After the new-revealed passages had been from the prophet's mouth taken down in writing by his scribe, they were published to his followers; several of whom took copies for their private use, but the far greater number got them by heart. The originals, when returned, were put promiscuously into a chest, observing no order of time; for which reason it is uncertain when many passages were revealed. When Mahomet died, he left his revelations in the same disorder, and not digested into the form in which we now find them. This was the work of his successor Abu Beer; who ordered the whole to be collected, not only from the palm-leaves and skins on which they had been written, and which were kept between two boards or covers, but also from the mouths of such as had gotten them by heart. From this it is generally imagined that Abu Beer was really the compiler of the Koran; though, for aught appears to the contrary, Mahomet left the chapters complete as we now have them, excepting such passages as his successor might add or correct from those who had gotten them by heart.

However, in the 30th year of the Hegira, Othman being then caliph, and observing the great disagreement in the copies of the Koran in the several provinces of the empire, ordered a great number of copies to be transcribed from that of Abu Beer; which copies were afterwards dispersed in the several provinces of the empire, and the old ones burnt. Yet, though many irregularities were corrected by this means, some few various readings still exist.

With so much esteem and reverence do Mussulmans regard the book of the Alcoran, that they dare not so much as touch it without being first washed, or legally purified; to prevent which, an inscription is put on the cover or label, "Let none touch but they who are clean." It is read with great care and respect; being never held below the girdle. They swear by it; take omens from it on all weighty occasions; carry it with them to war; write sentences of it in their banners; adorn it with gold and precious stones; and knowingly suffer it not to be in the possession of any of a different religion. Some say that it is punishable even with death, in a Christian, to touch it; others, that the veneration of the Mussulmans leads them to condemn the translating it into any other language as a profanation: but these seem to be aggravations. The Mahometans have taken care to have their scripture translated into the Persian, the Javan, the Malayan, and other languages; though, out of respect to the original, these versions are generally, if not always, interlineated.

By the advocates of Mahometanism, the Koran, as already observed, has always been held forth as the greatest of miracles, and equally stupendous with the act of raising the dead. The miracles of Moses and Jesus, they say, were transient and temporary; but that of the Koran is permanent and perpetual; and therefore far surpasses all the miraculous events of preceding ages. We will not detract from the real merit of the Koran: we allow it to be generally elegant, and often sublime: but at the

same time we reject with disdain its arrogant pretence to any thing supernatural; all the real excellence of the work being easily referable to natural and visible causes.

"In the language of Arabia, a language extremely loved and diligently cultivated by the people to whom it was vernacular, Mahomet found advantages which were never enjoyed by any former or succeeding possessor. It requires not the eye of a philosopher to discover, in every soil and country a principle of national pride: and, if we look back for many ages on the history of the Arabians, we shall easily perceive that pride among them invariably to have consisted in the knowledge and improvement of their native language. The Arabic, which has been justly esteemed the most copious of the eastern tongues; which had existed from the remotest antiquity; which had been embellished by numberless poets, and refined by the constant exercise of the natives; was the most successful instrument which Mahomet employed in planting his new religion among them. Admirably adapted by its unrivalled harmony, and by its endless variety, to add painting to expression, and to pursue the imagination in its unbounded flight; it became in the hands of Mahomet an irresistible charm to blind the judgment, and to captivate the fancy of his followers.

"Of that description of men, who first composed the adherents of Mahomet, and to whom the Koran was addressed, few, probably, were able to pass a very accurate judgment on the propriety of the sentiments, or on the beauties of the diction: but all could judge of the military abilities of their leader; and in the midst of their admiration it is not difficult to conceive, that they would ascribe to his compositions every imaginary beauty of inspired language.

"The shepherd and the soldier, though awake to the charms of those wild but beautiful compositions, in which were celebrated their favourite occupations of love or war, were yet little able to criticise any other works than those which were addressed to their imagination or the heart. To abstract reasonings on the attributes and the dispensations of the Deity, to the comparative excellencies of rival religions, to the consistency of any one religious system in all its parts, and to the force of its various proofs, they were quite inattentive. In such a situation, the appearance of a work which possessed something like wisdom and consistence; which prescribed the rules, and illustrated the duties, of life; and which contained the principles of a new and comparatively sublime theology, independently of its real and permanent merit; was likely to excite their astonishment, and to become the standard of future composition.

"In the first periods of the literature of every country, something of this kind has happened. The father of Grecian poetry very obviously influenced the taste and imitation of his countrymen. The modern nations of Europe all possess some original author, who, rising from the darkness of former ages, has begun the career of composition, and tinged with the character of his own imagination the stream which has flowed through his posterity.

