRIM, a town of Ireland, in the county of Wicklow, and province of Leinster, situated about thirteen miles south-west of Wicklow.

AGHRIM, in Galway; a small village, distant about thirty-two miles from Dublin, and rendered memorable by a decisive battle fought there, and at Kilcommodonhill, the 12th of July, 1691, between general Ginckle and Monsieur St. Ruth, the commanders under king William III. and James II. when St. Ruth, the general of the Irish army, with 7000 of his men, were slain; but of the English only 600. The victory was the more considerable, as the English army consisted of no more than 18,000 men; whereas the Irish were computed at 20,000 foot, and 5000 horse and dragoons. They lost likewise nine pieces of brass cannon; all their ammunition, tents, and baggage; most of their small arms, which they threw away to expedite their flight; with eleven standards and thirty-two pair of colours.

AGIADES, in the Turkish armies, a kind of pioneers employed in fortifying camps, smoothing of roads, and the like offices.

AGILE, *adj.* [*agile*, Fr. *agilis*, Lat.] Nimble; ready; having the quality of being speedily put in motion; active:

To guide its actions with informing care,
In peace to judge, to conquer in the war,
Render it *agile*, witty, valiant, sage,
As fits the various course of human age. *Prior*.

AGILENESS, *f.* The quality of being agile; nimbleness; readiness for motion; quickness; activity; agility.

AGILITY, *f.* [*agilitas*, Lat. from *agilis*, agile.] Nimbleness; readiness to move; quickness; activity.

The improving of agility was one of the chief objects of the institution of games and exercises. The athlete made particular profession of the science of cultivating and improving agility. Agility of body is often supposed peculiar to some people; yet it seems less owing to any thing peculiar, in their frame and structure, than to practice.

AGINCOURT, a village of the French Netherlands, situated in lat. 50. 35. N. lon. 2. 10. E. famous on account of the victory obtained by Henry V. of England over the French, in 1415.

The army of Henry, after landing in France, was by various accidents reduced to 10,000 men, of whom not a few were sick, or slowly recovering from sickness;—they had to traverse a long tract of country, inhabited by exasperated enemies, from whom they were to procure provisions, lodgings, guides, intelligence, and every thing they wanted;—that country was defended by many strong towns, intersected by deep rivers, and guarded by an army of 100,000, or (according to some contemporary writers) 140,000, men.

Henry, undaunted by all these dangers and difficulties, departed from Harfleur, marching his army in three lines, with bodies of cavalry on the wings. He proceeded by very easy journeys, that he might not fatigue his troops, or discourage them by the appearance of a flight; observing the strictest discipline, and paying generously for every thing he received; which induced the country people to bring provisions to his camp, in spite of all the commands they had received to the contrary. To keep his men in spirits, and from repining, the king fared as ill as the meanest soldier, always appearing with a cheerful countenance, and addressing them in the most friendly and encouraging language. They arrived at the village of Agincourt, in the county of St. Pol, on the evening of October 24; and there beheld the whole French army, at a small distance, directly in their route. The king took an attentive view of it from an eminence; and being fully convinced that it was impossible to proceed any further on his

his way to Calais without a battle, and equally impossible to return to Harfleur with so great an army in his rear, he resolved to hazard an action next morning, as the only means of preserving himself and his little army from destruction.

The English army lodged that night in the villages of Agincourt, Maisonneuve, and some others; where they met with better accommodation than they had been accustomed to for some time past, and spent part of their time in mutual exhortations to fight bravely in the approaching battle. The king, overhearing some of his nobles expressing a wish that the many brave men who were idle in England were present to assist them, is said to have cried out—"No! I would not have one man more:—if we are defeated, we are too many—if it shall please God to give us the victory, as I trust he will, the smaller our number the greater our glory." The moon happening to shine very bright, Henry, with some of his best officers, carefully examined the ground, and pitched upon a field of battle admirably calculated to preserve a little army from being surrounded by a great one. It was a gentle declivity from the village of Agincourt, of sufficient extent for his small army, defended on each side by hedges, trees, and brush-wood. Having placed guards, and kindled fires on all sides, the king and his army betook themselves to rest; except such as were of a more serious turn of mind, who, considering that as the last night of their lives, spent it in devotion.

The French, exulting in their numbers, confident of victory, and abounding in provisions, spent the night in noisy festivity, and in forming fanciful schemes about the disposal of their prisoners and their booty. It was in general resolved to put all the English to the sword, except the king and the chief nobility, who were to be taken prisoners for the sake of their ransom.

On the morning of Friday, the memorable 25th of October, A. D. 1415, the day of Crispin and Crispianus; the English and French armies were ranged in order of battle, each in three lines, with bodies of cavalry on each wing. The constable d'Albert, who commanded the French army, fell into the snare that was laid for him, by drawing up his army in the narrow plain between the two woods. This deprived him, in a great measure, of the advantage he should have derived from the prodigious superiority of his numbers; obliged him to make his lines unnecessarily deep, about thirty men in file, to crowd his troops, particularly his cavalry, so close together, that they could hardly move or use their arms; and, in a word, was the chief cause of all the disasters that followed. The French, it is said, had a considerable number of cannon of different sizes in the field; but we do not hear that they did any execution, probably for want of room. The first line of the French army, which consisted of 8000 men-at-arms on foot mixed with 4000 archers, with 500 men-at-arms mounted on each wing, was commanded by the constable d'Albert, the dukes of Orleans and Bourbon, and many other nobles; the dukes of Alençon, Brabant, and Bar, &c. conducted the second line; and the earls of Marle, Darmatine, Fauconberg, &c. were at the head of the third line. The king of England employed various arts to supply his defect of numbers. He placed 200 of his best archers in ambush, in a low meadow, on the flank of the first line of the French. His own first line consisted wholly of archers, four in file; each of whom, besides his bow and arrows, had a battle-axe, a sword, and a stake pointed with iron at both ends, which he fixed before him in the ground, the point inclining outwards, to protect him from cavalry; which was a new invention, and had a happy effect. That he might not be encumbered, he dismissed all his prisoners, on their word of honour to surrender themselves at Calais, if he obtained the victory; and lodged all his baggage in the village of Agincourt, in his rear, under a slender guard. The command of the first line was, at his earnest request, committed to Edward duke of York, assisted by the lords Beaumont, Willoughby,

and Fanhope; the second was conducted by the king, with his youngest brother Humphrey duke of Gloucester, the earls of Oxford, Marshal, and Suffolk; and the third was led by the duke of Exeter, the king's uncle. The lines being formed, the king, in shining armour, with a crown of gold adorned with precious stones on his helmet, mounted on a fine white horse, rode along them, and addressed each corps with a cheerful countenance and animating speeches. To inflame their resentment against their enemies, he told them, that the French had determined to cut off three fingers of the right hand of every prisoner; and to rouse their love of honour, he declared, that every soldier in that army who behaved well, should from henceforth be deemed a gentleman, and intitled to bear coat-armour.

When the two armies were drawn up in this manner, they stood a considerable time gazing at one another in solemn silence. But the king, dreading that the French would discover the danger of their situation and decline a battle, commanded the charge to be sounded, about ten o'clock in the forenoon. At that instant, the first line of the English kneeled down, and kissed the ground; and, then starting up, discharged a flight of arrows, which did great execution among the crowded ranks of the French. Immediately after, on a signal being given, the archers in ambush arose, discharged their arrows on the flank of the French line, and threw it into some disorder. The battle now became general, and raged with uncommon fury. The English archers, having expended all their arrows, threw away their bows, and, rushing forward, made dreadful havoc with their swords and battle-axes. The first line of the enemy was, by these means, defeated; its leaders being either killed or taken prisoners. The second line, commanded by the duke d'Alençon (who had made a vow either to kill or take the king of England, or to perish in the attempt), now advanced to the charge, and was encountered by the second line of the English, conducted by the king. This conflict was more close and furious than the former. The duke of Gloucester, wounded and unhorsed, was protected by his royal brother till he was carried off the field. The duke d'Alençon forced his way to the king, and assaulted him with great fury; but that prince brought him to the ground, and dispatched him with his own hand. Discouraged by this disaster, the second line made no more resistance; and the third fled without striking a blow; yielding a complete and glorious victory to the English, after a violent struggle of three hours duration.

The king did not permit his men to pursue the fugitives to a great distance, but encouraged them to take as many prisoners as they could on or near the field; in which they were so successful, that, in a little time, his captives were more numerous than his soldiers. A great proportion of these prisoners were men of rank and fortune; for many of the French noblesse being on foot, and loaded with heavy armour, could not make their escape. Among these were the dukes of Orleans and Bourbon, the marshal Boucicaut, the counts d'Eu, Vendome, Richemont, and Harcourt, and 7000 barons, knights, and gentlemen. The French left dead on the field of battle, the constable d'Albert, the three dukes of Alençon, Brabant, and Bar, the archbishop of Sens, one marshal, thirteen earls, ninety-two barons, 1500 knights, and a far greater number of gentlemen, besides several thousands of common soldiers. Even the French historians acknowledge, that the loss of the English was inconsiderable: those of our own contemporary writers, who make it the greatest, affirm, that it did not exceed 100, and that the duke of York and the earl of Suffolk were the only great men who fell on that side in this memorable action.

AGIO, *f.* [an Italian word, signifying ease or convenience.] A mercantile term, used chiefly in Holland and Venice, for the difference between the value of bank-notes and the current money.

AGIOSYMANDRUM, *f.* a wooden instrument used by

by the Greek and other churches under the dominion of the Turks, to call together assemblies of the people. The agiofymandrum was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGIS, king of Lacedæmon, and colleague of Leonidas in the government of Sparta, was a young prince of great hopes. He shewed himself just and obliging to all men; and, in the gentleness of his disposition, and the sublimity of his virtues, not only exceeded Leonidas, who reigned with him, but all the kings of Sparta from king Agefilaus. He was a very handsome person, and of a graceful behaviour; yet, to check the vanity he might take therein, he would always dress in a very plain manner. He had been bred very tenderly by his mother Agefistrata, and his grandmother Archidamia, who were the wealthiest of all the Lacedæmonians; yet, before the age of twenty-four, he so far overcame himself, as to renounce effeminate pleasures. In his diet, bathings, and in all his exercises, he chose to imitate the old Lyncurgic frugality and temperance; and was often heard to say, "He would not desire the kingdom, if he did not hope, by means of that authority, to restore their ancient laws and discipline." This maxim governed his whole life: and, with this view, he associated with men of interest and capacity, who were equally willing to bring about the great design he had formed of thoroughly reforming the state, now sunk into luxury and debauch. For this purpose attempts were made; and so far succeeded, that Leonidas thought it advisable to abdicate the throne. But Agefilaus, from interested views, acted so precipitately, that, while Agis was leading a body of Spartan troops to the assistance of the Achæans, a conspiracy was formed for restoring Leonidas, whose ambition, pride, and luxury, had greatly contributed to effeminate the minds of the people. Leonidas, being now re-settled on the throne, tried every method possible to get Agis into his power; and which he at last effected by the treachery of Amphares and Demochares. Being dragged away to the common prison, the ephori constituted by Leonidas sat ready to judge him. As soon as he came in, they asked him, "How he durst attempt to alter the government?" at which he smiled without affording an answer; which provoked one of the ephori to tell him, "That he ought rather to weep; for they would make him sensible of his presumption." Another asked him, "Whether he was not constrained to do what he did by Agefilaus and Lyfander?" To which Agis, with a composed countenance, answered, "I was constrained by no man; the design was mine; and my intent was to have restored the laws of Lyncurgus, and to have governed by them." "But do you not now (said one of his judges) repent of your rashness?" "No, (replied the king;) I can never repent of so just and honourable an intention." The ephori then ordered him to be taken away, and strangled. The officers of justice refused to obey; and even the mercenary soldiers declined so unworthy an action. Whereupon Demochares, reviling them for cowards, forced the king into the room where the execution was to be performed. Agis, about to die, perceiving one of the ferjeants bitterly bemoaning his misfortune: "Weep not, friend, for me, (said he) who die innocently; but grieve for those who are guilty of this horrid act. My condition is much better than theirs." Then, stretching out his neck, he submitted to death with a constancy worthy both of the royal dignity and his own great character. Immediately after Agis was dead, Amphares went out of the prison gate, where he found Agefistrata; who kneeling at his feet, he gently raised her up, pretending still the same friendship as formerly. He assured her, she need not fear any farther violence should be offered against her son; and that, if she pleased, she might go in and see him. She begged her mother might also have the favour of being admitted: to which he replied, "Nobody should hinder her." When they were entered, he commanded the gate should be again locked, and the grandmother to be the

first introduced. She was now grown very old, and had lived all her days in great reputation of wisdom and virtue. As soon as Amphares thought she was dispatched, he told Agefistrata she might go in, if she pleased. She entered: where, beholding her son's body stretched on the ground, and her mother hanging by the neck, she stood at first astonished at so horrid a spectacle: but, after a while recollecting her spirits, the first thing she did was to assist the soldiers in taking down the body; then covering it decently, she laid it by her son's; where, embracing and kissing his cheeks, "O my son, (said she,) it is thy too great mercy and goodness which hath brought thee and us to this untimely end." Amphares, who stood watching behind the door, rushed in hastily; and, with a furious tone and countenance, said to her: "Since you approve so well of your son's actions, it is fit you should partake in his reward." She, rising up to meet her destiny, only uttered these few words: "I pray the gods that all this may redound to the good of Sparta." After which she submitted to death with a composure and firmness that drew tears from the executioner.

To AGIST, *v. a.* [from *giste*, Fr. a bed or resting-place, or from *gister*, i. e. *stabulari*.] To take in and feed the cattle of strangers in the king's forest, and to gather the money. The officers that do this are called *agistors*, in English *guest* or *gift takers*. Their function is termed *agistment*; as, *Agistment* upon the sea-banks. This word *agist* is also used for the taking in of other men's cattle into any man's ground, at a certain rate per week.

AGISTMENT, *f.* in law, is where other men's cattle are taken into any ground, at a certain rate for their feeding. *4 Inst.* 293.

The tithe of agistment of cattle is due of common right, because the grass which is eaten is *de jure* titheable, and must have paid tithe if cut when full grown. And it is to be paid by the occupier of the ground, and not by the owner of the cattle; for, if the occupier in such case were not liable, it would be greatly inconvenient to sue every owner of the beasts, and it might be hard to be known, and infinite. Where there is no special custom concerning the manner of paying this tithe, it is usual to pay the tenth part of the money received; but this is only for convenience, for the tenth part of the produce, and not a sum of money, is due *de jure*. *2 Inst.* 651. *1 Roll's Abr.* 656. *Watf. c. 50.*

AGISTOR, or AGISTATOR, *f.* an officer belonging to forests, who has the care of cattle taken in to be grazed, and levies the moneys due on that account. They are created by letters patent; each royal forest having four agistors.

AGISYMBIA, anciently a district of Libya Interior, situated to the south-east of the Æthiopes Anthropophagi; the parallel passing through which, at 16° to the south of the Equator, was the utmost extent of the knowledge of the ancients to the south.

AGITABLE, *adj.* [*agitabilis*, Lat.] That which may be agitated, or put in motion; perhaps that which may be disputed.

To AGITATE, *v. a.* [*agitō*, Lat.] To put in motion; to shake; to move nimbly; as, The surface of the waters is *agitated* by the wind; The vessel was broken by *agitating* the liquor. To be the cause of motion; to actuate; to move. To affect with perturbation; as, The mind of man is *agitated* by various passions. To stir; to bandy from one to another; to discuss; to controvert; as, To *agitate* a question. To contrive; to revolve; to form by laborious thought.—Formalities of extraordinary zeal and piety are never more studied and elaborate, than when politicians most *agitate* desperate designs. *King Charles.*

AGITATION, *f.* [*agitatio*, Lat.] The act of moving or shaking any thing. The state of being moved or agitated; as, The waters, after a storm, are some time in a violent *agitation*. Discussion; controversial examination. Violent motion of the mind; perturbation; disturbance of the thoughts. Deliberation; contrivance; the state of

being consulted upon.—The project now in *agitation* for repealing of the test act, and yet leaving the name of an establishment to the present national church, is inconsistent. *Swift*.

AGITATION, in physics, an intestine commotion of the parts of a natural body. It is one of the chief instruments of mixture: by the agitation of the parts of the blood and chyle, in their continual circulation, sanguification is in a good measure effected. Agitation is also used in medicine for a species of exercise popularly called *swinging*.

AGITATOR, *f.* He that agitates any thing; he who manages affairs.

AGITATOR, in antiquity, a term used for a charioteer, especially those who drove in the circus at the curule games.

AGITATORS, in the English history, were certain officers set up by the army in 1647, to take care of its interests. Cromwell joined the agitators, only with a view to serve his own ends; which being once accomplished, he found means to get them abolished.

AGLAIA, the name of the youngest of the three Graces, espoused to Vulcan.

AGLET, *f.* [some derive it from *αἴγλη*, splendour; but it is apparently to be deduced from *aiguillette*, Fr. a tag to a point, and that from *aigu*, sharp.] A tag of a point curved into some representation of an animal, generally of a man.—He thereupon gave for the garter a chain worth 200*l.* and his gown addressed with *aglets*, esteemed worth 25*l.* *Hayward*.—In botany, the pendants at the ends of the chieftes of flowers, as in tulips.

AGLIONBY (John), an English divine, chaplain to king James I. a man of universal learning, who had a very considerable hand in the translation of the New Testament appointed by king James I. in 1604.

AGMAT, in the province, and on the river of the same name, in Morocco, is a pleasant town on the declivity of one of the mountains of Atlas. Lat. 30. 56. N. lon. 7. 15. W.

AGMEN, *f.* in antiquity, properly denotes a Roman army in march: in which sense, it stands contradistinguished from *acies*, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other. The Roman armies, in their marches, were divided into *primum agmen*, answering to our van-guard; *medium agmen*, our main-body; and *postremum agmen*, the rear-guard.

AGMINAL, *adj.* [from *agmen*, Lat.] Belonging to a troop.

AGNAIL, *adj.* [from *ange*, grieved, and *nagle*, Sax. a nail.] A disease of the nails; a whitlow; an inflammation round the nails.

AGNAN, a small town in France, in the department of Loire and Cher, in the form of an amphitheatre, at the foot of which runs the Cher, at the distance of sixty miles from Bourges.

AGNANTHUS, *f.* in botany. See *CORNUTIA*.

AGNATI, *f.* in law, are the kindred by the father's side, as *cognati* are kindred by the mother. 2 *Blackst.* 235.

AGNEL, *f.* an ancient French gold coin, first struck under the reign of St. Louis, worth about twelve sols six deniers. The agnel is also called sometimes *mouton d'or*, and *agnel d'or*, from the figures struck on one side.

AGNELET, *f.* an ancient French silver coin, worth about twenty sols, first struck under Philip le Bel.

AGNITION, *f.* [from *agnitio*, Lat.] Acknowledgement.

[To **AGNIZE**, *v. a.* [from *agnosco*, Lat.] To acknowledge; to own; to avow. This word is now obsolete.

AGNO, a river of Naples, which falls into the Mediterranean, about seven miles north of Puzzuoli.

AGNOETÆ, *f.* [from *αγνοειν*, to be ignorant of.] In church-history, a sect of ancient heretics, who maintained that Christ, considered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment.

AGNOMEN, *f.* in Roman antiquity, a kind of fourth or honorary name, given to a person on account of some extraordinary action, virtue, or other accomplishment. Thus the agnomen *Africanus* was bestowed upon Publius Cornelius Scipio, on account of his great achievements in Africa. The agnomen was the third in order of the three Roman names: thus, in Marcus Tullius Cicero, Marcus is the prænomen, Tullius the nomen, and Cicero the *agnomen*.

AGNOMINATION, *f.* [*agnominatio*, Lat.] Allusion of one word to another, by resemblance of sound.—The British continueth yet in Wales, and some villages of Cornwall, intermingled with provincial Latin, being very significative, copious, and pleasantly running upon *agnominations*, although harsh in aspirations. *Camden*.

AGNUS, or **LAMB**, *f.* in zoology, the young of the ovine or sheep. See *OVIS*.

AGNUS CASTUS, *f.* in botany, the trivial name of a species of the vitex. See *VITEX*.

The Greeks call it *αγνός*, chaste. It was famous among the ancients as a specific for the preservation of chastity. The Athenian ladies who made profession of chastity, lay upon the leaves of *agnus castus* during the feasts of Ceres. Being reputed a cooler, and particularly of the genital parts, it was anciently used in physic to allay those inordinate motions arising from femal turgescences: but it is out of the present practice.

AGNUS DEI, in the church of Rome, a cake of wax stamped with the figure of a lamb supporting the banner of the cross. These being consecrated by the pope with great solemnity, and distributed among the people, are supposed to have great virtues; as, to preserve those who carry them worthily, and with faith, from all manner of accidents; to expel evil spirits, &c. The name literally signifies *Lamb of God*; this being supposed an image or representation of the Lamb of God who took away the sins of the world. The Romish priests and religious derive considerable pecuniary advantage from selling these *Agnus Dei's* to some, and presenting them to others. The pope provides a regular supply, by consecrating them once in seven years. The *Agnus Dei* is forbidden to be brought into England under pain of incurring a *premunire*. 13 Eliz. cap. 2.

AGNUS DEI is also a popular name for that part of the mass wherein the priest, striking his breast three times, rehearses, with a loud voice, a prayer beginning with the words *Agnus Dei*.

AGNUS SCYTHICUS. See *SCYTHIAN LAMB*.

AGO, *adv.* [*agan*, Sax. past or gone; whence writers formerly used, and in some provinces the people still use, *agone* for *ago*.] Past; as, *long ago*; that is, long time has past since. Reckoning time towards the present, we use *since*; as, It is a year *since* it happened. Reckoning from the present, we use *ago*; as, It happened a year *ago*. This is not, perhaps, always observed.

AGOG, *adv.* [a word of uncertain etymology: the French have the term *à gogo*, in low language; as, *ils vivent à gogo*, they live to their wish. From this phrase our word may be, perhaps, derived.] In a state of desire; in a state of warm imagination; heated with the notion of some enjoyment; longing; strongly excited. It is used with the verbs *to be*, or *to set*; as, He is *agog*, or You may set him *agog*. It has the particles *on*, or *for*, before the object of desire:

On which the saints are all *agog*,
And all this for a bear and dog.

Butler.

Gypsies generally straggle into these parts, and set the heads of our servant-maids so *agog* for husbands, that we do not expect to have any business done as it should be, whilst they are in the country. *Addison*.

AGOING, *part. adj.* [from *a* and *going*.] In action; into action.—Their first movement, and impressed motions, demanded the impulse of an Almighty hand to set them first *agoing*. *Tatler*.

AGOGE,

AGOGÉ, *adj.* among ancient musicians, a species of modulation, wherein the notes proceed by contiguous degrees.

AGON, *f.* among the ancients, implied any dispute or contest, whether it had regard to bodily exercises or the accomplishments of the mind; and therefore poets, musicians, painters, &c. had their agones, as well as the athletes. Games of this kind were celebrated at most of the heathen festivals, with great solemnity, either annually, or at certain periods of years.

AGON also signified one of the ministers employed in the Heathen sacrifices, and whose business it was to strike the victim. The name is supposed to have been derived from hence, that standing ready to give the stroke he asked, *Agon?* or *Agone?* "Shall I strike?"

AGONALES, *f.* an epithet given to the **SALII**.

AGONALIA, *f.* in Roman antiquity, festivals celebrated in honour of Janus, or the god Agonius, whom the Romans invoked before undertaking any affair of importance.

AGONALIS CIRCUS, now La Piazza Navona, a long, large, beautiful, street, in the heart of Rome, adorned with fountains, and the obelisk of Caracalla, still retaining the form of that circus. The reason of the name Agonalis is either unknown or doubtful. Ovid seems to derive it from the agones, or solemn games, there celebrated; supposed to have been the *Ludi Apollinares*, or *Athiaci*, instituted by Augustus: whence the circus was called *Apollinaris*; also *Alexandrinus*, from the emperor Alexander Severus, who either enclosed or repaired the circus.

AGONE, *adv.* [*agan*, Sax.] Ago; past.

AGONISM, *f.* [*αγωνισμος*, Gr.] Contention for a prize.

AGONISMA, *f.* in antiquity, denotes the prize given to the victor in any combat or dispute.

AGONIST, *f.* [*αγωνιστης*, Gr.] A contender for prizes.

AGONISTARCHA, *f.* [from *αγων*, combat, and *αρχος*, chief.] In antiquity, seems to have been much the same with **AGONOTHETA**; though some suggest a difference, making it the office of the former to preside at and direct the private exercises of the athletes.

AGONISTES, *f.* [*αγωνιστης*, Gr.] A prize-fighter; one that contends at any public solemnity for a prize. Milton has so styled his tragedy, because Sampson was called out to divert the Philistines with feats of strength.

AGONISTICAL, *adj.* Relating to prize-fighting.

AGONISTICI, *f.* in church-history, a name given by Donatus to such of his disciples as he sent to fairs, markets, and other public places, to propagate his doctrine; for which reason they were also called *Circuitores*, *Circelliones*, *Catropitæ*, *Coropitæ*, and at Rome *Montenses*.

AGONIUM, *f.* in Roman antiquity, was used for the day on which the *rex sacrorum* sacrificed a victim, as well as for the place, where the games were celebrated, otherwise called *agon*.

To **AGONIZE**, *v. n.* [from *agonizo*, low Lat. *αγωνίζω*, Gr. *agoniser*, Fr.] To feel agonies; to be in excessive pain:

Dost thou behold my poor distracted heart,
Thus rent with agonizing love and rage,
And ask me what it means?

Rowe.

AGONOTHETA, or **AGONOTHETICI**, *f.* [*αγων* and *τις*, Gr.] In Grecian antiquity, was the president or superintendant of the sacred games; who not only defrayed the expences attending them; but inspected the manners and discipline of the athletes, and adjudged the prizes to the victors.

AGONY, *f.* [*αγων*, Gr. *agon*, low Lat. *agonie*, Fr.] The pangs of death; properly the last contest between life and death. Any violent or excessive pain of body or mind. It is particularly used in devotions for our Redeemer's conflict in the garden.

Much of the terror of death consists in the pangs and convulsions wherewith the agony seems attended; though we have reason to believe that the pain in such cases is ordinarily not extremely acute; a course of pain and sickness having usually stupified and indisposed the nerves for any quick sensations. However, various means have been thought of for mitigating the agony of death. Lord Bacon considers this as a part of the province of a physician; and that not only when such a mitigation may tend to a recovery, but also when, there being no hopes of a recovery, it can only tend to make the passage out of life more calm and easy. Complacency in death, which Augustus so much desired, is certainly no small part of happiness. Accordingly the author last cited ranks *euthanasia*, or the art of dying easily, among the desiderata of science; and does not even seem to disapprove of the course Epicurus took for that end,

—*Hinc stygiæ ebrius hausit aquas.*

Opium has been applied for this purpose, with the applause of some, but the condemnation of more.

AGONYCLITÆ, or **AGONYCLITES**, *f.* in church-history, a sect of Christians, in the seventh century, who prayed always standing, as thinking it unlawful to kneel.

AGOOD, *adv.* [from *a* and *good*.] In earnest; not fictitiously. Not in use.

AGORÆUS, *adj.* in heathen antiquity, an appellation given to such deities as had statues in the market-places; particularly Mercury, whose statue was to be seen in almost every public place.

AGORANOMUS, *f.* a magistrate of Athens, who had the regulation of weights and measures, the prices of provisions, &c. To these a certain toll or tribute was paid by all who brought any thing to sell in the market.

AGOSTA, a sea-port of Sicily, mostly swallowed up by an earthquake in 1763.

AGOUTI, or **AGUTTI**. See **MUS**.

AGRA, the capital town of a province of the same name, in Indostan, and in the dominions of the Great Mogul. It is looked upon as the largest city in these parts, and is in the form of a half-moon. A man on horseback can hardly ride round it in a day. It is surrounded with a wall of red stone, and with a ditch 100 feet wide. The palace is prodigiously large, and the seraglio commonly contains above 1000 women. There are upwards of 800 baths in this town; but that which travellers most admire, is the mausoleum of one of the Mogul's wives, which was twenty years in building. The indigo of Agra is the most valuable of all that comes from the East Indies. This town is seated on the river Jemma, about fifty miles above its confluence with the Tehemel, and is 300 miles N. E. of Surat. Lat. 26. 29. N. lon. 79. 12. E.

To **AGRACE**, *v. a.* [from *a* and *grace*.] To grant favours to; to confer benefits upon: a word not now in use.

AGRAMMATIST, *f.* [from *a*, priv. and *γραμμα*, a letter.] An illiterate man.

AGRARIAN LAWS, *f.* among the Romans, those relating to the division and distribution of lands; of which there were a great number; but that called the *Agrarian Law*, by way of eminence, was published by Spurius Cassius, about the year of Rome 268, for dividing the conquered lands equally among all the citizens, and limiting the number of acres which each citizen might enjoy.—The Roman lands were of several kinds; some conquered from the enemies; and not yet brought to the public account; others brought indeed to the public, but clandestinely usurped by private great men; lastly, others purchased with the public money, in order to be divided. Agrarian laws, either for dividing lands taken from the enemy, or the public lands, or those purchased with the public money, were easily passed without disturbance; but those whereby private rich men were to be deprived of their lands, and the common people put in possession of what

what had been held by the nobility, were never attempted without great disturbances. Several have pleaded for the necessity of agrarian laws among us: but no author has entered so deeply into the subject as Mr. Harrington in his Oceana.

AGREDA, a town of Spain, in Old Castile, near the frontiers of Arragon, and about three leagues south-west of Tarazon.

To AGREE, *v. n.* [*agrer*, Fr. from *gr*, liking or goodwill; *galia* and *gratus*, Lat.] To be in concord; to live without contention; not to differ. To grant; to yield to; to admit, with the particles *to* or *upon*.—And persuaded them to agree to all reasonable conditions. *2 Maccabees*, xi. 14.—We do not prove the origin of the earth from a chaos; seeing that is agreed on by all that give it any origin. *Burnet*.—To settle amicably. To settle terms by stipulation; to accord: followed by *with*.—Agree with thine adversary quickly, whilst thou art in the way with him; lest at any time the adversary deliver thee to the judge, and the judge deliver thee to the officer, and thou be cast into prison. *Matt. v. 25*.—To settle a price between buyer and seller.—Friend, I do thee no wrong: didst not thou agree with me for a penny. *Matt. xx. 13*.—To be of the same mind or opinion. To concur; to co-operate. To settle some point among many, with *upon* before a noun.—Strifes and troubles would be endless, except they gave their common consent all to be ordered by some whom they should agree upon. *Hooker*.—To be consistent; not to contradict. To suit with; to be accommodated to: with *to* or *with*. To cause no disturbance in the body.—I have often thought, that our prescribing asses milk in such small quantities is injudicious; for, undoubtedly, with such as it agrees with, it would perform much greater and quicker effects in greater quantities. *Arbutnot*.

To AGREE, *v. a.* To put an end to a variance. To make friends; to reconcile:

The mighty rivals, whose destructive rage
Did the whole world in civil arms engage,
Are now agreed. *Roscommon*.

AGREEABLE, *adj.* [*agrable*, Fr.] Suitable to; consistent with; conformable to. It has the particle *to* or *with*.—This paucity of blood is agreeable to many other animals, as frogs, lizards, and other fishes. *Brown*.—What you do, is not at all agreeable either with so good a Christian, or so reasonable and so great a person. *Temple*.—In the following passage the adjective is used by a familiar corruption for the adverb *agreeably*.—Agreeable hereunto, perhaps it might not be amiss, to make children, as soon as they are capable of it, often to tell a story. *Locke*.—Pleasing; that is suitable to the inclination, faculties, or temper: It is used in this sense both of persons and of things.

AGREEABLENESS, *f.* Consistency with; suitability to: with the particle *to*.—Pleasant tastes depend not on the things themselves; but their agreeableness to this or that particular palate, wherein there is great variety. *Locke*.—The quality of pleasing. It is used in an inferior sense, to mark the production of satisfaction, calm and lasting, but below rapture or admiration.—It has very much an image of that author's writing, who has an agreeableness that charms us, without correctness; like a mistress whose faults we see, but love her with them all. *Pope*.—Resemblance; likeness; sometimes with the particle *between*.—This relation is likewise seen in the agreeableness between man and the other parts of the universe. *Grew*.

AGREEABLY, *adv.* Consistently with; in a manner suitable to. Pleasingly.

AGREED, *part. adj.* Settled by consent.

AGREEINGNESS, *f.* Consistence; suitability.

AGREEMENT, *f.* [*agrement*, Fr. in law Latin *agreementum*, which Coke would willingly derive from *aggregatio mentium*.] Concord.—What agreement is there between the hyna and the dog? and what peace between the rich and the poor? *Eccclus. xiii. 18*.—Resemblance of one thing

to another.—The division and quavering which please so much in music, have an agreement with the glittering of light, as the moon-beams playing upon a wave. *Bacon*.—Compact; bargain; conclusion of controversy; stipulation.—Make an agreement with me by a present, and come out to me, and then eat ye every man of his own vine, and every one of his fig-tree. *2 Kings*, xviii. 31.

AGREEMENT, in law, is of three kinds:—1. An agreement executed already at the beginning; as where money is paid for the thing agreed on, or other satisfaction made. 2. An agreement after an act done by another; as where one doth such a thing, and another person agrees to it afterwards, which is executed also. 3. An agreement executory, or to be performed in future. This last sort of agreement may be divided into two parts; one certain at the beginning; the other, when, the certainty not appearing at the first, the parties agree that the thing shall be performed upon the certainty known. *Terms of the Law*.

An agreement put in writing only for remembrance, doth not change its nature; but, if it be put in writing, sealed and delivered, it is of greater force. *Hob. 79*.

By the statute of frauds, 29 Car. II. c. 3. all agreements for lands shall be in writing, signed by the parties, otherwise they shall only have effect as estates at will. And no action shall be brought, to charge any person upon any special promise to answer for the debt of another person, or upon any contract of marriage, or upon any agreement not to be performed within a year, unless the same be put in writing, and signed by the party charged therewith.

AGRESTIC, or AGRESTICAL, *adj.* [from *agrestis*, Lat.] Having relation to the country; rude; rustic.

AGRIA, called by the Germans Eger, is a small but strong town in Upper Hungary, and is a bishop's see. It is situated on a river of the same name, and has a citadel called Eriaw. It was besieged by the Turks in 1552, with 70,000 men: but they lost 8000 in one day; and were obliged to raise the siege, though the garrison consisted only of 2000 Hungarians, assisted by the women, who performed wonders on this occasion. However, it was afterwards taken by Mahomet III. in 1596; but was retaken by the emperor in 1687; since which time it has continued under the dominion of the house of Austria. It is forty-seven miles north-east of Buda, and fifty-five south-west of Cassovia. Lat. 48. 10. N. lon. 20. 10. E.

AGRIA, *f.* in medicine, is a malignant pustule, of which there are two sorts; one is small, and casts a roughness or redness over the skin, slightly corroding it, smooth about its centre, spreads slow, and is of a round figure; this sort is cured by rubbing it with the saliva before having breakfasted; the second sort ulcerates, with a violent redness and corrosion, so as to make the hair fall off. It is of an unequal form, and turns leprous; its cure is the application of pellitory of the wall in the manner of a poultice.

AGRICOLA (Cneus Junius), born at Ferjus in Provence, was, in Vespasian's time, made lieutenant to Vettius Bolanus in Britain; and, upon his return, was ranked by that emperor among the patricians, and made governor of Aquitania. This post he held three years; and, upon his return, was chosen consul, and afterward appointed governor of Britain, where he greatly distinguished himself. He reformed many abuses occasioned by the avarice or negligence of former governors, put a stop to extortion, and caused justice to be impartially administered. Vespasian dying about this time, his son Titus, knowing the great merit of Agricola, continued him in the government. In the spring, he marched towards the north, where he made some new conquests, and ordered forts to be built for the Romans to winter in. He spent the following winter in concerting schemes to bring the Britons to conform to the Roman customs. He thought the best way of diverting them from rising and taking arms, was to soften their rough manners, by proposing to them new kinds of pleasure, and inspiring them with a desire of imitating the Roman manners. Soon after this, the country was adorned with magnificent temples, ports,

cos, baths, and many other fine buildings. The British nobles had at length their sons educated in learning; and they, who before had the utmost aversion to the Roman language, now began to study it with great assiduity: they were likewise the Roman habit; and, as Tacitus observes, they were brought to consider those things as marks of politeness, which were only so many badges of slavery. Agricola, in his third campaign, advanced as far as the Tweed; and, in his fourth, he subdued the nations betwixt the Tweed and the friths of Edinburgh and Dumbritten, into which the rivers Glottra and Bodotria discharge themselves; and here he built fortresses to shut up the nations yet unconquered. In his fifth, he marched beyond the friths; where he made some new acquisitions, and fixed garrisons along the western coasts, over against Ireland. In his sixth campaign he passed the river Bodotria, ordering his fleet, the first which the Romans ever had in that country, to row along the coasts, and take a view of the northern parts. In the following spring, the Britons raised an army of 30,000 men; and the command was given to Galgacus, who, according to Tacitus, made an excellent speech to his countrymen on this occasion. Agricola likewise addressed his men in very strong and eloquent terms. The Romans gained the victory, and 10,000 of the Britons are said to have been killed. This happened in the reign of the emperor Domitian; who, growing jealous of the glory of Agricola, recalled him, under pretence of making him governor of Syria. Agricola died soon after; and his death is suspected to have been occasioned by poison given him by that emperor. Tacitus the historian married his daughter, wrote his life, and laments his death in the most pathetic manner.

AGRICOLA (George), a German physician, famous for his skill in metals. He was born at Glaucha, in Misnia, the 24th of March, 1494. The discoveries which he made in the mountains of Bohemia, gave him so great a desire of examining accurately into every thing relating to metals, that, though he had engaged in the practice of physic at Joachimsthal by advice of his friends, he still prosecuted his study of fossils with great assiduity; and at length removed to Chemnitz, where he entirely devoted himself to this study. He wrote several pieces upon this and other subjects; and died at Chemnitz the 21st of November, 1555.

AGRICOLA (John), a Saxon divine, born at Ilsebe, in 1492. He went as chaplain to count Mansfield, when that nobleman attended the elector of Saxony to the diet of Spire in 1526, and that of Ausburg in 1530. He was of a restless ambitious temper, rivalled and wrote against Melancthon, and gave count Mansfield occasion to reproach him severely. He obtained a professorship at Wittemberg, where he taught particular doctrines, and became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his very good friend. But, though he was never able to recover the favour either of the elector of Saxony or of Luther, he received some consolation from the fame he acquired at Berlin: where he became preacher at court; and was chosen in 1548, in conjunction with Julius Phlug and Michael Heldingus, to compose the famous *Interim*, which made so much noise in the world. He died at Berlin in 1566.

AGRICULTATION, *f.* [from *agri colare*, Lat.] Culture of the ground.

AGRICULTURE, *f.* [*agricultura*, Lat.] The art of husbandry, tillage, cultivation, improvement of the land, &c. For a complete Treatise on this important art, with all the late discoveries and improvements, see the article **HUSBANDRY**.

AGRIFOLIUM, or **AQUIFOLIUM**, *f.* in botany. See **ILEX**.

AGRIGENTUM, anciently a city of Sicily, part of the site of which is now occupied by a town called Girgenti. According to ancient authors, Dedalus, the most famous mechanician of fabulous antiquity, fled to this

spot for protection against Minos, and built many wonderful edifices for Cocalus king of the island. Long after his flight, the people of Gela sent a colony thither 600 years before the birth of Christ; and from the name of a neighbouring stream called the new city Acragas, whence the Romans formed their word Agrigentum. These Greeks converted the ancient abode of the Siculi into a citadel, to guard the magnificent city which they erected on the hillocks below.

An advantageous situation, a free government with all its happy effects, and an active commercial spirit, exalted their commonwealth to a degree of riches and power unknown to the other Greek settlements, Syracuse alone excepted. But the prosperity of Agrigentum appears to have been but of short duration, and tyranny soon destroyed its liberties.

Phalaris was the first that reduced it to slavery. His name is familiar to most readers on account of his cruelty, and the brazen bull in which he tortured his enemies. See **PHALARIS**.—Phalaris met with the common fate of tyrants, and after his death the Agrigentines enjoyed their liberty for 150 years; at the expiration of which term Thero usurped the sovereign authority. The moderation, justice, and valour, of this prince, preserved him from opposition while living, and have rescued his memory from the obloquy of posterity. He joined his son-in-law Gelo, king of Syracuse, in a war against the Carthaginians; in the course of which victory attended all his steps, and Sicily saw herself for a time delivered from her African oppressors. Soon after his decease, his son Thrasyldeus was despoiled of the diadem, and Agrigentum restored to her old democratical government. Ducetius next disturbed the general tranquillity. He was a chief of the mountaineers, descendants of the Siculi; and was an overmatch for the Agrigentines while they were unsupported by alliances, but sunk under the weight of their union with the Syracusans. Some trifling altercations dissolved this union, and produced a war, in which the Agrigentines were worsted, and compelled to submit to humiliating terms of peace. Repentment led them to embrace with joy the proposals of the Athenians, then meditating an attack upon Syracuse. Their new friends soon made them feel that the sacrifice of liberty and fortune would be the price of their protection; and this consideration brought them speedily back to their old connections. But, as if it had been decreed that all friendship should be fatal to their repose, this reconciliation and its effects drew upon them the anger of the Carthaginians. By this enemy their armies were routed, their city taken, their race almost extirpated, and scarcely a vestige of magnificence was left. Agrigentum lay fifty years buried under its own ruins; when Timoleon, after triumphing over the Carthaginians, and restoring liberty to Sicily, collected the descendants of the Agrigentines, and sent them to re-establish the dwellings of their forefathers. Their exertions were rewarded with astonishing success; for Agrigentum rose from its ashes with such a renewal of vigour, that in a very short time we find it engaged in the bold scheme of seizing a lucky moment, when Agathocles and Carthage had reduced Syracuse to the lowest ebb, and arrogating to itself supremacy over all the Sicilian republics. Xenodocus was appointed the leader of this arduous enterprise; and, had his latter operations been as fortunate as his first campaign, Agrigentum would have acquired such a preponderance of reputation and power, that the rival states would not even have dared to attack it. But a few brilliant exploits were succeeded by a severe overthrow; the Agrigentines lost courage, disagreed in council, and humbly sued for peace to Agathocles. This commonwealth afterwards took a strong part with Pyrrhus; and, when he left Sicily to the mercy of her enemies, threw itself into the arms of Carthage. During the first Punic war, Agrigentum was the head-quarters of the Carthaginians, and was besieged by the Roman consuls, who after eight months blockade took it by storm. It nevertheless changed mas-

ters several times during the contest between these rival states, and in every instance suffered the most cruel outrages. After this period very little mention of it occurs in history, nor do we know the precise time of the destruction of the old city and the building of the new one. See GIRGENTI.

The principal part of the ancient city lay in the vale; the present town, called Girgenti, occupies the mountain on which the citadel of Cocalus stood.

It was difficult to be more judicious and fortunate in the choice of situation for a large city. The inhabitants were here provided with every requisite for defence, pleasure, and comfort of life; a natural wall, formed by abrupt rocks, presented a strong barrier against assailants; pleasant hills sheltered them on three sides without impeding the circulation of air; before them a broad plain watered by the Acragas, gave admittance to the sea-breeze, and to a noble prospect of that awful element; the port or emporium lay in view at the mouth of the river, and probably the road across the flat was lined with gay and populous suburbs.

The hospitality and parade for which the Agrigentines are celebrated in history were supported by an extensive commerce; by means of which, the commonwealth was able to resist many shocks of adversity, and always to rise again with fresh splendour. It was, however, crushed by the general fall of Grecian liberty; the feeble remnants of its population, which had survived so many calamities, were at length driven out of its walls by the Saracens, and obliged to lock themselves up for safety among the bleak and inaccessible rocks of the present city.

At the north-east angle of the ancient limits, upon some foundations of large regular stones, a church has been erected; a road appears hewn in the solid rock for the convenience of the votaries that visited this temple in ancient days. It was then dedicated to Ceres and her daughter Proserpine, the particular patronesses of Sicily. Bishop Blaife succeeded to their honours.

At the south-east corner, where the ground, rising gradually, ends in a bold eminence, which is crowned with majestic columns, are the ruins of a temple said to have been consecrated to Juno. To the west of this stands the building commonly called the *Temple of Concord*; the stone of which, and the other buildings, is the same as that of the neighbouring mountains and cliffs, a conglutination of sea-sand and shells, full of perforations, of a hard and durable texture, and a deep reddish brown colour. This Doric temple has all its columns, entablature, pediments, and walls, entire; only part of the roof is wanting. It owes its preservation to the piety of some Christians, who have covered half the nave, and converted it into a church consecrated under the invocation of St. Gregory bishop of Girgenti.

Proceeding in the same direction, you walk between rows of sepulchres cut in the rock wherever it admitted of being excavated by the hand of man, or was so already by that of nature. Some masses of it are hewn into the shape of coffins; others drilled full of small square holes employed in a different mode of interment, and serving as receptacles of urns. One ponderous piece of the rock lies in an extraordinary position; by the failure of its foundation, or the shock of an earthquake, it has been loosened from the general quarry, and rolled down the declivity, where it now remains supine with the cavities turned upwards. Only a single column marks the confused heap of moss-grown ruins belonging to the temple of Hercules. It stood on a projecting rock above a chasm in the ridge, which was cut through for a passage to the emporium.

In the same tract, over some hills, is situated the building usually called the *Tomb of Thero*. It is surrounded by aged olive-trees, which cast a wild irregular shade over the ruin. The edifice inclines to the pyramidal shape, and consists at present of a triple plinth, and a base sup-

porting a square pedestal: upon this plain solid foundation is raised a second order, having a window in each front, and at each angle two Ionic pilasters crowned with an entablature of the Doric order. Its inside is divided into a vault, a ground room, and one in the Ionic story, communicating with each other by means of a small internal stair-case.

In the plain are seen the fragments of the temple of Esculapius; part of two columns and two pilasters, with an intermediate wall, support the end of a farm-house, and were probably the front of the cella. Pursuing the track of the walls towards the west, you arrive at a spot which is covered with the gigantic remains of the temple of Jupiter the Olympian, minutely described by Diodorus Siculus. It may literally be said that it has not one stone left upon another; and it is barely possible, with the help of much conjecture, to discover the traces of its plan and dimensions. Diodorus calls it the largest temple in the whole island: but adds, that the calamities of war caused the work to be abandoned before the roof could be put on; and that the Agrigentines were ever after reduced to such a state of poverty and dependence, that they never had it in their power to finish this superb monument of the taste and opulence of their ancestors. The length of this temple was 370 Greek feet, its breadth sixty, and its height 220, exclusive of the foundations or basement story; the extent and solidity of its vaults and underworks were wonderful; its spacious porticoes and exquisite sculpture were suited to the grandeur of the whole. It was not built in the usual style of Sicilian temples with a cella of massive walls and a pterygium, but was designed in a mixed taste with half columns let into the walls on the outside, the inside exhibiting a plain surface.

The next ruin belongs to the temple of Castor and Pollux; vegetation has covered the lower parts of the building, and only a few fragments of columns appear between the vines. This was the point of the hill where the wall stopped on the brink of a large fish-pond spoken of by Diodorus: it was cut in the solid rock thirty feet deep, and water was conveyed to it from the hills. In it was bred a great quantity of fish for the use of public entertainments; swans and various other kinds of wild fowl swam along its surface, for the amusement of the citizens, and the great depth of water prevented an enemy from surprising the town on that side. It is now dry, and used as a garden. On the opposite bank are two tapering columns without their capitals, most happily placed in a tuft of carob trees. Monte Toro, where Hanno encamped with the Carthaginian army, before the Roman consuls drew him into an engagement that ruined his defensive plan, is a noble back ground to this picturesque group of objects.

The whole space comprehended within the walls of the ancient city abounds with traces of antiquity, foundations, brick-arches, and little channels for the conveyance of water; but in no part are any ruins that can be presumed to have belonged to places of public entertainment. This is the more extraordinary, as the Agrigentines were a sensual people, fond of shows and dramatic performances, and the Romans never dwelt in any place long without introducing their savage games. Theatres and amphitheatres seem better calculated than most buildings to resist the outrages of time; and it is surprising that not even the vestiges of their form should remain on the ground.

AGRIMONIA, *f.* [from its abounding (*agris*) in the fields.] In botany, a genus of the dodecandria digynia class, ranking in the natural order of fenticosæ. The generic characters are—Calyx: perianthium one-leaved, five-cleft, acute, small, superior, permanent, fenced with an outer calyx. Corolla: petals five, flat, emarginate; claws narrow, inserted into the calyx. Stamina: filaments capillary, shorter than the corolla, inserted into the calyx; anthers small, twin, compressed. Pistillum: germ inferior; styles simple, the length of the stamens; stigmas obtuse. Pericarpium: none; calyx contracted at the neck, and

and hardened. Seeds: two, roundish.—*Essential Character.* Calyx five-cleft, fenced with another; petals five; seeds two, at the bottom of the calyx.

Species. 1. *Agrimonia eupatoria*, or common agrimony: stem-leaves pinnate, the end-lobe petiolate, fruits hispid. This species is a native of woods, shady places, hedges, and borders of corn-fields, in Great Britain, and most parts of Europe. It is perennial, and flowers in June and July. The root in spring is sweet-scented, and the flowers fresh gathered smell like apricots. Kalm informs us, that the Canadians use an infusion of the root in burning fevers, with great success. Dr. Hill affirms, that an infusion of six ounces of the crown of the root, in a quart of boiling water, sweetened with honey, and half a pint of it drunk three times a day, is an effectual cure for the jaundice. He advises to begin with a vomit, afterwards to keep the bowels soluble, and to continue the medicine so long as any symptoms of the disease remain. The leaves make a pleasant tea, said to be serviceable in hæmorrhages, and in obstructions of the liver and spleen. The country people also use them sometimes by way of cataplasm in contusions and fresh wounds. When this plant is coming into flower, it will dye wool a good bright full Nankeen colour: gathered in September, it yields a darker yellow. It gives a good dye at all times, and, being a common plant easily cultivated, deserves to have trials made of it by the dyers. In the Berlin acts it is recommended for dressing leather. Sheep and goats eat it, but kine, horses, and swine, refuse it.

2. *Agrimonia repens*, or creeping agrimony: stem-leaves pinnate, the end-lobe sessile, fruits hispid. This is of humble growth, seldom rising above two feet high; the pinnae of its leaves are longer and narrower than those of the former, and the spikes of flowers very short and thick. The roots spreading widely, it multiplies faster than the common sort; the seeds also are much larger and rougher. This was sent by M. Tournéfort to the royal garden at Paris; and from hence other botanic gardens have been supplied with it. It much resembles the foregoing, but the stems are shorter, thicker, and hirsute; the stipules are the length of the interstices, are reflected, and almost cover the whole stem. The end-lobe is not pedicelled, and the spike is short, dense, sessile, with bractes the length of the flower.

3. *Agrimonia decumbens*: leaves pinnate hirsute, stem procumbent, fruits every way hispid-hooked. A native of the Cape of Good Hope.

4. *Agrimonia agrimonoides*, or three-leaved agrimony: stem-leaves ternate, fruits smooth. Native of Italy and Carniola, in moist woods, and among bushes.

5. *Agrimonia parviflora*, or small-flowered agrimony: stem-leaves pinnate, leaflets many lanceolate, petals half as long again as the calyx, fruits hispid. Native of North America, and flowers in July.

Propagation and Culture. These are hardy perennial plants, which will thrive in almost any soil or situation, and require no other care than to keep them clear from weeds. They may be propagated by parting their roots, which should be done in autumn, when their leaves begin to decay, that the plants may be well established before the spring. They should not be planted nearer than two feet, that their roots may have room to spread. They may also be propagated by seeds, which should be sown in autumn; for, if they are kept out of the ground till spring, they seldom come up the same season.

AGRIMONIA, *f.* in botany. See *BIDENS* and *TRIUMFETTA*.

AGRIMONOIDES, *f.* in botany. See *AGRIMONIA*.

AGRIMONY (Bastard-Hemp), *f.* in botany. See *AGERATUM*.

AGRIMONY (Hemp), *f.* in botany. See *EUPATORIUM*.

AGRIMONY (Water-Hemp), *f.* in botany. See *BIDENS*.

AGRIONIA, *f.* in Grecian antiquity, festivals annually celebrated by the Bœotians in honour of Bacchus. At

these festivals, the women pretended to search after Bacchus as a fugitive; and, after some time, gave over their enquiry, saying, that he was fled to the Muses, and was concealed among them.

AGRIOPHAGI, *f.* in antiquity, a name given to those who fed on wild beasts. The word is Greek, compounded of *αγριος*, "wild, savage," and *φαγω*, "I eat." The name is given, by ancient writers, to certain people, real or fabulous, said to have fed altogether on lions and panthers. Pliny and Solinus speak of Agriophagi in Ethiopia, and Ptolemy of others in India on this side the Ganges.

AGRIPPA, *f.* in midwifery, a term applied to children brought forth with their feet foremost.

AGRIPPA (Herod), the son of Aristobulus and Mariamne, and grandson to Herod the Great, was born in the year of the world 3997, three years before the birth of our Saviour, and seven years before the vulgar æra. After the death of Aristobulus his father, Josephus informs us, that Herod his grandfather took care of his education; and sent him to Rome to make his court to Tiberius. The emperor conceived a great affection for Agrippa, and placed him near his son Drusus. Agrippa very soon won the graces of Drusus, and of the empress Antonia. But, Drusus dying suddenly, all those who had been much about him were commanded by Tiberius to withdraw from Rome, lest the sight and presence of them should renew his affliction. Agrippa, who had indulged his inclination to liberality, was obliged to leave Rome overwhelmed with debts, and in a very poor condition. He did not think it fit to go to Jerusalem, because he was not able to make a figure there suitable to his birth. He retired, therefore, to the castle of Massada, where he lived rather like a private person than a prince. Herod the Tetrarch, his uncle, who had married Herodias his sister, assisted him for some time with great generosity. He made him principal magistrate of Tiberias, and presented him with a large sum of money: but all this was not sufficient to answer the excessive expences and profusion of Agrippa; so that Herod growing weary of assisting him, and reproaching him with his bad œconomy, Agrippa took a resolution to quit Judea and return to Rome. Upon his arrival, he was received into the good graces of Tiberius, and commanded to attend Tiberius Nero, the son of Drusus. Agrippa, however, having more inclination for Caius the son of Germanicus, and grandson of Antonia, chose rather to attach himself to him; as if he had some prophetic views of the future elevation of Caius, who at that time was beloved by all the world. The great assiduity and agreeable behaviour of Agrippa so far engaged this prince, that he kept him continually about him.

Agrippa being one day overheard by Eutyches, a slave whom he had made free, to express his wishes for Tiberius's death and the advancement of Caius; the slave betrayed him to the emperor; whereupon Agrippa was loaded with fetters, and committed to the custody of an officer. Tiberius soon after dying, and Caius Caligula succeeding him, the new emperor heaped many favours and much wealth upon Agrippa; changed his iron fetters into a chain of gold; set a royal diadem upon his head; and gave him the tetrarchy which Philip, the son of Herod the Great, had been possessed of, that is, Batanea and Trachonitis. To this he added that of Lyfania; and Agrippa returned very soon into Judea to take possession of his new kingdom.

Caius being soon after killed, Agrippa, who was then at Rome, contributed much by his advice to maintain Claudius in possession of the imperial dignity, to which he had been advanced by the army. But in this affair Agrippa acted a part wherein he shewed more cunning and address than sincerity and honesty; for, while he made a show of being in the interest of the senate, he secretly advised Claudius to be resolute, and not to abandon his good fortune. The emperor, as an acknowledgement for his kind offices, gave him all Judea and the kingdom of Chalcis, which

which had been possessed by Herod his brother. Thus Agrippa became on a sudden one of the greatest princes of the east; and was possessed of as much, if not more, territories than what had been held by Herod the Great his grandfather. He returned to Judea, and governed it to the great satisfaction of the Jews. But the desire of pleasing them, and a mistaken zeal for their religion, induced him to commit an unjust action, the memory of which is preserved in Scripture, Acts xii. 1, 2, &c. for about the feast of the passover, in the year of Christ 44, St. James major, the son of Zebedee and brother to St. John the Evangelist, was seized by his order and put to death. He proceeded also to lay hands on St. Peter, and imprisoned him, waiting till the festival was over, that he might have him executed. But, God having miraculously delivered St. Peter from the place of his confinement, the designs of Agrippa were frustrated. After the passover, this prince went from Jerusalem to Cæsarea, and there had games performed in honour of Claudius. Here the inhabitants of Tyre and Sidon waited on him to sue for peace. Agrippa being come early in the morning to the theatre, with a design to give them audience, seated himself on his throne, dressed in a robe of silver tissue, worked in the most admirable manner. The rising sun darted on it with its rays, and gave it such a lustre as the eyes of the spectators could not endure. When therefore the king spoke to the Tyrians and Sidonians, the parasites around him began to say, that it was the voice of a god and not that of a man. Instead of rejecting these impious flatteries, Agrippa received them with an air of complacency; but at the same time observed an owl above him on a cord. He had seen the same bird before when he was in bonds by order of Tiberius; and it was then told him, that he should be soon at liberty: but that, whenever he saw the same thing a second time, he should not live above five days afterwards. He was therefore extremely terrified; and he died at the end of five days, racked with tormenting pains in his bowels, and devoured with worms. Such was the death of Herod Agrippa, after a reign of only seven years.

AGRIPPA II. son of the preceding, was made king of Chalcide; but, about four years after, he was deprived of that kingdom by Claudius, who gave him in the place of it other provinces. In the war Vespasian carried on against the Jews, this prince sent him a succour of 2000 men; by which it appears, that, though a Jew by religion, he was yet entirely devoted to the Romans, whose assistance indeed he wanted, to secure the peace of his own kingdom. He lived to the third year of Trajan, and died at Rome, A. C. 100. He was the seventh and last king of the family of Herod the Great. It was before him, and Berenice his sister, that St. Paul pleaded his cause at Cæsarea.

AGRIPPA (Marcus Vespasianus), son-in-law to Augustus, of mean birth, but one of the most considerable generals among the Romans. Augustus's victory over Pompey and Mark Antony was owing to his counsel. He adorned the city with the pantheon, baths, aqueducts, &c.

AGRIPPA (Henry Cornelius), a man of considerable learning, and a great magician according to report, was born at Cologne, the 14th of September, 1486, of a noble family. He was very early in the service of the emperor Maximilian; acted at first as his secretary; but, being no less soiled for the sword than the pen, he afterwards took to the profession of arms, and served that emperor seven years in Italy, where he distinguished himself in several engagements, and received the honour of knighthood for his gallant behaviour. To his military honours he was desirous likewise to add those of the universities, and accordingly took the degrees of doctor of laws and physic. He was a man of an extensive genius, and well skilled in many parts of knowledge, and a variety of languages. His insatiable curiosity, the freedom of his pen, and the inconstancy of his temper, involved him in many misfortunes: he was continually changing his situation; always engaging himself in some difficulty or other; and,

to complete his troubles, he drew upon himself the hatred of the ecclesiastics by his writings. In order to ingratiate himself into the favour of Margaret of Austria, governess of the Low Countries, he composed a treatise "On the Excellence of Women;" but the persecution he met with from the monks prevented him from publishing it, and obliged him to go over to England, where he wrote a Commentary upon St. Paul's Epistles. Upon his return to Cologne, he read public lectures upon those questions in divinity which are called *Quodlibetales*.

In the year 1515, he read lectures upon Mercurius Trismegistus at Pavia. He left this city the same year, or the year following. By his second book of Letters we find, that his friends endeavoured to procure him some honourable settlement at Grenoble, Geneva, Avignon, or Metz: he chose the last of these places; and in 1518, was employed as syndic, advocate, and counsellor, for that city. The persecutions raised against him by the monks, because he had refuted a vulgar notion about St. Anne's three husbands, and because he protected a countrywoman who was accused of witchcraft, obliged him to leave the city of Metz. Agrippa retired to Cologne in the year 1520, leaving without regret a city which those turbulent inquisitors had rendered averse to all polite literature and real merit. He left his own country in 1521, and went to Geneva: here his income must have been considerable; for he complains of not having enough to defray his expenses to Chamberi, in order to solicit a pension from the duke of Savoy. In this however his hopes were disappointed; and, in 1523, he removed to Fribourg, in Switzerland. The year following he went to Lyons, and obtained a pension from Francis I. He was appointed physician to the king's mother; but this did not turn out so much to his advantage as might be expected, nor did he attend her at her departure from Lyons, in August 1525, when he went to conduct her daughter to the borders of Spain. He was left behind at Lyons, and was obliged to implore the assistance of his friends in order to obtain his salary; and, before he received it, had the mortification of being informed that he was struck off the list. The cause of his disgrace was, that, having received orders from his mistress to examine by the rules of astrology what success would attend the affairs of France, he too freely expressed his dislike that she should employ him in such idle curiosities, instead of things of consequence: at which the lady was highly offended; and became yet more irritated against him, when she understood that his astrological calculations promised new successes to the constable of Bourbon. Agrippa, finding himself thus abandoned, gave way to the utmost rage and impetuosity of temper: he wrote several menacing letters, and threatened to publish some books, wherein he would expose the secret history of those courtiers who had worked his ruin: nay, he proceeded so far as to say, that he would for the future account that prince, to whom he had been counsellor and physician, as a cruel and perfidious Jezebel.

He now resolved to remove to the Low Countries; this he could not do without a passport, which he at length obtained, after many tedious delays, and arrived at Antwerp in July 1528. The duke de Vendome was the principal cause of these delays; for he, instead of signing the passport, tore it in pieces in a passion, protesting he would never sign it for a conjurer. In 1529, Agrippa had invitations from Henry king of England, from the chancellor of the emperor, from an Italian marquis, and from Margaret of Austria, governess of the Low Countries: he preferred the last, and accepted of being historiographer to the emperor, which was offered him by that prince. He published, by way of introduction, the History of the Government of Charles V. Soon after, Margaret of Austria died, and he spoke her funeral oration. His treatise "Of the Vanity of the Sciences," which he published in 1530, greatly enraged his enemies; and that which he soon after printed at Antwerp, "Of the Occult Philosophy," afforded them fresh prettexts for defaming his reputation,

putation. It was lucky for him that cardinal Campejus, the pope's legate, and the cardinal de la Mark, bishop of Liege, spoke in his favour. Their kind offices, however, could not procure him his pension as historiographer, nor prevent him from being thrown into prison at Brussels, in the year 1531. But he soon regained his liberty, and the year following paid a visit to the archbishop of Cologne, to whom he had dedicated his "Occult Philosophy," and from whom he had received a very obliging letter in return. The inquisitors endeavoured to hinder the impression of this work when he was about to print a second edition with emendations and additions; however, notwithstanding all their opposition, he finished it in 1533. He staid at Bonne till 1535; when he returned to Lyons, he was imprisoned for what he had written against the mother of Francis I. but he was soon released from his confinement, at the desire of several persons, and went to Grenoble, where he died the same year. Agrippa was accused of having been a magician and forcerer, and in compact with the devil; but we shall not offer such an affront to the understandings of our readers as to aim at clearing him from this imputation. However, as Mr. Bayle says, if he was a conjurer, his art availed him little, for he was often in danger of wanting bread. Besides the works already mentioned of Agrippa, he wrote also a Commentary upon the Art of Raimund Lull, and a Dissertation on Original Sin, wherein he asserts, that the fall of our first parents was owing to their immodesty and lust. We must not omit mentioning the Key he wrote to his "Occult Philosophy," which he reserved only for his friends of the first rank, and he explained it in a manner not very different from the doctrines of the Quietists. There was an edition of his works, printed at Lyons, 1550, in three volumes, 8vo.

AGRIPPINA, daughter of Germanicus, sister of Caligula, and mother of Nero; a woman of wit, but excessively lewd. She was thrice married, the last time to Claudius her own uncle, whom she poisoned to make way for Nero her son. Nero afterwards caused her to be murdered in her chamber, when she bade the executioner stab her first in the belly that had brought forth such a monster.

AGRIPPINA COLONIA UBIORUM, an ancient city, now Cologne: so called from Agrippina, who had a colony sent thither at her request by the emperor Claudius, to honour the place of her birth. See COLOGNE.

AGRIPPINIANS, in church-history, the followers of Agrippinus bishop of Carthage, in the third century, who first introduced and defended the practice of rebaptization.

AGROM, a disease frequent in Bengal and other parts of the Indies, wherein the tongue chaps and cleaves in several places, being extremely rough withal, and sometimes covered with white spots. The Indians are very fearful of this disease, which they attribute to extreme heat of the stomach. Their remedy is, to drink some chalybeate liquors, or the juice of mint.

AGROSTEMMA, *f.* [*αγρου στεμμα*, the garland of the field.] In botany, a genus of the decandria pentagynia class, ranking in the natural order of caryophyllei. The generic characters are—Calyx: perianth one-leaved, coriaceous, tubulous, five-toothed, permanent. Corolla: petals five; claws the length of the tube of the calyx: border spreading, obtuse. Stamina: filaments awl-shaped, five alternately later than the other five, inserted into each claw of the petals. Antheræ simple. Pistillum: germ ovate. Styles, filiform, erect, the length of the stamens. Stigmas, simple. Pericarpium: capsule oblong-ovate, covered, one-celled, five-valved. Seeds: very many, kidney-shaped, dotted. Receptacles: free, as many as seeds; the interior ones gradually longer.—*Essential Character.* Calyx, one-leaved, coriaceous. Petals, five, clawed; border obtuse, undivided. Capsule, one-celled.

Species. 1. *Agrostemma githago*, corn-campion, or cockle: hirsute, calyx longer than the corolla, petals entire or slightly emarginate, and naked. Cockle is a com-

mon weed in corn-fields, enlivening them at the expence of the careless husbandman, along with poppy and blue-bottle; and flowering in June or July.

2. *Agrostemma coronaria*, or rose-campion: tomentose, leaves ovate-lanceolate, petals slightly emarginate, crowned, ferrate. This species is a native of Italy, the Valais, and Siberia, and is biennial. The single rose-campion has been long an inhabitant of the English gardens, whereby, its seed having scattered, it is become a kind of weed. There are three varieties of this plant, one with deep red, another with flesh-coloured, and a third with white, flowers, but these are of a small esteem; for the double rose-campion, being a fine flower, has turned the others out of most good gardens.

3. *Agrostemma flos jovis*, or umbellate rose-campion: tomentose, petals emarginate, flowers in a corymb. This flowers in July, and the seeds ripen in September. It grows naturally on the Swiss and Piedmontese mountains, and in the Palatinate.

4. *Agrostemma cœli rosa*, or smooth-campion: smooth, leaves linear-lanceolate, petals emarginate, crowned. It is a native of Italy, Sicily, and the Levant; and, being a plant of little beauty, is only preserved in botanic gardens for the sake of variety.

Propagation and Culture. The single rose-campions propagate fast enough by their seeds, and come up better from self-sown seed than when they are sown by hand. The variety with double flowers, never producing any seeds, is propagated by parting the roots; the best time for this is in autumn, after the flowers are past; and, in doing this, every head which can be slipped off with roots should be parted. These must be planted in a border of fresh undunged earth, at the distance of six inches one from the other, observing to water them gently until they have taken root; after which they will require no more, for much wet is very injurious to them; as is also dung. In this border they may remain until spring, when they should be removed into the borders of the flower-garden, where they will be very ornamental during the time of flowering, which is July and August.—The umbellate rose-campion must have a shady situation, and will thrive best in a moist soil.

AGROSTIS, *f.* [*αγρος*, a field.] In botany, a genus of the tryandria digynia class, of the natural order of graminæ or grasses. The generic characters are—Calyx: a one-flowered, bivalve, acuminate glume. Corolla: bivalve, acuminate, one valve larger than the other. Stamina: filaments longer than the corolla, with forked antheræ. Pistillum: germ roundish; styles reflex, villous, with stigmas longitudinally hispid. Pericarpium: corolla growing to the seed, not gaping. Seed: roundish, pointed at both ends, the corolla adhering closely to it.—*Essential Character.* Calyx, bivalve, one-flowered, a little less than the corolla. Stigmas, longitudinally hispid.

Description. It is well observed by Dr. Stokes, that this is an artificial genus; that some of the species have the structure of *Bromus* and others of *Avena*; and, that in general they are very ill ascertained. The absence or presence of the awn in the corolla, which is fixed upon as a primary mark of distinction, is inconstant; and therefore he recommends particular attention to be paid to the open or closed state in which the valves of the calyx are found, immediately after the shedding of the pollen and the ripening of the seed; and also whether the flowers are scattered or clustered. Some of the species are referred by Swartz to *andropogon*; and of others he has formed a new genus under the name of *chloris*.

Species. 1. Awned. 1. *Agrostis spica venti*, or silky bent-grass: the outer petal has a very long stiff awn; the panicle is spreading. In this species the leaves are from a line and half to three lines in breadth. Panicle very large, enormously many-flowered, often nodding, green when young, purple when ripe. Annual, and frequent in sandy corn-fields, flowering from June to August.

2. *Agrostis interrupta*, or interrupted-spike bent-grass: the

the outer petal awned; the panicle attenuated, contracted, interrupted. According to Haller this is a variety of the former. It is a native of France, Italy, Switzerland, Carniola, and Germany. Annual.

3. *Agrostis miliacea*, or millet bent-grass: the outer petal terminating in a straight stiff awn of a moderate length. This resembles the first, but the awn is only the length of the flowers. It is a native of Montpellier, Spain, Siberia.

4. *Agrostis bromoides*, or bromo-like bent-grass: panicle simple, narrowed; corolla pubescent; awn straight, longer than the calyx. It grows wild about Montpellier. Perennial.

5. *Agrostis australis*, or southern bent-grass: the panicle approaching to a spike; the seed ovate, pubescent; awn the length of the calyx. This is a native of Portugal.

6. *Agrostis arundinacea*, or reedy bent-grass: panicle oblong, outer petal villous at the base, and furnished with a writhed awn, longer than the calyx. It grows to the height sometimes of four, but most frequently two, feet; very erect, with two or three knots. The goat will almost die of hunger rather than eat it. The Calmuc Tartars weave mats of it, and thatch their huts with it. It grows in many parts of Europe. Perennial.

7. *Agrostis calamagrostis*, or branching bent-grass: panicle thickened; whole of the outer petal woolly, awned at the tip; culm branching. This resembles the former, and is a native of Germany, Switzerland, and about Verona.

8. *Agrostis serotina*, or late bent-grass: floscules oblong mucronate; culm covered with very short leaves. Observed by Seguier near Verona.

9. *Agrostis rubra*, or red bent-grass: flowering part of the panicle very spreading; outer petal smooth; awn terminal, spiral, recurved. It is common in Sweden and Scotland.

10. *Agrostis spiciformis*, or spiky bent-grass: panicle resembling a spike; flowers two-awned: one awn inserted into the receptacle, jointed and longer than the other, which is straight, and inserted below the tip of the corolla, which is rough. 11. *Agrostis hirsuta*, or hairy bent-grass: panicle approaching to a spike, culm and leaves hirsute, glumes of the corolla awned on the back, and bifid at the tip. Both these were found in the island of Teneriffe by Masson.

12. *Agrostis matrella*: the flowers in racemes, outer valve of the calyx bent in, the tip of the keel only gaping. Grows in the sandy lands of Malabar.

13. *Agrostis canina*, or brown bent-grass: calyx elongate, a recurved awn on the back of the petals; culms prostrate, a little branching.

14. *Agrostis stolonifera*, or creeping bent-grass: branches of the panicle spreading, naked; culm creeping; calyxes equal.

15. *Agrostis capillaris*, or fine bent-grass: panicles capillary, spreading, flexuose; calyxes subulate, equal, smooth, coloured. This is common in pastures and by road sides. Perennial.

16. *Agrostis sylvatica*, or wood bent-grass: panicle contracted; calyxes equal, those of the barren flowers shorter than the corolla, those of the fertile ones twice as long. With us it grows in moist woods, as Bishop's wood, and Hornsey wood near London. Perennial.

17. *Agrostis alba*, or white bent-grass: panicles loose; calyxes equal; culm creeping. Grows in ditches, marshes, and moist meadows. Perennial.

18. *Agrostis pumila*, or dwarf bent-grass: panicle on one side, culms erect in bunches. This is a native of Iceland, Sweden, Germany, and Switzerland; England in dry places; also Wales and Scotland. Perennial.

19. *Agrostis minima*, or least bent-grass: panicle filiform. This is a spring plant; it flowers early, and ripens its seed in May. Mr. Hudson says, it flowers in July. It is a native of France and Germany: discovered by Mr. Stillingfleet in Wales. Annual.

20. *Agrostis tenacissima*, or tough bent-grass: panicle

contracted, filiform: flowers linear, valves parallel. It is a native of the East-Indies. Perennial.

21. *Agrostis virginica*, or Virginian bent-grass: panicle contracted, leaves rolled inwards, subulate, rigid, standing out. It is an elegant little plant; the stalk somewhat compressed, and seldom rising above four or five inches from the root.

22. *Agrostis mexicana*, or Mexican bent-grass: panicle oblong heaped, calyx and corolla acuminate and nearly equal. It is very difficult to determine this species. It flowereth the second year, and has the appearance of CINNA. This is a native of South America. Introduced in 1780, by Mr. Gilbert Alexander.

23. *Agrostis purpurascens*, or purple bent-grass: panicle contracted elongate, branches pressed close upright, florets unequal acuminate. A native of Jamaica.

24. *Agrostis indica*, or Indian bent-grass: panicle contracted, racemes lateral, erect, alternate. This species is a native of India, and was introduced here in 1773, by John Earl of Bute.

25. *Agrostis ciliata*, or ciliate bent-grass: glume of the calyx angular, and ciliate. A native of Japan.

26. *Agrostis panicea*, or bearded bent-grass: branches of the panicle divulged; branches of the panicle appressed; panicle subspiked, branches and branchlets fascicled; valves of the calyx, and one of the corolla, awned; that of the corolla short. Linnaeus, who makes two species of this, allows that his *paniceus* resembles his *montpelienensis* very much, but that the whole plant is soft, and only a palm in height. The first grows in marshes and wet pastures; the second in a dry soil; to which their difference is probably owing.

27. *Agrostis lenta*, or forked bent-grass: spikes subtern, umbellate, floscules awnless, oblong, acute, calyxine valves subequal, leaves and sheaths smooth. Native of the East-Indies. Found there by John Gerrard Koenig, M. D. Introduced in 1778, by Sir Joseph Banks. It flowers in July and August. Annual.

28. *Agrostis complanata*, or flat-stalked bent-grass: spikes unbelled, smooth; outer calyxine valves awned; flattened leaves, and sheaths smooth. It is a native of Jamaica. Found by Mr. Gilbert Alexander. Introduced in 1779. It flowers in July and August. Perennial.

29. *Agrostis pungens*, or prickly bent-grass: panicle contracted, leaves involute stiff pungent; the upper ones obliquely opposite; culm branching. A native of Arabia and Barbary. The Arabs use it in the hæmorrhoids. In dry places off the coast of the county of Nice. Perennial.

30. *Agrostis vinealis*, or short-awned bent-grass: culms ascending; calyx coloured, awn nearly straight, from below the middle of the back, about as long as the calyx. It is a native of Switzerland and the north of England.

31. *Agrostis ovata*, or ovate-panicked bent-grass: outer petal awned below the tip: panicle ovate, contracted, spike-form. This is a native of New Zealand.

32. *Agrostis odorata*, or sweet bent-grass: spikes with the florets pointing one way, heaped together, awnless. A native of Cochin China, near the coast. This grass is esteemed by the Cochin Chinese for the excellence and permanency of its odour; they dry it to perfume their clothes with.

33. *Agrostis plicata*, or plaited-leaved bent-grass: leaves plaited; spike linear awnless. This is a native of the suburbs of Canton.

34. *Agrostis cinna*: panicle contracted awnless, flowers acuminate, with one, two, or three, stamens, leaves flat, scabrous. See CINNA.

35. *Agrostis diandra*: panicle elongate contracted, flowers subulate awnless two-stamened, leaves convolute. Sent by Koenig from the East-Indies, under the name of CINNA.

Propagation and Culture. See GRASS.

AGROSTIS, *f.* in botany. See SCHOENUS, AIRA, MILIUM, MELICA, and CENCHRUS.

AGROSTOGRAPHIA,

AGROSTOGRAPHIA, *f.* signifies the history or description of grasses. See **GRASS**.

AGROUND, *adv.* [from *a* and *ground*.] Stranded; hindered by the ground from passing farther.—With our great ships, we durst not approach the coast, we having been all of us *aground*. *Raleigh*.—It is likewise figuratively used for being hindered in the progress of affairs; as, The negociators were *aground* at that objection.

AGRYPNIA, *f.* among physicians, implies an inaptitude to sleep; a troublesome symptom of feverish and other disorders.

AGRYPNIA, in the Greek church, implies the vigil of any of the greater festivals.

AGUE, *f.* [*aigu*, Fr. acute.] An intermitting fever, with cold fits succeeded by hot. The cold fit is, in popular language, more particularly called the *ague*, and the hot the fever. See **MEDICINE**.

AGUE-CAKE, *f.* the popular name for a hard tumor on the left side of the belly, lower than the false ribs, said to be the effect of intermitting fevers.

AGUED, *adj.* Struck with an *ague*; shivering; chill; cold: a word in little use.

AGUE-FIT, *f.* The paroxysm of the *ague*.

AGUE-PROOF, *adj.* Proof against *agues*; able to resist the causes which produce *agues*, without being affected.

AGUE-TREE, *f.* a name given to the *sassafras*, on account of its febrifuge qualities.

AGUEPERSE, a town of France, situated on the Lyons, about fifteen miles north of Clermont.

AGUILLANEUF, or **AUGILLANEUF**, *f.* [from the French *à*, to, *gui*, misleto, and *l'an neuf*, the new year.] A form of rejoicing used among the ancient Franks on the first day of the year. Its origin is traced from a druid-ceremony: the priests used to go yearly in December, which with them was reputed a sacred month, to gather misleto of the oak in great solemnity. The prophets marched in the front, singing hymns in honour of their deities; after them came a herald with a caduceus in his hand; these were followed by three druids abreast, bearing the things necessary for sacrifice; last of all came the chief or arch druid, accompanied with the train of people. The chief druid, climbing the oak, cut off the misleto with a golden sickle, and the other druids received it in a white cloth; on the first day of the year it was distributed among the people, after having blessed and consecrated it by crying *A gui l'an neuf*, to proclaim the new year. This cry is still continued in Picardy, with the addition of *Plantez, Plantez*, to wish a plentiful year. In Burgundy and some other parts, the children use the same word to beg a new year's gift. Of latter times the name *aguillaneuf* was also given to a sort of begging, practised in some dioceses, for church tapers, on new year's day, by a troop of young people of both sexes. It was attended with various ridiculous ceremonies, which occasioned the synods to suppress it.

AGUILLAR, a town of Spain, in the province of Navarre, about twenty-four miles of Estella.

AGUILLAR DEL CAMPO, a town of Old Castile, with the title of marquise, about fifteen leagues north of the city of Burgos.

AGUILON or **AQUILON** (Francis), was a Jesuit of Brussels, and professor of philosophy at Douai, and of theology at Antwerp. He was one of the first that introduced mathematical studies into Flanders; and he wrote a large work on Optics, which was published in folio, at Antwerp, in 1613; and a Treatise of Projections of the Sphere. He promised also to treat upon Catoptrics and Dioptrics; but this was prevented by his death, which happened at Seville, in the year 1617.

AGUIRRA (Joseph Sænz de), a Benedictine, and one of the most learned men of the seventeenth century. He was censor and secretary of the supreme council of the inquisition in Spain, and interpreter of the scriptures in the university of Salamanca. He printed three volumes

in folio upon Philosophy, a Commentary upon Aristotle's ten books of Ethics, and other pieces. He died at Rome August 19, 1699.

To **AGUISE**, *v. a.* [from *a* and *guise*.] To dress; to adorn; to deck: a word not now in use.

AGUIISH, *adj.* Having the qualities of an *ague*:

So calm, and so serene, but now,
What means this change on Myra's brow?
Her *aguish* love now glows and burns,
Then chills and shakes, and the cold fit returns.

Granville.

AGUISHNESS, *f.* The quality of resembling an *ague*.

AGUL, *f.* in botany, a synonyme of the *hedyfarum*. See **HEDYSARUM**.

AGUR. The xxxth chapter of the Proverbs begins with this title: "The words of Agur, the son of Jakeh;" which, according to the signification of the original terms, may be translated, as the Vulgate has it, *Verba congregantis, filii vomentis*; which translation Le Clerc condemns, supposing these to be proper names, which ought not to be translated. These words are rendered by Louis de Dieu, "The words of him who has recollected himself, the son of obedience." The generality of the fathers and commentators will have it, that Solomon describes himself under the name of Agur the son of Jakeh; others conjecture that Agur, as well as Lemuel (in chap. xxxi. 1.) were wise men who lived in the time of Solomon, and were his interlocutors in the book of Proverbs; an opinion which F. Calmet thinks is without the least show of probability, this book being nothing like a dialogue. This last expositor thinks it probable, that Agur was an inspired author different from Solomon, whose sentences it was thought fit to join with those of this prince, because of the conformity of their matter.

AGURAH, *f.* in Jewish antiquity, the name of a silver coin, otherwise called *gerah* and *kefita*.

AGURIUM, or **AGYRIUM**, anciently a town of Sicily, in the Val di Demona, near the river Semetus. The people were called *Populus Agyrinensis* by Cicero; *Agyrinus* by Pliny. It was the birth-place of Diodorus Siculus, as he himself testifies; but he calls it *Argyrium*, as it is now called S. Philippo d'Argirione, which modern name seems to confirm that *Argyrium* is the true reading.

AGUSADURA, *f.* in ancient customs, a fee due from vassals to their lord for the sharpening their ploughing tackle. Anciently the tenants in some manors were not allowed to have their rural implements sharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called *agusadura*, in some places *agusage*: which some take to be the same with what was otherwise called *reillage*, from the ancient French *reille*, a ploughshare.

AGUTI, *f.* in zoology, the trivial name of a species of the mouse, belonging to the mammalia glires of Linnæus. See **MUS**.

AGYEI, *f.* in antiquity, a kind of obelisks, sacred to Apollo, erected in the vestibles of houses, by way of security.

AGYNEIA, *f.* [*α*, priv. and *γυν*, a wife.] In botany, a genus of the monoecia monadelphia class, ranking in the natural order of tricocceæ. The generic characters are—Male flowers below the female. Calyx: six-leaved; leaflets oblong, obtuse, equal, permanent. Corolla: none. In the male, instead of filaments, a column shorter than the calyx; three or four antheræ, oblong, growing to the column below the top. In the female flowers, germ of the size of the calyx, subovate, obtuse, perforated at top with a six-notched hole; neither style nor stigma. Pericarpium: supposed to be a tricocceous capsule.—*Essential Character.* Calyx six-leaved; corolla none. Male. Antheræ three, growing to the rudiment of a style. Female. Germ perforated at top: without style or stigma.—It is very distinct in the want of a style or stigma.

Species.

Species. 1. *Agyncia* impubes: leaves smooth on both sides. 2. *Agynia pubera*: leaves downy underneath. Both are natives of China.

AGYNIANI, *f.* [*α, priv.* and *γυν, woman.*] In church-history, a sect who condemned all use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil. They are sometimes called *Agyni*, and *Agynenses*; and are said to have appeared about the year 694. It is no wonder they were of no long continuance. Their tenets coincide in a great measure with those of the Abellians, Gnostics, Cerdonians, and other preachers of chastity and abstinence.

AGYRTÆ, *f.* [*αγυρται, Gr.* formed of the verb *αγυρω*, I congregate; alluding to the practice of the charlatans, who gather a crowd about them.] In antiquity, a kind of impostors who ran about the country telling fortunes, and pretending to cure diseases by charms, sacrifices, and other religious mysteries; also to expiate the crimes of their deceased ancestors, by virtue of certain odours and fumigations; or to torment their enemies, by the use of magical verses and the like. Among the Greeks, they amount to the same with *Æruscatores* among the Latins, and differ not much from *Gypsies* among us.

AH, *interj.* A word noting sometimes dislike and censure. Sometimes contempt and exultation. Sometimes, and most frequently, compassion and complaint:

Ah me! the blooming pride of May
And that of beauty are but one:

At morn both flourish bright and gay,
Both fade at evening, pale and gone.

Prior.

When it is followed by *that*, it expresses vehement desire:

In goodness, as in greatness, they excel;

Ah! that we lov'd ourselves but half so well. *Dryden.*

- **AHA! AHA!** *interj.* A word intimating triumph and contempt.—They opened their mouths wide against me, and said, *Aha! aha!* our eye hath seen it. *Psal. xxxv. 21.*

AHAB, son of Omri king of Israel, succeeded his father, and surpassed all his predecessors in impiety and wickedness. He married Jezebel the daughter of Ethbaal king of the Zidonians, who introduced the idols of Baal and Astarte among the Israelites, and engaged Ahab in the worship of these false deities. God, being provoked by the sins of Ahab, sent the prophet Elijah to him (1 Kings, xvii. 1, &c.) who declared to him, that there would be a famine of three years continuance. The dearth having lasted three years, the prophet desired Ahab to gather all the people to mount Carmel, and with them the prophets of Baal: when they were thus assembled, Elijah caused fire to descend from heaven upon his sacrifice, after which he obtained of God that it should rain; and then the earth recovered its former fertility. Six years after this, Ben-hadad king of Syria laid siege to Jerusalem. But God, provoked at this proud Syrian, sent a prophet to Ahab, not only to assure him of victory, but to instruct him likewise in what manner he was to obtain it. Ahab was ordered to review the princes of the provinces, which he found to be a choice company consisting of 232 young men, who were to command the people in Samaria, amounting to about 7000 men: with this small army Ahab was directed to fall upon the great host of the Syrians at noon-day, while Ben-hadad and the thirty-two kings that accompanied him were drinking and making merry. Ben-hadad, having notice that they were marching out of the city, ordered them to be brought before him alive, whatever their designs were: but the young men, followed by this small army, advanced; and, killing all that opposed them, such a panic seized the Syrian troops, that they began to fly; and even Ben-hadad himself mounted his horse and fled with his cavalry; which Ahab perceiving, pursued them, killed great numbers of them, and took a considerable booty. After this the prophet came to Ahab, to animate him with fresh courage, and to caution him to keep upon his guard; assuring him that Ben-hadad would

return against him the year following. According to this prediction, at the end of the year he returned and encamped at Aphek, with a resolution to give the Israelites battle. Both armies being ranged in order of battle for seven days successively, at length, upon the seventh day, a battle ensued, wherein the Israelites killed 100,000 of the Syrians, and the rest fled to Aphek; but, as they were pressing to get into the city, the walls of Aphek fell upon them and killed 27,000 more. Ben-hadad throwing himself upon the mercy of Ahab, this prince received him into his own chariot, and made an alliance with him. The year following, Ahab desiring to make a kitchen-garden near his palace, requested of Naboth, a citizen of Jezreel, that he would sell him his vineyard, because it lay convenient for him. But, being refused, he returned in great discontentment to his house, threw himself upon the bed, turned towards the wall, and would eat nothing. Jezebel his wife, coming in, asked the reason of his great concern; of which being informed, she procured the death of Naboth, and Ahab took possession of his vineyard. As he returned from Jezreel to Samaria, the prophet Elijah met him, and said, "Hast thou killed, and also taken possession? Now saith the Lord, In the place where dogs licked up the blood of Naboth, shall dogs lick thy blood, even thine. As for Jezebel, of her the Lord spake, saying, The dogs shall eat Jezebel by the way of Jezreel." These prophecies were literally fulfilled upon both.