"But the prophet of Arabia had in this respect advantages peculiar to himself. His compositions were not to his followers the works of man, but the genuine language of Heaven, which had sent him. They were not confined therefore to that admiration which is so liberally bestowed on the earliest productions of genius, or to that fond attachment with which men every where regard the original compositions of their country: but with their admiration they blended their piety. To know and to feel the beauties of the Koran, was in some respect to share in the temper of heaven; and he who was most affected with admiration in the perusal of its beauties, seemed most fitly the object of that mercy which had given it to ignorant man. The Koran, therefore, became naturally and necessarily the standard of taste. With a language thus hallowed in their imaginations, they were too well satisfied, either to dispute its elegance or improve its structure. In succeeding

succeeding ages, the additional sanction of antiquity, or prescription, was given to these compositions which their fathers had admired: and, while the belief of its divine original continues, that admiration, which has thus become the test and the duty of the faithful, can neither be altered nor diminished.

"When therefore we consider these peculiar advantages of the Koran, we have no reason to be surprised at the admiration in which it is held. But if, descending to a more minute investigation of it, we consider its perpetual inconsistency and absurdity, we shall indeed have cause for astonishment at that weakness of humanity which could ever have received such compositions as the work of the Deity.

"The first praise of all the productions of genius is invention; that quality of the mind, which, by the extent and quickness of its views, is capable of the largest conceptions, and of forming new combinations of objects the most distant and unusual. But the Koran bears little impression of this transcendent character. Its materials are wholly borrowed from the Jewish and Christian scriptures, from the Talmudical legends and apocryphal gospels then current in the east, and from the traditions and fables which abounded in Arabia. The materials collected from these several sources are here heaped together, with perpetual and needless repetitions, without any settled principle or visible connection.

"When a great part of the life of Mahomet had been spent in preparatory meditation on the system he was about to establish, its chapters were dealt out slowly and separately during the long period of twenty-three years. Yet thus defective in its structure, and no less exceptionable in its doctrines, was the work which Mahomet delivered to his followers as the oracles of God.

"The most prominent feature of the Koran, that point of excellence in which the partiality of its admirers has ever delighted to view it, is the sublime notion it generally impresses of the nature and attributes of God. If its author had really derived these just conceptions from the inspiration of that Being whom they attempt to describe, they would not have been surmounted, as they now are on every side, with error and absurdity. But it might easily be proved, that whatever it justly defines of the divine attributes was borrowed from our holy scripture; which even from its first promulgation, but especially from the completion of the New Testament, has extended the views and enlightened the understandings of mankind; and thus furnished them with arms, which have too often been ineffectually turned against itself by its ungenerous enemies.

"In this instance particularly, the copy is far below the great original, both in the propriety of its images and the force of its descriptions. Our holy scriptures are the only compositions that can enable the dim sight of mortality to penetrate into the invisible word, and to behold a glimpse of the Divine perfections. Accordingly, when they would represent to us the happiness of Heaven, they describe it, not by any thing minute and particular, but by something general and great; something, that, without descending to any determinate object, may at once by its beauty and immensity excite our wishes and elevate our affections. Though in the prophetic and evangelical writings the joys that shall attend us in a future state are often mentioned with ardent admiration, they are expressed rather by allusion than similitude, rather by indefinite and figurative terms than by any thing fixed and determinate. 'Eye hath not seen, nor ear heard, neither hath entered into the heart of man, the things which God hath prepared for them that love him.' 1 Cor. ii. 9. What a reverence and astonishment does this passage excite in every hearer of taste and piety? What energy, and at the same time what simplicity, in the expression? How sublime, and at the same time how obscure, is the imagery?

"Different was the conduct of Mahomet in his descriptions of heaven and of paradise. Unassisted by the necessary influence of virtuous intentions and divine inspiration,

he was neither desirous, nor indeed able, to exalt the minds of men to sublime conceptions, or to rational expectations. By attempting to explain what is inconceivable, to describe what is ineffable, and to materialize what in itself is spiritual, he absurdly and impiously aimed to sensualize the purity of the Divine essence. Thus he fabricated a system of incoherence, a religion of depravity, totally repugnant indeed to the nature of that Being, who, as he pretended, was its object; but therefore more likely to accord with the appetites and conceptions of a corrupt and sensual age.