AHÆTULA, *f.* the trivial name of a species of the coluber. See **COLUBER**.

AHASUERUS, or **ARTAXERXES**, the husband of Esther; and, according to archbishop Usher and F. Calmet, the scripture name for Darius, the son of Hystaspes, king of Persia; though Scaliger will have Xerxes to be the husband of Esther, or the Ahasuerus of scripture; and Dr. Prideaux believes him to be Artaxerxes Longimanus. See **HISTORY OF PERSIA**.

AHAZ, king of Judah, the son of Jotham, remarkable for his vices and impieties. One of his sons he consecrated, by making him pass through and perish by the fire, in honour of the false god Moloch; and he offered sacrifices and incense upon the high places, upon hills, and in groves. Rezin king of Syria, and Pekah king of Israel, invaded Judea in the beginning of the reign of Ahaz; and, having defeated his army, laid siege to Jerusalem. When they found that they could not make themselves masters of that city, they divided their army, plundered the country, and made the inhabitants prisoners of war. Rezin and his part of the confederate army marched with all their spoil to Damascus; but Pekah with his division of the army having attacked Ahaz, killed 120,000 men of his army in one battle, and carried away men, women, and children, without distinction, to the number of 200,000. But, as they were carrying those captives to Samaria, the prophet Oded, with the principal inhabitants of the city, came out to meet them; and by their remonstrances prevailed with them to set their prisoners at liberty. At the same time the Philistines and Edomites invaded other parts of his land, killed multitudes of the people, and carried off much booty. In this distressed condition, Ahaz, finding no other remedy for his affairs, sent ambassadors to Tiglath-pileser king of the Assyrians; and, to engage him in his interest, he stripped the temple and city of all the gold which he could meet with, and sent it as a present. Accordingly Tiglath-pileser marched to the assistance of Ahaz, attacked Rezin and killed him, took his capital Damascus, destroyed it, and removed the inhabitants thereof to Cyrene.

AHAZIAH, the son and successor of Ahab king of Israel, reigned two years, part of the time alone, and part with his father Ahab, who ordained him his associate in the kingdom a year before his death. Ahaziah imitated his father's impieties, (1 Kings xxii. 52.) and paid his adoration to Baal and Astarte, the worship of whom had been introduced in Israel by Jezebel his mother.

AHAZIAH,

AHAZIAH, king of Judah, the son of Jehoram and Athaliah, succeeded his father in the kingdom of Judah in the year of the world 3119. He walked in the ways of Ahab's house, to which he was allied, his mother being of that family. He reigned only one year, being slain by Jehu the son of Nimshi.

AHEAD, *adv.* [from *a* and *head*.] Farther onward than another. Headlong; precipitantly: used of animals, and figuratively of men.—It is mightily the fault of parents, guardians, tutors, and governors, that so many men miscarry. They suffer them at first to run *ahead*, and, when perverse inclinations are advanced into habits, there is no dealing with them. *L'Esfrange*.

AHEAD, in sea-language, signifies further onward than the ship, or at any distance before her, lying immediately on that point of the compass to which her stem is directed. It is used in opposition to *astern*, which expresses the situation of any object behind the ship.

AHEIGHT, *adv.* [from *a* and *height*.] Aloft; on high: —From the dread summit of this chalky bourn!
Look up *aheight*, the shrill-gorg'd lark so far
Cannot be seen or heard. *Shakespeare*.

AHICCYATLI, *f.* in zoology, the Indian name of a serpent resembling the rattlesnake, only it wants the rattles. It is as fatal in the effect of its poison as any known species of serpent.

AHIJAH, the prophet of Shilo. He is thought to be the person who spoke twice to Solomon from God, once while he was building the temple, 1 Kings vi. 11. at which time he promised him his protection; and at another time after his falling into all his irregularities, when God expressed his indignation with great threatenings and reproaches. Ahijah was one of those who wrote the annals or history of this prince, 2 Chron. ix. 29. The same prophet declared to Jeroboam that he would usurp the kingdom, 1 Kings xi. 29, &c. and that two heifers should alienate him from the Lord, meaning the golden calves erected by Jeroboam, one at Dan, the other at Bethel. About the end of Jeroboam's reign, toward the year of the world 3046, Abijah the son of that prince fell sick; upon which Jeroboam sent his wife to this prophet to enquire what would become of the child. The queen therefore went to Ahijah's house in Shilo, disguised; but the prophet, on hearing the sound of her feet, said, "Come in, thou wife of Jeroboam; why feignest thou thyself to be another? for I am sent to thee with heavy tidings." Then he commanded her to go and tell Jeroboam all the evil that the Lord had declared he would bring upon his house for his impieties; that so soon as she should enter into the city her son Abijah should die, and should be the only one of Jeroboam's house that should receive the honours of a burial.

AHITOPHEL, a native of Gillo, was for some time the counsellor of king David, whom he deserted, by joining in the rebellion of Abshalom. This prince, upon his assuming the crown of Israel, sent for Ahitophel from Gillo, to assist him with his advice; for at that time Ahitophel's counsels were considered as the oracles of God. Nothing gave David more uneasiness than this event; and when Hushai his friend came to wait on him and attend him in his flight, he intreated him to return rather to Jerusalem, and endeavour to frustrate the measures which should be proposed by Ahitophel. When Abshalom was come to Jerusalem, he desired Ahitophel to deliberate with his other counsellors upon the measures which were proper for him to take. Ahitophel advised him in the first place to abuse his father's concubines; so that, when his party should understand that he had dishonoured his father in this manner, they might conclude that there were no hopes of a reconciliation, and therefore espouse his interest more resolutely. A tent, therefore, being prepared for this purpose upon the terrace of the king's palace, Abshalom, in the sight of all Israel, lay with his father's concubines. The next thing Ahitophel proposed was in the terms follow-

ing: "Let me now choose out 12,000 men, and I will arise and pursue after David this night, and I will come upon him while he is weary and weak-handed, and I will make him afraid, and all the people that are with him shall flee, and I will smite the king only; and I will bring back all the people unto thee; the man whom thou seekest is as if all returned; so all the people shall be in peace." This advice was very agreeable to Abshalom. However, Abshalom desired Hushai to be called, to give his opinion. Hushai being come, and hearing what advice Ahitophel had given, said, "The counsel which Ahitophel has given is not good at this time; what, for the present, in my opinion, may do better, is this: Let all Israel be gathered unto thee, from Dan even to Beer-sheba, as the sand that is by the sea for multitude, and put thyself in the midst of them; that wherever David is, we may fall upon him, and overwhelm him with our numbers, as the dew falleth upon the ground." This last advice, being more agreeable to Abshalom, was preferred; upon which Ahitophel saddled his ass, went to his house at Gillo, hanged himself, and was buried in the sepulchre of his fathers.

AHMELLA, *f.* in botany. See **BIDENS**.

AHOLIBAH and **AHOLAH**, are two feigned names made use of by Ezekiel, xxiii. 4. to denote the two kingdoms of Judah and Samaria. Aholah and Aholibah are represented as two sisters of Egyptian extraction. Aholah stands for Samaria, and Aholibah for Jerusalem. The first signifies a *tent*; and the second, *my tent is in her*. They both prostituted themselves to the Egyptians and Assyrians, in imitating their abominations and idolatries; for which reason they were abandoned to those very people for whom they had shewn so passionate and so impure an affection; they were carried into captivity, and reduced to the severest servitude.

AHOUAL, *f.* in botany, the trivial name of a species of the **CERBERA**.

A-HULL, *adv.* in sea-language, the situation of a ship when all her sails are furled on account of the violence of the storm, and when, having lashed her helm on the lee-side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AHUN, a town in France, in the Upper Marche and generality of Moulins, and is a royal jurisdiction. It is seated on the river Creuse, eight miles south-east of Gueret, thirty north-east of Lomages, and thirty-five south-east of Moulins. Lat. 49. 5. N. lon. 2. 8. E.

AHUYS, a town of Sweden. It is small, but very strong by its situation, and has a good port. It is in the principality of Gothland, in the territory of Bleckingy, near the Baltic Sea, about eighteen miles from Christianstad. Lat. 56. 20. N. lon. 14. 10. E.

AI, anciently a town in Judea, to the north of Jericho, called *Ainæ* by Josephus, and the inhabitants *Ainataæ*. Joshua having sent a detachment of 3000 men against Ai, God permitted them to be repulsed on account of Achan's sin, who had violated the anathema pronounced against the city of Jericho. But after the expiation of this offence, God commanded Joshua to march with the whole army of the Israelites against Ai, and treat this city and the kingdom thereof as he had treated Jericho, with this difference, that he gave the plunder of the town to the people. Joshua sent by night 30,000 men to lie in ambush behind Ai; having first well instructed those who had the command of them in what they were to do; and the next day, early in the morning, he marched against the city with the remainder of his army. The king of Ai, perceiving them, sallied hastily out of the town with all his people, and fell upon the forces of the Israelites, who upon the first onset fled, as if they had been under some great terror. As soon as Joshua saw the enemy all out of the gates, he raised his shield upon the top of a pike, which was the signal given to the ambuscade; whereupon they immediately entered the place, which they found without defence, and set fire to it. The people of Ai, perceiving the smoke ascending, were willing to return, but discovered

those who had set fire to the city in their rear, while Joshua and those who were with him, turning about, fell upon them, and cut them in pieces. The king was taken alive, and afterwards put to death.

AJALON, a town of the tribe of Dan, one of the Levitical. Another in the tribe of Benjamin, in whose valley Joshua commanded the moon to stand still, being then in her decrease, and consequently to be seen at the same time with the sun.

AJAN, a coast and country of Africa, has the river Quilmanci on the south; the mountains from which that river springs, on the west; Abyssinia or Ethiopia, and the Strait of Babelmandel, on the north; and the Eastern or Indian Ocean, on the east. The coast abounds with all necessaries of life, and has plenty of very good horses. The kings of Ajan are often at war with the emperor of the Abyssinians; and all the prisoners they take they sell to the merchants of Cambaya, those of Aden, and other Arabs, who come to trade in their harbours, and give them in exchange, coloured cloths, glass-beads, raisins, and dates; for which they also take back, besides slaves, gold and ivory. The whole sea-coast, from Zanguebar to the Strait of Babelmandel, is called the coast of Ajan; and a considerable part of it is styled the Desert-coast.

AJAX, the son of Oileus, was one of the principal generals that went to the siege of Troy. He ravished Cassandra, the daughter of Priam, even in the temple of Minerva, where she thought to have found sanctuary. It is said, he made a serpent of fifteen feet long so familiar with him, that it ate at his table, and followed him like a dog. The Locrians had a singular veneration for his memory.

AJAX, the son of Telamon, was, next to Achilles, the most valiant general among the Greeks at the siege of Troy. He commanded the troops of Salamis, and performed many great actions, of which we have an account in the *Iliad*, in *Diclys Cretensis*, and in the twenty-third book of Ovid's *Metamorphoses*. He was so enraged that the arms of Achilles were adjudged to Ulysses, that he immediately became mad. The Greeks paid great honours to him after his death, and erected a magnificent monument to his memory upon the promontory of Rhe-tium.

AJAX, *f.* in antiquity, a furious kind of dance, in use among the Grecians; intended to represent the madness of that hero after his defeat by Ulysses, to whom the Greeks had given the preference in his contest for Achilles's arms. Lucian, in his *Treatise of Dancing*, speaks of dancing the *ajax*. There was also an annual feast called *ajantia*, *ajantia*, consecrated to that prince, and observed with great solemnity in the island of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was exposed, set out with a complete set of armour.

AJAZZO, a sea-port town of the island of Corfica, in the Mediterranean, with a bishop's see. Lat. 41. 40. lon. 26. 35.

AJAZZO, a sea-port town of Natolia, in the province of Caranania, anciently Silesia, seated on the coast of the Mediterranean, thirty miles north of Antioch, and fifty west of Aleppo, where the city of Illus anciently stood, and near which Alexander fought his second battle with Darius. Lat. 37. 0. lon. 33. 10.

AICHSTAT, a town of Germany, in Franconia, and capital of a bishopric of the same name. It is remarkable for a curious and highly-valuable piece of workmanship, called the Sun of the Holy Sacrament, which is in the church. It is of massy gold, of great weight, and is enriched with 350 diamonds, 1400 pearls, 250 rubies, and other precious stones. This place is moderately large, and seated in a valley on the river Altmul, ten miles north of Newburgh, and thirty-seven south of Nuremberg. Lat. 49. 0. N. lon. 11. 10. E. The bishopric is forty-five miles in length and seventeen in breadth; and the bishop is chancellor of the church of Mayence or Mentz.

AICUROS, *f.* a species of parrot. See **PSITTACUS**.

To AID, *v. a.* [*aider*, Fr. from *adjutare*, Lat.] To help; to support; to succour:

By the loud trumpet, which our courage *aids*,
We learn that sound as well as sense persuades.

Roscommon.

AID, *f.* Help; support. The person that gives help or support; a helper; auxiliary.—Thou hast said, It is not good that man should be alone; let us make unto him an *aid*,—like unto himself. *Tobit*, viii. 6.

AIDAB, a town on the confines of Abassia, in Africa, opposite to Giiodda; from hence great numbers of Africans take shipping to visit Mecca.

AIDAN, king of Scotland. His father Goran was murdered by conspirators, in the year 535, at which time this prince was very young. Eugenius, nephew to the last king, succeeded to the throne. The queen dowager took the first opportunity of quitting the kingdom, and retiring, with her two sons, Reginans and Aidan, into Ireland; the latter being then about seven years of age. They were very kindly received by Tauthalius the reigning king; and the queen, and her eldest son, died there. Aidan continued there forty-eight years, great part of which time Eugenius reigned; and after him his brother Congallus, who, being conscious of the wrong done to the right heir of the crown, ordered Aidan to be brought home, which was undertaken and performed by the celebrated St. Columb. But, on their arrival in Scotland, they were informed the king was dead, and that his brother Kennatillus was by the Scots put in possession of the throne. After the burial of the deceased prince, Columb went to court with Aidan; and, to the surprise of all people, was received by the new king with much kindness and respect, he telling Aidan, he should assist him in governing the kingdom, which would become his very shortly, to whom of right it pertained. The king, being old and infirm, died soon after, and was succeeded by Aidan, according to Boetius, in the year 578. Aidan went into Galloway, immediately after his coronation, and suppressed certain robbers who had infested that country, and committed great outrages in it; and he instituted annual assizes there, at Lochaber, and Caithness. But some of the young nobility, quarrelling at a hunting match, suddenly interrupted these works of peace. This affray, ending in bloodshed, caused several of them to retire into the dominions of the British king. Aidan, in virtue of a treaty with this prince, often demanded them, and was constantly refused. Incensed at this treatment, he entered his country, took a great number of prisoners, and carried off a quantity of cattle. Brudeus, resenting this, made an attack upon Galloway, and did much mischief. At length a general engagement ensued: the Picts were routed with great slaughter; the Scots lost a number of men, and amongst them Arthur the king's son. St. Columb, hearing of this war, came to the king, and charged him with shewing too much willingness to shed blood; this made so strong an impression on the mind of the prince, that he would not suffer this excellent man to depart till he undertook to negotiate a peace, which he executed with great success. But, some fresh disturbances arising, a pitched battle ensued; and the Saxons and Picts, after an obstinate engagement, were totally routed. He reigned quietly after this for about eleven years, when Ethelfrid prevailed on the Picts to renew the war. Aidan, though very old, marched to the place where he expected the British army to have joined him; but his allies failing, gave his enemies such an advantage over him, that they cut to pieces the chief of his forces; the king himself had a narrow escape. The fall of Theobald, the king's brother, proves this to have been a hard-fought battle: the consequences of which, and the news of the death of St. Columb, hastened the end of the good old king, and brought him to the grave in the year 606, at the age of seventy-eight. He reigned thirty-two years.

AIDAN,

AIDAN, in the seventh century, was bishop of Lindisfarne, or Holy Island, and was originally a monk in the monastery of Hii, or Jona, one of the islands of the Hebrides. At the request of Oswald, king of Northumberland, he came into England in the year 634, and undertook to instruct that prince's subjects in the knowledge of the Christian religion. Oswald was slain in battle, and Aidan continued to govern the church of Northumberland, under his successors, Oswin and Oswi, till Oswin was treacherously murdered, and Aidan survived him but twelve days; he fat sixteen years, and died in August, 651.

AIDANCE, *f.* Help; support: a word little used.

AIDANT, *adj.* [*aidant*, Fr.] Helping; helpful: not in use.

AID-DE-CAMP, *f.* in military affairs, an officer employed to receive and carry the orders of a general.

AIDER, *f.* He that brings aid or help; a helper; an ally.

AIDLESS, *adj.* [from *aid* and *less*, an inseparable particle.] Helpless; unsupported; undefended.

AID-PRAYER, *f.* in law, is a word made use of in pleading, for a petition in court to call in help from another person that hath an interest in the thing contested. As tenant for life, being impleaded, may pray in aid him in the reversion; that is, desire the court that he may be called by writ, to allege what he thinks proper for maintenance of the right of the person calling him, and of his own. *F. N. B.*

AIDS, *f.* in law, were originally mere benevolences, granted by the tenant to his lord, in times of difficulty and distress; but in process of time they grew to be considered as a matter of right, and not of discretion. These aids were principally three:—1. To ransom the lord's person, if taken prisoner. 2. To make the lord's eldest son a knight. 3. To marry the lord's eldest daughter, by giving a suitable portion. The aids for making the eldest son a knight, and for marrying the eldest daughter, were fixed by act of parliament at 20s. being the supposed twentieth part of every knight's fee. The aid for ransoming the lord's person was in its nature uncertain and incapable of being ascertained. 2 *Blackst.* 64.

AIDS, in the manege, are the same with what some writers call *cherishings*, and used to avoid the necessity of corrections. The inner heel, inner leg, inner rein, &c. are called *inner aids*; as the outer heel, outer leg, outer rein, &c. are called *outer aids*.

AIGHENDALE, *f.* the name of a liquid measure used in Lancashire, containing seven quarts.

AIGLE, a bailiwick in the territory of Romand, in Switzerland, consists of mountains and valleys, the principal of which are the Aigle and Bex. Through these is the great road from Vallais into Italy. When we pass by Villeneuve, which is at the head of the lake of Geneva, we enter into a deep valley three miles wide, bordered on one side with the Alps of Switzerland, and on the other with those of Savoy, crossed by the river Rhone. Six miles from thence we meet with Aigle, a large town, seated on a wide part of the valley, where are vineyards, fields, and meadows. The governor's castle is on an eminence that overlooks the town, and has a lofty marble tower. This government has nine large parishes; and is divided into four parts, Aigle, Bex, Olon, and Ormont. This last is among the mountains, and joins to Rougemont. It is a double valley, abounding in pasture-lands. Ivorna, in the district of Aigle, was in part buried by the fall of a mountain, occasioned by an earthquake, in 1584.

AIGLE, a small town, in France, in Upper Normandy, twenty-three miles from d'Evereux, and thirty-eight from Rouen. It is surrounded with walls and ditches, has six gates, three suburbs, and three parishes. It trades in corn, toys, and more particularly in needles and pins. Lat. 48.35. N. lon. 1.5. E.

AIGUESCAUDES, a place in the department of the Lower Pyrenees, remarkable for a warm spring, the waters of which are oily, saponaceous, and spirituous; they

have a foetid smell, and are used both outwardly and inwardly.

AIGUEMORTES, a town in the department of the Mouths of the Rhone. It formerly stood near the sea, and had a harbour; but this is choked up, and the sea has retired two French leagues from the town, leaving it in a morass. Lat. 43.34. N. lon. 4.3. E.

AIGUILLON, a small town of France, in the province of Guienne, situated at the conflux of the rivers Garonne and Lot.

AIGUISCE, in heraldry, denotes a cross with its four ends sharpened, but so as to terminate in obtuse angles. It differs from the cross fitchee, in as much as the latter tapers by degrees to a point, and the former only at the ends.

AIGULET, *f.* [*aigulet*, Fr.] A point with tags; points of gold at the end of fringes.

TO AIL, *v. a.* [*eglan*, Sax. to be troublesome.] To pain; to trouble; to give pain.—And the angel of God called to Hagar out of heaven, and said unto her, What *aieth* thee, Hagar? fear not: for God hath heard the voice of the lad where he is. *Gen.* xxi. 17.—It is used in a sense less determinate for to affect in any manner; as, Something *ails* me that I cannot sit still; What *ails* the man that he laughs without reason? To feel pain; to be incommoded. It is remarkable, that this word is never used but with some indefinite term, or the word *nothing*; as, *What ails him? What does he ail? He ails something; he ails nothing. Something ails him; nothing ails him.* Thus we never say, A fever *ails* him, or He *ails* a fever, or use definite terms with this verb.

AIL, *f.* A disease.

AILAH, thought to be the Elath mentioned in Scripture, a small town of Arabia Petraea, on one of the north bays of the Red Sea, near the road which the pilgrims take from Egypt to Mecca.

AILANTHUS, *f.* [from the Amboina name *Aylanto*, which signifies the tree of heaven; so called from its lofty growth.] In botany, a genus of the polygamia monoeica class, but placed by Schreber in the dioecia decandria class. The generic characters are—I. Male. Calyx: perianthium one-leaved, five-parted, very small. Corolla: petals five, lanceolate, acute, convolute at the base, spreading. Stamina: filaments ten, compressed, the length of the corolla; antheræ oblong, versatile. II. Female. Calyx: as in the male, permanent. Corolla: as in the male. Pistillum: germs 3—5, curved inwards; styles lateral; stigmas capitate. Pericarpium: capsules as many as there are germs, compressed, membranaceous, fabre-shaped, acute, on one of the edges emarginate. Seeds: solitary, lens-shaped, bony, close to the emarginature. III. Hermaphrodite. Calyx: as in the male and female. Corolla: as in the male. Stamina: filaments two or three, as in the male. Pistillum, pericarpium, and seed, as in the female.—*Essential Character.* Male. Calyx five-parted; corolla five-petalled; stamina ten. Female. Calyx and corolla as in the male; germs 3—5; styles lateral; pericarpium membranaceous, one-seeded. Hermaphrodite. Calyx and corolla as in the male; stamina 2—3.

There is but one species, which is called *ailanthus glandulosa*, or tall *ailanthus*. This tree rises with a straight trunk to the height of forty or fifty feet; the bark is grey, slightly furrowed, and has white marks on it; the young twigs are covered with a fine velvet down. Leaves large, smooth, alternate, unequally pinnate, disposed horizontally. Flowers very numerous; they exhale a disagreeable odour. The *ailanthus* grows very fast in our climate; and, being a handsome tree rising to a considerable height, is proper for ornamental plantations. The wood is hard, heavy, glossy like fatten, and susceptible of a very fine polish. Before the fructification was known, this tree passed for a species of *rhus*; and it is memorable among us for the dispute it occasioned between Mr. Ellis and Mr. Miller, which is recorded in the Philosophical Transactions. The latter contended that this tree was the *fast-no-ki*, or spurious

spurious varnish-tree of the Japanese: but it is clear that he was mistaken; for the leaves of that tree are entire, and have none of those singular glands which are found in this; nor does the aïlanthus yield any juice. It is a native of China; and was first raised in England by Mr. Miller and Philip Carteret Webb, Esq. about the year 1751, from seeds sent over by Father d'Incarville. With us it has hitherto produced only male flowers; at Paris and Leyden it has borne female flowers and fruit, but the fruit has not ripened. Some years it bears only male flowers; but about twice in ten years it has both male and female flowers, in France.

AILE, *f.* [of the French *aïeul*, *avus*, a grandfather.] In law, is a writ that lies, where a man's grandfather, or great grandfather (called *besafle*), being seized of lands and tenements in fee-simple on the day that he died, a stranger abateth or entereth the same day, and dispossesses the heir of his inheritance. *F. N. B.*

AILING, *part. adj.* Sickly; full of complaints.

AILMENT, *f.* Pain; disease.

AILMER, or **ÆTHELMARE**, earl of Cornwall and Devonshire, in the reign of king Edgar. It is not known of what family he was. His authority and riches were great, and so also was his piety. He founded the abbey of Cerne, in Dorsetshire; and had so great a veneration for Eadwald, the brother of St. Edmund the Martyr, who had lived a hermit in that country, near the Silver Well, as they called it, that, with the assistance of archbishop Dunstan, he translated his relics to the old church of Cerne.

AILRED, or **EELRED**, abbot of Revesby in Lincolnshire, in the reigns of Stephen and Henry II. He was born in 1109, of a noble family, and educated in Scotland with Henry the son of king David. On his return to England, he became a monk of the Cistercian order, in the monastery of Revesby, of which he afterwards was made abbot. He died on the 12th of January 1166, aged 57, and was buried in his monastery. "He was (says Leland) in great esteem during his life; celebrated for the miracles wrought after his death; and admitted into the catalogue of saints." His principal work is the *Speculum Charitatis*. Leland, Bale, and Pits, mention several manuscripts of his writing, which never were published.

AILSA, an insulated rock on the western coast of Scotland, between the shores of Airshire and Cantire. It is two miles in circumference at the base, is accessible only at one place, and rises to a great height in a pyramidal form. A few goats and rabbits subsist among the short grafs and furze; but the importance of the rock consists in the great variety and boundless numbers of birds, by which it is frequented, particularly the gannets or solan-geese, whose young are used at the best tables, and bring a good price. Other birds are caught for their feathers. The depth of water around the base is from seven to forty-eight fathoms. It is surrounded with excellent banks, well stocked with cod and other white fish.

To AIM, *v. n.* [It is derived by Skinner from *esmer*, to point at.] To endeavour to strike with a missile weapon; to direct towards; with the particle *at*:

Aim'st thou at princes, all amaz'd they said. *Pope.*

To point the view, or direct the steps towards any thing; to tend towards; to endeavour to reach or obtain: with *to* formerly, now only with *at*.—Religion tends to the ease and pleasure, the peace and tranquillity, of our minds, which all the wisdom of the world did always *aim at*, as the utmost felicity of this life. *Tillotson.*

To AIM, *v. a.* To direct the missile weapon; more particularly taken for the act of pointing the weapon by the eye, before its dismissal from the hand.

AIM, *f.* The direction of a missile weapon. The point to which the thing thrown is directed. In a figurative sense, a purpose; a scheme; an intention; a design:

But see how oft ambitious *aims* are crost,
And chiefs contend till all the prize is lost. *Pope.*

The object of a design; the thing after which any one endeavours. Conjecture; guess.

There is a history in all men's lives,
Figuring the nature of the times deceas'd;
The which observ'd, a man may prophesy,
With a near *aim*, of the main chance of things. *Shakespeare.*

AINSWORTH (Dr. Henry), an eminent nonconformist divine, who, about the year 1590, distinguished himself among the Brownists; which drew upon him such troubles, that he was obliged to retire to Holland, and became minister of a church at Amsterdam. His skill in the Hebrew language, and his excellent Annotations on the Holy Scriptures, which are still highly esteemed, gained him great reputation. His learned productions were esteemed even by his adversaries, who, while they refuted his extravagant tenets, yet paid a proper deference to his abilities. But nothing could have effect upon him, or make him return home: so he died in exile. His death was sudden, and not without suspicion of violence: for it is reported, that, having found a diamond of great value, he advertised it; and when the owner, who was a Jew, came to demand it, he offered him any gratuity he would desire. Ainsworth, though poor, requested only of the Jew, that he would procure him a conference with some of his rabbis upon the prophecies of the Old Testament relating to the Messiah, which the Jew promised; but, not having interest to obtain such a conference, it was thought that he contrived to get Ainsworth poisoned. He was undoubtedly a person of profound learning, and deeply read in the works of the rabbis. He had a strong understanding, quick penetration, and wonderful diligence. He published occasionally several treatises, many of which made a great noise in the world.

AINSWORTH (Robert), born at Woodyale in Lancashire in 1660, was master of a boarding-school at Bethnal-green, from whence he removed to Hackney, near London. After acquiring a moderate fortune, he retired, and lived privately till the time of his death, which happened in 1743. We are indebted to him for the best Latin and English Dictionary extant: he published it in quarto, 1736; and in 1752, the fourth edition, under the care of Dr. Ward of Gresham college, and the Rev. William Younge, was enlarged to two vols. folio. He had a turn for Latin and English poetry, as well as for antiquities; and some single single poems of his have been printed in each of those languages. He died at London the 4th of April 1743, aged eighty-three years, and was buried, according to his own desire, at Poplar.

AIR, *f.* [*air*, Fr. *air*, Lat.] The element encompassing the terraqueous globe. See **AEROLOGY**. The state of the air; or the air considered with regard to health. Air in motion; a small gentle wind:

Let vernal *airs* through trembling osiers play,
And Albion's cliffs resound the rural lay. *Pope.*

Scent; vapour. Blast; pestilential vapour.—Stinks which the nostrils straight abhor are not the most pernicious, but such *airs* as have some similitude with man's body; and so insinuate themselves, and betray the spirits. *Bacon.*—Any thing light or uncertain; that is as light as air. The open weather; air unconfined. Vent; utterance; emission into the air. Publication; exposure to the public view and knowledge.—I am sorry to find it has taken *air*, that I have some hand in these papers. The mien, or manner of a person; the look. An affected or laboured manner or gesture; as, a lofty *air*, a gay *air*. *Airs* in horsemanship, denote the artificial or practised motions of a managed horse.

To AIR, *v. a.* To expose to the air; to open to the air.—Fleas breed principally of straw or mats, where there hath been a little moisture, or the chamber and bed-straw kept close, and not *aired*. *Bacon.*—To gratify, by enjoying the open air, with the reciprocal pronoun.—As I was *airing*

airing myself on the tops of the mountains, I fell into a profound contemplation on the vanity of human life. *Ad-dison*.—To air liquors; to warm them by the fire: a term used in conversation. To breed in nests. In this sense, it is derived from *aerie*, a nest. It is now out of use.

AIR, *f.* in medicine, &c. makes one of the six non-naturals.—From observations on bleeding in rheumatisms, and after taking cold, it is evident the air can enter with all its qualities, and vitiate the whole texture of the blood and other juices.—From the palsies, vertigoes, and other nervous affections, caused by damps, mines, &c. it is evident, that air thus qualified can relax and obstruct the whole nervous system. And from the colics, fluxes, coughs, and consumptions, produced by damp, moist, and nitrous, air, it is evident it can corrupt and spoil the noblest organs of the human frame.

Circulation of AIR in Rooms. To render the circulation of air sensible, let the air of a room be heated by a strong fire, whilst the air of a contiguous room is cold; then let the door between these two rooms be opened, in which case the hot air of one room, being lighter, will pass through the upper part of the opening of the door into the cold room; and, on the contrary, the cold air of the other room, being heavier, will pass into the former room through the lower part of the opening; accordingly, it will be found, that applying a lighted candle at the top, in the middle, and at the lower part, of the opening between the two rooms, a strong current of air will appear to pass from the hot into the cold room near the top; a contrary current of air will appear to pass from the latter into the former room near the lower part of the said opening; whilst in the middle there is little or no motion at all, as may be clearly perceived by the direction of the flame of the candle.

It is for the same reason that when the fire is lighted in a chimney, a strong current of air is occasioned to enter the room, which may be felt by applying the hand near the key-hole, or other such small openings, if the doors and windows are shut; for the air over the fire being heated becomes lighter, and ascends into the chimney, consequently other colder air must supply its place, which forces its way through all the small openings it can find. Were a room with a fire in it to be perfectly closed, excepting the chimney, the air in it would soon become unwholesome for respiration, and the fire would be soon extinguished, besides other inconveniences. Hence it appears, that those persons mistake who expect to keep the air of a room sweet and wholesome, especially for convalescents, by accurately stopping all the smallest openings that admit fresh air. When the current of air that enters into a room is on some side of it where it falls immediately upon the persons who sit in the room, then it may be offensive, especially to delicate constitutions. In that case, such opening should be closed: but at the same time another opening should be made, for admitting fresh air, in a more convenient part; for a circulation of air, especially in rooms where a fire is kept, is not only salutary and useful, but absolutely necessary.

It is a vulgar error among many people, to believe that fire purifies the contaminated air, by destroying the noxious particles mixed with it; and for this reason they think, that the fire kept in a room where the air is tainted purifies the room, by rendering the air in it again fit for respiration. Indeed, a fire kept in a room or apartment where the air is tainted, as is the case with hospitals, gaols, and the like, does certainly purify the apartment; and the practice is very useful; but, this effect is only because the fire promotes the circulation of the air, and dries the dampness of rooms, furniture, &c. so that it is not the infected air that is purified, but it is new, fresh, and wholesome air, that by the action of the fire has taken the place of the infected air; which infected air, being rarefied by the heat, has been expelled from the apartment. Fire and combustion in general is so far from purifying contaminated air, that it actually contaminates a

prodigious quantity of it in a short time; so that not only a common fire, but even a lighted candle, when kept in a well-closed room, wherein the external air has not access, instead of purifying, renders the air of that room noxious.

A method has been lately invented, and a patent obtained, by Mr. Joseph Green, of Wandsworth, near London, for warming rooms and buildings with hot air of a more pure quality than has hitherto been used. The principle on which this invention is founded is the heating air, for the purpose of warming buildings, by means of hollow vessels, or pipes, immersed in hot water or steam, whereby too great a degree of heat is avoided, and the air remains unburnt, and fit for respiration. "For this purpose," says the patentee, "I provide a boiler made of iron, copper, or other fit materials, with a cover fastened thereto. Within the boiler I fix a hollow vessel or worm, and sometimes several such vessels or worms, made of lead, copper, earthen ware, or other proper materials; and into each of these hollow vessels or worms I introduce the external or open air, by the medium of a pipe, which I make to pass through a convenient part of the boiler, firmly soldered or cemented into it; and which pipe I communicate with the said vessels or worms. The boiler may be fixed in the ordinary manner in any of the lower apartments, or other convenient part of the house or buildings; or it may be fixed behind a stove or grate, so as to be heated by means of a common fire, in any of the rooms, and the size of it should be regulated by the extent of the building proposed to be warmed. From the hollow vessels or worms, pipes are fixed, and carried, in the most convenient manner, to the different rooms, or parts of the buildings, to which the warm air is to be conveyed. To these pipes are fixed cocks or sliders, in order to admit, or prevent, the introduction of the warm air into any particular room or place; and in some convenient part of the pipes I place a shifting valve, or self-acting cock, to prevent the bursting of the boiler, or pipes, by the force of the steam. The boiler being in part filled with water, a fire is lighted in the furnace, and the water made to boil, or brought to such a degree of heat as may be found necessary; by this heat the air contained in the hollow vessels or worms before-mentioned, being rarefied and warmed, will ascend, and is to be admitted, by means of the above-mentioned cocks or sliders, or by any other convenient mode, into the several apartments to be warmed. When the rooms are at too great a distance from the boiler to be warmed by single pipes, then, in order to prolong the direction of the heat, I either inclose the pipes, through which the warm air is conveyed, in large pipes, to which the steam rises from the boiler, or I introduce the warm air into the larger and the steam into the smaller pipes; by which means the air-pipes are prevented from growing cool so soon as they would do if they were exposed to the action of the open air. I also in certain cases, where I judge it proper and more convenient, place my air-vessel or worm in a vessel distinct from the boiler, but still having a communication therewith for the steam from the boiler to pass, and thus heat the air-vessel or worm by means of steam only; by the above process too great a degree of heat is avoided, and the air remains unburnt, and fit for respiration. The patent for this invention is dated Dec. 9, 1793.

AIR-BALLOONS, a general name given to bags of any light substance filled with inflammable air, or other permanently elastic fluid, whose specific gravity is considerably less than that of common atmospheric air. The consequence of their being filled in this manner is, that, if they are of any considerable magnitude, they ascend in the air to an amazing height; and will not only ascend in this manner by themselves, but carry up along with them great weights, and continue to rise till they attain an height in which the circumambient air is of the same specific gravity with themselves. In this situation they will either float or be driven in the direction of the wind or

current of air in which they are exposed, remaining in these elevated regions till the fluid escapes by the bursting of the bags from the superior elasticity of the fluid, or by its gradual evaporation through the pores of the envelope. The history, principles, &c. of those machines are detailed under the article *AEROSTATION*; in addition to which we shall now give the following particulars. The first voyage performed in an air-balloon in England was by Vincent Lunardi, a native of Italy, who ascended from the Artillery-ground in London, on the 15th of September, 1784. His machine was made of oiled silk, painted in alternate stripes of blue and red; and its diameter was thirty-three feet. From a net, which covered about two-thirds of the balloon, forty-five cords descended to a hoop hanging below the balloon, to which the gallery was attached. The machine had no valve; and its neck, which terminated in the form of a pear, was the aperture through which the inflammable air was introduced, and through which it might be let out. The balloon was filled with air produced from zinc by means of diluted vitriolic acid. And when the aeronaut departed, at two o'clock, he took up with him a dog, a cat, and a pigeon. After throwing out some ballast, to clear the houses, he ascended to a considerable height; and the direction of his motion at first was north-west by west; but, as the balloon rose higher, it came into another current of air, which carried it nearly north. In the course of his voyage the thermometer was as low as twenty-nine degrees, and the drops of water which had collected round the balloon were frozen. About half after three he descended very near the ground, and landed the cat, which was almost dead with cold: then rising, he prosecuted his voyage, till at ten minutes past four o'clock he landed near Ware in Hertfordshire. He descended by means of his oars or wings.

The second aerial voyage in England, was performed by Mr. Blanchard, and Mr. Sheldon professor of anatomy to the Royal Academy, being the first Englishman who ascended with an aerostatic machine. They ascended at Chelsea the 16th of October, at nine minutes past twelve o'clock. Mr. Blanchard, having landed Mr. Sheldon at about fourteen miles from Chelsea, re-ascended alone, and finally landed near Romsey in Hampshire, about seventy-five miles distant from London, having gone nearly at the rate of twenty miles an hour. The wings used on this occasion it seems produced no deviation from the direction of the wind. Mr. Blanchard said that he ascended so high as to feel a great difficulty of breathing: and that a pigeon, which flew away from the boat, laboured for some time to sustain itself with its wings in the rarefied air, but, after wandering a good while, returned, and rested on the side of the boat.

On the 4th of October, Mr. Sadler, an ingenious tradesman at Oxford, ascended at that place with an inflammable-air balloon of his own construction and filling. And again on the 12th of the same month he ascended at Oxford, and floated to the distance of fourteen miles in seventeen minutes, which is at the rate of near fifty miles an hour.

On the 4th of January, 1785, a Mr. Harper ascended at Birmingham with an inflammable-air balloon, and went to the distance of fifty miles in an hour and a quarter, and suffered no other inconvenience than a temporary deafness, and what might be expected from the changes of wet and cold. The thermometer descended from forty to twenty-eight degrees.

On the 19th of January, Mr. Crosbie ascended at Dublin in Ireland, with an inflammable-air balloon, to a great height. He rose so rapidly that he was out of sight in three minutes and a half. By suddenly opening the valve he descended just at the edge of the sea, as he was driving towards the channel, being unprovided for properly passing over to England.

On the 23d of March, Count Zambeccari and Admiral Sir Edward Vernon ascended at London, and sailed

to Horsham in Sussex, at the distance of thirty-five miles, in less than an hour. The voyage proved very dangerous, owing to some of the machinery about the valve being damaged, which obliged them to cut open some part of the balloon when they were about two miles perpendicular height above the earth, the barometer having fallen from 30.4 to 20.8 inches. In descending they passed through a dense cloud, which felt very cold, and covered them with snow. The observations they made were, that the balloon kept perpetually turning round its vertical axis, sometimes so rapidly as to make each revolution in four or five seconds; that a peculiar noise, like rustling, was heard among the clouds, and that the balloon was greatly agitated in the descent.

On May the 5th, Mr. Sadler, and William Windham, Esq. member of parliament for Norwich, ascended at Moulsey-hurst. The machine took a south-east course, and the current of air was so strong that they were in great danger of being driven to sea. They had the good fortune however to descend near the conflux of the Thames and Medway, not a mile from the water's edge. By an accident they lost their balloon: for, while the aeronauts were busied in securing their instruments, the country people, whom they had employed in holding down the machine, suddenly let go the cords, when the balloon instantly ascended, and was driven many miles out to sea, where it fell, and was taken up by a trading vessel. It was afterwards restored again, and another voyage made with it from Manchester to Pontefract, in which Mr. Sadler was still more unfortunate; for no person being near when it descended, and not being able to confine it by his own strength, he was dragged by it over trees and hedges; and at last was forced to quit it at the utmost danger of his life; after which it rose, and was out of sight in a few minutes. It was afterwards found near Gainborough.

On the 12th of May Mr. Crosbie ascended, at Dublin, as high as the tops of the houses; but soon descended again with a velocity that alarmed all the spectators for his safety. On his stepping out of the car, in an instant Mr. McGuire, a college youth, sprang into it, and the balloon ascended with him to the astonishment of the beholders, and presently he was carried with great velocity towards the channel in the direction of Holyhead. This being observed, a crowd of horsemen pursued full speed the course he seemed to take, and could plainly perceive the balloon descending into the sea. Lord H. Fitzgerald, who was among the foremost, instantly dispatched a swift-sailing vessel mounted with oars, and all the boats that could be got, to the relief of the gallant youth; whom they found almost spent with swimming, just time enough to save his life.

On the 19th of July, at twenty minutes past two o'clock, Mr. Crosbie again ascended at Dublin, with intent to cross the channel to Holyhead in England. The usual form of the boat had been changed, for a capacious wicker basket, of a circular form, round the upper edges of which were fastened a great many bladders, which were intended to render his gallery buoyant, in case of a disaster at sea. About 300 pounds of ballast were put into the basket, but the aeronaut discharged half a hundred on his first rise. At first the current of air carried him due west; but it soon changed his course to nearly north-east, pointing almost towards Whitehaven. At upwards of forty miles from the Irish shore, he found himself within clear sight of both lands, and he said it was impossible to give any adequate idea of the unspeakable beauties which the scenery of the sea, bounded by both lands, presented. He rose at one time so high, that by the intense cold his ink was frozen, and the mercury sunk into the ball of the thermometer. He was sick, and felt a strong prepression on the tympanum of the ears. At his utmost height he thought himself stationary; but on liberating some gas he descended to a current of air blowing north, and extremely rough. He now entered a thick cloud, and encountered

countered strong blasts of wind, with thunder and lightning, which brought him rapidly towards the surface of the water. Here the balloon made a circuit, but, falling lower, the water entered his car, and he lost his notes of observation. All his endeavours to throw out ballast were of no avail; the force of the wind plunged him into the ocean; and with much difficulty he put on his cork jacket. The propriety of his idea was now very manifest in the construction of his boat: as by the admission of the water into the lower part of it, and the suspension of his bladders, which were arranged at the top, the water, added to his own weight, became proper ballast; and the balloon maintaining its poise, it became a powerful sail, by means of which, and a snatch-block to his car, he went before the wind as regularly as a sailing vessel. In this situation he found himself inclined to eat, and he took a little fowl. At the distance of a league he discovered some vessels crowding after him; but, as his progress outstripped all their endeavours, he lengthened the space of the balloon from the car, which gave a check to the rapidity of his sailing, and he was at length overtaken and saved by the Dunleary barge, which took him on-board, and steered to Dunleary, towing the balloon after them.