"That we may not appear to exalt our Scriptures thus far above the Koran by an unreasonable preference, we shall produce a part of the second chapter of the latter, which is deservedly admired by the Mahometans, who wear it engraved on their ornaments, and recite it in their prayers. 'God! there is no God but he; the living, the self-subsisting: neither slumber nor sleep seizeth him: to him belongeth whatsoever is in heaven, and on earth. Who is he that can intercede with him but through his good pleasure? He knoweth that which is past, and that which is to come. His throne is extended over heaven and earth, and the preservation of both is to him no burden. He is the high, the mighty.' *Sale's Kor.* ii. p. 30. 4to edit.

"To this description who can refuse the praise of magnificence? Part of that magnificence, however, is to be referred to that verse of the Psalmist whence it was borrowed: 'He that keepeth Israel, shall neither slumber nor sleep.' *Psal.* cxxi. 4. But, if we compare it with that other passage of the same inspired Psalmist, all its boasted grandeur is at once obscured, and lost in the blaze of a greater light. 'O my God, take me not away in the midst of my days; thy years are throughout all generations. Of old hast thou laid the foundations of the earth; and the heavens are the work of thy hands. They shall perish, but thou shalt endure; yea, all of them shall wax old, as doth a garment; as a vesture shalt thou change them, and they shall be changed; but thou art the same, and thy years shall not fail.' The Koran, therefore, upon a retrospective view of these several circumstances, far from supporting its claim to a supernatural work, sinks below the level of many compositions confessedly of human origin; and still lower does it fall in our estimation, when compared with that pure and perfect pattern which we justly admire in the scriptures of truth. It is therefore abundantly apparent, that no miracle either was externally performed for the support, or is internally involved in the composition, of the Mahometan revelation."

ALCORAN is also figuratively applied to certain other books full of impieties and impostures, particularly the Alcoran of the Cordeliers, which placed St. Francis on a level with Jesus Christ. Erasmus Albertus exposed the folly and absurdity of it, in a publication, entitled, *The Alcoran of the Franciscans*, with a preface by Martin Luther.

ALCORANISTS, among Mahometans, those who adhere strictly to the letter or text of the alcoran, from an opinion of its ultimate sufficiency and perfection. The Persians are generally Alcoranists, as admitting the Alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. besides the Alcoran, admit a multitude of traditions. The Alcoranists, among Mahometans, amount to much the same with the textuaries among the Jews. The Alcoranists can find nothing excellent out of the Alcoran; are enemies of philosophers, metaphysicians, and scholastic writers. With them the Alcoran is every thing.

ALCOVE, *f.* [*alcoba*, Span.] A recess, or part of a chamber, separated by an estrapade, or partition, and other correspondent ornaments; in which is placed a bed of state, and sometimes seats to entertain company;

Deep in a rich *alcove* the prince was laid,
And slept beneath the pompous colonnade.

Pope.

ALCUDIA, a town in Majorca, of about 1000 houses, situated

situated between two large harbours. Lat. 39. 50. N. lon. 3. 0. E.

ALCUINUS (Flaccus), an ecclesiastic of the eighth century. He was sent on an embassy by Offa king of Mercia to the emperor Charlemagne; who contracted so great an esteem and friendship for him, that he earnestly solicited, and at length prevailed upon, him, to settle in his court, and become his preceptor in the sciences. Alcuinus accordingly instructed that great prince in rhetoric, logic, mathematics, and divinity; which rendered him one of his greatest favourites. "He was treated with so much kindness and familiarity (says a contemporary writer) by the emperor, that the other courtiers called him, by way of eminence, *the emperor's delight*." Charlemagne employed his learned favourite to write several books against the heretical opinions of Felix bishop of Urgel in Catalonia, and to defend the orthodox faith against that heresiarch, in the council of Francfort, A. D. 894; which he performed to the entire satisfaction of the emperor and council, and even to the conviction of Felix and his followers, who abandoned their errors. The emperor consulted chiefly with Alcuinus on all things relating to religion and learning; and, by his advice, did many great things for the advancement of both. An academy was established in the imperial palace, over which Alcuinus presided, and in which the princes and prime nobility were educated; and other academies were established in the chief towns of Italy and France, at his instigation, and under his inspection. "France (says one of our best writers of literary history) is indebted to Alcuinus for all the polite learning it boasted of in that and the following ages. The universities of Paris, Tours, Fulden, Soissons, and many others, owe to him their origin and increase; those of whom he was not the superior and founder, being at least enlightened by his doctrine and example, and enriched by the benefits he procured for them from Charlemagne." After Alcuinus had spent many years in the most intimate familiarity with the greatest prince of his age, he at length, with great difficulty, obtained leave to retire from court to his abbey of St. Martin's at Tours. He composed many treatises on a great variety of subjects, in a style much superior in purity and elegance to that of the generality of writers in the age in which he flourished. He died A. D. 804. His works were collected and published by Andrew du Chesne in one volume folio, Paris, 1617.