A similar accident happened to Major Money, who ascended at Norwich, on the 22d of July, at twenty minutes past four in the afternoon; when meeting with an improper current, and not being able to let himself down, on account of the smallness of the valve, he was driven out to sea, where, after blowing about for near two hours, he dropped into the water. Here the struggles were astonishing which he made to keep the balloon up, which was torn, and hung only like an umbrella over his head. A ship was once within a mile, but, he adds, whether from want of humanity, or by mistaking the balloon for a sea-monster, they sheered off, and left him to his fate: but a boat chased him for two hours, till just dark, and then bore away. He now gave up all hopes, and began to wish that providence had given him the fate of Pilate de Rozier, (which see under AEROSTATION,) rather than such a lingering death. Exerting himself however to preserve life as long as possible, by keeping the balloon floating over his head, to keep himself out of the water, into which nevertheless he sunk gradually inch by inch, as it lost its power, till he was at length breast-deep in water, when he was providentially taken up by a revenue cutter, at half past eleven at night, but so weak that he was obliged to be lifted out of the car into the ship.

About the latter end of August, the longest aerial voyage hitherto made, was performed by Mr. Blanchard, who ascended at Lille, accompanied by the Chevalier de l'Épinard, and travelled 300 miles in their balloon before it descended. On this occasion, as on some former ones, Mr. Blanchard made trial of a parachute, like a large umbrella, invented to break the fall in case of an accident happening to the balloon: with this machine he dropped a dog from the car after his ascension, which descended gently and unhurt.

October the 5th, Mr. Lunardi made the first aerial voyage in Scotland. He ascended at Edinburgh, and after various turnings, landed near Cupar, in Fife, having described a track of forty miles over the sea, and ten over the land, in an hour and a half. He said the mercury in the barometer sunk as low as 18.3 inches at his greatest elevation.

November the 19th, the celebrated Blanchard ascended at Ghent to a great height, and after many dangers descended at Delft without his car, which he cut away to lighten the machine when he was descending too rapidly, and slung himself by the cords to the balloon, which served him then in the nature of a parachute. On his first ascent, when he was almost out of sight, he let down a dog, by means of a parachute, which came easily to the ground.

November the 25th, Mr. Lunardi ascended at Glasgow, and in two hours he described a track of 125 miles.

It is further remarkable that, being overcome with drowsiness, he says he slept for about twenty minutes in the bottom of the car, during his voyage.

To obviate the danger of a fall, arising from any accident happening to the balloon, some experiments have been made with a parachute, by Mr. Blanchard, whose endeavours and perseverance have continued longer than in any other person: we have accounts of two voyages performed by him; which, being very curious, we shall relate in Mr. Blanchard's own words, taken from his letter, dated Leipzick, October the 9th, 1787, to the editors of the Paris Journal. "I did not mention," says he, "in your interesting paper, my ascension at Strasburg on the 26th of last August: the weather was so horrible that I mounted only for the sake of contenting the astonishing crowd of strangers assembled there from all parts of the country. Every body seemed satisfied at the attempt, but I assure you, gentlemen, that I was far from being pleased with so common an experiment. The only remarkable thing that occurred at that time, was the following circumstance: At the height of about 2000 yards, or a mile and half a quarter, I let down a dog tied to the parachute, who, instead of descending gently, was forcibly carried, by a whirlwind, above the clouds. I met him soon after, bending his course directly downwards, and, as on recollecting his master he began to bark a little, I was going to take hold of the parachute, when another whirlwind lifted him again to a great height. I lost him for the space of six minutes, and perceived him afterwards, with my telescope, as if sleeping in the cradle or basket belonging to the machine. Continually agitated, and impetuously tossed through every point of the compass, by the violence of the different currents of air, I determined to end my voyage on the other side of the Rhine, after having passed vertically over Zell. I descended at a small village with an intention to be assisted a little, and about thirty men soon came within reach of the balloon very a-propos, and fixed me to the ground. The wind was so violent that anchors or ropes would have been of no service. I had however added to the large aerostatic globe a smaller one, of sixty pounds ascensional force, which would have contributed to fix me, when once I let it loose; but, notwithstanding this precaution, the men's assistance was very necessary to me. The parachute was still wavering in the air, and did not come down till twelve minutes after."

"I performed my twenty-seventh ascension at Leipzick, the 29th of September, in the midst of an incredible number of spectators, forming one of the most brilliant assemblies I ever beheld. The sky was as clear and serene as possible, and the air so calm that many of my friends, and multitudes of others, could follow me on horseback, and even on foot. I was sometimes so near them that they thought they could reach me, but I could soon find the means of rising; and once, when they had actually taken hold of the cords, to see me float with the strings in their hands, I suddenly cut them, and mounted again in the air. All these amusing evolutions were in sight of the town and its environs. At length I yielded to the earnest solicitations of the company, and entered the town triumphantly in my car, followed by a concourse of people transported with joy, and amidst the acclamations of thousands. The next day I emptied the inflammable air into another globe, with which I intended to try some experiments; and I let it off with a cradle, in which a dog was fixed. The balloon, having reached a considerable height, made an explosion in its under part, as I had imagined it would, having previously disposed it in a proper manner for that purpose; by which means the little animal fell gently to the ground."

"Having repeated this experiment, at the town's request, I prepared the globe in such a manner as to cause an explosion in its upper part, and added a parachute with two small dogs fixed to it. They went so high, that, notwithstanding the serenity of the sky, the balloon was lost

in its immense expanse. Telescopes of the best sort became useless, and I began to be apprehensive for the death of the little animals, on account of the severity of the cold. They descended however about two hours after, quite safe and well, in the town of Delitzsch, three miles from Leipzick. I went to claim them, and found them again over the town in the air with the parachute."

Mr. Blanchard's thirty-second ascension was made at Brunswick, in the month of August 1788, in which he was much assisted by means of his wings.

In regard to philosophical observations, derived from the new subject of air-balloons, there have been very few made; the novelty of the discovery, and of the prospect enjoyed from the car of an aerostatic machine, have commonly distracted the attention of the aeronauts; not to remark that many of the adventurers were inadequate to the purpose of making improvements in philosophy, being mostly influenced either by pecuniary motives, or the vanity of adding their names to the list of aerial travellers. The agreeable stillness and tranquillity experienced aloft in the atmosphere, have been matter of general observation. Some machines have ascended to a great height, as far, it has been said, as two miles; and they have commonly passed through fogs and clouds, above which they have enjoyed the clear light and heat of the sun, whilst the earth beneath was actually covered by dense clouds, which poured down abundance of rain. In ascending very high, the aeronauts have often experienced a pain in their ears, arising, it is supposed, from the internal air being not of the same density as the air without; but the pain usually went off in a short time: and it seems that this effect is similar to what is experienced by persons who descend by a diving-bell to considerable depths in the sea. The late unfortunate Mr. Spalding, the celebrated diver, spoke of this effect with a marked and philosophical accuracy: after descending two or three fathoms below the surface, he began to feel a pain in his ears, which gradually increased to a very great degree if the descent was too quick; his method was therefore to descend slowly, and to make a stop for some minutes at the depth of five fathoms, which is nearly equal to the pressure of the atmosphere, and where consequently the air in his bell was of double the density of common air at the surface; after resting here awhile, his ears, as he expressed it, gave a crack, and he was suddenly relieved of the pain. He then descended five fathoms more, with the same symptoms, and the same effect: and so on continually, from one five fathoms to another, descending leisurely, and stopping a little at each stage, to give time for his constitution to adapt itself to the degree of condensation of the air; after which he felt no more inconvenience, till he came to ascend again, which was performed with the same caution and circumstances. One experiment is recorded, in which the air of a high region, being brought down, and examined by means of nitrous air, was found to be purer than the air below. The temperature of the upper regions too, it has been found, is much colder than that of the air near the earth; the thermometer, in some aerostatic machines, having descended many degrees below the freezing point of water, while it was considerably higher than that degree at the earth's surface.

AIR-BLADDER, *f.* Any cuticle or vesicle filled with air.—The pulmonary artery and vein pass along the surfaces of these *air-bladders*, in an infinite number of ramifications. *Arbutnot.*—The bladder in fishes, by the contraction and dilatation of which, they vary the properties of their weight to that of their bulk, and rise or fall.—Tho' the *air-bladder* in fishes seems necessary for swimming, yet some are so formed as to swim without it. *Cudworth.*

AIR-BUILT, *adj.* Built in the air, without any solid foundation:

Hence the fool's paradise, the statesman's scheme,
The *air-built* castle, and the golden dream,
The maid's romantic wish, the chemist's flame,
And poet's vision of eternal fame.

Pope.

AIR-DRAWN, *adj.* Drawn or painted in air: a word not used.

AIRER, *f.* He that exposes to the air.

AIR-GUN, *f.* in pneumatics, is a machine for propelling bullets with great violence, by the sole means of condensed air. The first account we meet with of an air-gun, is in the *Elemens d'Artillerie* of David Rivaut, who was preceptor to Louis XIII. of France. He ascribes the invention to one Marin, a burgher of Liseux, who presented one to Henry IV.

To construct a machine of this kind, it is only necessary to take a strong vessel of any sort, into which the air is to be thrown or condensed by means of a syringe, or otherwise, the more the better; then a valve is suddenly opened, which lets the air escape by a small tube in which a bullet is placed, and which is thus violently forced out before the air. It is evident then that the effect is produced by virtue of the elastic property of the air; the force of which is directly proportional to its condensation; and therefore the greater quantity that can be forced into the engine, the greater will be the effect. Now this effect will be exactly similar to that of a gun charged with powder, and therefore we can easily form a comparison between them: for inflamed gunpowder is nothing more than very condensed elastic air; so that the two forces are exactly similar. Now it is shewn by Mr. Robins, in his *New Principles of Gunnery*, that the fluid of inflamed gun-powder, has, at the first moment, a force of elasticity equal to about 1000 times that of common air; and therefore it is necessary that air should be condensed 1000 times more than in its natural state, to produce the same effect as gun-powder. But then it is to be considered, that the velocities with which equal balls are impelled, are directly proportional to the square roots of the forces; so that, if the air in an air-gun be condensed only ten times, then the velocity it will project a ball with, will be, by that rule, one-tenth of that arising from gun-powder; and, if the air were condensed twenty times, it would communicate a velocity of one-seventh of that of gun-powder. But in reality the air-gun shoots its ball with a much greater proportion of velocity than as above, and for this reason, that as the reservoir, or magazine of condensed air, is commonly very large in proportion to the tube which contains the ball, its density is very little altered by expanding through that narrow tube, and consequently the ball is urged all the way by nearly the same uniform force as at the first instant; whereas the elastic fluid arising from inflamed gun-powder is but very small in proportion to the tube or barrel of the gun, occupying at first indeed but a very small portion of it next the but-end: and therefore by dilating into a comparatively large space, as it urges the ball along the barrel, its elastic force is proportionally weakened, and it acts always less and less on the ball in the tube. From which cause it happens, that air, condensed into a good large machine only ten times, will shoot its ball with a velocity but little inferior to that given by the gun-powder. And if the valve of communication be suddenly shut again by a spring, after opening it to let some air escape, then the same collection of it may serve to impel many balls, one after the other.

In all cases in which a considerable force is required, and consequently a great condensation of air, it will be requisite to have the condensing syringe of a small bore, perhaps not more than half an inch in diameter: otherwise the force to produce the compression will become so great, that the operator cannot work the machine; for, as the pressure against every square inch is about fifteen pounds, and against every circular inch about twelve pounds, if the syringe be one inch in diameter, when one atmosphere is injected, there will be a resistance of twelve pounds against the piston; when two, of twenty-four pounds; and, when ten are injected, there will be a force of 120 pounds to overcome; whereas ten atmospheres act against the half-inch piston, whose area is but one-quarter of the former, with one-quarter of the force only, namely, thirty pounds;

A I R

Improved Air Guns.

pounds; and forty atmospheres may be injected with such a syringe, as well as ten with the larger.

There are air-guns of various constructions; an easy and portable one is represented in the annexed Plate, *fig. 1.* which is a section lengthways through the axis, to shew the inside. It is made of brass, and has two barrels; the inner barrel A, of a small bore, from which the bullets are shot; and the larger barrel E S C D R, on the outside of it. In the stock of the gun there is a syringe M N P S, whose rod M, draws out to take in air; and, by pushing it in again, the piston N, drives the air before it, through the valve P, into the cavity between the two barrels. The ball K, is put down into its place in the small barrel, with the rammer, as in another gun. There is another valve at S L, which, being opened by the trigger O, permits the air to come behind the ball, so as to drive it out with great force. If this valve be opened and shut suddenly, one charge of condensed air may make several discharges of bullets; because only part of the injected air will then go out at a time, and another bullet may be put into the place K: but if the whole air be discharged on a single bullet, it will impel it more forcibly. This discharge is effected by means of a lock (*fig. 2.*) when fixed to its place as usual in other guns; for, the trigger being pulled, the cock will go down and drive a lever which opens the valve.

Dr. Macbride mentions an improvement of the air-gun, made by Dr. Ellis, in which the chamber for containing the condensed air is not in the stock, which renders the machine heavy and unweildy, but has five or six hollow spheres belonging to it, of about three inches diameter, fitted to a screw on the lock of the gun. These spheres are contrived with valves, to confine the air which is forced into their cavities, so that a servant may carry them ready charged with condensed air: and thus the gun of this construction is rendered as light and portable as one of the smallest fowling-pieces.

Fig. 3. represents an air-gun made by the late Mr. B. Martin, of London, and now by several of the mathematical-instrument and gun makers of the metropolis; which, for simplicity and perfection, perhaps exceeds any other that has been contrived. A, is the gun-barrel, of the size and weight of a common fowling-piece, with the lock, stock, and ramrod. Under the lock, at B, is a round steel tube, having a small moveable pin in the inside, which is pushed out when the trigger is pulled, by the springwork within the lock; to this tube B, is screwed a hollow copper ball C, perfectly air-tight. This copper ball is fully charged with condensed air by means of a syringe, previous to its being applied to the tube B. Hence, if a bullet be rammed down in the barrel, the copper ball screwed fast, and the trigger be pulled, then the pin in B, will forcibly push open a valve within the copper ball, and let out a portion of the condensed air; which air will rush up through the aperture of the lock, and forcibly act against the bullet, driving it to the distance of sixty or seventy yards, or farther. If the air be strongly condensed at every discharge, only a portion of the air escapes from the ball; therefore, by re-cocking the piece, another discharge may be made; and this repeated fifteen or sixteen times. An additional barrel is sometimes made, and applied for the discharge of shot, instead of the ball above described.

Sometimes, in a more simple construction, the syringe is applied to the end of the barrel C, (*fig. 4.*) the lock and trigger shut up in a brass case D, and the trigger pulled, or the discharge made, by pulling the chain B. In this contrivance there is a round chamber for the condensed air at the end of the spring at E, and it has a valve acting in a similar manner to that of the copper ball. When this instrument is not in use, the brass case D, is made to slide off, and the instrument then becomes a walking-stick: from which circumstance, and the barrel being made of cane, or brass, &c. it has been called the *air-cane*. The head of the cane uncrews and takes off at A, where the extremity of the piston-rod in the barrel is shewn. An

iron rod is placed in a ring at the end of this, and the air is condensed in the barrel in a manner similar to that of the gun above; but its force and action are not near so strong as in the gun.

Magazine AIR-GUN. This is an improvement of the common air-gun, made by that ingenious artist, L. Colbe. By his contrivance, ten bullets are so lodged in a cavity, near the place of discharge, that they may be successively drawn into the barrel, and shot so quickly as to be nearly of the same use as so many different guns; the only motion required, after the air has been injected, being that of shutting and opening the hammer, and cocking and pulling the trigger. *Fig. 5.* is a longitudinal section of this gun, as large in every part as the gun itself; and as much of its length is shewn as is peculiar to this construction; the rest of it being like the ordinary air-gun. A B C, is part of the stock; G, is the end of the injecting syringe, with its valve H, opening into the cavity F F F, between the barrels. K K K, is the small or shooting barrel, which receives the bullets, one at a time, from the magazine D E, being a serpentine cavity, in which the bullets are lodged, and closed at the end D; from whence, by one motion of the hammer, they are brought into the barrel at I, and thence are shot out by the opening of the valve V, which lets in the condensed air from the cavity F F F, into the channel V K I, and so along the inner barrel K K, whence the bullet is discharged. L L, is the key of a cock, having a hole through it; which hole, in the present situation, makes part of the barrel K K, being just of the same bore: so that the air which is let in at every opening of the valve V, comes behind this cock, and, taking the ball out of it, carries it forward, and so out of the mouth of the piece.

To bring in another bullet to succeed I, which is done in an instant, bring the cylindrical cavity of the key of the cock, which made part of the barrel K K K, into the situation M N, so that the part I may be at K; then turning the gun upside-down, one bullet next the cock will fall into it out of the magazine, but will go no farther into this cylindrical cavity, than the two little pieces *ss* will permit it; by which means only one bullet at a time will be taken in to the place I, to be discharged again as before.

AIR-HOLE, *f.* A hole to admit the air.

AIRINESS, *f.* Openness; exposure to the air. Lightness; gaiety; levity.—The French have indeed taken worthy pains to make classic learning speak their language; if they have not succeeded, it must be imputed to a certain talkativeness and *airiness* represented in their tongue, which will never agree with the sedateness of the Romans, or the solemnity of the Greeks. *Felton.*

AIRING, *f.* A short journey or ramble to enjoy the free air. It is a term peculiarly used for the exercising horses in the open air. It purifies the blood; purges the body from gross humours; and, as the jockies express it, teaches the horse how to make his wind rake equally, and keep time with the other motions of his body. It also sharpens the stomach, and keeps the creature hungry; which is a thing of great consequence, as hunters and racers are very apt to have their stomach fall off, either from want of exercise, or from the too-violent exercise which they are often exposed to. It likewise greatly contributes to bring a horse to perfect wind, and sound courage.

AIR-JACKET, *f.* a sort of jacket made of leather, in which are several bags, or bladders, composed of the same materials, communicating with each other. These are filled with air through a leather tube, having a brass stop-cock accurately ground at the extremity, by which means the air blown in through the tube is confined in the bladders. The jacket must be wet, before the air be blown into the bags, or otherwise it will immediately escape through the pores of the leather. By the help of these bladders, which are placed near the breast, the person is supported in the water, without making the efforts used in swimming.

AIRLESS, *adj.* Wanting communication with the free air:

Nor stony tower, nor walls of beaten brass,
Nor *airless* dungeon, nor strong links of iron,
Can be retentive to the strength of spirit. *Shakespeare.*

AIRLING, *f.* [from *air*, for *gayety*.] A young, light, thoughtless, gay, person.

AIR-PIPES, *f.* an invention for drawing foul air out of ships, or any other close places, by means of fire. These pipes were invented by Mr. Sutton, a brewer in London; and from him have received the name of *Sutton's Air-pipes*. The principle on which their operation depends is known to every body, being indeed no other than that air is necessary for the support of fire; and, if it has not access from the places most adjacent, will not fail to come from those that are more remote. Thus, in a common furnace, the air enters through the ash-hole; but, if this is closed up, and a hole made in the side of the furnace, the air will rush in with great violence through that hole. If a tube of any length whatever is inserted in this hole, the air will rush through the tube into the fire, and of consequence there will be a continued circulation of air in that place where the extremity of the tube is laid. Mr. Sutton's contrivance then, as communicated to the Royal Society by Doctor Mead, amounts to this:—"As, in every ship of any bulk, there is already provided a copper or boiling-place proportionable to the size of the vessel; it is proposed to clear the bad air, by means of the fire already used under the said coppers or boiling-places for the necessary uses of the ship.

"It is well known, that, under every such copper or boiler, there are placed two holes, separated by a grate; the first of which is for the fire, and the other for the ashes falling from the same; and that there is also a flue from the fire-place upward, by which the smoke of the fire is discharged at some convenient place of the ship. It is also well known, that the fire once lighted in these fire-places, is only preserved by the constant draught of air through the fore-mentioned two holes and flue; and that, if the said two holes are closely stopped up, the fire, though burning ever so briskly before, is immediately put out.

"But if, after shutting up the above-mentioned holes, another hole be opened, communicating with any other room or airy place, and with the fire, it is clear, the said fire must again be raised and burn as before, there being a like draught of air through the same as there was before the stopping up of the first holes; this case differing only from the former in this, that the air feeding the fire will now be supplied from another place. It is therefore proposed, that, in order to clear the holds of ships of the bad air therein contained, the two holes above-mentioned (the fire-place and the ash-place) be both closed up with substantial and tight iron doors; and that a copper or leaden pipe, of sufficient size, be laid from the hold into the ash-place, for the draught of air to come in that way to feed the fire. And thus it seems plain, from what has been already said, that there will be, from the hold, a constant discharge of the air therein contained; and consequently, that the air, so discharged, must be as constantly supplied by fresh air down the hatches or such other communications as are opened into the hold; whereby the same must be continually freshened, and its air rendered more wholesome and fit for respiration. And if into this principal pipe so laid into the hold, other pipes are let in, communicating respectively either with the well or lower decks; it must follow, that part of the air, consumed in feeding the fire, must be respectively drawn out of all such places to which the communication shall be so made."

This account is so plain, that no doubt can remain concerning the efficacy of the contrivance: it is evident, that, by means of pipes of this kind, a constant circulation of fresh air would be occasioned through those places where it would otherwise be most apt to stagnate and putrefy. Several other contrivances have been used for the same

purpose; and Doctor Hales's ventilators, by some unaccountable prejudice, have been reckoned superior in efficacy and even simplicity to Mr. Sutton's machine, which at its first invention met with great opposition, and even when introduced by Dr. Mead, who used all his interest for that purpose, was shamefully neglected.

A machine capable of answering the same purpose was invented by M. Defaguliers, which he called the *ship's lungs*. It consisted of a cylindrical box set up on its edge, and fixed to a wooden pedestal. From the upper edge of the box issued a square trunk open at the end, and communicating with the cavity of the box. Within this box was placed a cylindrical wheel turning on an axis. It was divided into twelve parts, by means of partitions placed like the radii of a circle. These partitions did not extend quite to the centre, but left an open space of about eighteen inches diameter in the middle; towards the circumference, they extended as far as possible without interfering with the case, so that the wheel might always be allowed to turn freely. Things being thus circumstanced, it is plain, that, if the wheel was turned towards that side of the box on which the trunk was, every division would push the air before it, and drive it out through the trunk, at the same time that fresh air would come in through the open space at the centre, to supply that which was thrown out through the trunk. By turning the wheel swiftly, a strong blast of air would be continually forced out through the square trunk, on the same principles on which a common fanner winnows corn. If the wheel is turned the opposite way, a draught of air may be produced from the trunk to the centre. If this machine, then, is placed in a room where a circulation of air is wanted, and the trunk made to pass through one of the walls; by turning the wheel swiftly round, the air will be forced with great velocity out of that room, at the same time that fresh air will enter through any chinks by which it can have access, to supply that which has been forced out.

It is evident, that the circulation which is promoted by this machine, is entirely of the same kind with that produced by Mr. Sutton's; the turning of the wheel in M. Defaguliers's machine being equivalent to the rarefaction of the air by fire in Mr. Sutton's: but that the latter is vastly superior, as acting of itself, and without intermission, requires no arguments to prove. Mr. Sutton's machine has yet another convenience, of which no other contrivance for the same purpose can boast; namely, that it not only draws out putrid air, but destroys it by causing it to pass through fire; and experience has abundantly shewn, that though putrid air is thrown into a great quantity of fresh air, it is so far from losing its pernicious properties, that it often produces noxious diseases. We do not say, indeed, that putrid air becomes salutary by this means: but it is undoubtedly rendered less noxious than before; though, whether it is equally innocent with the smoke of a fire fed in the common way, we cannot pretend to determine.

Besides this machine by M. Defaguliers, the ventilators of Dr. Hales, already mentioned, and those called *wind-fails*, are likewise used for the same purpose. The former of which is an improvement of the Hessian-bellows: the other is a contrivance for throwing fresh air into those places where putrid air is apt to lodge; but this has the last-mentioned inconvenience in a much greater degree than any of the others, as the blast of fresh air throws out that which was rendered putrid by stagnation, in such a manner as to contaminate all around it. See **WIND-SAILS**.

AIR-PUMP, in pneumatics, is a machine for exhausting the air out of a proper vessel, and so to make what is commonly called a vacuum; though in reality the air in the receiver is only rarefied to a great degree, so as to take off the ordinary effects of the atmosphere. So that by this machine we learn, in some measure, what our earth would be without air; and how much all vital, generative, nutritive, and alterative, powers, depend upon it.

The principle on which the air-pump is constructed, is the

the spring and elasticity of the air; as that on which the common or water pump is formed, is the gravity of the same air; the one gradually exhausting the air from a vessel by means of a piston, with a proper valve, working in a cylindrical barrel or tube; and the other exhausting water in a similar manner.

The air-pump has proved one of the principal means of performing philosophical discoveries, that has been invented by the moderns. The idea of such a machine occurred to several persons nearly about the same time. But the first it seems was completed by Otto Guericke, the celebrated consul of Magdeburg, who exhibited his first public experiments with it, before the emperor and the states of Germany, at the breaking up of the imperial diet at Ratisbon, in the year 1654. But it was not till the year 1672, that Guericke published a description of the instrument, with an account of his experiments, in his *Experimenta Nova Magdeburgica de Vacuo Spacia*; though an account of them had been published by Schottus in 1657, in his *Mechanica Hydraulico Pneumatica*.

Dr. Hook and M. Duhamel ascribe the invention of the air-pump to Mr. Boyle. But that great man frankly confesses that Guericke was beforehand with him in the execution. Some attempts, he assures us, he had indeed made upon the same foundation, before he knew any thing of what had been done abroad: but the information he afterwards received from the account given by Schottus, enabled him, with the assistance of Dr. Hook, after two or three unsuccessful trials, to bring his design to maturity. The product of their labours was a new air-pump, much more easy, convenient, and manageable, than the German one. And hence, or rather from the great variety of experiments to which this illustrious author applied the machine, it was afterwards called *Machine Boyleana*, and the vacuum produced by it *Vacuum Boyleanum*.

Most of the air-pumps that were first made, consisted of only one barrel, or hollow cylinder, of brass, with a valve at the bottom, opening inwards; and a moveable embolus or piston, having likewise a valve opening upwards, and so exactly fitted to the barrel, that when it is drawn up from the bottom, by means of an indented iron rod or rack, and a handle turning a small indented wheel, playing in the teeth of that rod, all the air will be drawn up from the cavity of the barrel; there is also a small pipe opening into the bottom of the barrel, by means of which it communicates with any proper vessel to be exhausted of air, which is called a receiver, from its office in receiving the subjects upon which experiments are to be made in vacuo: the whole being fixed in a convenient frame of wood-work, where the end of the pipe turns up into a horizontal plate, upon which the receiver is placed, just over that end of the pipe.

The other parts of this machine, being only accidental circumstances, chiefly respecting conveniency, have been diversified and improved from time to time, according to the address and several views of the makers. That of Otto Guericke was very rude and inconvenient, requiring the labour of two strong men, for more than two hours, to extract the air from a glass, which was also placed under water; and yet allowed of no change of subjects for experiments.

Mr. Boyle, from time to time, removed several of these inconveniences, and lessened others; but still the working of his pump, which had but one barrel, was laborious, by reason of the pressure of the atmosphere, a great part of which was to be removed at every lift of the piston, when the exhaustion was nearly completed. Various improvements were successively made in the machine by the philosophers about that time, and soon after, who cultivated this new and important branch of pneumatics; as Papin, Merfenne, Mariotte, and others. But still they laboured under a difficulty of working them, from the circumstance of the single barrel, till Papin, in his farther improvements of the air-pump, removed that inconvenience, by the use of a second barrel or piston, contrived to

rise as the other fell, and to fall as it rose; by which, and the great improvements made by Mr. Hauksbee, the pressure of the atmosphere on the descending piston always nearly balanced that of the ascending one; so that the winch, which worked them up and down, was easily moved by a very gentle force with one hand: and, besides this, the exhaustion was hereby made in less than half the time.

Some of the Germans, and others likewise, made improvements in the air-pump, and contrived it to perform the counter office of a condenser, in order to examine the properties of the air depending on its condensation.

Mr. Boyle contrived a mercurial gauge or index to the air-pump, which is described in his first and second *Physico-Mechanical Continuations*, for measuring the degrees of the air's rarefaction in the receiver. This gauge is similar to the barometer, being a long glass tube, having its lower end immersed in an open basin of quicksilver, but its other end, which was open also, communicating with the receiver; which, being exhausted, this tube is equally exhausted of air at the same time, and the external air presses the quicksilver up into the tube, to a height proportioned to the degree of exhaustion.

Mr. Vream, an ingenious pneumatic operator, made an improvement in Hauksbee's air-pump, by reducing the alternate up-and-down motion of the hand and winch to a circular one. In his method, the winch is turned quite round, and yet the pistons are alternately raised and depressed; by which the trouble of shifting the hand backwards and forwards, as well as the loss of time, and the shaking of the pump, are prevented.

The air-pump, thus improved, is represented in the annexed Plate, *fig. 1.* where A, is the receiver to be exhausted, ground truly level at the bottom, set over a hole in the top of the pump, from which descends the bent pipe B, to the cistern C, with which the two barrels D D, communicate, in which the pistons are worked by a toothed wheel, by turning the handle E; by which the racks F F, with the pistons, are worked alternately up and down. G G, is the gauge-tube, immersed in a basin of quicksilver H, at bottom, and communicating with the receiver at top; from which however it may be occasionally disengaged, by turning a cock. And I, is another cock, by turning of which, the air is again let into the exhausted receiver; into which it is heard to rush with a considerable hissing noise.

Notwithstanding the great excellency of Mr. Hauksbee's air-pump, it was still subject to inconveniences, from which it was in a great measure relieved by some contrivances of Mr. Smeaton, which are described at large in the *Philos. Transf.* for the year 1752. The principal improvements suggested by Mr. Smeaton, relate to the gauge, the valves of the piston, and the piston going closer down to the bottom of the barrel; for his pump has only one. By the last of these, the air was extracted more perfectly at each stroke. By the second, he remedied an inconvenience arising from the valve-hole of the piston being too wide properly to support the bladder-valve which covered it: instead of the usual circular orifice. Mr. Smeaton perforated the piston with seven small and equal hexagonal holes, one in the centre, and the other six around, forming together the appearance of a transverse section of a honey-comb; the bars or divisions between which, served to support the pressure of the air on the valve. His gauge consists of a bulb of glass, of a pear-like shape, and capable of holding about half a pound of quicksilver: it is open at the lower end, the other terminating in a tube hermetically sealed; and it has annexed to it a scale, divided into parts of about one-tenth of an inch, and answering to the 1000th part of the whole capacity. During the exhaustion of the receiver, the gauge is suspended in it by a wire; but when the pump has been worked as much as necessary, the gauge is pushed down, till the open end be immersed in a basin of quicksilver placed underneath. The air is then let into the receiver again,

and the quicksilver driven by it from the basin up into the gauge, till the air remaining in it become of the same density as the air without; and, as the air always takes the highest place, the tube being uppermost, the expansion will be determined by the number of divisions occupied by the air at the top. This air-pump is made to act also as a condensing engine, as some German machines had done before, by the very simple apparatus of turning a cock.

By means of this gauge, Mr. Smeaton judged that his machine was incomparably better than any former ones, as it seemed to rarefy the air in the receiver 1000, or even 2000, times, while the best of the former construction only rarefied about 140 times; and so the case has since been always understood, an implicit confidence being placed in Mr. Smeaton's accuracy, till the fallacy was accidentally detected in the manner related at large by Mr. Nairne, in the *Philos. Transf.* for the year 1777. This accurate and ingenious artist, wanting to make trial of Mr. Smeaton's pear-gauge, executed an air-pump of his improved construction, in the best manner possible; which, in various experiments made with it, appeared, by the pear-gauge, to rarefy the air to an amazing degree indeed, being at times from 4,000 to 10,000, or 50,000, or even 100,000, times rarefied. But, upon measuring the same expansion by the usual long and short tube gauges, which both accurately agreed together, he found that these never shewed a rarefaction of more than 600 times; widely different from the same as measured by the pear or internal gauge, by experiments often repeated.

"Finding (says Mr. Nairne) still this disagreement between the pear-gauge and the other gauges, I tried a variety of experiments; but none of them appeared to me satisfactory, till one day in April, 1776, shewing an experiment with one of these pumps to the Hon. Henry Cavendish, Mr. Smeaton, and several other gentlemen of the Royal Society, when the two gauges differed some thousand times from one another, Mr. Cavendish accounted for it in the following manner:—'It appeared (he said) from some experiments of his father's, Lord Cavendish, that water, whenever the pressure of the atmosphere on it is diminished to a certain degree, is immediately turned into vapour, and is as immediately turned back again into water on restoring the pressure. This degree of pressure is different according to the heat of the water: when the heat is 72° of Fahrenheit's scale, it turns into vapour as soon as the pressure is no greater than that of three quarters of an inch of quicksilver, or about one-fortieth of the usual pressure of the atmosphere; but, when the heat is only 41°, the pressure must be reduced to that of a quarter of an inch of quicksilver before the water turns into vapour. It is true, that water exposed to the open air, will evaporate at any heat, and with any pressure of the atmosphere; but that evaporation is intirely owing to the action of the air upon it; whereas the evaporation here spoken of, is performed without any assistance from the air. Hence it follows, that when the receiver is exhausted to the above-mentioned degree, the moisture adhering to the different parts of the machine will turn into vapour, and supply the place of the air, which is continually drawn away by the working of the pump; so that the fluid in the pear-gauge, as well as that in the receiver, will consist in a good measure of vapour. Now, letting the air into the receiver, all the vapour within the pear-gauge will be reduced to water, and only the real air will remain uncondensed; consequently the pear-gauge shews only how much real air is left in the receiver, and not how much the pressure or spring of the included fluid is diminished; whereas the common gauges shew how much the pressure of the included fluid is diminished, and that equally, whether it consists of air or of vapour."

Mr. Cavendish having explained so satisfactorily the cause of the disagreement between the two gauges, Mr. Nairne considered that, if he were to avoid moisture as much as possible, the two gauges should nearly agree. And in fact they were found to do so, each shewing a rare-

refaction of about 600, when all moisture was perfectly cleared away from the pump, and the plate and the edges of the receiver were secured by a cement instead of setting it upon a soaked leather, as in the usual way. But, by future experiments, Mr. Nairne found that the same excellent machine would not exhaust more than fifty or sixty times; when the receiver was set upon leather soaked in water, the heat of the room being about 57°. And from the whole, Mr. Nairne concludes that the air-pump of Otto Guericke, and those contrived by Mr. Gratorix and Dr. Hook, and the improved one by M. Papin, both used by Mr. Boyle; as also Hawksbee's, & Gravefande's, Muchenbroeck's, and of all those who have used water in the barrels of their pumps, could never have exhausted to more than between forty and fifty, if the heat of the place was about 57°; and although Mr. Smeaton, with his pump, where no water was in the barrel, but where leather soaked in a mixture of water and spirit of wine was used on the pump-plate, to set the receiver upon, may have exhausted all but a thousandth, or even a ten-thousandth, part of the common air, according to the testimony of his pear-gauge; yet so much vapour must have arisen from the wet leather, that the contents of the receiver could never be less than a seventieth or eightieth part of the density of the atmosphere. But, when nothing of moisture is used about this machine, it will, when in its greatest perfection, rarefy its contents of air about 600 times.

It is evident that by means of these two gauges we can ascertain the several quantities of vapour and permanent air which make up the contents of the receiver, after the exhaustion is made as perfect as can be; for the usual external gauge determines the whole contents, made up of the vapour and air, whilst the pear-gauge shews the quantity of real permanent air; consequently the difference is the quantity of vapour.

The principal cause which prevents this pump from exhausting beyond the limit above-mentioned, is the weakened elasticity of the air within the receiver, which, decreasing in proportion as the quantity of the air within is diminished, becomes at last incapable of lifting up the valve of communication between the receiver and the barrel; and consequently no more air can then pass from the former to the latter.

Several ingenious persons have used their endeavours to remove this imperfection in the best air-pumps. Amongst these, one Mr. Haas has succeeded tolerably well; having, by means of a contrivance to open the communication valve in the bottom of the barrel, made his machine so perfect, that, when every thing is in the greatest perfection, it rarefies the contents of the receiver as far as 1000 times, even when measured by the exterior gauge.

But the imperfections of the air-pump have more recently been removed by an ingenious contrivance of Mr. Cuthbertson, a mathematical-instrument maker at Amsterdam, now of London, whose air-pump has neither cocks nor valves, and is so constructed, that what supplies their place has the advantages of both, without the inconveniences of either. He has also made improvements in the gauges, by means of which he determines the height of the mercury in the tube, by which the degree of exhaustion is indicated, to the hundredth part of an inch. And to obviate the inconvenience of the elastic vapour arising from the wet leather, upon which the receiver is placed, for common experiments, he recommends the use of leather dressed with allum, and soaked in hog's lard, which he found to yield very little of this vapour; but, when the utmost degree of exhaustion is required, his advice is, to dry the receiver well, and set it upon the plate without any leather, only smearing its outer edges with hog's lard, or with a mixture of three parts of hog's lard and one of oil. But the use of the leather has long been laid aside by our English instrument-makers, a circumstance which probably had not come to Mr. Cuthbertson's knowledge. An account of this instrument, and of some experiments performed

AIR .

Improved Air Pumps.

London Published as the Act directs, Feb. 20th 1796, by W. Miller.

J. Pass. sculp.

performed with it, was published at Amsterdam in the year 1787; from which experiments it appears that, by a coincidence of the several gauges, a rarefaction of 1200 times was shewn; but, when the atmosphere was very dry, the exhaustion has been so complete, that the gauges have shewn the air in the receiver to be rarefied above 2400 times.

Fig. 2, in the annexed Plate, is a perspective view of Mr. Cuthbertson's air-pump, with its two principal gauges screwed into their places. These need not be used together, except in cases where the utmost exactness is required. In common experiments one of them is removed, and a stop-screw put in its place. *Fig. 3*, represents a cross-bar, for preventing the barrels from being shaken in working the pump, or by any accident. Its proper place in the pump is shewn by the dotted lines; where it is confined, and kept close down on the barrels, by two slips of wood A A, which must be drawn out, as well as the screws B B, when the pump is to be taken asunder.

There are made also, by different persons, portable or small air-pumps, of various constructions, to set upon a table, to perform experiments with, as represented in the Plate, *fig. 4*. In these, the gauge is varied according to the fancy of the maker, but commonly it consists of a bent glass tube, like a syphon, open only at one end. The gauge is placed under a small receiver communicating, by a pipe, with the principal pipe leading from the general receiver to the barrels. The close end of the gauge, of three or four inches long, before the exhaustion, has the quicksilver forced close up to the top by the pressure of the air on the open end; but, when the exhaustion is considerably advanced, it begins to descend, and then the difference of the heights of the quicksilver in the two legs, compared with the height in the barometrical tube, determines the degree of exhaustion. So if the difference between the two be one inch, when the barometer stands at 30°, the air is rarefied thirty times; but, if the difference be only half an inch, the rarefaction is sixty times, and so on.

In whatever manner or form this machine be made, the use and operation of it are always the same. The handle, which works the piston, is moved up and down in the barrel, by which means a barrel of the contained air is drawn out at every stroke of the piston, in the following manner: by pushing the piston down to the bottom of the barrel, where the air is prevented from escaping downwards, by its elasticity it opens the valve of the piston, and escapes upwards above it into the open air; then raising the piston up, the external atmosphere shuts down its valve, and a vacuum would be made below it, but for the air in the receiver, pipe, &c. which now raises the valve in the bottom of the barrel, and rushes in and fills it again, till the whole air in the receiver and barrel be of one uniform density, but less than it was before the stroke, in proportion as the sum of all the capacities of the receiver, pipe, and barrel, together, is to the same sum wanting the barrel. And thus is the air in the receiver diminished at each stroke of the piston, by the quantity of the barrel or cylinder full, and therefore always in the same proportion: so that, by thus repeating the operation again and again, the air is rarefied to any proposed degree, or till it has not elasticity enough to open the valve of the piston or of the barrel, after which the exhaustion cannot be any farther carried on: the gauge, in comparison with the barometer, shewing at any time what the degree of exhaustion is, according to the particular nature and construction of it.

But, supposing no vapour from moisture, &c. to rise in the receiver, the degree of exhaustion, after any number of strokes of the piston, may be determined by knowing the respective capacities of the barrel and the receiver, including the pipe, &c. For as we have seen above that every stroke diminishes the density in a constant proportion, namely, as much as the whole content exceeds that of the cylinder or barrel; and consequently the sum of as many diminutions as there are strokes of the piston, will

shew the whole diminution by all the strokes. So, if the capacity of the barrel be equal to that of the receiver, in which the communication-pipe is always to be included; then, the barrel being half the sum of the whole contents, half the air will be drawn out at one stroke; and consequently the remaining half, being dilated through the whole or first capacity, will be of only half the density of the first: in like manner, after the second stroke, the density of the remaining contents will be only half of that after the first stroke, that is, only one-fourth of the original density; continuing this operation, it follows that the density of the remaining air will be one-eighth after three strokes of the piston, one-sixteenth after four strokes, $\frac{1}{32}$ after five strokes, and so on, according to the powers of the ratio $\frac{1}{2}$; that is, such power of the ratio as is denoted by the number of the strokes.

Some of the principal effects and phenomena of the air-pump, are the following:—That, in the exhausted receiver, heavy and light bodies fall equally swift; so, a guinea and feather fall from the top of a tall receiver to the bottom exactly together. That most animals die in a minute or two: but, however, That vipers and frogs, though they swell much, live an hour or two; and, after being seemingly quite dead, come to life again in the open air. That snails survive about ten hours; efts, or slow-worms, two or three days; and leeches five or six. That oysters live for twenty-four hours. That the heart of an eel, taken out of the body, continues to beat for good part of an hour, and that more briskly than in the air. That warm blood, milk, gall, &c. undergo a considerable intumescence and ebullition. That a mouse or other animal may be brought, by degrees, to survive longer in a rarefied air than it naturally does. That air may retain its usual pressure, after it is become unfit for respiration. That the eggs of silk-worms hatch in vacuo. That vegetation stops. That fire extinguishes; the flame of a candle usually going out in about one minute; and charcoal in about five minutes. That red-hot iron, however, seems not to be affected; and yet sulphur or gunpowder are not lighted by it, but only fused. That a match, after lying seemingly extinct a long time, revives again on re-admitting the air. That a flint and steel strike sparks of fire as copiously, and in all directions, as in air. That magnets, and magnetic-needles, act the same as in air. That the smoke of an extinguished luminary gradually settles to the bottom in a darkish body, leaving the upper part of the receiver clear and transparent; and that on inclining the vessel sometimes to one side, and sometimes to another, the smoke preserves its surface horizontal, after the nature of other fluids. That heat may be produced by attrition. That camphire will not take fire; and that gun-powder, though some of the grains of a heap of it be kindled by a burning-glass, will not give fire to the contiguous grains. That glow-worms lose their light in proportion as the air is exhausted, and at length become totally obscure; but, on re-admitting the air, they presently recover it all. That a bell, on being struck, is not heard to ring, or very faintly. That water freezes. But that a syphon will not run. That electricity appears like the aurora borealis. With multitudes of other curious and important particulars, to be met with in the numerous writings on this machine, namely, besides the Philosophical Transactions of most Academies and Societies, in the Writings of Torricelli, Pascal, Merfenne, Guericke, Schottus, Boyle, Hook, Duhamel, Mariotte, Hauksbee, Hales, Muschenbroeck, Gravesande, Desaguliers, Franklin, Cotes, Helsham, and a great many other authors. See also the article PNEUMATICS.

AIR-SHAFTS, among miners, denote holes or shafts let down from the open air to meet the adits and furnish fresh air. The damps, want and impurity of air, which occur, when adits are wrought thirty or forty fathoms long, make it necessary to let down air-shafts, in order to give the air liberty to play through the whole work, and thus discharge bad vapours, and furnish good air for respiration: the

expende of which shafts, in regard to their vast depths, hardness of the rock, drawing of water, &c. sometimes equals, nay exceeds, the ordinary charge of the whole adit. Sir Robert Murray describes a method, used in the coal-mines at Liege, of working mines without air-shafts.

When the miners at Mendip have sunk a groove, they will not be at the charge of an air-shaft till they come at ore; and for the supply of air have boxes of elm exactly closed, of about six inches in the clear, by which they carry it down about twenty fathoms. They cut a trench at a little distance from the top of the groove, covering it with turf and rods disposed to receive the pipe, which they contrive to come in sideways to their groove, four feet from the top; which carries down the air to a great depth. When they come at ore, and need an air-shaft, they sink it four or five fathoms distant, according to the convenience of the breadth, and of the same fashion with the groove, to draw as well ore as air.

AIR-THREADS, in natural history, a name given to the long filaments, so frequently seen in autumn floating about in the air. These threads are the work of spiders, especially of that species called the long-legged field-spider; which, having mounted to the summit of a bush or tree, darts from its tail several of these threads, till one is produced capable of supporting the creature in the air: on this it mounts in quest of prey, and frequently rises to a very considerable height. See *ARANEÆ*.

AIR-TRUNK, is a contrivance by Dr. Hales to prevent the stagnation of putrid effluvia in gaols, and other places where a great number of people are crowded together in a small space. It consists of a long square trunk open at both ends; one of which is inserted into the ceiling of the room, the air of which is required to be kept pure; and the other extends a good way beyond the roof. Thro' this trunk a continued circulation is carried on: and the reason is, that the putrid effluvia which do so much mischief when collected, being much lighter than the pure atmosphere, arise to the top of the room; and, if they there find a vent, will continually go out through it. These effluvia arise in very considerable quantity, being calculated by the late Dr. Keil at no less than thirty-nine ounces from one man in twenty-four hours.

These trunks were first made trial of by Mr. Yeoman, over the House of Commons, where they were nine inches wide within; and over the court of King's Bench in Westminster-hall, where they were six inches wide. They are sometimes made wider, and sometimes narrower: but the wider they are the longer they ought to be, more effectually to promote the ascent of the vapour. The reason why vapours of this kind ascend more swiftly through a long trunk than a short one, is, that the pressure of fluids is always according to their different depth, without regard to the diameter of their basis, or of the vessel which contains them; and, upon this principle, a gallon of water may be made to split a strong cask. See *HYDROSTATICS*. When the column of putrid effluvia is long and narrow, the difference between the column of atmosphere pressing on the upper end of the trunk, and that which presses on the lower end, is much greater than if the column of putrid effluvia was short and wide; and, consequently, the ascent is much swifter. One pan of a single pair of scales, which was two inches in diameter, being held within one of these trunks over the House of Commons, the force of the ascending air made it rise so as to require four grains to restore the equilibrium, and this when there was no person in the house; but, when it was full, no less than twelve grains were requisite to restore the equilibrium; which clearly shews that these trunks must be of real and very great efficacy.

AIR-VESSEL, in hydraulics, is a vessel of air within some water-engines, which being compressed, by forcing in a considerable quantity of water, by its uniform spring, forces it out at the pipe in a constant uninterrupted stream, to a great height.

Air-vessel too, in the improved fire-engines, is a metal-

lic cylinder, placed between the two forcing-pumps, by the action of whose pistons the water is forced into this vessel, through two pipes, with valves; then the air, previously contained in it, is compressed by the water, in proportion to the quantity admitted, and this air, by its spring, forces the water through a pipe by a constant and equal stream; whereas, in the common squirting engine, the stream is discontinued between the several strokes. See *HYDRAULICS*.

AIR-VESSELS, in botany, are spiral ducts in the leaves, &c. of plants, supposed to be analagous to the lungs of animals, in supplying the different parts of a plant with air.

AIRY, *adj.* [from *air*; *aërius*, Lat.] Composed of air. Relating to the air; belonging to the air.—There are fishes that have wings, that are no strangers to the *airy* region. *Boyle*.—High in air. Open to the free air. Light as air; thin; unsubstantial; without solidity.—I hold ambition of so *airy* and light a quality, that it is but a shadow's shadow. *Shakespeare*.—Wanting reality; having no steady foundation in truth or nature; vain; trifling.—I have found a complaint concerning the scarcity of money, which occasioned many *airy* propositions for the remedy of it. *Temple*.—Fluttering; loose; as if to catch the air; full of levity.—By the name of ladies, he means all young persons, slender, finely shaped, *airy*, and delicate: such as are nymphs and Naiads. *Dryden*.—Gay; sprightly: full of mirth; vivacious; lively; spirited; light of heart.—He that is merry and *airy* at shore when he sees a sad tempest on the sea, or dances when God thunders from heaven, regards not when God speaks to all the world. *Taylor*.

AIR, *f.* in mythology, was adored by the Heathens under the names of Jupiter and Juno; the former representing the superior and finer part of the atmosphere, and the latter the inferior and grosser part. The augurs also drew presages from the clouds, thunder, lightning, &c.

AIR, in painting, &c. denotes the manner and very life of action; or it is that which expresses the disposition of the agent. It is sometimes also used in a synonymous sense with gesture or attitude.

AIR, in music, is taken in different senses. It is sometimes contrasted with harmony; and, in this sense, it is synonymous with melody in general. Its proper meaning is, A tune which is set to words, or to short pieces of poetry that are called *songs*. In operas, we give the name of *air* to such pieces of music as are formed with measures and cadences, to distinguish it from the recitative; and, in general, every piece of music is called an air, which is formed for the voice, or even for instruments, and adapted to stanzas, whether it forms a whole in itself, or whether it can be detached from any whole of which it forms a part, and be executed alone. If the subject admits of harmony, and is set in parts, the air is, according to their number, denominated a *duett*, a *trio*, a *quartetto*, &c. We need not follow Rousseau, and the other philologists, in their endeavours to investigate the etymon of the word *air*. Its derivation, though found and ascertained, would contribute little to illustrate its meaning in that remote sense, to which, through a long continuance of time, and the various vicissitudes of language, it has now passed. The curious may consult the same article in the *Dictionnaire de Musique*, by M. Rousseau.

In modern music, there are several different kinds of *airs*, each of which agrees to a certain kind of dancing, and from these dances the airs themselves take their specific names. The airs of our operas, are, if we may be permitted the expression, the canvass or substratum upon which are painted all the pictures of imitative music; melody is the design, and harmony the colouring; every picturesque object selected from the most beautiful parts of nature, every reflected sentiment of the human heart, are the models which the artist imitates; whatever gains attention, whatever interests the soul, whatever charms the ear, or causes emotion in the heart, these are the objects of his imitation. See *IMITATION*. An air which delights the

the ear, and discovers the learning of the composer; an air invented by genius, and composed with taste, is the noblest effort of music: it is this which explores the compass, and displays the delicacy, of a beautiful voice; it is in this where the charms of a well-conducted symphony shine; it is by this, that the passions, excited and inflamed by nice gradations, reach and agitate the soul through the avenues of external sense. After hearing a beautiful air, the mind is acquiescent and serene: the ear is satisfied, not disgusted: it remains impressed on the fancy, it becomes a part of our essence, we carry it with us, we are able to repeat it at pleasure: without the ability acquired by habit to breathe a single note of it, we execute it in our imagination in the same manner as we heard it upon the theatre: one sees the scene, the actor, the theatre; one hears the accompaniments and the applauses. The real enthusiast in music never forgets the beautiful airs which he has heard; when he chooses, he causes the opera to re-commence.

AIR, or **AYR**, a town of Scotland, capital of an extensive county of the same name. It stands on the river Air, and was formerly a place of good trade, and seat of fisheries; all of which have vanished, and the people now live by one another. Air appears, from history and other documents, to have been a considerable place at the time of the Norman conquest. About a mile north from the town there is a lazaret-house, commonly called the King's Chapel, which king Robert de Bruce set apart for the maintenance of lepers.

AIRA, *f.* [*αἶρα*, Gr.] In botany, a genus of the triandria digynia class, of the natural order of gramina or grasses. The generic characters are—Calyx: a two-flowered two-valved glume; valves ovate-lanceolate, acute, equal. Corolla: bivalve; valves like those of the calyx; nectary two-leaved; leaflets acute, gibbous at the base. Stamina: filaments capillary, the length of the flower, with oblong antheræ, forked at each end. Pistillum: germ ovate; styles setaceous spreading, with pubescent stigmas. Pericarpium: none. Seed: subovate, covered by the corolla.—*Essential Character.* Calyx two-valved, two-flowered, without any rudiment of a third.

Species. I. Naked or awnless. 1. *Aira arundinacea*, or reedy aira-grafs: panicle oblong, on one side, imbricate; leaves flat. Found by Tournefort in the Levant, and by Loureiro in Cochinchina.

2. *Aira minuta*, or minute aira-grafs: panicle loose, almost level-topped, very branching. An annual grass, found by Loefling in Spain. It differs from that which is figured by Buxbaum, only in being much smaller, and not an inch high.

3. *Aira aquatica*, or water aira-grafs: panicle spreading, flowers smooth, longer than the calyx, leaves flat. In the water this grass runs to a considerable distance, throwing off roots and young shoots as it passes along; the stalk is hollow, and remarkably tender. It is easily known by the purple or bluish colour of the panicles; the flowers also have a sweet taste. It flowers in June and July, but it is not worth cultivating. *Poa aquatica* is a much stronger plant. There is a variety of this (according to Schreber) in dry soils, which has the calyxes five-flowered, and the flowers very remote from each other.

II. Awned. 4. *Aira subspicata*, or spiked aira-grafs: leaves flat, panicle spiked, flowers awned on the middle; awn reflex, loose. Found on the mountains of Switzerland, Savoy, Denmark, and Lapland. Perennial.

5. *Aira cæspitosa*, or turf aira-grafs: leaves flat; panicle spreading; petals villous and awned at the base; awn straight, short. In moist meadows it sometimes produces three or four floscules in one calyx. In marshes it is frequently viviparous. Growing in tufts, it occasions irregularities, tussocks, or hassocks, as they are vulgarly called in meadows. Cows, goats, and swine, eat it, but horses are not fond of it. Found in meadows, fields, and woods. Perennial.

6. *Aira flexuosa*, or heath aira-grafs: leaves setaceous, culms almost naked, panicle divaricated, peduncles flexuose. This species is eaten by horses, kine, and sheep. It is a native of heaths, barren pastures, and rocky moors. Perennial.

7. *Aira montana*, or mountain aira-grafs: leaves setaceous, panicle narrowed, flowers hairy at the base and awned, awn twisted and very long. According to Haller, Leers, &c. this is only a variety of the foregoing. Mr. Hudson has a variety of this which he calls *setacea*. Native of high heaths and barren pastures, and is perennial. Sheep are very fond of it.

8. *Aira Alpina*, or Alpine aira-grafs: leaves subulate, panicle dense, flowers hairy at the base and awned; awn short. Grows on the mountains of Germany, Savoy, and Lapland.

9. *Aira villosa*, or villose aira-grafs: leaves subulate, panicle long and narrow; flowers sesquialteral, shaggy, awned; awn straight, short. Found at the Cape of Good Hope by Thunberg.

10. *Aira canescens*, or grey aira-grafs: leaves setaceous, the upper one involving the panicle at bottom like a spathe. Native of sandy shores, the walls of Basil, and the sandy fields of Germany and Piedmont.

11. *Aira præcox*, or early aira-grafs: leaves setaceous, sheaths angled, flowers panicle-spiked, and awned at the base. This species has a sweet taste; cows are very fond of it; horses and sheep eat it. It is found in ditches, on banks of streams, and in wet meadows; flowering in June and July.

12. *Aira coryphyllea*, or silver aira-grafs: leaves setaceous, panicle divaricated, flowers awned distant. Native of sandy pastures and heaths of England, France, Switzerland, Piedmont, Germany, and Denmark. Annual.

13. *Aira Antartica*, or South-Sea aira-grafs: leaves flat; panicle compound, spreading; calyxes three flowered; floscules awned in the middle; awn elongated straightish. Native of New Zealand.

14. *Aira involucrata*, or involucred aira-grafs: panicle spreading, involucred with bristles at the base; floscules awnless. It is annual, and flowers in June and July. Native of Spain, near Madrid, on barren hills.

Propagation and Culture. See GRASS.

AIRA, *f.* in botany. See **MELICA**, **POA**, **CYNOSURUS**, and **HOLCUS**.

AIRA CAPENSIS, *f.* in botany. See **EHRHARTA**.

AIRA INDICA, *f.* in botany. See **PANICUM**.

AIRA VARIA, *f.* in botany. See **CYNOSURUS**.

AIRANI, *f.* in church-history, an obscure sect of Arians, in the fourth century, who denied the consubstantiality of the Holy Ghost with the Father and the Son. They are otherwise called *Airanista*; and are said to have taken their name from one *Airas*, who distinguished himself at the head of this party, in the reigns of Valentinian and Gratian.

AIRE, a town of France, in Proper Gascony, of which it is the capital; was a bishop's see. It is seated on the river Adour, on the declivity of a mountain. E. lon. 0. 3. N. lat. 43. 47.

AIRE, a strong town in the Netherlands, in the county of Artois, with a castle. It was taken by the French in 1710, and was confirmed to them by the treaty of Utrecht. It is seated on the river Lis, twenty-two miles south of Dunkirk, and communicates with St. Omer's by a canal cut from the river Aa. E. lon. 2. 31. N. lat. 50. 38.

AIRS, in the manege, are the artificial motions of taught horses; as the demivolt, curvet, capriole, &c.

AIRY TRIPLICITY, among astrologers, denotes the three signs, gemini, libra, and aquarius.

AISLE, *f.* [Thus the word is written by Addison, but perhaps improperly; since it seems deducible only from, either *aile*, a wing, or *allée*, a path, and is therefore to be written *aile*.] The walks in a church, or wings of a quire.—The abbey is by no means so magnificent as one would expect

expect from its endowments. The church is one huge nef, with a double *aisle* to it; and, at each end, is a large quire. *Addison*.

AISNE, a river of France, which rises in Champaign, and runs W. by Soissons in the Isle of France, falling in the river Oise, a little above Campeigne.

AIT, or **EYGH**, *f.* [supposed, by *Skinner*, to be corrupted from *islet*.] A small island in a river.

AITOCZU, a considerable river of Lesser Asia, which, arising in the mountain Taurus, falls into the south part of the Euxine sea.

AITONIA, *f.* [from Mr. Aiton, late gardener to his majesty at Kew.] In botany, a genus of the monadelphia octandria class, of the natural order of columniferae. The generic characters are—Calyx: perianth one-leaved, erect, four-parted, short, divided into four ovate sharp segments. Corolla: has four, erect, equal, broadly-ovate, concave, very obtuse, petals. Stamina: filaments joined as far as the middle, divided above into eight; awl-shaped, furrowed, standing out of the corolla; and having ovate furrowed antherae. Pistillum: germ superior, ovate, smooth, subangular; style one, filiform, of the same length with the stamens; stigma obtuse, undivided. Pericarpium: an ovate, dry, membranaceous, four-cornered, one-celled, brittle, berry; the corners are produced and sharp. Seeds: many, fixed to a column, globular and smooth. Obf. It varies with five-cleft ten-stamened flowers.—*Essential Character*. Style, one. Calyx, four-parted. Corolla, four-petalled. Berry, dry, quadrangular, one-celled, many-seeded.

There is only one *species*, which is called *aitonia* Capensis, or Cape *aitonia*. The fruit resembles that of the winter cherry. It was found at the Cape by Thunberg; and introduced here in 1774, by Mr. Francis Masson. This shrub is of slow growth with us, and seldom exceeds three feet in height. When it is of sufficient age, it produces flowers and fruit through most of the year. The segments of the calyx and the petals are red at the ends; the fruit is also of a fine red colour, and large.

Propagation and Culture. It is raised only from seeds, which are sparingly produced in this country; and it must be kept in the green-house or Cape-stove.

AJUGA *f.* [*a* priv. and *Juga*, one of Juno's names; from a supposed power of procuring abortion; which however this plant does not possess.] In botany, a genus of the didymia gymnospermia class, of the natural order of verticillatae or labiatae. The generic characters are—Calyx: perianth one-leaved, short, cut half-way into five clefts, with the segments nearly equal. Corolla: monopetalous, ringent; tube cylindric, bent in, upper lip very small, erect, bifid, obtuse; lower large, spreading, trifid, obtuse; middle division very large and obcordate; side-ones small. Stamina: filaments subulate, erect, longer than the upper lip: antherae twin. Pistillum: germ four-parted; style filiform, situation and length as in the stamens; stigmas two, slender, the lowest shorter. Pericarpium: none; the calyx, which is converging, fosters the seeds. Seeds: somewhat oblong.—*Essential Character*. Corolla, upper lip very small. Stamina, longer than the upper lip.

Species. 1. *Ajuga orientalis*, or eastern bugle: flowers inverted. This species has purple flowers. It was first brought into Europe from the Levant, by Tournefort. It has since been observed by Thunberg in Japan, and by Loureiro in Cochinchina. There are two or three varieties differing only in the colours of their flowers.

2. *Ajuga pyramidalis*, or pyramidal bugle: spike a quadrangular villous pyramid, leaves approximating, root-leaves very large, bractes nearly entire. The leaves are often brown, and the plant is biennial. It flowers in April: with us usually later. A native of Italy, France, Germany, Switzerland, Sweden, and Denmark; also of Wales and Scotland.

3. *Ajuga alpina*, or alpine bugle: stem simple, stem-leaves equalling the radical ones. Alpine bugle has the

leaves much longer than those of the common fort; the stalks are weaker, and decline on every side; and the whirls of flowers are much smaller, and more distant. It differs from the second in the leaves being wrinkled, more ovate and crowded, hirsute, the petioles shorter and broader, the spike proceeding immediately from the root. At the top of the root are circles of leaves, whence arise leafy stems, four or six inches high. It also differs from the second, according to Linnæus, in the root-leaves being scarcely larger than the others: flowers on both sides ten, not three; deep blue, not white; bractes green, not coloured. Grows naturally on the Alps, and is admitted into some gardens for the sake of variety, and propagates in plenty by its trailing stalks. It requires a moist shady situation. Introduced here in 1775, by doctors Pitcairn and Fothergill.

4. *Ajuga genevensis*, or geneva bugle: leaves downy streaked with lines, lowermost narrower; calyxes shaggy; bractes generally three-lobed. This species approaches near to the common fort, but the leaves are downy, and the calyxes very rough. There are two varieties of this, one with a white, the other with a red, flower. It grows wild not only about Geneva, but also in many of the southern countries of Europe.

5. *Ajuga reptans*, or common bugle: smooth and creeping by runners. The common bugle has the stalk upright, six inches high, hairy, purple. It flowers from May to June. It grows naturally in woods and moist meadows in most parts of England, and the countries of Europe south of us. It increases gently by the side-shoots, which put out roots at their joints. There are two varieties of this, one with a white, and the other with a pale purple, flower, which grow in several parts of Westmoreland; but these do not differ in any other respect than in the colour of their flowers from the blue sort. The common bugle is recommended as a vulnerary herb, both internally and externally. It is numbered amongst cooling and gently astrigent vegetables. The roots strike a black colour with vitriol of iron. Some foreign physicians of eminence recommended a decoction of this herb in the quinsy, but it is out of use among us. It is constantly found mixed with the vulnerary herbs imported from Switzerland. Official writers call it *consolida media*, or middle confound. This is so common wild, that it is seldom admitted into gardens.

6. *Ajuga decumbens*, or Japanese bugle: decumbent and villous; leaves obovate, toothed. This species has branched, decumbent with the ends standing up, four or five inches in length. Root-leaves many, larger than those on the stem, all petiolate. The flowers in whirls small and blue.

Propagation and Culture. The first sort requires a little protection in winter, the plants should be put into pots filled with a loamy soil; they may stand in a shady situation during summer; but in winter they must be removed under a common frame, where they may enjoy as much free air as possible in mild weather; in hard frosts however they must be covered. It may be propagated by seeds, which should be sown soon after they are ripe, in a pot filled with loam, placed in a shady situation till autumn, and then removed under a frame. In the spring, they should be transplanted into separate pots, as soon as they are strong enough to remove, and treated as directed for the old plants. It may be also increased by offsets: but this is a very slow method, because this species puts out few of them. The sixth sort may be increased and treated in the same manner. As to all the rest, they are hardy, and easily multiplied by the side-shoots: they delight in a moist shady situation, and are apt to spread too much.

AJUGA, *f.* in botany. See **TEUCRIUM**.

AIUS LOCUTIUS, the name of a deity to whom the Romans erected an altar.—The words signify “a speaking voice.”—The following accident gave occasion to the Romans erecting an altar to the Aius Locutius: A plebeian, named

named M. Seditius, acquainted the tribunes, that, in walking the streets by night, he had heard a voice over the temple of Vesta, giving the Romans notice that the Gauls were coming against them. This intimation was, however, neglected; but, after the truth was confirmed by the event, Camillus acknowledged this voice to be a new deity, and erected an altar to it under the name of the Aius Locutius.

AJUTAGE, *f.* [*ajutage*, Fr.] A kind of tube fitted to the mouth of the vessel through which the water of a fountain is to be played. To the different form and structure of ajutages is owing to the great variety of fountains. See **FOUNTAIN** and **HYDROSTATICS**.

AIX, a small ancient town in the duchy of Savoy, with the title of a marquise. It is seated on the lake Bourget, at the foot of a mountain, between Chamberry, Annecy, and Rumilly. Here is a triumphal arch of the ancient Romans, but it is almost entirely ruined. The mineral waters bring a great number of strangers to this place. It was originally called *Aqua Gratiana*, from the hot baths built there by the emperor Gratian. E. long. 7. 10. N. lat. 45. 40.

AIX, an ancient city, the capital of Provence, in France. It has the air of silence and gloom so commonly characteristic of places destitute of commerce or industry. It is, however, a well-built city; and most like Paris of any place in France, as well for the largeness of the buildings as in respect of the politeness of the inhabitants. It is embellished with abundance of fine fountains, and several beautiful squares. The preachers square is on the side of a hill; it is about 160 yards in length, and is surrounded with trees, and houses built with stone three stories high. The guild-hall is at one end of the city, and is distributed into several fine apartments. The hotel of the city is a handsome building, but hid by the houses of the narrow street in which it is placed. The cathedral church is a gothic structure, with tombs of several earls of Provence, and some good pictures by French masters. The Corse, or Orbitelle, is a magnificent walk, above 300 yards long, formed by a triple avenue of elms, and two rows of regular and stately houses. The church of the fathers of the oratory is a handsome building; and not far from thence is the chapel of the blue penitents, which is full of paintings. The convent of preachers is very fine; in their church was a silver statue of the Virgin Mary almost as big as the life. There are other churches and buildings which contain a great number of rarities. The baths without the city have good buildings, raised at a vast expence, for the accommodation of those who drink the waters. Although Aix was the first Roman settlement in Gaul, it is not remarkable for ancient remains. The warm springs, from which it is now known and frequented, induced Sextus Calvinus to found a colony here, to which he gave the name of *Aqua Sextia*. They were supposed to possess particular virtues in cases of debility; and several altars have been dug up sacred to Priapus, the inscriptions on which indicate their gratitude to that deity for his supposed succour and assistance. E. long. 5. 32. N. lat. 43. 32.

AIX, a small island on the coast of France, between the isle of Oleron and the continent. It is twelve miles north-west of Rochfort, and twelve south-south-west of Rochelle. W. long. 1. 4. N. lat. 46. 5.

AIX-LA-CHAPELLE, a fine city of Germany, in the circle of Westphalia and duchy of Juliers.—All authors are agreed about its antiquity, it being mentioned in Cæsar's Commentaries and the Annals of Tacitus. The Romans had colonies and fortresses there, when they were at war with the Germans; but the mineral waters and the hot bath so increased its fame, that, in process of time, it was advanced to the privileges of a city, by the name of *Aquægranii*, that is, the waters of Granian; that which it has now, of Aix-la-Chapelle, was given it by the French, to distinguish it from the other Aix. It is so called, on account of a chapel built in honour of the Holy

Virgin by Charlemagne; who, having repaired, beautified, and enlarged, the city, which was destroyed by the Huns in the reign of Attila in 451, made it the usual place of his residence. The town is seated in a valley surrounded with mountains and woods, and yet the air is very wholesome. It may be divided into the inward and outward city. The inward is encompassed with a wall about three quarters of a league in circumference, having ten gates; and the outward wall, in which there are eleven gates, is about a league and a half in circumference. There are rivulets which run through the town and keep it very clean, turning several mills; besides twenty public fountains, and many private ones. They have stone-quarries in the neighbourhood, which furnish the inhabitants with proper materials for their magnificent buildings, of which the stadt-house and the cathedral are the chief. There are likewise thirty parochial or collegiate churches. The market-place is very spacious, and the houses round it are stately.

Aix-la-Chapelle is a free imperial city, and changes its magistracy every year on the eve of St. John Baptist. The mayor is in the nomination of the elector palatine, in the quality of the Duke of Juliers, as protector of the city. This place is famous for several councils and treaties of peace concluded here; particularly those between France and Spain in 1668, and between Great Britain and France in 1748.

The hot sulphureous waters for which this place has so long been celebrated, arise from several sources, which supply eight baths constructed in different parts of the town. These waters near the sources are clear and pellucid; and have a strong sulphureous smell resembling the washings of a foul gun; but they lose this smell by exposure to the air. Their taste is saline, bitter, and urinous. They do not contain iron. They are also neutral near the fountain, but afterwards are manifestly and pretty strongly alkaline, inasmuch that clothes are washed with them without soap.—On the vaults above the springs and aqueducts of these waters is found, every year, when they are opened, a quantity of fine white-coloured flowers of sulphur, which has been sublimed from the waters. The heat of the water of the hottest spring, by Dr. Lucas's account, raises the quicksilver of Fahrenheit's thermometer to 136—by Mons. Monet's account, to 146—and the heat of the fountain, where they commonly drink, by Dr. Lucas's account, to 112. These waters are powerfully diaphoretic and diuretic; and, if taken in quantity, prove purgative. Of the three hot European waters of note, viz. that of Aix-la-Chapelle, Bourbon, and Bath, the first abounds more eminently with sulphur, whence it is the hottest, the most nauseous, and purgative. The Bath water is, however, the least possessed of these qualities. These waters are efficacious in diseases proceeding from indigestion, and from foulness of the stomach and bowels. In rheumatisms; in the scurvy, scrophula, and diseases of the skin; in hysteric and hypochondriac disorders; in nervous complaints and melancholy; in the stone and gravel; in paralytic complaints; in those evils which follow an injudicious use of mercury; and in many other cases. They ought not, however, to be given in hectic cases where there is heat and fever, in putrid disorders, or where the blood is dissolved, or the constitution much broken down. The time of drinking, in the first season, is from the beginning of May to the middle of June; and, in the latter season, from the middle of August to the latter end of September.

There are galleries or piazzas under which the company walk during the time of drinking, in order to promote the operation of the waters.—The Poor's Bath is free for every body, and is frequented by crowds of poor people. It is scarcely necessary to add, that there are all kinds of amusements common to other places of public resort; but the sharps appear more splendidly here than elsewhere, assuming titles, with an equipage suitable to them.—Aix-la-Chapelle is twenty-one miles from Spa, thirty-

thirty-six from Liege, and thirty from Cologne. E. lon. 5. 48. N. lat. 51. 55.

AIZOON, *f.* [*αἰζών*, *sempervivum* or ever-living.] In botany, a genus of the icofandria pentagynia class, ranking in the natural order of succulentæ. The generic characters are—Calyx: perianthium one-leaved: divided into five lanceolate permanent segments. Corolla: none. Stamina: filaments very many, capillary, inserted by bunches into the sinuses of the calyx. Antheræ simple. Pistillum: germ five-cornered, superior. Styles five, simple. Sigmæ simple. Pericarpium: capsule five-celled, five-valved, swelling and retuse. Seeds: several, roundish, or kidney-shaped.—*Essential Character.* Calyx, five-parted. Petals, none. Capsules, superior, five-celled, five-valved.

Species. 1. Aizoon canariense, or purslane-leaved aizoon: leaves wedge-ovate, flowers sessile. A native of the Canary islands. Annual.

2. Aizoon hispanicum, or Spanish aizoon: leaves lanceolate, flowers sessile. It grows naturally in Spain and Africa. This is also an annual plant, whose branches trail on the ground. The flowers have no beauty; these plants therefore are preserved only by those who are curious in collecting rare plants. A variety of this comes from the Cape, with the stem and leaves shaggy, but the upper surface of the leaves less so.

3. Aizoon-lanceolatum, or panicled aizoon: leaves lanceolate, flowers panicled. It grows naturally at the Cape of Good Hope. This is of humble growth, and perishes soon after the seeds are ripe. Cultivated in 1759, by Mr. Miller. Biennial.

4. Aizoon farmentosum: leaves linear-filiform, panicle dichotomous, flowers solitary, peduncled. 5. Aizoon paniculatum, or panicled aizoon: shaggy; leaves lanceolate; flowers sessile; branches erect. 6. Aizoon perfoliatum, or perfoliate aizoon: downy; leaves inversely-ovate, conjoined, crystalline-dotted; flowers peduncled. 7. Aizoon glinoides, or hairy aizoon: shaggy, herbaceous, procumbent; leaves ovate, flowers sessile, distinct. 8. Aizoon secundum: shag-hoary, herbaceous, procumbent: leaves ovate; flowers sessile, imbricate, one-ranked. 9. Aizoon fruticosum, or shrubby aizoon: shrubby, erect, smooth; leaves lanceolate; flowers sessile. 10. Aizoon rigidum, or stiff aizoon: shrubby, procumbent, downy; leaves ovate; flowers sessile, remote. All these were found at the Cape; the fourth by Sparrman, the rest by Thunberg.

Propagation and Culture. The first sort must be raised on a moderate hot-bed in the spring; and, when the plants are fit to remove, they should be carefully taken up, and planted each in a small pot filled with fresh light earth, and plunged into another moderate hot-bed, observing to shade them from the sun, until they have taken fresh root; after which they must be hardened by degrees to bear the open air, into which they should be removed in June, placing them in a sheltered situation, where they will flower, and ripen their seeds in September, soon after which the plants will perish. The second and third sorts may be propagated in the same manner; and, when the plants have acquired strength, they may be removed into the full ground; but they require a poor sandy soil, for in rich ground they grow very luxuriant in branches, but will not flower till late in the season, and therefore rarely perfect their seeds; but when they are planted in dry sand, or lime-rubbish, they will be more productive of flowers, and less vigorous in their branches. The other species must be managed in the same manner, as other Cape plants.

AIZOON, *f.* in botany. See **SEDUM**.

AKBER, emperor of Indostan, the sixth in descent from Tamerlane, and contemporary with queen Elizabeth, was universally esteemed a great and good prince. He was also successful in war, having in his reign made several conquests, and reduced to obedience almost all the provinces of Indostan which had revolted from his father,

and predecessor, Hemajoon; and his political talents, together with his unremitting attention to the happiness of his subjects, are sufficiently apparent from the regulations which he established for every department of the empire. He was born at Amercote, A. D. 1542, was proclaimed emperor in 1556, and died at Agra in 1605, after a reign of forty-nine years and eight months. The history of this potentate has been written, with great elegance and precision, by the vizier Abul Fazel, under the title of "Ayeen Akbery, or, the Institutes of the emperor Akber."

To AKE, *v. n.* [from *αχέ*, Gr. and therefore more grammatically written *ache*.] To feel a lasting pain, generally of the internal parts; distinguished from smart, which is commonly used of uneasiness in the external parts; but this is no accurate account.—Were the pleasure of drinking accompanied, the very moment, with that sick stomach and *aching* head, which, in some men, are sure to follow, I think no body would ever let wine touch his lips. *Locke*.—It is frequently applied, in an improper sense, to the heart; as, the *heart aches*; to imply grief or fear. *Shakespeare* has used it, still more licentiously, of the soul.—My soul *aches*.

AKENSIDE (Mark), a celebrated physician, and a poet. He was born at Newcastle-upon-Tyne, Nov. 9, 1721; and, after being educated at the grammar-school in Newcastle, was sent to the universities of Edinburgh and Leyden; at which last he took his degree of doctor in physic. He was afterwards admitted by mandamus to the same degree at Cambridge; elected a fellow of the college of physicians, and one of the physicians at St. Thomas's hospital; and, upon the establishment of the queen's household, appointed one of the physicians to her majesty.

Dr. Akenfide was very early introduced to the acquaintance of the most eminent men of his age for learning and ingenuity; with many of whom he became entangled in disputes and altercations, chiefly on subjects of literature and politics, that fixed on his character the stamp of haughtiness and self-conceit, and drew him into disagreeable situations. Hence many, who admired him for his genius and parts, were shy of continuing his intimates.—The value of that precept which exhorts us to live peaceably with all men, or, in other words, to avoid creating enemies, can only be estimated by the reflection on those many amiable qualities against which the neglect of it will preponderate. Akenfide was a man of religion and strict virtue; a philosopher, a scholar, and a fine poet. His conversation was of the most delightful kind; learned, instructive, and, without any affectation of wit, cheerful and entertaining.—He died of a putrid fever, June 23, 1770; and is buried in the parish-church of St. James, Westminster.

AKIBA, a famous rabbin, flourished a little after the destruction of Jerusalem by Titus. He kept the flocks of a rich citizen of Jerusalem till the fortieth year of his age, and then applied himself to study in the academies for twenty-four years; and was afterwards one of the greatest masters in Israel, having had 24,000 scholars. He declared for the impostor Barcochebas, whom he owned for the Messiah; and not only anointed him king, but took upon himself the office of his master of the horse. The troops which the emperor Hadrian sent against the Jews, who under the conduct of this false Messiah had committed horrid massacres, exterminated this faction. Akiba was taken, and put to death with great cruelty. He lived 120 years; and was buried with his wife in a cave upon a mountain not far from Tiberias, and his 24,000 scholars were buried round about him upon the same mountain.

AKIN, *adj.* [from *α* and *κιν*.] Related to; allied by blood: used of persons. Allied to by nature; partaking of the same properties: used of things.—The cankered passion of envy is nothing *akin* to the silly envy of the ass. *L'Estrange*.

AKISSAT, the ancient Thyatira, a city in Natolia, in Asia, situated in a plain eighteen miles broad, which produces

duces plenty of cotton and grain. The inhabitants are said to be nearly all Mahometans, and there are six or seven mosques, which are all of marble. There are remarkable inscriptions on marble in several parts of the town, which are part of the ruins of ancient Thyatira. It is seated on the river Hermus, fifty miles from Pergamos. E. lon. 28. 30. N. lat. 38. 50.

AKOND, an officer of justice in Persia, who takes cognizance of the causes of orphans and widows; of contracts, and other civil concerns. He is the head of the school of law, and gives lectures to the subaltern officers; he has his deputies in all the courts of the kingdom, who, with the second *sadra*, makes all contracts.

AL, an Arabic particle prefixed to words, and signifying much the same with the English particle *the*: Thus they say, alkerries, alkoran, &c. i. e. the kermes, the koran, &c.

AL, or ALD, a Saxon term frequently prefixed to the names of places, denoting their antiquity; as Aldborough, Aldgate, &c.

ALA, a term used by botanists for the hollow of a stalk, which either the leaf, or the pedicle of the leaf, makes with it; or it is that hollow turning, or sinus, placed between the stalk or branch of a plant and the leaf, whence a new offspring usually issues. Sometimes it is used for those parts of leaves otherwise called *lobes* or *wings*.—Those petals of papilionaceous flowers, placed between those other petals called the *vexillum* and *carina*, and which make the top and bottom of the flower, are also called *ala*.

ALÆ is likewise used for those extremely slender and membranaceous parts of some seeds, which appear as wings placed on them; it likewise signifies those membranaceous expansions running along the stems of some plants, which are therefore called *alated stalks*.

ALÆ, in anatomy, a term applied to the lobes of the liver, the cartilages of the nostrils, &c.

ALÆ, in the Roman art of war, were the two wings or extreme parts of the army drawn up in order of battle.

ALABA, one of the three smallest districts of Biscay in Spain, but pretty fertile in rye, barley, and fruits. Here are also very good mines of iron, and it had formerly the title of a kingdom.

ALABANDA, anciently a town of Caria, near the Meander, situate beneath eminences resembling asses with pack-saddles, which gave rise to the jest; and between Amyzo to the west, and Stratonice to the east. Under the Romans they enjoyed a convention of jurisdiction, by Pliny reckoned the fourth in order; hence the proverb in Stephanus, expressing their happiness.

ALABARCHA, in antiquity, a kind of magistrate among the Jews of Alexandria, whom the emperors allowed them to elect, for the superintendency of their policy, and to decide their differences and disputes.

ALABASTER (William), an English divine, born at Hadley in the county of Suffolk. He was one of the doctors of Trinity college in Cambridge; and he attended the earl of Essex as his chaplain in the expedition to Cadiz in the reign of queen Elizabeth. It is said, that his first resolution of changing his religion was occasioned by his seeing the pomp of the churches of the Roman communion, and the respect with which the priests seemed to be treated amongst them. He was, however, soon tired of the Romish communion, and he returned to England in order to resume his former religion. He obtained a prebend in the cathedral of St. Paul, and after that the rectory of Therfield in Hertfordshire. He was well skilled in the Hebrew tongue; but he gave a wrong turn to his genius by studying the Cabala, with which he was strangely infatuated.

ALABASTER, *f.* [*αλαβαστρον*.] In natural history, a species of that genus of stones whose base is calcareous earth. It differs from marble in being combined, not with the aerial, but with vitriolic, acid; therefore, when mixed with any acid, no effervescence appears. It is soluble in about 500 times its weight of water at the temperature of

sixty. It is fusible alone in a long-continued porcelain heat, or by the blow-pipe. Specific gravity 1.87. Texture granular, with shining particles. In composition, and consequently in its chemical properties, it does not differ from gypsum, selenite, and plaister of Paris.

There are three species of alabaster. 1. The snow-white shining alabaster, or lygdinum of the ancients, is found in Taurus, in pieces large enough to make dishes, or the like. It cuts very freely, and is capable of a fine polish. 2. The yellowish alabaster, or phengites of Pliny, found in Greece, Germany, France, and England. 3. Variegated, yellow, and reddish; alabaster; which is the common alabaster of the ancients, and so soft that it may be cut with a knife. The alabasters are frequently used by statuary for small statues, vases, and columns. After being calcined and mixed with water, they may be cast in any mould like plaister of Paris. See GYPSUM. Alabaster, Mr. Boyle observes, being finely powdered, and thus set in a basin over the fire, will, when hot, assume the appearance of a fluid, by rolling in waves, yielding to the smallest touch, and emitting vapour; all which properties it loses again on the departure of the heat, and discovers itself a mere incoherent powder. The fineness and clearness of this stone render it in some measure transparent; whence it has been sometimes also employed for windows. There is a church at Florence still illuminated by alabaster windows. Instead of panes of glass, there are slabs of alabaster near fifteen feet high, each of which forms a single window, through which the light is conveyed. The countries in Europe which abound most in alabaster, are Germany, towards Coblenz; the province of Maconnois, in the neighbourhood of Cluni in France; Italy, towards Rome; where that of Montaiout is particularly remarkable not only for its whiteness, but also for the bigness of its blocks, some of which are so large, that statues as big as the life may easily be cut out of them.

ALABASTER, in antiquity, a term used for a vase wherein odoriferous liquors were anciently put. The reason of the denomination is, that vessels for this purpose were frequently made of the alabaster stone, which Pliny and others represent as peculiarly proper for the purpose. Alabaster is also said to have been used for an ancient liquid measure, containing ten ounces of wine, or nine of oil. In this sense, the alabaster was equal to half the sextary.

ALABASTRUM DENDROIDE, *f.* a kind of laminated alabaster, beautifully variegated with the figures of shrubs, trees, &c. found in great abundance in the province of Hohenstein.

ALACARNES, islands of New Spain, so called from the number of scorpions found there.

ALACK, *interj.* [This word seems only the corruption of *alas*.] An expression of sorrow.

ALACKADAY, *interj.* [This, like the former, is for *alas the day*.] A word noting sorrow and melancholy.

ALACRIOUSLY, *adv.* [from *alacrius*, supposed to be formed from *alacris*.] Cheerfully; without dejection.

ALACRITY, *f.* [*αλακритας*, Lat.] Cheerfulness, expressed by some outward token; sprightliness; gaiety; liveliness; cheerful willingness.

ALADINISTS, *f.* a sect among the Mahometans answering to free-thinkers among us.

ALADULIA, a considerable province of Turkey in Asia, in that part called Natolia. It has the Mediterranean Sea on the south; and the Euphrates, or Prat, on the east, which divides it from Diarbeker. It is divided into two parts: the north, comprehended between Taurus, Antitaurus, and the Euphrates, is a beglerbeglic, which bears the name of Marash, the capital town; and the south, seated between mount Taurus and the Mediterranean, is united to the beglerbeglic of Aleppo. The country is rough, ragged, and mountainous; yet there are good pastures, and plenty of horses and camels. The people are rude and thievish. The capital is Malatigah.

ALAIN (Chartier), secretary to Charles VII. of France, born

born in the year 1386. He was the author of several works in prose and verse; but his most famous performance was his Chronicle of King Charles VII. Bernard de Girard, in his preface to the History of France, styles him, "an excellent historian, who has given an account of all the affairs, particulars, ceremonies, speeches, answers, and circumstances, at which he was present himself, or had information of." Giles Coroxet tells us, that Margaret, daughter to the king of Scotland, and wife to the dauphin, passing once through a hall where Alain lay asleep, she stopped and kissed him before all the company who attended. Some of them telling her, that it was strange she should kiss a man who had so few charms in his person, she replied, "I did not kiss the man, but the mouth from whence proceeds so many excellent sayings, so many wise discourses, and so many elegant expressions." M. Fontenelle, among his Dialogues of the Dead, has one upon this incident, between the princess Margaret and Plato. M. Pasquier compares Alain to Seneca, on account of the great number of beautiful sentences interspersed throughout his writings.

ALAINS, a most barbarous people from the north, who, in the fourth and fifth century, joining themselves to the Goths and Vandals, carried terror and desolation wherever they went, and overspread a great part of the south of Europe, and the north of France.

ALAIS, a town in the department of Gard, near a beautiful plain or meadow, at the foot of the Cevennes. It contains 10,000 inhabitants, and the annual export of raw silk from it, is 1,200,000lbs. From the foot of one of the adjacent mountains, issues a hot medicinal spring, and many openings in the rocks shew that mines have been wrought here. It is 350 miles east of Paris, and thirty-seven north of Montpellier. Lat. 44. 8. N. lon. 4. 10. E.

ALAMANDUS (Lewis), in French *Aleman*, archbishop of Arles, and cardinal of St. Cecilia, was one of the greatest men of the fifteenth century. The cardinal presided in the council of Basil, which deposed Eugenius IV. and elected the antipope Felix V.

ALAMANNI (Lewis) was born at Florence, of a noble family, on the 28th of October, 1495. He was obliged to fly his country for a conspiracy against Julius de Medici, who was soon after chosen pope under the name of Clement VII. During this voluntary banishment, he went into France; where Francis I. from a love to his genius and merit, became his patron. He died at Amboise on the 18th of April 1556, being in the 61st year of his age. He left many beautiful poems, and other valuable performances, in the Italian language. We have also some notes of his upon Homer's Iliad and Odyssey; those upon the Iliad were printed in the Cambridge edition of Homer in 1689, and Joshua Barnes has also inserted them in his fine edition of Homer, in 1711.

ALAMIRE, *f.* The lowest note but one in Guido Arentine's scale of music.

ALAMODALITY, *f.* in a general sense, is the accommodating a person's behaviour, dress, and actions, to the prevailing taste of the times in which he lives.

ALAMODALITY OF WRITING, is the accommodation of mental productions, both as to the choice of subject and the manner of treating it, to the genius or taste of the times, in order to render them more acceptable to the readers.

ALAMODE, *adv.* [*à la mode*, Fr.] According to the fashion; a low word. It is used likewise by shopkeepers for a kind of thin silken manufacture.

ALAMOS (Balthazar), a Spanish writer, born at Medina del Campo, in Castile. After having studied the law at Salamanca, he entered into the service of Anthony Perez, secretary of state under Philip II. He was in high esteem and confidence with his master, upon which account he was imprisoned after the disgrace of this minister. He was kept in confinement eleven years, when Philip III. coming to the throne, set him at liberty. Alamos continued in a private capacity, till the duke of Olivarez, the

favourite of Philip IV. called him to public employments. He was a man of wit as well as judgment, but his pen was superior to his tongue. He died in the 88th year of his age. His Spanish translation of Tacitus, and the aphorisms which he added in the margin, gained him great reputation. This work was published at Madrid in 1614; and was to have been followed, as mentioned in the king's privilege, with a commentary, which, however, has never yet appeared. The author composed the whole during his imprisonment.

ALAN (Cardinal William), was born at Russel in Lancashire, in the year 1532. He went to Oxford at the age of fifteen, and in 1550 was elected fellow of Oriel college. In 1556, being then only twenty-four years old, he was chosen principal of St. Mary's Hall, and one of the professors of the university. In 1558 he was made canon of York; but, upon queen Elizabeth's accession to the throne, he left England, and settled at Louvain in an English college, of which he became the chief support. In 1565 he visited his native country; but, on account of his extreme activity in the propagation of the Roman Catholic religion, he was obliged to fly the kingdom in 1568. He went first to Mechlin, and then to Douai, where he was made doctor of divinity. Soon after, he was appointed canon of Cambrai, and then canon of Rheims. He was created cardinal on the 28th of July 1587, by the title of *St. Martin in Montibus*; and obtained from the king of Spain a rich abbey in the kingdom of Naples, and afterwards the bishopric of Mechlin. It is supposed to have been by the advice and instigation of this priest, that Philip II. attempted to invade England. He died on the 20th of October 1594, aged sixty-three; and was buried in the English college at Rome. He was a man of considerable learning, and an elegant writer. He wrote many books in defence of the Romish religion. The most remarkable are, 1. A Defence of the Twelve Martyrs in one Year. Thomas Alfield was hanged for bringing, and publishing, this and other of Alan's works, into England, in the year 1584. 2. A Declaration of the Sentence of Sextus V. &c. a work intended to explain the pope's bull for the excommunication of queen Elizabeth, and to exhort the people of England to take up arms in favour of the Spaniards. Many thousand copies of this book, printed at Antwerp, were put on board the Armada, to be dispersed by the Catholics in England; but, the enterprise failing, they were afterwards destroyed. 3. Of the Worship due to Saints and their Relics, 1583. This treatise was answered by lord Burleigh, and is esteemed the most elegant of the cardinal's writings.

ALANBY, Cumberland, an agreeable watering-place much resorted to in the bathing season. They are extensive here in the herring fishery, and there is good anchorage in the bay. It is about twenty miles north of Whitehaven and south of Carlisle.

ALAND, a cluster of Swedish islands, at the entrance of the Gulf of Bothnia, in the Baltic Sea. The principal island, which gives name to the rest, is about forty miles long, and from twelve to sixteen broad. It contains fifteen villages, 9000 inhabitants, and lies seventy-five miles east of Stockholm.

ALAND (Sir John Fortescue), LL. D. R. S. S. baron of the Exchequer, puisne judge of both benches to king George I. and a peer of England in the subsequent reign; was born March 7, 1670; second son to Edmund Fortescue, Esq. of London. He was descended from Sir John Fortescue, lord chief justice, and lord high chancellor of England, under king Henry VI. Sir John added his latter name of Aland in compliment to his lady, who was the eldest daughter to Henry Aland, Esq. of Waterford, in Ireland. Sir John Fortescue Aland was entered at Oxford; and, as he was intended for the profession of the law, upon leaving the university, he became a member of the Inner Temple, where he was chosen reader in the year 1716. He was called to the bar about the happy era of the glorious revolution, in which situation he shone with
meridian

meridian lustre. In the year 1714, he was appointed solicitor-general to his royal highness the Prince of Wales, afterwards George II. and in 1718, he was constituted one of the justices of the court of King's Bench in the place of Sir John Pratt. In the year 1728 he was appointed one of the justices of the court of Common Pleas, which he held until the year 1746, when he resigned the same, having sat in the superior courts of Westminster for the long period of thirty years. In honour to the judicial integrity and abilities of Sir John, his majesty was pleased to create him a peer of Ireland, by the style and title of John lord Fortescue Aland, baron Fortescue, of Credan, in the kingdom of Ireland, by privy seal, dated at Kensington, June 26, 1746, 19 George II. and by patent dated at Dublin, August 15, the same year. Sir John left behind him the following juridical writings:—1. The Difference between an absolute and limited Monarchy, as it more particularly regards the English Constitution. 2. Reports of Select Cases in all the courts of Westminster-hall, *tempore* William III. and queen Anne; also, The Opinion of all the Judges of England relating to the great-est Prerogatives of a Queen Consort.

ALAND, *adv.* [from *a* for *at*, and *land*.] At land; landed; on the dry ground.—He only, with the prince his cousin, were cast *aland*, far off from the place whither their desires would have guided them. *Sidney*.

ALANDRA, a small town of Estremadura, on the Tagus, fifteen miles from Lisbon.

ALARAF, *f.* in the Mahometan theology, the partition-wall that separates heaven from hell. The word is plural, and properly written *al araf*; in the singular it is written *al arf*. It is derived from the Arabic verb *arafa*, to distinguish. *Al araf* gives the denomination to the seventh chapter of the Alcoran, wherein mention is made of this wall. Mahomet seems to have copied his *al araf*, either from the great gulf of separation mentioned in the New Testament, or from the Jewish writers, who also speak of a thin wall dividing heaven from hell. Mahometan writers differ extremely as to the persons who are to be found on *al araf*. Some take it for a sort of limbus for the patriarchs, prophets, &c. others place here such whose good and evil works so exactly balance each other, that they deserve neither reward nor punishment. Others imagine this intermediate space to be possessed by those who, going to war without their parents leave, and suffering martyrdom there, are excluded paradise for their disobedience, yet escape hell because they are martyrs.

ALARBES, a name given to those Arabians who live in tents, and distinguish themselves by their dres from the others who live in towns.

ALARES, *f.* in Roman antiquity, an epithet given to the cavalry, on account of their being placed in the two wings of the army.

ALARIC, a famous general of the Goths. He entered Thrace at the head of 200,000 men, and laid waste all the country through which he passed. He marched next to Macedonia and Thessaly: the Thessalians met him near the mouth of the river Peneas, and killed about 3000 of his army; nevertheless he advanced into Greece, and, after having ravaged the whole country, returned to Epirus, loaded with immense spoils: after staying here five years, he resolved to turn his arms to the west. He then marched through Pannonia; and, finding little resistance, entered Italy under the consulship of Stilicho and Aurelianus, A. D. 400. After various battles and treaties, he at last took Rome by treachery, and permitted his soldiers to plunder it, A. D. 409. Alaric, having laid waste a great part of Italy, intended to pass into Sicily; but a storm obliging him to land again, he besieged the city of Cosenza; and, having taken it, he died there in 411, eleven years after he first entered Italy.

ALARM, *f.* [from the French *à l'arme*, to arms; as, *crier à l'arme*, to call to arms.] A cry by which men are summoned to their arms; as, at the approach of an ene-

my. A cry or notice of any danger approaching; as, An *alarm* of fire. Any tumult or disturbance.

ALARM, in the military art, denotes either the apprehension of being suddenly attacked, or the notice thereof, signified by the firing a cannon, firelock, or the like. False alarms are frequently made use of, to harraßs the enemy, by keeping them constantly under arms. Sometimes also this method is taken to try the vigilance of the piquet-guard, and what might be expected from them in case of real danger.

ALARM, in fencing, is the same with what is otherwise called an appeal, or challenge.

To ALARM, *v. a.* To call to arms. To disturb; as, with the approach of an enemy. To surprise with the apprehension of any danger. To disturb in general:

His son, Cupavo, brush'd the briny flood;
Upon his stern a brawny Centaur stood,
Who heav'd a rock, and threat'ning still to throw,
With lifted hands, *alarm'd* the seas below. *Dryden*.

ALARM-BELL, *f.* The bell that is rung upon any sudden emergency, as a fire, mutiny, or the like.

ALARMING, *part. adj.* Terrifying; awakening; surprising; as, An *alarming* message; an *alarming* pain.

ALARM-POST, *f.* The post or place appointed to each body of men to appear at, when an alarm shall happen.

ALARUM, *f.* Corrupted as it seems from ALARM.

ALAS, *interj.* [*helas*, Fr. *cylaes*, Dutch.] A word expressing lamentation, when we use it of ourselves. A word of pity, when used of other persons. A word of sorrow and concern, when used of things.—Thus saith the Lord God, Smite with thine hand, and stamp with thy foot, and say, *Alas!* for all the evil abominations of the house of Israel. *Ezekiel*.

ALAS THE DAY, *interj.* Ah, unhappy day!

ALAS THE WHILE, *interj.* Ah, unhappy time!

ALASCANI, *f.* in church-history, a sect of Antilutherans, whose distinguishing tenet, besides their denying baptism, is said to have been this, that the words, "This is my body," in the institution of the eucharist, are not to be understood of the bread, but of the whole action or celebration of the supper.

ALASCO (John), a Polish nobleman of the 16th century, who, imbibing the reformed opinions, was expelled his country, and became preacher to a Protestant congregation at Embden; but, foreseeing persecution there, came to England about the year 1551, while the reformation was carrying on under Edward VI. The publication of the Interim driving the Protestants to such places as afforded them toleration, 380 were naturalized here, and obtained a charter of incorporation, by which they were erected into an ecclesiastical establishment, independent on the church of England. The Augustine friars' church was granted them, with the revenues, for the maintenance of Alasco as superintendant, with four assistant ministers, who were to be approved by the king: and this congregation lived undisturbed until the accession of Queen Mary, when they were all sent away. They were kindly received and permitted to settle at Embden; and Alasco at last, after an absence of twenty years, by the favour of Sigismund, returned to his own country, where he died in 1560. He had some particular tenets; and his followers are called *Alascani*, in church history.

ALATAMAHA, a large river of North America, which, rising in the Apalachian mountains, runs south-east through the province of Georgia, and falls into the Atlantic Ocean, below the town of Frederica.

ALATE, *adv.* [from *a* and *late*.] Lately; no long time ago.

ALATERNOIDES, *f.* in botany. See PHYLLICA, CLUTIA, CEANOTHUS, and MYRICA.

ALATERNUS, *f.* in botany, the trivial name of a species of the rhamnus. See RHAMNUS and PHYLLICA.

ALAVA, a district of Spain, about twenty miles in length

length and seventeen in breadth, containing very good iron mines.

ALAUDA, or **LARK**, *f.* in ornithology, a genus of birds of the order of passerines; the characters of which are these—The beak is cylindrical, subulated, straight; and the two mandibles or chaps are of equal size. The tongue is bifid, and the hinder claw is straight and longer than the toe. There are twenty-eight species of the *alauda*, of which the following are the most remarkable:

1. The *arvensis*, or common sky-lark. This and the wood-lark are the only birds that sing as they fly; this raising its note as it soars, and lowering it till it quite dies away as it descends. It will often soar to such a height, that we are charmed with the music when we lose sight of the songster; it also begins its song before the earliest dawn. It continues its harmony several months, beginning early in the spring on pairing. In the winter they assemble in vast flocks, grow very fat, and are taken in great numbers for our tables. They build their nest on the ground, beneath some clod, forming it of hay, dry fibres, &c. and lay four or five eggs. These birds are generally taken in the greatest quantity in the neighbourhood of Dunstable; the season begins about the 14th of September, and ends the 25th of February; and during that space about 4000 dozen are caught, which supply the markets of the metropolis. See **BIRD-CATCHING**. Vastly greater numbers than the above, however, are caught at times in different parts of Germany, where there is an excise upon them. Keyser says, that the excise alone produces 6000 dollars (about 900l. sterling) every year to the city of Leipzig; whose larks are famous all over Germany, as having the most delicate flavour. But it is not only at Leipzig that they are taken in such numbers, but also in the country about Naumburg, Merseburg, Halle, and other parts.

2. The *pratensis*, or tit-lark, has the two outward feathers of the wing edged with white, and frequents the meadows. It is found frequently in low marshy grounds; and, like other larks, it builds its nest among the grass, and lays five or six eggs. Like the wood-lark, it sits on trees; and has a most remarkable fine note, singing in all situations, on trees, on the ground, while it is sporting in the air, and particularly in its descent.

3. The *arborea*, or wood-lark, is a native of Europe, and is distinguished by an annular white fillet about the head. It is inferior in size to the sky-lark, and is of a shorter thicker form; the colours are paler, and its note is less sonorous and less varied, though more sweet. It perches on trees, and whistles like the blackbird. It will sing in the night; and, like the common lark, will sing as it flies. It builds on the ground, and lays five eggs. The males of this and the last are known from the females by their superior size.

4. The *campestris* has one half of its chief feathers of the wings brown, except two in the middle which are white, and the throat and breast are yellowish.

5. The *trivialis*, whose chief feathers on the tail are brown, only half of the outermost is white, and the second is white at the end, in the shape of a wedge; there is likewise a double whitish line on the wings. It is a native of Sweden, and perches on the tops of trees.

6. The *cristata*. The chief tail-feathers are black, but the two outermost are edged with white, and the head is crested. It is a native of Europe. It sings well, like the sky-lark; lays four or five eggs; and is said to hatch twice in a year.

7. The *spinoletta*: the chief tail-feathers are black, only the outermost two are obliquely half white. It is a native of Italy.

8. The *alpestris*: the chief wing-feathers are half white, the throat yellow, and it has a black streak under the eyes and on the breast. It inhabits North America, where it is migratory. It visits the neighbourhood of Albany the beginning of May, but goes farther north to breed. In

winter it comes in vast flocks into Virginia and Carolina, returning north in spring. It runs into holes; whence the natives of these last parts have given it the name of *chichup-pi-sue*. The English call it the *ortalon*, and reckon it delicious eating. By some it is called *snow-bird*, as being very plenty in that season.

9. The *magna*, is yellow on the belly, with a crooked black streak on the breast, and the three side-feathers of the tail white. This species is a native of Africa and America.

10. The New Zealand lark, is seven and a half inches in length; the bill is half an inch, of a pale ash-colour, with the upper part black; the upper parts of the body are dusky, edged with pale ash-colour; the breast and belly are white; the legs reddish ash-colour, and the claws black. It inhabits Charlotte Sound, and is called *kogoo aroore*.

ALAUTA, a considerable river of Turkey in Europe, which, after watering the north-east part of Transylvania and part of Wallachia, falls into the Danube opposite Nicopolis.

ALAY, *f.* [signifying in the Turkish language “the triumph.”] A ceremony which accompanies the assembling together the forces of that vast empire upon the breaking out of a war. It consists of the most insipid buffoonery, attended with acts of the most shocking barbarity. That which took place upon occasion of the late war between the Porte and Russia, is described by Baron Tott as follows:

“It consists in a kind of masquerade, in which each trade successively presents to the spectators the mechanical exercise of its respective art. The labourer draws his plough, the weaver handles his shuttle, the joiner his plane; and these different characters, seated in cars richly ornamented, commence the procession, and precede the standard of Mahomet, when it is brought out of the seraglio to be carried to the army, in order to insure victory to the Ottoman troops.

“This banner of the Turks, which they name *Sandjak-Cheriff*, or “The standard of the Prophet,” is so revered among them, that, notwithstanding its reputation has been so often tarnished, it still retains their implicit confidence, and is the sacred signal unto which they rally. Every thing proclaims its sanctity. None but the emirs are allowed to touch it; they are its guards, and it is carried by their chief. The Mussulmen alone are permitted to look upon it. If touched by other hands, it would be defiled; if seen by other eyes, profaned. In short, it is encompassed by the most barbarous fanaticism.

“A long peace had unfortunately caused the ridiculousness, and especially the danger, of this ceremony to be forgotten. The Christians imprudently crowded to see it; and the Turks, who, by the situation of their houses, could make money of their windows, began to profit by the advantage; when an emir, who preceded the banner, proclaimed with a loud voice, ‘Let no infidel dare to profane with his presence the holy standard of the prophet; and let every Mussulman who perceives an unbeliever make it known under pain of reprobation.’

“From that moment no asylum was to be found; even those became informers, who, by letting out their houses, had rendered themselves accomplices in the crime. A religious fury seized on every mind, and put arms in every hand; the more atrocious the cruelty, the more was it meritorious. No regard was paid to sex or age; pregnant women, dragged by the hair, and trodden under feet by the multitude, perished in the most deplorable manner. Nothing was respected by these monsters; and under such auspices the Turks commenced the war.”

ALB, *f.* [*album*, Lat.] In the Romish church, a vestment of white linen hanging down to the feet, and answering to the surplice of the English clergy. In the ancient church, it was usual, with those newly baptized, to wear an alb, or white vestment; and hence the Sunday after Easter

Fig. 1. The Flapping Lark. 2. The Sirli, or African Lark.

Easter was called *dominica in albis*, on account of the albs worn by those baptized on Easter-day.

ALB, is also a name of a Turkish coin, otherwise called asper. See ASPER.

ALBA, anciently a town of the Marfi, in Italy, situated on the north side of the Lacus Fucinus, still retaining its name. It stands upon an eminence, and is noted in Roman history for being the state prison where captive princes were shut up, after being barbarously dragged through the streets of Rome at the chariot wheels of a triumphant consul. Perſes king of Macedon terminated his wretched career in this confinement, with his son, the last hope of an illustrious line of kings. Syphax the Numidian, and Bituinus king of the Aveni, were also condemned to this gaol by the particular clemency of the senate, which sometimes indulged its savage disposition by putting its captives to death. Alba being situated in the centre of Italy, amidst difficult mountainous passes, and far from all means of escape, was esteemed a most proper place for the purpose of guarding prisoners of importance. Artificial strength was added to its natural security by fortifications, which remain to this day in a state that proves their ancient solidity. For the entertainment of the garriſon, which was required in a place of such consequence, an amphitheatre was erected, of which the ruins are still visible, as well as the foundations of a temple, and other buildings of Roman times. Lucius Vitellius, brother to the emperor of that name, had a villa near this place, famous for the variety and excellence of its fruit-trees, which he had brought from Syria. His gardens were the nurseries where several of the most delicious stone-fruits, that are now so common in Europe, were first cultivated and multiplied. It must have been necessary at Alba to shelter trees transplanted from Asia, and to treat them with great tenderness and care, in order to rear them to perfection: for the climate of this high region is extremely rigorous in winter; the cold season lasts long, and is accompanied with violent storms of wind and falls of snow. The lake has been often frozen entirely over.

ALBA (Duke of), was indisputably one of the greatest generals of the sixteenth century. This remarkable person, whose character exhibits such a singular mixture of vices and virtues, was born in the year 1508, and was descended from one of the most illustrious families in Spain. Defined from his youth to the profession of arms, he made his first campaign at the age of seventeen, and the year following was present at the famous battle of Pavia. Even at this early period the duke shewed signs of that cruelty which afterwards rendered him so odious. Strada gives us the following instance of it:—The emperor asking his advice on the manner in which he should punish the revolters, he answered, “That such a rebellious city should be razed to the ground.” Charles, who, notwithstanding his wrath, still preserved an affection for the city in which he was born, ordered the duke to ascend a tower, from which the whole extent of the city might be seen. On his return, he asked him, with a scornful smile, How many Spanish skins would make such a glove; the name of Ghent in French, in which language he addressed him, signifying a glove. Alba, perceiving he had offended the emperor, held down his head without making any reply.

In the year 1542, the duke of Alba, having the command of the fortrefs of Perpignan, which was besieged by the French, defended it with such intrepidity, that the enemy were obliged to raise the siege, and return to France, without having effected any thing. From this time he found himself daily rising in his sovereign's favour, so that he was appointed grand master of the Imperial court; and, in 1546, was made commander in chief of the army in Germany. At the battle of Muleberg he gave proofs of extraordinary courage, and contributed not a little to the victory obtained there. It was reported, that, during the combat, the sun stood still, as if to render the emperor's triumph more complete. Charles had sufficient

weakness and vanity to wish that this ridiculous tale might obtain belief, and he be considered as a second Joshua. In the war with France the duke of Alba commanded the army under the emperor. At the siege of Metz, in 1552, he performed prodigies of valour; though the place was so well defended, that Charles was obliged to abandon the siege.

Whatever favour the duke of Alba had enjoyed under Charles V. his greatness was not at its summit till the reign of Philip II. He was soon the acknowledged favourite of this cruel monarch, with whose sanguinary disposition his own perfectly accorded. In 1559, he was sent to Paris, to espouse the princess Elizabeth in his master's name, and conduct her into Spain. Six years afterwards, when Charles IX. king of France, the queen his mother, and Elizabeth, had an interview at Bayonne, the duke was again appointed to be the conductor of the latter. He appeared with a most splendid equipage; and, at the entertainments made on the occasion, signalised himself greatly by his address and ability.

The Flemings, robbed of their privileges, and, by the establishment of the inquisition, deprived of their dearest possession, liberty, had frequently addressed their complaints to the court of Spain; but their grievances always went unredressed. The repeated contempt they experienced exhausted their patience, and they took up arms. The duke of Feria and the prince Ercoti advised the king to employ gentle methods with them; but the duke of Alba was for compelling the rebels to return to their duty by force. This counsel was too well suited to the character of the king not to meet his approbation; accordingly he gave it the preference, and, without taking time to weigh the matter deliberately, instantly resolved to send into the Netherlands a chosen army under the command of the duke of Alba, to whom he gave an unlimited authority, with the title of governor-general of those countries. For more than six years the duke ruled the Netherlands with a rod of iron. The unfortunate counts Egmont and Horne were the first victims of his rage, losing their lives on the scaffold. Many people of rank expressing themselves to the duke with some surprise at his rigour, he answered coolly, “The heads of a couple of salmon are better than those of a thousand frogs.” Such was his cruelty, that he frequently boasted of having caused upwards of eighteen thousand men to suffer by the hands of the executioner, during his regency.

Notwithstanding the innumerable complaints made against him, the king loaded him with favours, and gave him his confidence in a greater degree than ever. Thus he lived many years, esteemed by his friends, hated in secret by those who envied him, and deified by his flatterers, till an unforeseen accident lost him the king's favour, and banished him from the court. Garcias de Toledo, one of his sons, had seduced a lady of the first rank under a promise of marriage, which he refused to fulfil. The king gave orders, that he should be arrested and confined till he had performed his promise. By the help of his father, who was no less averse to the match than himself, Garcias found means to escape; and, the better to frustrate the king's intention, was immediately married to his cousin, the daughter of the marquis of Villeux. Philip was so highly incensed at this step, that he forbade the duke to appear at court, and banished him to the castle of Uzeda. This was a thunder-stroke to the duke, who was thus obliged to spend near two years in exile.

Immediately on the death of Henry king of Portugal, in 1580, Philip resolved to assert his pretensions to that kingdom. Success could only be hoped for from arms; and for this enterprise who so fit as the duke of Alba, in whom all the talents and qualifications constituting a great general were in the most eminent degree united? Thus, when he least expected it, the banished duke received a visit from two messengers of the king, who demanded, whether his health would permit him to take the command

of the army destined for the conquest of Portugal. Alba answered, without much hesitation, that he was ready to sacrifice in the king's service what little health and strength he had left; and immediately prepared for his departure. His intention was to pay his respects to his sovereign in person; but Philip, who never forgot, and never pardoned, an offence, would not see him, sending him his orders and instructions in writing.

The duke arrived in Portugal, at the head of his army, in the month of June 1580. Almost every town opened its gates to him, and acknowledged Philip as its lawful sovereign. Don Antony, prior of Crato, having assembled a considerable army at Lisbon, and seated himself on the throne of Portugal, it was necessary to repair to that city. To avoid various inconveniences, the duke of Alba resolved on transporting his army to Cascais by water. On his arrival, he found the enemy advantageously posted; i.e. however, prepared to attack them in their entrenchments. The Spaniards, waiting only the word of command, were surprised to learn, that the Portuguese had on a sudden taken flight; the duke was therefore soon in possession of Cascais, where he exercised his usual cruelties. Many places successively experienced the same fate, and Don Antony was attacked, defeated, and his army entirely destroyed. Lisbon immediately surrendered, and the whole kingdom was at the mercy of the conqueror. The issue of this enterprise was a new triumph for the duke, now upwards of seventy years old; but in Portugal, as in the Netherlands, his laurels were tarnished by pride and cruelty. Alba did not long survive the conquest of Portugal, for he died in 1582, at the age of seventy-four.

ALBA FIRMA, *f.* in law, a white rent, paid in silver, in distinction from rent paid in corn, cattle, or the like.

ALBA HELVIORUM, or **ALBAUGUSTA**, afterwards called Vivarium, now Viviers, in the south-east of Languedoc, on the Rhone. In the lower age the inhabitants were called *Albenses*, and their city *Civitas Albensum*, in the *Notitia Galliarum*. Lat. 44. 50. lon. 4. 45. E.

ALBA JULIA, now Weissenburg, a town of Transylvania, on the river Marisus, or Merisch, to the west of Hermanstadt, supposed to be called Alba Julia, after Julia Domna, the mother of Caracalla. It was also called *Apulum Augustum*. Lat. 46. 46. lon. 25. 0. E.

ALBA LONGA, anciently a colony from Lavinium, in Latium, established by Ascanius the son of Æneas, at the foot of Mons Albanus: called Alba from a white sow found by Æneas, which farrowed thirty white pigs on that spot; which circumstance was interpreted to portend the building of a city there in thirty years after. The epithet *Longa* was added on account of its length.

ALBA POMPEIA, on the river Ceba, now Ceva, in Liguria, the birth-place of the emperor Pertinax; a colony either established at first by Pompey, or re-established by him after having been before settled by Scipio. The inhabitants were called *Albenses Pompeiani*. At this day the town is simply called Alba, without any epithet.

ALBA TERRA, *f.* one of the numerous names for the philosophers' stone.

ALBAHURIM, *f. figura sexdecim laterum*, a figure of great importance according to astrological physicians, who built their prognostics on it.

ALBAN (St.) is said to have been the first person who suffered martyrdom for Christianity in Britain; he is therefore usually styled the protomartyr of this island. He was born at Verulam, and flourished towards the end of the 3d century. In his youth he took a journey to Rome, in company with Amphibalus a monk of Caerleon, and served seven years as a soldier under the emperor Dioclesian. At his return home he settled in Verulam; and, through the example and instructions of Amphibalus, renounced the errors of paganism, in which he had been educated, and became a convert to the Christian religion. It is generally agreed, that Alban suffered martyrdom during the great persecution under the reign of Dioclesian; but au-

thors differ as to the year when it happened. The story and circumstances relating to his martyrdom, according to Bede, are as follows:—Being yet a pagan (or at least it not being known that he was a Christian), he entertained Amphibalus in his house. The Roman governor, being informed thereof, sent a party of soldiers to apprehend Amphibalus; but Alban, putting on the habit of his guest, presented himself in his stead, and was carried before that magistrate. The governor having asked him of what family he was? Alban replied, "To what purpose do you inquire of my family? if you would know my religion, I am a Christian." Then, being asked his name, he answered, "My name is Alban; and I worship the only true and living God, who created all things." The magistrate replied, "If you would enjoy the happiness of eternal life, delay not to sacrifice to the great gods." Alban answered, "The sacrifices you offer are made to devils; neither can they help the needy, or grant the petitions of their votaries." His behaviour so enraged the governor, that he ordered him immediately to be beheaded. In his way to execution, he was stopped by a river, over which was a bridge so thronged with spectators that it was impossible to cross it; the saint, as we are told, lifted up his eyes to heaven, and the stream was miraculously divided, and afforded a passage for himself and a thousand more persons. This wonderful event converted the executioner upon the spot, who threw away his drawn sword, and, falling at St. Alban's feet, desired he might have the honour to die with him. This sudden conversion of the headsmen occasioning a delay in the execution till another person could be got to perform the office, St. Alban walked up to a neighbouring hill, where he prayed for water to quench his thirst, and a fountain of water sprung up under his feet: here he was beheaded on the 23d of June. The executioner is said to have been a signal example of divine vengeance; for, as soon as he gave the fatal stroke, his eyes dropped out of his head. We may see the opinion of Milton in regard to this narrative, in his *History of England*. His words are these, speaking of St. Alban, "The story of whose martyrdom, soiled and worse martyred with the fabling zeal of some idle fancies, more fond of miracles than apprehensive of the truth, deserves no longer digression." Between 400 or 500 years after St. Alban's death, Offa, king of the Mercians, built a very large and stately monastery to his memory; and the town of St. Alban's, in Hertfordshire, takes its name from our protomartyr.

ALBANA, anciently a sea-port town of Albania, on the Caspian Sea, between the rivers Casius and Albanus; now called Baehu, or Baehy, giving name to the Caspian Sea, viz. *Mar de Baku*. Lat. 40. 0. lon. 49. 0. E.

ALBANENSES, *f.* in church-history, the same with Albigenes, according to some; according to others, different. Those, however, who are for distinguishing them, attribute the same opinions to both; only making the Albanenses to have been prior in respect of time, as having been found towards the close of the eighth century; whereas the Albigenes appeared not till the twelfth. See **ALBIGENSES**.

ALBANI, *f.* in Roman antiquity, a college of the *salii*, or priests of Mars; so called from mount Albanus, the place of their residence.

ALBANI (Francis), a celebrated painter, born in Bologna, March 17, 1578. His father was a silk-merchant, and intended to bring up his son to that business; but Albani, having a strong inclination to painting, when his father died devoted himself entirely to that art, though then but twelve years of age. He first studied under Denys Calvert; Guido Rheni being at the same time under this master, with whom Albani contracted a very great friendship. Calvert drew but one profile for Albani, and afterwards left him entirely to the care of Guido; under whom he made great improvement, his fellow-disciple instructing him with the utmost attention and good humour. He followed Guido to the school of Caraches: but a little

tle after their friendship for each other began to cool; which was owing perhaps to the pride of Albani, who could not bear to see Guido surpass him, or to the jealousy of Guido at finding Albani make so swift a progress. They certainly endeavoured to eclipse one another; for, when Guido had set up a beautiful altar-piece, Albani would oppose to it some fine picture of his: thus did they behave for some time, and yet spoke of each other with the highest esteem. Albani, after having greatly improved himself under the Caraches, went to Rome, where he continued many years, and married in that city; but, his wife dying, he returned to Bologna, where he entered again into the state of matrimony. His second wife (Doralice) was well descended, and possessed a singular share of beauty and good sense. Hence Albani reaped the advantage of having a most beautiful model; so that he had now no occasion to make use of any other woman to paint a Venus, the Graces, Nymphs, and other deities, whom he took a particular delight in representing. His wife answered this purpose admirably well; for, besides her bloom of youth, and the beauty of her person, he discovered in her so much modesty, so many graces and perfections, so well adapted to painting, that it was impossible for him to meet with a more finished woman. She afterwards brought him several boys, all extremely beautiful and finely proportioned; so that she and her children were the originals of his most agreeable and graceful compositions. Doralice was so conformable to his wishes, that she took a pleasure in setting the children in different attitudes, holding them naked, and sometimes suspended by strings, when Albani would draw them in a thousand different ways. It was from them, too, that the famous sculptors Flaminio and Argaldi modelled their little Cupids. Albani was of a happy temper and disposition; his paintings, says Malvasia, breathing nothing but content and joy. He died the 4th of October, 1660, to the great grief of all his friends and the whole city of Bologna. Malvasia has preserved some verses, intended for his monument, to the following purport: "That the mortal remains of the illustrious Albani, who gave life to shade, lie interred in this tomb; the earth never produced so wonderful an artist, or a hand equal to his immortal one; which gave colours to the soul, and a soul to colours. Prometheus animated clay, and gave life by means of the sun; but Albani animated merely by the assistance of shade." He was very famous in his life-time, and had been visited by the greatest painters. Several princes honoured him with letters; and amongst the rest Charles I. who invited him to England by a letter signed with his own hand.

ALBANIA, a province of Turkey in Europe, on the gulph of Venice, bounded by Livadia on the south, by Thessaly and Macedonia on the east, and on the north by Bosnia and Dalmatia. The people are strong, large, courageous, and good horsemen; but are said to be of a thievish disposition: the Grand Signior procures excellent soldiers from hence, particularly cavalry, known by the name of *Arnauts*. There are several large towns in this province; and the inhabitants are almost all Christians of the Greek church, and descended from the ancient Scythians. Formerly it was part of the kingdom of Macedonia. Their chief manufacture is carpets. Lat. from 39. to 43. N. lon. from 28. to 31. E.

ALBANIA, a country of Asia, bounded on the west by Iberia; on the east by the Caspian Sea; on the north by mount Caucasus; on the south by Armenia, and the river Cyrus, now Kur; which, springing from the Moschian mountains that separate Colchis from Armenia, and watering the country of Mekan, receives the Aragus and Araxes, and falls into the Caspian Sea within a small distance from the southern borders of this country. The whole country, formerly called Albania, now goes under the names of Shirwan and East Georgia, and is extremely fruitful and pleasant. The ancient historians take notice of the Albanian men being tall, strong-bodied, and, ge-

nerally speaking, of a very graceful appearance; far excelling all other nations in comeliness as well as stature. Modern travellers take no notice of the appearance of the men; but extol the beauty of the women, which seems to be unnoticed by the ancients. The Albanians were anciently an independent and powerful people; but we find no mention made of their kings till the reign of Alexander the Great, to whom the king of Albania is said to have presented a dog of an extraordinary fierceness and size.

ALBANO, a town of Italy, on a lake of the same name, in the Campagnio of Rome. It was called by the ancients *Albanum Pompeii*, and built out of the ruins of the ancient Alba Longa, which was destroyed by Tullus Hostilius. It stands within twelve miles south-east of Rome, and for the pleasantness of its situation is the summer retirement of a great many Roman princes. It is likewise the see of a bishop, who is one of the six senior cardinals. The town is famous for its excellent wine, and the ruins of a mausoleum, which, according to the tradition of the inhabitants, was made for Afcenius. The prospect from the garden of the Capuchins is extremely pleasant, taking in the Campagnio of Rome, and terminating in a full view of the Tuscan sea. Close by the town lies the Alban lake, of an oval figure, and about seven miles in circumference, which, by reason of the high mountains round it, looks like the area of a great amphitheatre. It abounds with excellent fish, and over against the hermitage it is said to be unfathomable. The mountain of Albano is called *Monte Cavo*, on the top of which was a celebrated temple dedicated to Jupiter and Juno. Near the Capuchins there is another convent of Franciscans; and not far from thence the palace of cardinal Barberini, remarkable for very pleasant gardens, with the ruins of ancient baths, and several old fragments of mosaic work. E. lon. 13. 10. N. lat. 41. 43.

There is likewise another town of the same name in the Basilicate of the kingdom of Naples, remarkable for the fertility of the surrounding territory, and for the nobility of the inhabitants.

ALBAN'S (St.) a market-town of Hertfordshire, is a great thoroughfare, accommodated with good inns, on the north-west road from London, at the distance of twenty-one miles. This town sends two members to parliament, gives the title of duke to the noble family of Beaulieu, and has one of the best markets for wheat in England. St. Alban's is seated near the ruins of an ancient Roman city, by Tacitus called *Verulam*; and by the Saxons *Watlingcester*, because it is seated on the road called *Watling-street*. Nothing now remains of Verulam but the ruins of old walls; in the fields adjacent to which they continue to find Roman coins, as they formerly found tessellated pavements. In memory of St. Alban, Offa, king of the Mercians, anno 795, erected an abbey, calling it St. Alban's; and near it the town of the same name was afterwards built. The church of the abbey is remaining to this day. When the monasteries were dissolved, the townsmen paid 400l. to prevent its being levelled with the ground, and have since converted it into a parish-church, which, for its largeness, beauty, and antiquity, claims a particular regard. It had a noble font of solid brass, in which the children of the kings of Scotland were used to be baptized; and was brought from Edinburgh, by Sir Philip Lea, when the city was in flames; but in the time of the civil wars it was taken away. About eighty years since, a tomb was discovered in this church, said to be that of Humphry Duke of Gloucester: when the leaden coffin was opened, the body was found entire, being preserved in a sort of pickle. There was a stately cross in the middle of the town, as there were in many other places where queen Eleanor's body rested when it was brought out of the north for interment at Westminster; but it has been some time demolished. The market days are Wednesday and Saturdays. W. lon. 0. 12. N. lat. 51. 44.

ALBANUS MONS, now called *Mont Albano*, sixteen miles from Rome, at the foot of which Alba Longa stood.

ALBANUS MONS, to the north of Istria, called *Albius* by Strabo; the extremity of the Alps, which, together with the mountains to the east, joining it, called *Montes Bebi*, separates the farther Liburnia and Dalmatia from Pannonia.

ALBANY, a British fortress seated on the S. W. of Hudson's bay. W. lon. 84. 20. N. lat. 53. 20.

ALBANY, a city of North America, the capital of one of the ten counties of the province of New York, which goes by the same name, is a well-built place. Here the sachems, or the kings of the Five Nations of Iroquois, met the governors of the British plantations, when they entered into any treaty with them. It contains 600 houses, and 4000 inhabitants, many of whom are the descendants of the first colonists, the Dutch; but, adventurers from various parts are led here, by the advantages for trade, which the place affords, it being situated on one of the finest rivers in the world, and the store-house of the trade to and from Canada and the Lakes. It is 160 miles N. of the city of New York. Lat. 42. 36. N. lon. 75. 20. W.

ALBARA, *f.* in botany. See CANNA.

ALBARAZIN, a strong town, and one of the most ancient, of the kingdom of Arragon in Spain. It is the seat of a bishop, and produces the best wool in all Arragon. It is about 100 miles east of Madrid. E. lon. 2. 10. N. lat. 40. 32.

ALBARI, in antiquity, properly denoted those who gave the whitening to earthen vessels, &c. In which sense they stood contradistinguished from *Dealbatores*, who whitened walls.

ALBARIUM OPUS, in the ancient building, the incrustation or covering of the roofs of houses with white plaster, made of mere lime. This is otherwise called *opus album*.

ALBATEGNI, an Arabic prince of Batan in Mesopotamia, who was a celebrated astronomer, about the year of Christ 880. He is also called *Muhammed ben Geber Albategni*, *Mahomet the son of Geber*, and *Muhammedes Aractensis*. He made astronomical observations at Antioch, and at Racah or Aracta, a town of Chaldea, which some authors call a town of Syria or Mesopotamia. Finding that the tables of Ptolemy were imperfect, he computed new ones, which were long used as the best among the Arabs: these were adapted to the meridian of Aracta or Racah. Albategni composed in Arabic a work under the title of *The Science of the Stars*, comprising all parts of astronomy, according to his own observations and those of Ptolemy. This work, translated into Latin by Plato of Tibur, was published at Nuremberg in 1537, with some additions and demonstrations of Regiomontanus; and the same was reprinted at Bologna, in 1645, with this author's notes. In this work, Albategni gives the motion of the sun's apogee since Ptolemy's time, as well as the motion of the stars, which he makes one degree in seventy years. He made the longitude of the first star of Aries to be $18^{\circ} 2'$; and the obliquity of the ecliptic $23^{\circ} 35'$. And upon Albategni's observations were founded the Alphonsine tables of the moon's motions; as is observed by Nicholas Muler, in the *Tab. Priscæ*, p. 248.

ALBATEI EQUI, an appellation given to such horses, in the games of the ancient circus, as wore white furniture.

ALBATROSS, in ornithology, a species of the diomedea. See DIOMEDEA.

ALBAZIN, a town of Greater Tartary, with a strong castle. It is situated upon the river Amur, and belongs to the Muscovites. E. lon. 103. 30. N. lat. 54. 0.

ALBE, *f.* a small piece of money, current in Germany, worth only a French sol and seven deniers.

ALBEIT, *adv.* [a coalition of the words *all be it so*.] Although; notwithstanding; though it should be.—He, who has a probable belief that he shall meet with thieves in such a road, thinks himself to have reason enough to decline it, *albeit* he is sure to sustain some loss, though yet considerable, inconvenience by his so doing. *South.*

ALBEMARLE, or AUMARLE, a town of France, in Upper Normandy, in the territory of Caux, from whence the noble family of Keppel takes the title of earl. The ferges of this town are in high esteem. It is seated on the declivity of a hill, on the confines of Picardy, thirty-five miles N. E. of Rouen, and seventy N. W. of Paris. E. lon. 2. 21. N. lat. 49. 50.

ALBEMARLE, the most northern part of the province of North Carolina in America.

ALBENGUA, a town of Italy, in the territory of Genoa. It is the see of a bishop; and is a very ancient handsome town, but not well peopled on account of the infalubrity of the air. It is a sea-port, about thirty-eight miles S. W. of Genoa. E. lon. 8. 13. N. lat. 44. 4.

ALBERNUO, a kind of camblet, brought from the Levant by the way of Marseilles.

ALBERONI (Julius) was the son of a gardener near Parma, and when a boy officiated as bell-ringer, and attended upon the parish-church of his village. The rector, finding him a shrewd sharp lad, taught him Latin. Alberoni afterwards took orders, and had a small living, on which he resided, little thinking of the great fortune that was one day to await him. M. Campistron, a Frenchman, secretary to the Duke of Vendôme, who commanded the armies of Louis XIV. in Italy, was robbed, and stripped of his clothes, and of all the money that he had about him, by some ruffians, near Alberoni's village. Alberoni, hearing of his misfortune, took him into his house, furnished him with clothes, and gave him as much money as he could spare for his travelling expences. Campistron, no less impressed with his strength of understanding than with the warmth of his benevolence, took him to the head-quarters, and presented him to his general, as a man to whom he had very great obligations. M. de Vendôme, finding Alberoni to be a man of parts, gave him a petty employment under him, and took him with him to Spain. By degrees he obtained the marshal's confidence, and proposed the daughter of his sovereign the duke of Parma to him, as a fit match for the king of Spain. Alberoni's proposal was attended to, and the princess was demanded in marriage by that monarch, then Philip V. The duke of Parma consented with great readiness to a match that was to procure his daughter the sovereignty of so great a kingdom as that of Spain. When every thing was settled, and immediately before the princess was to set out for her new dominions, the ministry of Spain had heard that the princess was a young woman of a haughty imperious temper, and extremely intriguing and ambitious. They therefore prevailed upon the king to write to the duke, to request another of his daughters in marriage, to whose quiet disposition they could not possibly have any objections. The king did as he was desired, and sent his letter by a special messenger. Alberoni, who was then at Parma, hearing of this, and afraid that all his projects of ambition would come to nothing, unless the princess whom he recommended, and who of course would think herself highly obliged to him for her exalted situation, became queen of Spain, had the messenger stopped at one day's journey from Parma, and gave him his choice, either to delay his coming to Parma for a day, or to be assassinated. He of course chose the first of these alternatives, and the princess set out upon her journey to Spain, and became queen of that country. Alberoni was soon made prime minister of Spain; a cardinal, and archbishop of Valencia; and exercised his ministry with the most complete despotism. One of Alberoni's projects was to dispossess the Duke of Orleans of the regency of France, and to bestow it upon his own sovereign, as the oldest representative of the house of Bourbon; to place the pretender on the throne of England, and add to Spain the kingdom of Naples and Sicily. His project was however discovered by the regent, and one of the conditions he made with the king of Spain was, the banishment of Alberoni from his councils and his kingdom. With this he was obliged to comply, and the cardinal received orders to leave Madrid in

in twenty-four hours, and the kingdom of Spain in fifteen days. Alberoni, who took with him great wealth, was upon the second day of his journey, when it was perceived that he was carrying out of the kingdom with him the celebrated will of Charles II. of Spain, which gave that kingdom to its then sovereign. Persons were detached from Madrid to wrest this serious and important document from him, which it was supposed he intended to take to the emperor of Germany, to ingratiate himself with him. With some violence they effected their purpose, and the cardinal proceeded on his journey to the frontiers of France, where he was received by an officer, sent by the regent to conduct him through that kingdom as a state prisoner. As a true politician, however, yields to circumstances, and is never embarrassed by any change of affairs, Alberoni, on his arrival in France, wrote to the regent, to offer him his services against Spain. To this letter, however, his highness disdained to return any answer. The cardinal's disgrace happened in 1720, and he retired to Parma for some time, till he was summoned by the pope to attend a consistory, in which his conduct was to be examined by some of the members of the Sacred College, respecting a correspondence he was supposed to have kept up with the Grand Seigneur. He was sentenced to be confined one year in the Jesuits College at Rome. After this he returned to Parma, near which city he founded, at a very great expence, an establishment for the instruction of young men destined for the priesthood. In the disastrous campaign of 1746, the buildings were destroyed by the three armies that were in the neighbourhood; and, as the cardinal was not supposed to have been over-delicate in his acquirement of the means by which his establishment was to have been supported, his countrymen did not appear to express much dissatisfaction at the demolition of it. Alberoni, soon after this, went to Rome, and was made legate of Romagna by Clement XII. He died at Rome, in 1752, at the age of eighty-seven years. He preserved inviolate, to the last, the powers of his mind and of his body.

ALBERT, Margrave of Brandenburg, and the last grand master of the Teutonic order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace at Cracow in 1525, by which he was acknowledged duke of the east part of Prussia (formerly called for that reason *Ducal Prussia*), but to be held as a fief of Poland, and to descend to his male heirs. See PRUSSIA.

ALBERTI (Leone Battista), was descended from a noble family in Florence; and perfectly acquainted with painting, sculpture, and architecture. He wrote of all three in Latin; but his studies did not permit him to leave any thing considerable behind him in painting. He was employed by pope Nicholas V. in his buildings, which he executed in a beautiful manner; and his work on architecture, which consists of ten books, is greatly esteemed. He died in 1485.

ALBERTISTS, a sect of scholastics, so named from their leader Albertus Magnus.

ALBERTUS MAGNUS, a very learned man in the thirteenth century, who, among a multitude of books, wrote several upon the various mathematical sciences, as Arithmetic, Geometry, Perspective or Optics, Music, Astrology, and Astronomy.

Albertus Magnus was born at Lavingen on the Danube, in Suabia, in 1205, or according to some in 1193; and he died at a great age, at Cologne, November 15, 1280. Vossius and other authors speak of him as a great genius, and deeply skilled in all the learning of the age. His writings were so numerous, that they make twenty-one volumes in folio, in the Lyons edition of 1615. He has passed also for the author of some writings relating to midwifery, &c. under the title of *De natura rerum*, and *De secretis mulierum*, in which there are many phrases and expressions unavoidable on such a subject, which gave great offence, and raised a clamour against him as the supposed author, and inconsistent with his character, being a Dominican friar, and sometime bishop of Ratisbon; which dignity however he

soon resigned, through his love for solitude, to enter again into the monastic life. But the advocates of Albert assert, that he was not the author of either of these two works. It must be acknowledged however, that there are, in his Comment upon the Master of Sentences, some questions concerning the practice of conjugal duty, in which he has used some words rather too gross for chaste and delicate ears: but they allege what he himself used to say in his own vindication, that he came to the knowledge of so many monstrous things at confession, that it was impossible to avoid touching upon such questions. Albert was certainly a man of a most curious and inquisitive turn of mind, which gave rise to other accusations against him; such as, that he laboured to find out the philosopher's stone; that he was a magician; and that he made a machine in the shape of a man, which was an oracle to him, and explained all the difficulties he proposed: the common cant accusations of those times of ignorance and superstition. But, having great knowledge in the mathematics and mechanics, by his skill in these sciences he probably formed a head, with springs, capable of articulate sounds; like the machines of Boetius and others. John Matthæus de Luna, in his treatise *De Rerum Inventoribus*, has attributed the invention of fire-arms to Albert; but in this he is refuted by Naude, in his *Apologie des Grands Hommes*.

ALBERTUS, a gold coin, worth about fourteen French livres: it was coined by Albertus archduke of Austria.

ALBESIA, in antiquity, a kind of shields otherwise called *Decumana*. See DECUMANA.

ALBI, a city of France, the capital of the Albigeois, in Languedoc. The cathedral is dedicated to St. Cecilia, and has one of the finest choirs in the kingdom. Here was a very valuable silver shrine, of exquisite workmanship, of the Mosaic kind, containing the reliques of St. Clair, the first bishop of this city. It is seated on the river Tarn, thirty-five miles north-by-west of Toulouse, and 250 south of Paris. E. lon. o. 52. N. lat. 43. 56.

The Albigeois is a small territory about twenty-seven miles in length, and twenty in breadth, abounding in corn, woad, grapes, saffron, plums, and sheep; and the inhabitants trade in dried prunes, grapes, a coarse sort of cloth, and wines of Gaillac. They have likewise several coal-mines.

ALBIGENSES, in church-history, a sect or party of reformers, about Toulouse and the Albigeois in Languedoc, who sprung up in the twelfth century, and distinguished themselves by their opposition to the discipline and ceremonies of the Romish church.

This sect had their name, it is supposed, either by reason there were great numbers of them in the diocese of Albi, or because they were condemned by a council held in that city. In effect, it does not appear that they were known by this name before the holding of that council. The *Albigenses* were also called *Albians*, *Albigesi*, *Albi*, and *Albanenses*, though some distinguish these last from them. Other names given to them are, *Henricians*, *Abelardists*, *Bulgarians*, &c. some on account of the qualities they assumed; others on that of the country from whence it is pretended they were derived; and others on account of persons of note who adopted their cause, as Peter de Brius, Arnold de Bresse, Abelard, Henry, &c. Berengarius, if not Wickliff himself, is by some ranked in the number.

The errors imputed to them by their opponents, the monks of those days, were, That they admitted two Christs; one evil, who appeared on earth; the other good, who has not yet appeared: That they denied the resurrection of the body; and maintained human souls to be daemons imprisoned in our bodies, by way of punishment for their sins: That they condemned all the sacraments of the church; rejected baptism as useless; held the eucharist in abhorrence; excluded the use of confessions and penance; maintained marriage unlawful; laughed at purgatory, prayers for the dead, images, crucifixes,

cifixes, &c.—There were likewise said to be two two classes of them; the Perfect, and the Believers. The perfect boasted of their living in continence, of eating neither flesh, eggs, nor cheese. The believers lived like other men, and were even loose in their morals; but they were persuaded they should be saved by the faith of the perfect, and that none were damned who received imposition of hands from them. But from these charges also they are generally acquitted by Protestants; who consider them as the pious inventions of the Romish church, whose members deem it meritorious by any means to blacken heretics.

However this be, the Albigenes grew so formidable that the Catholics agreed upon a holy league or croisade against them. They were at first supported by Raimond count of Toulouse. Pope Innocent III. desirous to put a stop to their progress, sent a legate into their country; which failing, he stirred up Philip Augustus king of France, and the other princes and great men of the kingdom, to make war upon them. Upon this the count of Toulouse, who had sided with them, made his submission to the pope, and went over to the Catholics: but soon after, finding himself plundered by the crusaders, he declared war against them, and was joined by the king of Arragon. His army was defeated at the siege of Muret, where he himself was killed, and the defeat followed by the surrender of the city of Toulouse, and soon after by the conquest of the greatest part of Languedoc and Provence. His son Raimond succeeded him; who agreed with the king and the pope to set up the inquisition in his estates, and to extirpate the Albigenes. In an assembly held at Milan, the archbishop of Toulouse drew up articles; agreeable to which the count made a most ample declaration against them, which he published at Toulouse in 1253. From this time the Albigenes dwindled by little and little, till the times of the reformation; when such of them as were left fell in with the Vaudois, and became conformable to the doctrine of Zuinglius and the disciples of Geneva.

ALBIGENSES is also a name sometimes given to the followers of Peter Vaud, or Waldo; and hence synonymous with what we more properly call *Waldenses*, or Poor Men of Lyons. In this sense the word is applied by Camerarius, Thuanus, and several other writers. The reason seems to be, that the two parties agreed in their opposition to the papal innovations and encroachments, though in divers other respects said to be different enough.

ALBITEMELIUM, ALBINTIMILIUM, or ALBIUM ITEMELIUM, now Vintimiglia, situated in the south-west of the territory of Genoa, near the borders of the county of Nice, with a port on the Mediterranean, at the mouth of the rivulet Rotta, about half way between Monaco and St. Remo. Lat. 43. 17. lon. 7. 40. E.

ALBIOECE, or ALEBECE; otherwise called *Reii Apollinares*, also *Civitas Reiensum*; now Riez, in Provence, about eighteen leagues to the north-east of Toulon, on the north side of the rivulet Verdon, was originally a Roman colony. It is sometimes written Regium. The people were called *Albici* by Cæsar. Lat. 43. 20. lon. 1. 0. E.

ALBINI, *f.* in antiquity, the workmen employed in what was called *Opus Albarium*. They make a different profession from the *dealbatores*, or *whiteners*.

ALBINOS, the name by which the Portuguese call the White Moors, whose colour resembles not that of the Europeans, but their whiteness is similar to that of milk, or to the hairs of a white horse. Their skin is covered with a kind of short white down, but not so thick as to conceal the skin. Their eye-brows are perfectly white, as well as their hair, which is seven or eight inches long, and half crisped; and, what is singular, their eye-lids are oblong, or rather in the form of a crescent, with the points turned down. Their eyes are red, and so weak that they can hardly see any object during the day; they cannot suffer the rays of the sun, and have no distinct vision but from the light of the moon.

Not long ago we had an account from Surinam of a negro of Angola, whose skin and hair were perfectly white, though both his father and mother had very dark complexions. The eyes of this Albino had a constant vibratory motion, and were incapable of distinguishing objects with exactness except in the dark. In the *Journal de Physique* of M. Rosier, for May 1777, M. Diqueuare has published an account of a white negro girl who was born at Dominica, in 1759, of black parents. "She has all the features of the negroes, especially those of Lower Guinea; and her hair, eye-brows, and eye-lashes, are the same in every respect, except the colour. Her hair, though a kind of very short wool, is fair; and her eye-brows, as well as her eye-lashes, are of a yellowish pale colour. The colour of her skin is a dead white; her cheeks, lips, nose, and other sanguine parts, have a slight tint of red, which becomes stronger when she is affected with liveliness or fear. Her eyes are long; the pupils approach, or sometimes recede from, each other, with a continual and involuntary motion; she is weak but not short sighted. Light is disagreeable to her, and towards night she sees neither better nor further than others. She has a timid air, a soft voice, and the smell of green leeks; but her skin is not soft like that of the negroes. Her parents have had several black children; but it is said, that an older one, who was born white, gradually became blacker as he grew up, and at last assumed the colour of the Cabres."—One of these Albinos was brought into England by the late Rev. George Whitfield, from America. It was a female; and she was afterwards exhibited as a great curiosity.

In Saussure's *Voyages dans les Alpes*, is the following account of two boys, at Chamouni, who were called Albinos:—"The elder, who was at the end of the year 1785 about twenty or one-and-twenty years of age, had a dull look, with lips somewhat thick, but nothing else in his features to distinguish him from other people. The other, who is two years younger, is rather a more agreeable figure: he is gay and sprightly, and seems not to want wit. But their eyes are not blue; the iris is of a very distinct rose-colour: the pupil too, when viewed in the light, seems decidedly red; which seems to demonstrate, that the interior membranes are deprived of the uvea, and of that black mucous matter that should line them. Their hair, their eye-brows, and eye-lashes, the down upon their skin, were all, in their infancy, of the most perfect milk-white colour, and very fine; but their hair is now of a reddish cast, and has grown pretty strong. Their sight too is somewhat strengthened; though they exaggerate to strangers their aversion for the light, and half shut their eye-lids to give themselves a more extraordinary appearance. But those who, like me, have seen them in their infancy, before they were tutored to this deceit, and when too few people came to Chamouni to make this affectation profitable to them, can attest that then they were not very much offended with the light of day. At that time, they were so little desirous of exciting the curiosity of strangers, that they hid themselves to avoid such; and it was necessary to do a sort of violence to them before they could be prevailed on to allow themselves to be inspected. It is also well known at Chamouni, that when they were of a proper age they were unable to tend the cattle like the other children at the same age; and that one of their uncles maintained them out of charity, at a time of life when others were capable of gaining a subsistence by their labour.

"I am therefore of opinion, that we may consider these two lads as true Albinos: for, if they have not the thick lips and flat noses of the white negroes, it is because they are Albinos of Europe, not of Africa. This infirmity affects the eyes, the complexion, and the colour of the hair; it even diminishes the strength, but does not alter the conformation of the features. Besides, there are certainly in this malady various degrees: some may have less strength, and be less able to endure the light: but these circumstances in those of Chamouni are marked with characters sufficiently strong to entitle them to the unhappy advantage of being

being classed with that variety of the human species denominated Albinos.

"When nature presents the same appearance often, and with circumstances varied, we may at last discover some general law, or some relation which that appearance has with known causes: but, when a fact is so singular and so rare, it gives but little scope to conjectures: and it is very difficult to verify those by which we attempt to explain it. I at first imagined that this disease might be referred to a particular sort of organic debility; that a relaxation of the lymphatic vessels within the eye might suffer the globules of the blood to enter too abundantly into the iris, the uvea, and even into the retina, which might occasion the redness of the iris and of the pupil. The same debility seemed also to account for the intolerance of the light, and for the whiteness of the hair. But a learned physiologist, M. Blumenbach, professor in the university at Göttingen, who has made many profound observations on the organs of sight, and has considered with great attention the Albinos of Chamouni, attributes their infirmity to a different cause.

"The study of comparative anatomy has furnished him with frequent opportunities of observing this phenomenon; he has found it in brutes, in white dogs, and in owls; he says, it is generally to be seen in the warm-blooded animals; but that he has never met with it in those with cold blood.

"From his observations, he is of opinion, that the redness of the iris, and of the other internal parts of the eye, as well as the extreme sensibility that accompanies this redness, is owing to the total privation of that brown or blackish mucus, that, about the fifth week after conception, covers all the interior parts of the eye in its found state. He observes, that Simon Pontius, in his *Treatise de Coloribus Oculorum*, long ago remarked, that in blue eyes the interior membranes were less abundantly provided with this black mucus, and were therefore more sensible to the action of light. This sensibility of blue eyes agrees very well, says M. Blumenbach, with northern people, during their long twilight; while, on the contrary, the deep black in the eyes of negroes enables them to support the splendor of the sun's beam in the torrid zone.

"As to the connection between this red colour of the eyes and the whiteness of the skin and hair, the same learned physiologist says, that it is owing to a similarity of structure, *consensus ex similitudine fabricae*. He asserts, that this black mucus is formed only in the delicate cellular substance, which has numerous blood-vessels contiguous to it, but contains no fat; like the inside of the eye, the skin of negroes, the spotted palate of several domestic animals, &c. And, lastly, he says, that the colour of the hair generally corresponds with that of the iris.

"At the very time that M. Blumenbach was reading this memoir to the Royal Society of Göttingen, M. Buzzi, surgeon to the hospital at Milan, an elevé of the celebrated anatomist Moscati, published, in the *Opusculi Selecti de Milan*, 1784, a very interesting memoir, in which he demonstrates by dissection what Blumenbach had only supposed.

"A peasant of about thirty years of age died at the hospital of Milan of a pulmonary disorder. His body, being exposed to view, was exceedingly remarkable by the uncommon whiteness of the skin, of the hair, of the beard, and of all the other covered parts of the body. M. Buzzi, who had long desired an opportunity of dissecting such a subject, immediately seized upon this. He found the iris of the eyes perfectly white, and the pupil of a rose-colour. The eyes were dissected with the greatest possible care, and were found entirely destitute of that black membrane which anatomists call the uvea: it was not to be seen either behind the iris or under the retina. Within the eye there was only found the choroid coat extremely thin, and tinged of a pale red colour, by vessels filled with discoloured blood. What was more extraordinary, the skin, when detached from different parts of the body, seem-

ed also entirely divested of the rete mucosum: maceration did not discover the least vestige of this, not even in the wrinkles of the abdomen, where it is most abundant and most visible.

"M. Buzzi likewise accounts for the whiteness of the skin and of the hair, from the absence of the rete mucosum, which, according to him, gives the colour to the cuticle, and to the hairs that are scattered over it. Among other proofs of this opinion, he alleges a well-known fact, that, if the skin of the blackest horse be accidentally destroyed in any part of the body, the hairs that afterwards grow on that part are always white, because the rete mucosum which tinges those hairs is never regenerated with the skin.

"The proximate cause of the whiteness of Albinos, and the colour of their eyes, seems therefore pretty evidently to depend on the absence of the rete mucosum: But what is the remote cause?

"In the first place, it seems probable, that men affected with this infirmity form no distinct species, for they are produced from parents that have dark skins and black eyes. What is it then that destroys the rete mucosum in such persons? M. Buzzi relates a singular fact, which seems to throw some light on this subject.

"A woman of Milan, named Colcagni, had seven sons. The two eldest had brown hair and black eyes; the three next had white skins, white hair, and red eyes; the two last resembled the two eldest. It was said that this woman, during the three pregnancies that produced the Albinos, had a continual and immoderate appetite for milk, which she took in great quantities: but that when she was with child of the other four children, she had no such desire. It is not however ascertained, that this preternatural appetite was not itself the effect of a certain heat, or internal disease, which destroyed the rete mucosum in the children before they were born.

"The Albinos of Chamouni are also the offspring of parents with dark skins and black eyes. They have three sisters by the same father and mother, who are also brunettes. One of them that I saw had the eyes of a dark brown, and the hair almost black. They are said, however, to be all afflicted with a weakness of sight. When the lads are married, it will be curious to observe how the eyes of their children will be formed. The experiment would be particularly decisive if they were married to women like themselves. But this faulty conformation seems to be more rare among women than among men; for the four of Milan, the two of Chamouni, the one described by Maupertuis, the one by Helvetius, and almost all the instances of these singular productions, have been of our sex. It is known, however, that there are races of men and women affected with this disease, and that these races perpetuate themselves in Guinea, in Java, at Panama, &c.

"Upon the whole, this degeneration does not seem to be owing to the air of the mountains; for though I have traversed the greatest part of the Alps, and the other mountains of Europe, these are the only individuals of the kind that ever I met with."

ALBINUS (Bernhard Siegfried), a celebrated physician and anatomist, was born at Francfort on the Oder, in 1697. Though distinguished in every branch of literature, his attention was particularly turned to anatomy and surgery; and his peculiar attachment to these branches of knowledge, which he cultivated under the eye of his father, who was professor of anatomy and surgery at Leyden, gained him the intimate friendship of Ruysch and Raw. From Leyden he went to Paris, where he attended the lectures of Du Verney, Vaillant, and other celebrated professors. But he had scarcely spent a year there, when he was invited by the curators of the university of Leyden to be a lecturer in anatomy and surgery at that place. In 1721, upon the death of his father, he succeeded to the professorship; in which capacity he not only paid the greatest attention to the pupils entrusted to his care, but laboured greatly in the improvement of the medical art. His numerous

merous and splendid publications soon extended his reputation over Europe; and the societies of London, Peterburgh, and Haerlem, cheerfully received him as an associate. In 1745, he was appointed professor of the practice of medicine at Leyden, and was succeeded in the anatomical chair by his brother Frid. Bern. Albinus. He was twice rector of the university, and as often refused that high honour when it was voluntarily offered him. At length, worn out by long service and intense study, he died on September 9, 1770, aged seventy-four.

ALBION, the ancient name of Britain, from the Latin *album*, "white," on account of the chalky cliffs on its sea-coasts.

New ALBION, a name given by Sir Francis Drake to California.

ALBIERO, *f.* in astronomy, a star of the third or fourth magnitude in the constellation CYGNUS.

ALBIS, now the Elbe, which divided ancient Germany in the middle, and was the boundary of the ancient geography of Germany, so far as that country was known to the Romans: all beyond they owned to be uncertain, no Roman except Drusus and Tiberius having penetrated so far as the Elbe. In the year of the building of the city 744, or about six years before Christ, Domitius Ahenobarbus, crossing the river with a few, merited the ornaments of a triumph; so glorious was it reckoned at Rome to have attempted its passage.

ALBISOLA, a small town belonging to the republic of Genoa: here is a porcelain manufacture, and several country-houses of the Genoese nobility. It was bombarded in 1745 by the English. Lat. 44. 15. N. lon. 8. 20. E.

ALBOGALERUS, *f.* in Roman antiquity, a white cap worn by the *flamen dialis*, on the top of which was an ornament of olive-branches.

ALBORA, *f.* a sort of itch, or rather leprosy. Paracelsus says, it is a complication of the morpew, serpigo, and leprosy. When cicatrices appear in the face like the serpigo, and then turn to small blisters of the nature of morpew, it is the albora. It terminates without ulceration, but by fetid evacuations in the mouth and nostrils; it is also seated in the root of the tongue. Internal medicines, as well as corrosive ones, are forbidden.

ALBORAK, *f.* amongst the Mahometan writers, the beast on which Mahomet rode in his journeys to heaven. The Arab commentators give many fables concerning this extraordinary vehicle. It is represented as of an intermediate shape and size between an ass and a mule. A place, it seems, was secured for it in paradise at the intercession of Mahomet; which, however, was in some measure extorted from the prophet, by Alborak's refusing to let him mount him when the angel Gabriel was come to conduct him to heaven.

ALBORO, *f.* in zoology, a name by which the erythrurus, a small red fish caught in the Mediterranean, is commonly known in the markets of Rome and Venice.

ALBOURG, a town of Denmark. See AALBORG.

ALBRICIUS, born at London, was a great philosopher, a learned and able physician, and well versed in all the branches of polite literature. He lived in the eleventh century, and wrote several works in Latin; particularly, 1. Of the Origin of the Gods. 2. The Virtues of the Ancients. 3. The Nature of Poison, &c.

ALBUCA, *f.* [from *albus*, Lat. white.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of lilia or liliaceæ. The generic characters are—Corolla: petals six, oblong-oval, permanent; the three outer spreading, the three inner converging. Stamina: filaments shorter than the corolla, three opposite to the inner petals, linear-fusulate, complicate a little above the base, then flat; three opposite to the outer petals, thicker; antheræ on the former, oblong, fixed to the inflex tip of the filament below the middle, upright; on the latter, similar but effete, or none. Pistillum: germ oblong, triangular; style three-sided; stigma a triangular pyramid. Pericarpium: an oblong, obtuse, triangular,

three-celled, three-valved, capsule. Seeds: numerous, flat, lying over each other, and widening outwards.—*Essential Character.* Corolla six-petalled, the inner ones difform. Stamina, three of the six castrated; stigma surrounded by three cups.

Species. I. Three stamens only fertile. 1. *Albuca altissima*, or tall albuca: interior petals glandulose and bent in at the tip, leaves subulate, channelled-convolute. In this species the leaves are so deeply channelled as to be almost rolled into a cylinder; they are two feet long, and almost three inches broad at the base. It flowers in April and May, and was introduced into England about 1780, by Messrs. Kennedy and Lee.

2. *Albuca major*, or great albuca: interior petals glandulose and bent in at the tip, leaves linear-lanceolate, flatish. Mr. Miller has, by mistake, made this a native of Canada, whereas all the species come from the Cape of Good Hope. It flowers in May.

3. *Albuca minor*, or small albuca: interior petals glandulose and bent in at the tip, leaves linear-subulate, channelled. It flowers in May and June.

4. *Albuca coarctata*, or channel-leaved albuca: interior petals vaulted at the tip; leaves smooth, linear, subulate, channelled; peduncles the length of the bractes. The flowers are yellow, which appear in May. It was introduced here in 1774.

5. *Albuca spiralis*, or spiral-leaved albuca: interior petals vaulted at the tip, leaves spiral.

II. All the stamens fertile. 6. *Albuca fastigiata*, or upright-flowered albuca: interior petals vaulted at the tip, leaves smooth, peduncles very long. It flowers in May, and was introduced in 1774.

7. *Albuca viscosa*, or viscose albuca: interior petals vaulted at the tip, leaves hairy-glandulose. It flowers in May and June, and was introduced about 1779, by John Fothergill, M. D.

8. *Albuca Abyssinica*, or Abyssinian albuca: leaves linear, channelled, smooth.

Propagation and Culture. If the roots are kept in pots, filled with light earth, and sheltered under a hot-bed frame in winter, they will thrive and produce flowers; but the best method is to have a border in the front of a greenhouse, or stove, where the roots of most of the bulbous flowers may be planted in the full ground, and screened in winter from frost; in such situations they thrive much better, and flower stronger, than when kept in pots. Mr. Miller says, that he raised the third sort from seed, and that it generally flowers twice a-year, first in March or April, and again in July or August; but that it did not produce any seeds. He affirms, that the second sort is so hardy, that the roots may be planted about four inches deep in a border of light earth, where they will thrive, and produce their flowers late in the summer.

ALBUGINEA TUNICA, *f.* in anatomy, the third or innermost coat or covering of the testes; it is likewise the name given to one of the coats of the eye.

ALBUGINEOUS, *adj.* [*albugo*, Lat.] Resembling the white of an egg.

ALBUGO, or LEUCOMA, *f.* in medicine, a distemper occasioned by a white opaque spot growing on the cornea of the eye, and obstructing vision.

ALBUM, *f.* in antiquity, a kind of white table or register, wherein the names of certain magistrates, public transactions, &c. were entered. Of these there were various sorts; as the *album decurionum*, *album senatorum*, *album judicum*, *album prætoris*, &c. *Album decurionum* was the register wherein the names of the decuriones were entered, and is otherwise called *matriculatio decurionum*. *Album senatorum*, the list of senators' names, which was first introduced by Augustus, and renewed yearly. *Album judicum*, that wherein the names of the persons of those decuriae who judged at certain times were entered. *Album prætoris*, that wherein the formula of all actions, and the names of such judges as the prætor had chosen to decide causes, were written. The high priest entered the chief

chief transactions of each year into an album, or table, which was hung up in his house for the public use.

ALBUM, in later times, denoted a kind of table, or pocket-book, wherein the men of letters with whom a person had conversed, inscribed their names with some sentence or motto.

ALBUM GRÆCUM, among physicians, the white dung of dogs, formerly prescribed for inflammations of the throat, &c. but now justly despised.

ALBUMAZAR, a learned Arabian astronomer in the tenth century, who wrote a treatise *Of the Revolution of the Years*.

ALBUMEN, the white of an egg. For its nature, origin, and office, see EGG.

The white of an egg, according to Boerhaave, makes an extraordinary menstruum. Being boiled hard in the shell, and afterwards suspended in the air by a thread, it resolves and drops down into an insipid, scentless, liquor, which appears to be that anomalous unaccountable menstruum so much used by Paracelsus; and will, though it contain nothing sharp, oleaginous, or saponaceous, make a thorough solution of myrrh; which is more than either water, oil, spirits, or even fire itself, can effect.

A little putrid white of egg taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhoea, and gripes; it inflames the bile, excites heat, thirst, fever; and dissolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm; it may be taken in luke-warm milk; but, if any other heat is applied to it, the nutritious quality will be destroyed. The fresh white of egg prevents burns from rising in blisters, if it is used immediately after the accident: it mitigates inflammations of the eyes, and preserves the face from sun-burning. In pharmacy, it is used as a medium to render balsams and turpentine, &c. miscible with aqueous fluids; but, as it disagrees with many stomachs when thus taken, a mucilage of gum-arabic may supply its place, it being as good a medium in similar circumstances, and not apt to offend the tenderest stomach. The eggs of all birds are pretty nearly similar with regard to their flavour and nutritious effects: though some are deeper coloured, and more tenacious, than others. It is surprising what a quantity of egg will be digested by some persons; but in most, this power is very limited; for a smaller bulk of this, than of any other food, will satisfy and occupy the digestive powers of most men. It is a more calefactive food than any other animal substance; and, during digestion, is less stimulant.

ALBUQUERQUE, a small city in Spain, in the province of Estremadura, is seated on an eminence, nine miles from the frontiers of Portugal. It is commanded by an almost impregnable fortress, built on a high mountain, and serving to defend the town. It carries on a great trade in the wool and woollen manufactures. It was taken by the allies of Charles king of Spain in 1705. W. lon. 7. 0. N. lat. 38. 52.

ALBUQUERQUE (Alphonso), a native of Portugal. Little is known of this great commander before he was appointed by king Emanuel to the command of a squadron destined for India, where by his exploits he raised the arms of his country to the highest pitch of glory. His principal expedition was against Goa, which he invested with twenty-three ships, and about 5000 men.—The forts near it on the continent were taken and destroyed; and, learning that the city was in the greatest consternation, he sent deputies to offer the people his protection, and the enjoyment of their religion. The citizens accepted the conditions, and Albuquerque entered Goa the following day, being the 16th of February, 1510. This city has long been the head of the Portuguese dominions in India. Here Albuquerque fixed his winter-quarters, and behaved himself in such a manner as to merit the esteem of every one. But, while he was thus employed, some of the chief Portuguese began to murmur against him. However, by

seizing and imprisoning the leaders, he quieted the disturbance. The enemy, being informed of the dissensions among the Portuguese, made an attack upon the island, and, landing men, laid siege to the city, pressing it hard. The situation of Albuquerque became now truly distressing; an enemy vastly superior without, discontent among his officers within, and his troops greatly diminished. These circumstances determined him to embark on-board his ships, and evacuate the city, which he effected after a fierce combat, having first set fire to the magazines.

He then steered to a place called Repander to winter; but the enemy soon obliged him to remove, and take shelter between the continent and the island of Divar, where he was informed his enemies were also preparing to make an attack upon him. In this extremity, being also very scarce of provisions, he determined to make a desperate effort on a strong castle, called Pangin. Accordingly, having stationed a force to prevent succours being sent to it, he proceeded under cover of the night, and succeeded in surprising the fort and camp of the enemy, both which were taken without much resistance. Such an unexpected turn of good fortune determined him not only to object to offers of peace, but also to make another attack on Goa. In this he succeeded, and killed 3000 of the enemy. This success induced him to aim at greater enterprises. Collecting his forces, he sailed from Goa for the island of Sumatra; and, after concluding a treaty with the princes of that island, he proceeded to the city of Malacca, and made himself master of it. Having settled affairs there, he returned to Goa, laid siege to the city of Benafar, and, having been unsuccessful, consented to a peace with the Zamorin. To this great man the Portuguese owe the foundation of the immense power they once possessed in India; and, had they pursued the maxims he laid down, they might possibly have enjoyed them to this day. He was a man of great humanity, dreaded for his bravery, and beloved for his benevolent disposition. His death was most sincerely felt by all the people of Goa, where he was buried with great funeral honours.

ALBURN, the English name of a compound colour, being a mixture of white and red, or reddish brown. Skinner derives the word, in this sense, from the Latin *albus*, and the Italian *burno*, from *bruno*, "brown."

ALBURNUM, the soft white substance which in trees is found between the liber or inner bark and the wood, and in progress of time, acquiring solidity, becomes itself the wood. From its colour and comparative softness, it has been styled by some writers the fat of trees, *adeps arborum*. The alburnum is found in largest quantities in trees that are vigorous; though in such as languish, or are sickly, there is a great number of beds. In an oak six inches in diameter, this substance is nearly equal in bulk to the wood. In a trunk of one foot diameter, it is as one to three and a half; of two and a half feet diameter, as one to four and a half, &c. but these proportions vary according to the health and constitution of the trees.—The alburnum is frequently gnawed in pieces by insects, which lodge in the substance, and are nourished from it.

ALBURNUS, in zoology, a species of the *cyprinus* of Linnæus. See CYPRINUS.

ALBY, an ancient town in the department of Tarn. There are very beautiful walks in the environs of the town, and the adjacent country is very fertile, producing the various kinds of grain, excellent wines, flax, hemp, saffron, aniseed, coriander and woad; the fine pastures afford wool of a good quality, which is manufactured into stockings, ratteens, shalloons, coarse woollens, &c. and the wax-candles made here are very fine. This town is forty-two miles N. E. of Toulouse, and 335 S. of Paris. Lat. 44. 15. N. lon. 2. 14. E. The Albigenes, so called from their making their first appearance in this city, were a people who, so early as the eleventh century, disputed the authority of the pope; for this he excommunicated them: a very cruel persecution was raised against them by means of a crusade.

ALCA, or *Auk*, in ornithology, a genus of the order of anseres. The beak of this genus is without teeth, short, convex, compressed, and frequently furrowed transversely: the inferior mandible is gibbous near the base; the feet have generally three toes. The species of the alca are twelve; of which the most remarkable are,

1. The *impennis*, northern penguin, or great auk, with a compressed bill furrowed on each side, and an oval spot on each side of the eyes. According to Mr. Martin, this bird sometimes breeds on the isle of St. Kilda, in Scotland. It lays one egg, which is six inches long, of a white colour; some are irregularly marked with purplish lines crossing each other, others blotched with black, and ferruginous about the thicker end: if the egg is taken away, it will not lay another that season. It lays its egg close to the sea-mark, being incapable, by reason of the shortness of its wings, to mount higher. The length of this bird, to the end of its toes, is three feet: but its wings are so small, as to be useless for flight; the length, from the tip of the longest quill-feathers to the first joint, being only four inches and a quarter. This bird is observed by seamen never to wander beyond soundings; and according to its appearance they direct their measures, being then assured that land is not very remote. It sometimes frequents Norway, the Ferroe isles, Iceland, Greenland, and Newfoundland; and feeds much on the lump-fish, father-lasher, and other fish of that size. The young birds eat rose-root, and other plants. The old ones are very rarely seen on-shore, though the young ones are not unfrequently met with. It is a very shy bird. It walks ill; but dives well, and is taken in the manner used for the razor-bill and puffin. The skin between the jaws is blown into a bladder, and used for the darts of the Greenlanders, as is also that of some other birds. The skin of the body is supposed to be used by the Esquimaux Indians for garments.

2. The *alle*, little auk, or black and white diver, with a smooth conical bill, a white streak on the belly and wings, and black feet. The bulk of this species exceeds not that of a blackbird. It is not very common in Britain, being only met with now and then. It seems to be most plentiful towards the north, being met with in various parts as far as Spitzbergen. It is common in Greenland, in company with the black-billed species; feeds on the same food; and lays two bluish white eggs, larger than those of a pigeon. It flies quick, and dives well; and is always dipping its bill into the water while swimming or at rest on the water. It grows fat in the stormy season, from the waves bringing plenty of crabs and small fish within its reach; but from its size it is less sought after than the others. In Greenland it is called the *ice-bird*, being the harbinger of ice. This species is sometimes seen of a pure white.

3. The *arctica*, or puffin, with a compressed bill and four furrows; the orbit of the eyes and temples are white. The legs of this species are very small; and placed so far behind as to disqualify it from standing except quite erect, resting not only on the foot, but the whole length of the leg. This circumstance makes the rise of the puffin from the ground very difficult, and it meets with many falls before it gets on wing; but, when that is effected, few birds fly longer or stronger. These birds frequent the coasts of several parts of Great-Britain and Ireland; but no place in greater numbers than Priestholm-isle, where their flocks may be compared to swarms of bees for multitude. These are birds of passage; they resort there annually about the fifth or tenth of April, quit the place (almost to a bird), and return twice or thrice before they settle to burrow and prepare for ovation and incubation. They begin to burrow the first week in May; but some few save themselves that trouble, and dislodge the rabbits from their holes, taking possession of them till their departure from the isle. Those which form their own burrows, are at that time so intent on the work as to suffer themselves to be taken by the hand. This task falls

chiefly to the share of the males; who also assist in incubation. The first young are hatched the beginning of July. The old ones shew vast affection towards them; and seem totally insensible of danger in the breeding season. If a parent is taken at that time, and suspended by the wings, it will in a sort of despair treat itself most cruelly, by biting every part it can reach; and the moment it is loosed, will never offer to escape, but instantly resort to its unfledged young: this affection ceases at the stated time of migration, which is most punctually about the 11th of August, when they leave such young as cannot fly to the mercy of the peregrine falcon, who watches the mouth of the houses for the appearance of the little deserted puffins, which, forced by hunger, are compelled to leave their burrows. They lay only one egg. The eggs differ much in form: some have one end very acute; others have both extremely obtuse; all are white. Their flesh is excessively rank, as they feed on sea-weeds and fish, especially sprats: but, when pickled and preserved with spices, are admired by those who love high eating. Dr. Caius tells us, that in his days the church allowed them in Lent instead of fish. These birds are common in Ireland; on the island Sherries, three leagues N. N. W. of Holyhead; and in the S. Stack, near Holyhead, they breed in plenty. They inhabit Iceland and Greenland; and breed in the extreme parts of the islands. It is also found in the Ferroe isles, where it is called *lunda*; and in the Farn isles, where it is called *coulteneb*, from the shape of the bill. It goes also by various other names; such as *guldin-head*, *bottle-nose*, and *helegug*, in Wales; at Scarborough, *mullet*; and in Cornwall, *pope*. In America they are said to frequent Carolina in winter; and have been met with in Sandwich Sound by our late voyagers.

4. The *torda*, or razor-bill, with four furrows on the bill, and a white line on each side running from the bill to the eyes. These birds, in company with the guillemot, appear in our seas the beginning of February; but do not settle on their breeding places till they begin to lay, about the beginning of May. They inhabit the ledges of the highest rocks that impend over the sea, where they form a grotesque appearance; sitting close together, and in rows one above another. They properly lay but one egg apiece, of an extraordinary size for the bulk of the bird, being three inches long: it is either white, or of a pale sea-green, irregularly spotted with black; if this egg is destroyed, both the auk and the guillemot will lay another; if that is taken, then a third: they make no nest; depositing their egg on the bare rock; and, though such multitudes lay contiguous, by a wonderful instinct each distinguishes its own. What is also matter of great amazement, they fix their egg on the smooth rock with so exact a balance, as to secure it from rolling off; yet, should it be removed, and then attempted to be replaced by the human hand, it is extremely difficult, if not impossible, to find its former equilibrium. According to Mr. Latham, it is by means of a cement that the bird fixes its egg. The eggs are food to the inhabitants of the coast they frequent; which they get with great hazard, being lowered from above by ropes, trusting to the strength of their companions, whose footing is often so unstable that they are forced down the precipice, and perish together. These birds are found in the north of Europe, also in Iceland, Greenland, and on the coast of Labrador. In Europe they extend along the White Sea into the Arctic Asiatic shores, and from thence to Kamtschatka and the gulph of Ochotka: It is the only one which reaches the inland Baltic; being found there on the Carls-Ozar isles, near Gothland, and the isle of Bondon off Angermania.

5. The *pica*, or black-billed auk, has the bill of the same form with the *torda*, but is entirely black. The cheeks, chin, and throat, are white: in all other respects it agrees with the former species. Mr. Latham is of opinion that it is no other than the young of that species. Mr. Pennant observes; that it is sometimes found on our coasts; but, according to Mr. Latham, it is in the winter.

The Puffin & Razor-Bill.

London Published as the Act directs, August 20. 1796, by J. Wilkes.

ter-season only, when the common sort has quitted them. They are said to be met with on the coast of Candia, and other parts of the Mediterranean. They are common in the bay of Gibraltar, where it is curious to see their activity under water when pursuing the fish; for, as the water in the bay is sometimes clear for a great depth from the surface, these birds may be often seen as it were flying after their prey, with all the agility of a bird in the air, turning in every direction after the fish, with such wonderful address and dexterity as seldom to miss their aim.

6. The cirrhata of Dr. Pallas, or tufted auk, somewhat larger than the common puffin, and the colours much the same; the bill is an inch and three-quarters in length, the same in depth at the base, and crossed with three furrows; over each eye arises a tuft of feathers four inches in length, which falls elegantly on each side of the neck, reaching almost to the back, and are white as far as they are attached to the head, but afterwards of a fine buff yellow; the legs are of a bright red, and the claws black. The female is principally distinguished by having the bill crossed only with two furrows instead of three. This species inhabits the shores of Kamtschatka, the Kurile islands, and those intervening between Kamtschatka and America. In manners it greatly resembles the puffin, living all day at sea, but at no great distance from the rocks; it comes on shore at night, burrows a yard deep under ground, and makes a nest with feathers and sea-plants; is monogamous, and lodges there the whole night with its mate. It lays one white egg, the end of May or beginning of June, which alone is thought fit to be eaten, the flesh of the bird itself being insipid and hard. It feeds on crabs, shrimps, and shell-fish, which last it forces from the rocks with its strong bill.

7. The pttacula, or perroquet auk, of Dr. Pallas, is about the size of the little auk. The bill is much compressed on the sides, in shape convex both above and below, and of a bright red colour; from the remote corner of each eye is a very slender tuft of fine white feathers, hanging down the neck; the head and upper part of the body are dusky; the lower whitish, varied with black edges; the legs are of a dirty yellow, and the webs dusky. This species is found at Kamtschatka, in the isles towards Japan, and on the western shores of America. They are sometimes seen in flocks, but seldom far from land, except when driven by storms. At nights they harbour in the crevices of rocks. They lay an egg almost the size of a hen's, about the middle of June, upon the bare rock or sand, for they make no nest. Like most of the tribe, they are stupid birds, as may be evinced by the method of catching them. One of the natives places himself under a loose garment of fur, of a particular make, with large open sleeves, among the rocks at evening; when the birds, returning to their lodging-places at dusk, run under the skirts, and up the arm-holes, for shelter during the night, and thus becomes an easy prey. Their stupidity likewise occasions them to fly aboard a ship at such times, mistaking it for a roofing-place; whereby navigators have been taught to avoid the danger of falling in too near with land.

ALCACAR, a palace on one side of Toledo, in New Castile. It stands on the top of a steep rock, and commands a prospect of the city, and of the river Tagus, running at its foot through the neighbouring fields.

ALCÆUS, a famous ancient lyric poet, born at Mitylene, in the island of Lesbos. He flourished in the 44th Olympiad, at the same time with Sappho, who was likewise of Mitylene. Alcæus was a great enemy to tyrants, but not a very brave soldier. He was present at an engagement, wherein the Athenians gained a victory over the Lesbians; and here, as he himself is said to have confessed in one of his pieces, he threw down his arms, and saved himself by flight. The poetical abilities of Alcæus are undisputed; and, though his writings were chiefly in the lyric strain, yet his muse was capable of treating the sublime subjects with a suitable dignity.

ALCÆUS, an Athenian tragic poet, and, as some think,

the first composer of tragedies. He renounced his native country Mitylene, and passed for an Athenian. He left ten pieces, one of which was *Pasiphaë*, that which he produced when he disputed with Aristophanes, in the fourth year of the 97th Olympiad.

There is another ALCÆUS mentioned in Plutarch, perhaps the same whom Porphyrius mentions as a composer of satirical iambics and epigrams, and who wrote a poem concerning the plagiarism of Euphorus the historian. He lived in the 145th Olympiad.

We are told likewise of one ALCÆUS, a Messenian, who lived in the reign of Vespasian and Titus. We know not which of these it was who suffered for his lewdness a very singular kind of death, which gave occasion to the following epitaph:

Ἀλκαίῳ ταφος ἔσθ', &c.

This is Alcæus's tomb; who died by a radish,
The daughter of the earth, and punisher of adulterers.

This punishment, inflicted on adulterers, was thrusting one of the largest radishes up the anus of the adulterer: or, for want of radishes, they made use of a fish with jagged fins, and a large head.

ALCAHEST, *f.* An Arabic word, to express an universal dissolvent, pretended to by Paracelsus and Helmont.

ALCAICS, *f.* in ancient poetry, a denomination given to several kinds of verse, from Alcæus, their inventor. The first kind consists of five feet, viz. a spondee, or iambic; an iambic; a long syllable; a dactyle; another dactyle. The second kind consists of two dactyles and two trochees: as, *Exilium impositura cymbæ*. Besides these two, which are called *dactylic alcaics*, there is another styled simply *alcaic*; consisting of an epitrite, a choriambus, another choriambus, and a bacchius.

ALCAIC ODE, *f.* a kind of manly ode composed of several troches, each consisting of four verses; the two first of which are always alcaics of the first kind; the third verse is a diameter hypercatalectic, or consisting of four feet and a long syllable; and the fourth verse is an alcaic of the second kind.

ALCAID, ALCAYDE, or ALCALDE, *f.* [from *al*, Arab. and קריק, Heb. the head.] In the polity of the Moors, Spaniards, and Portuguese, a magistrate, or officer of justice, answering nearly to the French provost and the British justice of the peace. The alcaid among the Moors is vested with supreme jurisdiction, both in civil and criminal cases.

ALCALA DE GUADEIRA, a small town of Spain, in Andalusia, upon the river Guadeira. Here are abundance of springs, from whence they convey water to Seville by an aqueduct. Lat. 37. 15. N. lon. 6. 16. W.

ALCALA DE HENARES, a beautiful and large city of Spain, in New Castile, seated upon the river Henares, which washes its walls. It is built in a very agreeable plain, and is of an oval figure. The streets are handsome and straight; one of them is very long, running from one end of the city to the other. The houses are well built; and there are several squares, the largest of which is an ornament to the city; it is surrounded on all sides with piazzas, where tradesmen have their shops. The university was founded by cardinal Ximenes, archbishop of Toledo, about the beginning of the sixteenth century. The land about Alcala is watered by the Henares, well cultivated, and very fruitful, while that at a distance is dry and sterile; it yields grain in plenty, very good muscat wine, and melons of a delicious kind. Without the walls is a spring, the water of which is so pure and so well tasted, that it is inclosed and shut up for the king of Spain's own use, from whence it is carried to Madrid. This city is ten miles south-west of Guadalaxara, and thirteen miles east of Madrid. Lat. 40. 30. N. lon. 4. 20. W.

ALCALA REAL, a small city of Spain, in Andalusia, with a fine abbey. It is built on the top of a high mountain, and the road to it is incommodious, rough, and unequal. Lat. 37. 18. N. lon. 4. 15. W.

ALCAMER, an ancient and handsome town of the United Provinces, in the environs of which they make the best butter and cheese, and rear the most highly-valued tulips, in Holland. It is seventeen miles north-by-west of Amsterdam. Lat. 52.40. N. lon. 13. 52. E.

ALCALY, **ALCALI**, or **ALKALI**. See **CHEMISTRY**.

ALCANIS, a town of Arragon, in Spain, seated on the river Guadaloupe, twelve miles from Caspe. It was formerly the capital of the king of the Moors. Here is a very remarkable fountain, which throws up water through forty-two pipes. It is surrounded with gardens and fruit-trees, and defended with a good fortress. Lat. 41. 0. N. lon. 0. 5. W.

ALCANNA, *f.* a powder prepared from the leaves of the Egyptian privet, in which the people of Cairo drive a considerable trade. It is much used by the Turkish women to give a golden colour to their nails and hair. In dyeing, it gives a yellow colour when steeped with common water, and a red one when infused in vinegar. There is also an oil extracted from the berries of alcanna, and used in medicine as a calmer.

ALCANTARA, a small but very strong city of Estremadura, in Spain. It gives name to one of the three orders of knighthood. It is seated on the banks of the Tagus, twenty-one miles from Coria, in a very fruitful soil, and is celebrated for its bridge over that river. This was built in the time of the emperor Trajan, as appears by an inscription over one of the arches, by the people of Lusitania, who were assailed to supply the expence. It is raised 200 feet above the level of the water; and, though it consists but of six arches, is 670 feet in length, and twenty-eight in breadth. At the entrance of the bridge, there is a small antique chapel hewn in a rock by the ancient Pagans, who dedicated it to Trajan, as the Christians did to St. Julian. This city was built by the Moors, on account of the convenience of this bridge, which is at a place where the Tagus is very deep, running between two high steep rocks: for this reason, they called it *Al-Cantara*, which, in their language, signifies "the bridge." It was taken from them in 1214, and given to the knights of Calatrava, who afterwards assumed the name of Alcantara. It was taken by the earl of Galloway, in April 1706, and retaken by the French in November following. It is forty-five miles from Madrid, and 125 from Seville. Lat. 39. 30. N. lon. 7. 12. W.

Knights of ALCANTARA, a military order of Spain, which took its name from the above-mentioned city. They make a very considerable figure in the history of the expeditions against the Moors. The knights of Alcantara make the same vows as those of Calatrava, and are only distinguished from them by this, that the cross fleur de lys, which they bear over a large white cloak, is of a green colour. They possess thirty-seven commanderies. After the expulsion of the Moors, and the taking of Granada, the sovereignty of the order of Alcantara and that of Calatrava was settled in the crown of Castile by Ferdinand and Isabella. In 1540, the knights of Alcantara sued for leave to marry, which was granted them.

ALCAREZ, a small city of La Mancha, in Spain, defended by a strong castle, and remarkable for an ancient aqueduct. It stands near the river Guardamena, and the soil about it is very fruitful. They have a breed of small running-horses, which are very fleet and strong. It is twenty-five miles north of the confines of Andalusia, 108 south of Cuenca, and 138 south-by-east of Madrid. Lat. 38. 28. N. lon. 1. 50. W.

ALCASSAR DO SAL, a town of Portugal in Estremadura, which has a castle said to be impregnable. It is indeed very strong, both by art and nature, being built on the top of a rock, which is exceedingly steep on all sides. Here is a salt-work which produces very fine white salt, from whence the town takes its name. Lat. 38. 18. N. lon. 9. 10. W.

ALCASSAR, a city of Barbary, seated about two leagues from Larache, in Aſſa, a province of the kingdom of Fez.

It was of great note, and the seat of the governor of this part of the kingdom. It was built by Jacob Almanzor, king of Fez, about the year 1180, and designed for a magazine and place of rendezvous for the great preparations he was making to enter Granada in Spain, and to make good the footing Joseph Almanzor had got some time before. It is said his father first invaded Spain with 300,000 men, most of whom he was obliged to bring back to Africa to quiet a rebellion that had broken out in Morocco. This done, he returned to Spain again, with an army, as it is said, of 200,000 horse and 300,000 foot. The city is now fallen greatly to decay, so that of fifteen mosques there are only two that they make use of. Here are a great number of flocks, who live very familiarly with the people, walking about the town, possessing the tops of the houses and mosques without molestation; for they esteem them sacred birds, and account it sinful to disturb them. Not far from hence is the river Elnahaffen, famous for the battle fought between Don Sebastian king of Portugal and the Moors; in which the Portuguese were defeated and their king slain. Lat. 35. 15. N. lon. 12. 35. W.

ALCAVALA, *f.* in the Spanish finances, was at first a tax of ten per cent. afterwards of fourteen per cent. and is at present of only six per cent. upon the sale of every sort of property, whether moveable or immoveable; and it is repeated every time the property is sold. The levying of this tax requires a multitude of revenue-officers sufficient to guard the transportation of goods, not only from one province to another, but from one shop to another. It subjects every farmer, every manufacturer, every merchant, and shopkeeper, to the continual visits and examination of the tax-gatherers. Through the greater part of a country in which a tax of this kind is established, nothing can be produced for distant sale. The produce of every part of the country must be proportioned to the consumption of the neighbourhood. It is to the alcavala, accordingly, that Ustaritz imputes the ruin of the manufactures of Spain. He might have imputed to it likewise the declension of agriculture, it being imposed not only upon manufactures, but upon the rude produce of the land.

ALCAZA LEGUER, a town of Africa, in the kingdom of Fez, and in the province of Ilabat. It was taken by Alphonso, king of Portugal, in 1468; but soon after that, it was abandoned to the Moors. It is seated on the coast of the straits of Gibraltar. Lat. 38. 0. N. lon. 5. 30. W.

ALCAZER, a town of Spain, in New Castile, seated on the river Guardamena, which has a fortress on a high hill for its defence, and lies in a very fruitful country. It is 100 miles north-west of Carthage. Lat. 38. 15. N. lon. 2. 10. W.

ALCE, **ALCES**, or **ELK**, *f.* in zoology, the trivial name of a species of the cervus, belonging to the order of mammalia pecora. See **CERVUS**.

ALCEA, *f.* [from *αλκυ*, *robur*: on account of its supposed strength as a remedy in the dysentery, &c.] In botany, a genus of the monadelphia polyandria class, and of the natural order of columneræ. The generic characters are—Calyx: double, each one-leaved; the outer cut half-way into six parts, permanent, and very spreading; the inner cut half-way into five parts, larger, and permanent. Corolla: of five obcordate, emarginate, spreading, petals, coalescing at their bases. Stamina: filaments uniting into a sort of five-angled cylinder at bottom, loose at top, and inserted into the corolla; antheræ almost kidney-shaped. Pistillum: germ orbiculate; style cylindric, short; stigmas about twenty, setaceous, the length of the style. Pericarpium: many jointed arils in a ring round a columnar flattened receptacle, parting and opening on the inside. Seed: one, flat, kidney-shaped, in each aril.—*Essential Character*. Calyx double, outer six-cleft; arils many, one-seeded.

Species. 1. *Alcea rosea*, or common hollyhock: leaves finuate-angular. 2. *Alcea scicifolia*, or fig-leaved hollyhock: leaves palmate. The first and second are distinct species, whose difference in the form of their leaves always

ways continues. The leaves of the first sort are roundish, and cut at their extremity into angles; whereas those of the second are deeply cut into six or seven segments, so as to resemble a hand. Linnæus however doubts whether they are distinct species, and seems to think the second is a variety of the first. Allione says that the hollyhock grows wild in the county of Nice. Both sorts were cultivated by Gerard in 1597. The colours of their flowers being accidental, and the double flowers being only varieties which have risen from culture, we have not enumerated them here, but shall only mention the various colours which are commonly observed; these are, white, pale, red, deep-red, blackish-red, purple, yellow, and flesh-colour. Although these varieties of double hollyhocks are not constant, yet, where the seeds are carefully saved from the most double flowers, the greatest number of the plants will arise nearly the same as the plants from which they were taken, both as to their colour and the fulness of their flowers, provided no plants with single or bad-coloured flowers are permitted to grow near them. Therefore, so soon as any such appear, they should be removed from the good ones, that their farina may not spread into the other flowers, which would cause them to degenerate. The first species grows naturally in China. Linnæus refers it to Siberia. A dwarf sort, with beautiful double variegated flowers, has been in great esteem for some years past, under the name of Chinese hollyhock. These plants, although natives of warm countries, yet are hardy enough to thrive in the open air in England, and have for many years been some of the greatest ornaments in the garden, toward the latter part of the summer; but, since they have become very common, have not been regarded so much as they deserve, partly from their growing too large for small gardens, and their requiring tall stakes to secure them from being broken by strong winds. But in large gardens, where they are properly disposed, they make a fine appearance; for, as their spikes of flowers grow very tall, there will be a succession of them, on the same stems, more than two months; the flowers on the lower part of the spike appearing in July, and, as their stalks advance, new flowers are produced till near the end of September. When they are planted in good ground, their stalks often rise to the height of eight or nine feet, so that near six feet of each will be garnished with flowers; which, when double and of good colours, will make a fine appearance, especially if the various colours are properly intermixed.

3. *Alcea Africana*, or African hollyhock: leaves three-lobed crenated, flowers solitary axillary, both calyxes fix-parted. This species is a native of the eastern shore of Africa.

Propagation and Culture. They are propagated by seeds, which, as has already been observed, should be carefully saved from those plants whose flowers are the most double, and of the best colours. If these are preserved in their covers until spring, the seeds will be better, provided they are gathered very dry, and care be taken that no damp comes to them in winter, which will cause their covers to be mouldy, and thereby spoil the seeds. The seeds should be sown on a bed of light earth, about the middle of April, and must be covered about half an inch deep: some persons sow them in shallow drills, and others scatter the seeds thinly over the whole bed. When they are sown in the former method, the plants generally come up thick, and will require to be transplanted sooner than those which are sown in the latter. By the first, the seeds may be more equally covered, and kept clean with less trouble, because the ground between the drills may be hoed. When the plants have put out six or eight leaves, they should be transplanted into nursery-beds, at a foot distance from each other, observing to water them until they have taken good root; after which they will require no farther care, but to keep them clean from weeds till October, when they should be transplanted where they are to remain. Some persons let their plants remain a year longer in the nursery-beds to see their flowers, before they remove them

to the flower-garden; but, when this is intended, the plants should be planted at a greater distance in the nursery-beds, otherwise they will not have room to grow. However, the plants should be removed the first autumn, for young plants more surely grow than those which are older; and, if the seeds are carefully saved, there will not be one in ten of the plants come single or of bad colours.

ALCEA, *f.* in botany. See *HIBISCUS* and *MALVA*.

ALCEA FLORIDANA, *f.* in botany. See *GORDONIA*.

ALCEDO, or *KINGFISHER*, *f.* in ornithology, a genus of the order of *picæ*. The alcedo has a long, strait, thick, triangular, bill; with a fleshy, plain, short, flat, tongue. Of this genus there are a great many species, with one or other of which almost every part of the world is furnished. Most of them frequent rivers, and live on fish, the singularity of catching which is admirable: sometimes hovering over the water, where a shoal of small fishes is seen playing near the surface; at other times waiting with attention, on some low branch hanging over the water, for the approach of a single one who is so unlucky as to swim that way; in either case dropping like a stone, or rather darting with rapidity, on its prey; when, seizing it crosswise in his bill, it retires to a resting-place to feast on it; which it does piecemeal, bones and all, without reserve, afterwards bringing up the indigestible parts in pellets, like birds of prey. The wings of most of the genus are very short; yet the birds fly rapidly, and with great strength. It may be remarked, that, throughout this genus, blue, in different shades, is the most predominant colour. The species found in the South-Sea Islands are held in a kind of superstitious veneration by the natives of the places they severally inhabit, perhaps on account of their being frequently seen flying about the morais or burial-places. That which inhabits Otaheite, where it is called *Erooro*, is accounted particularly sacred, and not allowed to be taken or killed.

1. The *ispida*, or common kingfisher, is not much larger than a swallow; its shape is clumsy; the bill disproportionately long; it is two inches from the base to the tip; the upper chap black, and the lower yellow. But the colours of this bird atone for its inelegant form: the crown of the head and the coverts of the wings are of a deep blackish green, spotted with bright azure: the back and tail are of a most resplendent azure; the whole under-side of the body is orange-coloured; a broad mark of the same passes from the bill beyond the eyes; beyond that is a large white spot: the tail is short, and consists of twelve feathers of a rich deep blue; the feet are of a reddish yellow, and the three joints of the outermost toe adhere to the middle toe, while the inner toe adheres only by one. From the diminutive size, the slender short legs, and the beautiful colours, of this bird, no person would be led to suppose it one of the most rapacious little animals that skims the deep. Yet it is for ever on the wing in quest of fish; which it takes in surprising quantities, when we consider its size and figure. It takes its prey after the manner of the osprey, balancing itself at a certain distance above the water for a considerable space, then darting into the deep, and seizing the fish with inevitable certainty. While it remains suspended in the air, in a bright day, the plumage exhibits a beautiful variety of the most dazzling and brilliant colours. This striking attitude did not escape the notice of the ancients; for Ibycus, as quoted by Athenæus, styles those birds *αλκυονες πανσιπτειροι*, "the halcyons with expanded wings." It makes its nest in holes in the sides of cliffs, which it scoops to the depth of three feet; and lays from five to nine eggs, of a most beautiful semi-transparent white. The female begins to lay early in the season, and excludes her first brood about the beginning of April. The male, whose fidelity exceeds even that of the turtle, brings her large provisions of fish while she is thus employed; and she, contrary to most other birds, is found plump and fat at that season. The male, that used to twitter before this, now enters the nest as quietly and as privately as possible.

The young ones are hatched at the expiration of twenty days; but are seen to differ as well in their size as in their beauty. This species is the *αλκυοναφω*, or mute halcyon of Aristotle, which he describes with more precision than is usual with that great philosopher. After his description of the bird follows that of its nest; than which the most inventive of the ancients have delivered nothing that appears at first sight more fabulous and extravagant. He relates, that it resembled those concretions that are formed by the sea-water; that it resembled the long-necked gourd; that it was hollow within; that the entrance was very narrow, so that, should it overset, the water could not enter; that it resisted any violence from iron, but could be broken with a blow from the hand; and that it was composed of the bones of the *βελον*, or sea-needle. The nest had medical virtues ascribed to it; and from the bird was called *halcyoneum*. In a fabulous age, every odd substance that was flung ashore received that name; a species of tubular coral, a sponge, a zoophyte, and a miscellaneous concrete, having by the ancients been dignified with that title from their imaginary origin. Yet much of this seems to be founded on truth. The form of the nest is justly described; and the materials which Aristotle says it was composed of, are not entirely of his own invention. Whoever has seen the nest of the kingfisher will observe it strewn with the bones and scales of fish; the fragments of the food of the owner and its young. On the foundation laid by the philosopher, succeeding writers formed other tales extremely absurd; and the poets, indulging the powers of imagination, dressed the story in all the robes of romance. This nest was a floating one:

Incubat halcyone pendentibus æquore nidis.

Ovid. Met. lib. xi.

It was therefore necessary to place it in a tranquil sea, and to supply the bird with charms to allay the fury of a turbulent element during the time of its incubation; for it had, at that season, power over the seas and the winds.

Χ' αλκυονες φορησεντι τα κυματα, την τε θαλασσαν,
Τον τε νοτον, τον τ' ευρον, ος εσχάτα φυνια κινει
Αλκυοντες, γλαυκαίς Νηρησι ται τε μαλιστα
Ορνιδαν επιλαδεν.

Theocrit. Idyl. vii. l. 57.

May *halcyons* smooth the waves, and calm the seas,
And the rough south-east sink into a breeze;
Halcyons, of all the birds that haunt the main,
Most lov'd and honour'd by the Nereid train. *Fawkes.*
These birds were equally favourites with Thetis as with the Nereids:

Dilectæ Thetidi halcyones.

Virg. Georg. i. 399.

as if to their influence these deities owed a repose in the midst of the storms of winter, and by their means were secured from those winds that disturb their sub-marine retreats, and agitated even the plants at the bottom of the ocean. Such are the accounts given by the Roman and Sicilian poets. Aristotle and Pliny tell us, that this bird is most common in the seas of Sicily; that it sat only a few days, and those in the depth of winter, and during that period the mariner might sail in full security; for which reason they were styled *halcyon days*:

Perque dies placidos hiberno tempore septem
Incubat halcyone pendentibus æquore nidis:
Tum via tuta maris: ventos custodit, et arcet
Æolus egressu.

Ovid. Met. lib. xi.

Alcyone, compressed,
Seven days sits brooding on her watery nest,
A wintry queen; her fire at length is kind,
Calms every storm, and hushes every wind. *Dryden.*

In after-times, these words came to express any season of prosperity; these were the *halcyon days* of the poets; the brief tranquillity, the *septem placidi dies*, of human life. —As the ancients have had their fables concerning this bird, so have the modern vulgar. It is an opinion gene-

rally received among them, that the flesh of the kingfisher will not corrupt, and that it will even banish all vermin. This has no better foundation than that which is said of its always pointing, when hung up dead, with its breast to the north. The only truth which can be affirmed of this bird when killed is, that its flesh is utterly unfit to be eaten; while its beautiful plumage preserves its lustre longer than that of any other. This bird is found not only in Britain, but throughout Europe, Asia, and Africa; as specimens have been received from both China, Bengal, and Egypt. Belon also remarks his having met with it in Romania and Greece; and Scopoli notices it as a bird of Carniola, where he says it remains the whole year as in England. M. D'Aubenton has kept these birds for several months, by means of small fish put into basons of water, on which they have fed; for on experiment they have refused all other kinds of nourishment.

2. The rudis, or Egyptian kingfisher, as described by Hasselquist, is the size of the Royton crow. The bill is blackish, more than half an inch broad at the base, and two inches in length; the head, shoulders, and back, are brown, marked with oblong ferruginous spots; the throat is of a ferruginous white; the belly and thighs are whitish, marked with longitudinal broadish cinereous spots; the upper tail coverts quite white; the quills spotted with white on the inner webs, chiefly at the tips; the tail is ash-coloured; the legs are of a pale green; and the claws blackish. It inhabits Lower Egypt, about Cairo; builds in sycamore and date trees; and feeds on frogs, insects, and small fish, which last it meets with in the fields when they are overflowed. Its cry is not unlike that of the common crow.

3. Le taparara of Buffon is about the size of a starling. The upper mandible of the bill is black, the lower red; the hind part of the neck, the back, and scapulars, are of an elegant blue; the rump and upper tail coverts bright beryl-blue; the under parts of the body are white; the wing coverts blue; and the legs red. Inhabits Cayenne and Guiana, at which last place the natives call all the kingfisher tribe by the name *taparara*. In this part of South America, which contains many rivers full of fish, kingfishers, as might be expected, abound in vast numbers; but, what is remarkable, they never herd together, always being found single, except in breeding-time, which is about the month of September. They lay their eggs in the holes of banks, like the kingfisher of Europe. The cry of this bird imitates the word *carac*.

4. The torquata, or cinereous kingfisher, is about the size of a magpie, and fifteen inches and a half in length. The bill is three inches and a half long, and brown; the base of the lower mandible reddish; the head is crested; the upper parts of the head and body are bluish ash; the under parts chestnut; the throat is whitish, descending down the neck, and passing behind like a collar, ending towards the back in a point; the under tail coverts are of a pale fulvous, transversely-striated with black; smaller wing coverts varied with bluish, ash, black, and yellowish; the legs are red, and the claws blackish. It inhabits Martinico and Mexico; at which last it is called *achalatalalli*. This bird migrates into the northern parts of Mexico at certain seasons only, and is supposed to come there from hotter regions.

[The jacamars are much allied to this genus, and have been ranked under it by Linnæus. Their toes are, however, differently placed; their food also is different, being insects alone, and not fish; and their haunts are different, being moist woods, and not shores or the banks of rivers.]

5. The galbula, or green jacamar, is about the size of a lark. The bill is black, of a square form, a little incurvated, and sharp at the point; the plumage in general, in the upper part of the body, is of a most brilliant green, glossed with copper and gold in different lights; the belly, throat, and vent, are rufous; the tail is composed of ten feathers, and shaped like a wedge; the legs are of a greenish yellow, very short and weak; the claws are black.

This

ALCEDO.

Edwards del.

Paris sculp.

The Ispida, or common Kingfisher, Lock & Men.

London, Published as the Act directs May 28. 1766 by W. Mills.

This species is found both in Guiana and Brasil, in the moist woods, which it prefers to the more dry spots, for the sake of insects, on which it feeds. It is seldom seen except single, as it is a very solitary bird, keeping for the most part in the thickest parts; its flight quick, but short; perches on branches of a middling height, where it sits all night, and frequently part of the day, without stirring. They are said to have a short and agreeable note. The natives of Guiana call this bird *venetore*, and the Creoles, *colibri des grands bois*. At Brasil their flesh is eaten.

6. The paradisæa, or paradise jacamar, is of the same size with the former, and has a similar bill; the throat, fore part of the neck, and under wing coverts, are white; the rest of the plumage is of a deep dull green, in some lights appearing almost black, in others with a slight gloss of violet and copper bronze; the tail is composed of twelve feathers of unequal lengths; the two middle ones longest; the legs are black; the toes are placed two before and two behind, and pretty much united. It inhabits Surinam; and, like the others, it feeds on insects; and sometimes, contrary to them, frequents open places. It flies farther at a time, perches on the tops of trees, and is frequently found with a companion, not being quite so solitary a bird as the other. It also differs in the note, having a kind of soft whistle often repeated, but not heard a great way off. Above thirty other species have been described by ornithologists.

ALCESTER, Warwickshire, (or Aulcester, originally Alncester,) is a neat market-town, and a place of great antiquity, twenty miles from Birmingham; sixteen from Warwick; eight from Stratford-on-Avon; ten from Evesham, Worcestershire; thirteen from Broomsgrove; thirteen from Droitwich; and twenty from Worcester; to all which places there are excellent turnpike-roads. It is eight miles from Henley in Arden, and one hundred and two from the metropolis, and is situated in a pleasant and fertile vale, near the conflux of the Alne and Arrow; from the first of which rivers and its having been a city, or fortified place, in the times of the Saxons, the name is probably derived. The Roman Way, called Ickenild-street, passed through or near this place; and many coins, Roman bricks, &c. continue to be found. There is a very considerable market for corn, &c. on Tuesdays; and three fairs, on Tuesday before Lady-day, the 18th of May, and the 17th of October, for horses, cattle, sheep, &c. The earl of Warwick is lord of the manor, and patron of the rectory; and, in the year 1765, generously surrendered the tolls of the market and fairs for the benefit of the town and county. It is governed by a steward, deputy steward, two bailiffs, and constables, who are elected annually at the court-leet, &c. of the lord of the manor.

In the parish were formerly two chantries, and an abbey erected on a piece of ground encompassed with the river Arrow, and a moat, which made it a kind of island. The church is a neat edifice situate near the centre of the town. Here are also three meeting-houses, viz. presbyterians, anabaptists, and quakers.

Walter Newport, Gent. of Holdenby, in the county of Northampton, (34 Eliz.) gave the sum of 400l. to buy lands, or an annuity of the value of 20l. a-year, to found and endow a school. In this town are also eight almshouses for aged men and women, with suitable allowances; and many other charities to the poor of this parish. The principal manufactory carried on here is needle-making, which affords employment to many families.

ALCHEMILLA, *f.* [from its having been celebrated by the *alchemists*.] In botany, a genus of the tetandria monogynia class, ranking in the natural order of senticosæ. The generic characters are—Calyx: perianthium one-leaved, tubulous, permanent; edge flat, divided into eight segments. Stamina: filaments erect, awl-shaped, very small, on the edge of the calyx; antheræ roundish. Pistillum: germ ovate; style filiform, length of the stamina, inserted at the base of the germ; stigma globular. Pericarpium: none, the neck of the calyx closes and never

opens. Seed: solitary, elliptic, compressed.—*Essential Character*. Calyx eight-cleft; seed, one.

Species. 1. *Alchemilla vulgaris*, or common ladies' mantle or bearsfoot: leaves lobed. The whole plant is astringent. In the province of Smolandia, in Gothland, they make a tincture of the leaves, and give it in spasmodic or convulsive diseases. Horses, sheep, and goats, eat it. Cows are not fond of it. It grows naturally in high pastures in several parts of England, but is not very common near London: the roots are composed of many thick fibres, which spread greatly when they are in a proper soil; the leaves rise immediately from the root sustained by long petioles; they are roundish, and divided into seven or eight lobes, scalloped round the edges, somewhat like the ladies' scalloped mantles, from whence it had its name. The flower-stems arise between the leaves about a foot high, which divide into many branches, and have at each joint one small leaf, shaped like those below; the flowers are composed of an herbaceous calyx, without any corolla, so that the only beauty of this plant is in the leaves, which are used in medicine, and are esteemed to be vulnerary, drying, and binding, and are of great force to stop inward bleeding. There is a variety, which is much smaller; the leaves are much whiter, and appear silky; the flower-stems do not branch out so much, nor are the flowers produced in so large clusters; their calyx is broader, and the segments more obtuse. Besides this, the species varies much in size, being abundantly larger in a moist soil, and in gardens, than on its native dry hills and mountains. Dr. Withering mentions another variety with a white calyx.

2. *Alchemilla Alpina*, or cinquefoil or Alpine ladies' mantle: leaves digitate, serrate. Grows naturally on the mountains in Yorkshire, Westmoreland, and Cumberland, generally upon moist boggy places. It is also a native of Sweden, Denmark, the Alps, and other cold parts of Europe; and is admitted into gardens for the sake of its elegance. The leaves of this sort are very white, and consist of from five to nine folioles; the flower-stems seldom rise more than six inches high, nor do the flowers make a better appearance than the other. It has a great affinity with the foregoing.

3. *Alchemilla aphanoides*: leaves many-parted; stem erect. This is a small plant, about the size of pursley piert, or *aphanes arvensis*, and much resembling it in the leaves; it is also annual like that, but has the eight-cleft calyx of this genus. Found in New Granada.

4. *Alchemilla pentaphyllea*, or five-leaved ladies' mantle: leaves quinate, multifid, smooth. Grows naturally on the high Alps, as Gothard, Furca, Speluga, Pilat, &c. and is only to be found in some few curious botanic gardens in this country.

Propagation and Culture. These are all, except the third, abiding plants, which have perennial roots, and annual stalks, perishing in autumn. They may be propagated by parting their roots; the best time for doing this is in autumn, that their roots may be established before the drying winds of the spring come on. They should have a moist soil, and a shady situation, otherwise they will not thrive in the southern parts of England. When they are propagated by seeds, they should be sown in the autumn, on a shady moist border, and, when the plants come up, they will require no other care but to be kept clean from weeds.

ALCHEMICAL, *adj.* Relating to alchemy; produced by alchemy.

ALCHEMICALLY, *adv.* In the manner of an alchemist; by means of alchemy.

ALCHEMIST, *f.* One who pursues or professes the science of alchemy:

To solemnize this day, the glorious sun
Stays in his course, and plays the *alchemist*,
Turning, with splendour of his precious eye,
The meagre cloddy earth to glittering gold. *Shakespeare*.

ALCHEMY, *f.* [of *al*, Arab. and *χημα*, Gr.] That branch of chemistry which had for its principal objects the transmutation of metals into gold; the panacea, or universal remedy; an alkaleft, or univerfal menftruum; an univerfal ferment; and many other things equally obfcure.

ALCHEMY, a kind of mixed metal ufed for fpoons, and kitchen utenfils.—White *alchemy* is made of pan-brafs one pound, and arfenicum three ounces; or *alchemy* is made of copper and auripigmentum. *Bacon*.

ALCHORNEA, *f.* [from Mr. Stainby Alchorne, apothecary, of London.] In botany, a genus of the dioecia monadelphia clafs, or, according to Swartz, of the monadelphia octandria. The generic characters are—I. Male. Calyx: perianthium three or five leaved; leaflets ovate, concave, equal, coloured, deciduous. Stamina: filaments eight, equal, fcarce longer than the calyx, fightly connate at the bafe; antheræ ovate, upright. Pistillum: a rudiment. II. Female. Calyx: perianthium one-leaved, four or five toothed; teeth equal, fmall. Pistillum: germ twin, fuperior; ftyles two, very long, filiform; fligmas fimple, acute. Pericarpium: capfule berried, two-feeded, two-celled, two-valved. Seeds: folitary, large, oblong.—*Effential Character*. Male. Calyx, three-five-leaved. Female. Calyx, five-toothed; ftyles, two-parted; capfule berried, dicoccous.

There is but one fpecies, which is called alchornea latifolia.

ALCIAT (Andrew), a great lawyer, who flourifhed in the fixteenth century, born at Milan. He mixed much of polite learning in the explication of the laws, and happily drove out the barbarity of language which till then had reigned in the lectures and writings of lawyers; for which Thuanus highly praifes him. He publifhed a great many law-books, and fome notes upon Tacitus. His Emblems have been much admired, and tranflated into French, Italian, and Spanifh; and feveral learned men have written commentaries on them.

ALCIBIADES, an Athenian general. It was the fate of this great man to live at a time when his country was the fcene of confufion. The Greeks, grown infolent from their conquells in Perfia, turned their army againft each other, and banded together under the conduct of the two moft opulent ftates, Athens and Lacedæmon. Alcibiades, in the midft of an expedition he had planned againft the enemy of his country, was recalled home to answer fome charge of a private nature; but, fearing the violence of his enemy, inftead of going to Athens, he offered his fervices at Sparta, where they were readily accepted. By his advice the Lacedæmonians made a league with Perfia, which gave a very favourable turn to their affairs. But his credit in the republic raifing jealousies againft him, he privately reconciled himfelf to his country, and took again the command of an Athenian army. Here victory, waiting as it were at his command, attended all his motions. The lofs of feven battles obliged the Spartans to fue for peace. He enjoyed his triumphs, however, only a fhort time at Athens. One unfuccefsful event made him again obnoxious to the malice of the citizens; and he found it expedient to retire from Athens. In his abfence the Spartans again took the lead, and at the fatal battle of Ægos entirely fubdued the Athenian power. Alcibiades, though in exile, endeavoured to reftore the power of his country; of which the Spartans having intelligence, procured him to be affaffinated. He was a man of admirable accomplifhments, but indifferently principled; of great parts; and of an amazing verfatility of genius.

ALCINO MOUNT, a fmall town of Tufcany, fituated on a mountain. In this neighbourhood is produced the moft exquisite wine in Italy, called Mufcatello di Mont Alcino; but the inhabitants are not allowed to fell a fingle pipe of it, till the great-duke has firft ordered what number he judges proper for his own ufe.

ALCINOUS, a king of the Phœnicians, in the ifland now called Corfu, was fon of Naufithous, and grandfon

of Neptune and Peribea. It is by his gardens this king has chiefly immortalized his memory. He received Ulyffes with much civility, when a ftorm had caft him on his coaft.

ALCMAER, a city of the United Provinces, fituated in North Holland, about four miles from the fea, fifteen from Haerlem, and eighteen from Amfterdam. It is a handfome city, and one of the cleaneft in Holland. The ftreets and houfes are neat and regular, and the public buildings very beautiful. It had formerly two parifh-churches, dedicated to St. Matthew and St. Lawrence. The latter had fo high a tower, that it ferved for a fea-mark to the veffels that were in the open fea; but, in 1464, it tumbled down, and damaged the other church fo much, that they were both demolished in 1470, and one church was built in their ftead, dedicated to the fame faints. The Spaniards, under the command of Frederic of Toledo, fon of the duke of Alba, came to befiege it, after they had taken Haerlem, in 1573; but were forced to raife the fiege, after three months lying before it, as well on account of the infection of the air as the ftout refiftance of the inhabitants and foldiers; even the women fignaling themfelves bravely in its defence. It is recorded in the register of this city, that, in the year 1637, 120 tulips, with the off-fets, fold at public auction for 90,000 florins; a fingle one of them, named the Viceroy, fold for 4203 guilders; and not only the name and price, but the weight, of thefe flowers, are particularly fet down in the city registers. The paffion of giving enormous prices for flowers and flower-roots, by which many were ruined, was come to fo great a height, that the ftates interfered, and put a ftop to it, by fevere penalties. The town has a very good trade in butter and cheefe, of which a vaft quantity is fold every year, and is efteemed the beft in Holland. Lat. 52. 28. N. lon. 4. 26. E.

ALCMAN, a lyric poet, who flourifhed in the twenty-feventh Olympiad. He was born at Sparta; and compofed feveral poems, of which only fome fragments are remaining, quoted by Athenæus and fome other ancient writers. He was very amorous; accounted the father of gallant poefy; and is faid to have been the firft that introduced the custom of finging love-fongs in company. He is reported to have been one of the greateft eaters of his age; upon which Mr. Bayle remarks, that fuch a quality would have been extremely inconvenient, if poetry had been at that time upon fuch a footing as it has been often fince, not able to procure the poet bread. He died of a difeafe fimilar to that of Philip II. king of Spain; for he was eaten up with lice.

ALCMANIAN, *f.* in ancient lyric poetry, a kind of verfe confifting of two dactyles and two trochees; as,—*Virgini|bus pue|rifque| canto*. The word is formed from Alcman, the name of an ancient Greek poet, in great efteem for his erotics or amorous compofitions.

ALCMENA, the daughter of Electryon king of Mycenæ, and wife of Amphitryon. Jupiter putting on the fhape of her hufband, while he was abroad in the wars, begot Hercules upon her. He made that night as long as three ordinary ones.

ALCOCK (John), doctör of laws, and bifhop of Ely in the reign of king Henry VII. was born at Beverly, in Yorkfhire, and educated at Cambridge. He was firft made dean of Weftminfter, and afterwards appointed mafter of the rolls. In 1471, he was confecrated bifhop of Rochefter; in 1476, he was tranflated to the fee of Worcester; and, in 1486, to that of Ely. He was a prelate of great learning and piety; and fo highly efteemed by king Henry, that he appointed him lord prefident of Wales, and afterwards lord chancellor of England. Alcock founded a fchool at Kingfton-upon-Hull, and built the fpacious hall belonging to the epifcopal palace at Ely. He was alfo the founder of Jefus-college, in Cambridge, for a mafter, fix fellows, and as many fcholars. This houfe was formerly a nunnery, dedicated to St. Radigund; and, as Godwin

1. The Indian spotted Kingfisher. 2. The Paradise Jacamar.

Godwin tells us, the building being greatly decayed, and the revenues reduced almost to nothing, the nuns had all forsaken it, except two; whereupon bishop Alcock procured a grant from the crown, and converted it into a college. But Camden and others tell us, that the nuns of that house were so notorious for their incontinence, that king Henry VII. and pope Julius II. consented to its dissolution: Bale accordingly calls this nunnery *spiritualium meretricium canobium*, "a community of spiritual harlots." Bishop Alcock wrote several pieces, amongst which are the following: 1. Mons Perfectionis. 2. In Psalmos Penitentiales. 3. Homiliae Vulgares. 4. Meditationes Patrum. He died October 1, 1500; and was buried in the chapel he had built at Kingston-upon-Hull.

ALCOHOL, *f.* in chemistry, spirit of wine highly rectified. It is also used for any highly-rectified spirit. Alcohol is extremely light and inflammable; it is a strong antiseptic, and therefore employed to preserve animal substances. The term alcohol is also used for any fine impalpable powder.

ALCOHOLIZATION, *f.* The process of rectifying any spirit. It is also used for pulverization.

To ALCOHOLIZE, *v. a.* To make an alcohol; that is, to rectify spirits till they are wholly dephlegmated. To comminute powder till it is wholly without roughness.

ALCOR, *f.* [Arab.] In astronomy, a small star adjoining to the large bright one in the middle of the tail of *ursa major*. It is a proverb among the Arabians, applied to one who pretends to see small things, but overlooks much greater: "Thou canst see *alcor*, and yet not see the full moon."

ALCORAN, or AL-KORAN, *f.* the scripture or bible of the Mahometans. The word is compounded of the Arabic particle *al*, and *coran* or *horan*, derived from the verb *caraa* or *haraa*, to read. The word therefore properly signifies, the reading; or rather, *that which ought to be read*. The Koran is divided into 114 larger portions of a very unequal length, which we call *chapters*; but the Arabians *sowar*. These chapters are not, in the manuscript copies, distinguished by their numerical order, but by particular titles, which are taken sometimes from a particular matter treated of, or person mentioned therein; and some chapters have two or more titles, occasioned by the difference of the copies. Every chapter is subdivided into smaller portions of very unequal length, with us called *verses*, but in Arabic *ayat*; the same with the Hebrew *otok*, signifying *signs* or *wonders*; such as are the secrets of God, his attributes, &c. Many of these have their particular titles also.

Besides these unequal divisions of chapter and verse, the Mahometans have also divided their Koran into sixty equal portions, which they call *Ahzab*, in the singular *Hizeb*, each sub-divided into four equal parts; which is an imitation of the Jews, who have an ancient division of their Mishna into sixty portions called *Massekoth*.

Next after the title, at the head of every chapter, except only the ninth, is prefixed the following solemn form, by the Mahometans called the *Bismallah*, "IN THE NAME OF THE MOST MERCIFUL GOD;" which form they constantly place at the beginning of all their books and writings in general, as a peculiar mark or distinguishing characteristic of their religion, it being counted a sort of impiety to omit it. Mahomet probably took this form, as he did many other things, from the Persian Magi, who used to begin their books in these words, *Benam Yezdan hakhsaishgher dadar*; that is, "In the name of the most merciful just God." There are twenty-nine chapters of the Koran which have this peculiarity, that they begin with certain letters of the alphabet, some with a single one, others with more. These letters the Mahometans believe to be the peculiar marks of the Koran, and to conceal several profound mysteries; but they have been explained by writers in many different ways.

The Koran is universally allowed to be written with the utmost elegance and purity of language, and is confessed-

ly the standard of the Arabic tongue. Indeed the more orthodox believe, and are taught by the book itself to consider it inimitable by any human pen; a permanent miracle; greater than that of raising the dead, and alone sufficient to convince the world of its divine original. To this miracle, in fact, did Mahomet himself chiefly appeal for the confirmation of his mission, publicly challenging the most learned men in Arabia to produce even a single chapter that might be compared with it.

The general design of the Koran was to unite the professors of the three different religions, then followed in the populous country of Arabia, in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies partly of ancient and partly of novel institution, enforced by the consideration of rewards and punishments both temporal and eternal; and to bring them all to the obedience of Mahomet, as the prophet and ambassador of the deity.

The great doctrine then of the Koran is the unity of God; to restore which point Mahomet pretended was the chief end of his mission; it being laid down by him as a fundamental truth, That there never was, nor ever can be, more than one true orthodox religion. Whenever this religion became neglected, or corrupted in essentials, God, he asserted, had the goodness to re-inform and admonish mankind thereof, by several prophets, of whom Moses and Jesus were the most distinguished, till the appearance of Mahomet, who is their seal, and no other to be expected after him. The more effectually to enforce this idea, great part of the Koran is employed in relating examples of dreadful punishments formerly inflicted by God on those who rejected and abused his messengers; several of which stories, or some circumstances of them, are taken from the Old and New Testaments, but many more from the Apocryphal books and traditions of the Jews and Christians of those ages. Indeed, few or none of the relations or circumstances in the Koran were invented by Mahomet, as is generally supposed; it being easy to trace the greatest part of them much higher, as the rest might be, were more of those books extant, and were it worth while to make the enquiry.

The rest of the Alcoran is taken up in prescribing necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the Supreme Being, and resignation to his will. One of their most learned commentators distinguishes the contents of the Alcoran into *allegorical* and *literal*; under the former are comprehended all the obscure, parabolical, and enigmatical passages, with such as are repealed, or abrogated; the latter, such as are clear, and in full force.

The most excellent moral in the whole Alcoran, interpreters say, is that in the chapter *Al Ahraf*, viz. "Shew mercy, do good to all, and dispute not with the ignorant." Mahomet, according to the authors of the *Keschaf*, having begged of the angel Gabriel a more ample explication of this passage, received it in these terms: "Seek him who turns thee out, give to him who takes from thee, pardon him who injures thee; for God will have you plant in your soul the roots of his chief perfections." It is evident, this commentary is copied from the gospel. (See Exodus xxxiii. 4, 5.) But it matters not so much who had it first, as he who observes it best. The caliph Hafs, son of Hali, being at table, a slave unfortunately let fall a dish of meat reeking hot, which scalded him severely. The slave fell on his knees, rehearsing the words of the Alcoran, "Paradise is for those who restrain their anger." I am not angry with thee, answered the caliph.—"And for those who forgive offences against them," continues the slave. I forgive thee thine, replies the caliph.—"But above all, for those who return good for evil," adds the slave. I set thee at liberty, rejoined the caliph; and I give thee ten dinars.

The Mahometans believe, that the Koran is of divine original; nay, that it is eternal and uncreated, remaining, as some express it, in the very essence of God: that the

first transcript has been from everlasting by God's throne, written on a table of vast bigness, called the *preserved table*, in which are also recorded the divine decrees past and future; that a copy from this table, in one volume on paper, was by the ministry of the angel Gabriel sent down to the lowest heaven, in the month of Ramadan, on the night of *power*: from whence Gabriel revealed it to Mahomet by parcels, some at Mecca, and some at Medina, at different times, during the space of twenty-three years, as the exigency of affairs required; giving him, however, the consolation to shew the whole (which they tell us was bound in silk, and adorned with gold and precious stones of paradise) once a-year; but in the last year of his life he had the favour to see it twice. They say, that few chapters were delivered entire, the most part being revealed piecemeal, and written down from time to time by the prophet's amanuensis in such a part of such and such a chapter, till they were completed, according to the directions of the angel.