ALCYON, the trivial name of a species of alcedo. See **ALCEDO**.

ALCYONIUM, an obsolete name of a submarine plant. It is also used for a kind of coral, or astroites, frequently found fossil in England.

ALCYONIUM STAGNUM, a lake in the territory of Corinth, whose depth was unfathomable, and in vain attempted to be discovered by Nero.

ALCYONIUS (Peter), a learned Italian, who flourished in the sixteenth century. He was well versed in the Greek and Latin tongues, and wrote some pieces of eloquence which met with great approbation. The two orations he made after the taking of Rome, wherein he represented very strongly the injustice of Charles V. and the barbarity of his soldiers, were excellent pieces. There is also an oration ascribed to him, on the knights who died at the siege of Rhodes.

ALDBOROUGH, or **ALDEBURGH**, Suffolk, is a sea-port town, seventy-six computed and eighty-eight measured miles from London, both strongly and pleasantly situated in the valley of Slaughden, having the sea and an extensive view of the German ocean on the east, and the river Ald on the west. It is a commodious harbour for seamen and fishermen, upon which account it is fully inhabited by these sort of people. It is a town corporate, governed by two bailiffs, twelve capital burgeses, and twenty-four inferior officers. It sends two members to parliament: it has a market weekly on Saturday, and a fair annually on the first Tuesday in Lent. It had formerly three streets in a row, and nearly a mile in length; but

is now reduced to two streets by the encroachment of the sea: it is reckoned by the physicians to be one of the most healthy places along the coast, and as remarkable for longevity, being subject to cooling and refreshing breezes from the sea, on which account a great deal of company resort to the town in summer for the benefit of their health and sea-bathing, to which the pleasantness of the spot invites; and is growing into much repute. The shore is also much admired for its evenness and regular declivity for the bathing machines, which are upon a remarkably safe and commodious construction. The hills at the back of the town are likewise much esteemed for the pleasant walks, and for the fine and beautiful prospects of the surrounding country for many miles. There are no manufactories except the drying of red sprats, which are caught and dried in great abundance, and exported to Holland. It is equally famous for the soles and lobsters, which are caught in great quantities, and far surpass any other for fine flavour. Fish of all kinds are in great plenty, as well as every other commodity. Aldborough is within eight miles of the once famous and ancient city of Dunwich, and seven miles of Saxmundham, (being the next post-town, where coaches and stage-waggons pass through daily;) five miles from the borough of Orford; twelve miles from Wickham market; eighteen from Woodbridge; and twenty-six from Ipswich, (the county town.) E. long. 1. 32. N. lat. 52. 50.

ALDBOROUGH, a market-town in the west-riding of Yorkshire, seated on the river Ouse, fifteen miles north-west of York, and 200 miles north of London. It sends two members to parliament. W. long. 0. 20. N. lat. 54. 15. It was anciently a Roman city, called *Ipsurum Brigantium*; and several coins and monuments of the Saxons and Romans have been discovered there.

ALDEBARAN, in astronomy, a star of the first magnitude, called in English the *bull's eye*, as making the eye of the constellation Taurus. Its longitude is 6 deg. 32. min. 9 sec. of Gemini, and its latitude 5 deg. 29 min. 40 sec. south.

ADDERBURY, Wiltshire, two miles from Salisbury, on a healthy hill, near the Avon. A manufacture of cottons and fustians is carried on here. By a fire in 1777, 200 houses were destroyed.

ALDER-TREE, *f.* in botany. See **BETULA**.

ALDER, (Black,) *f.* in botany. See **RHAMNUS**.

ALDERHOLM, a pleasant island of Sweden, formed by the three arms of a river running through Gentle, a town of Nordland, in Sweden. Here is a wharf, a repository for planks and deals, two packing-houses, a large custom-house for taking toll of the ships, an arsenal for cannon, and a granary.

ALDERLEY, Gloucestershire, near Wotton-Under-edge. On some of the hills here are found fossils, apparently petrifications of marine shell.

ALDERLEY, Staffordshire, near Seisdon.

ALDERLIEVEST, *adj. superl.* [from *ald*, *alder*, old, elder, and *lieve*, dear, beloved.] Most beloved; which has held the longest possession of the heart:

The mutual conference that my mind hath had,
In courtly company, or at my beads,
With you, mine *alderlievest* sovereign,
Makes me the bolder.

Shakespeare.

ALDERMAN, *f.* [from *ald*, old, and *man*.] In the British policy, a magistrate subordinate to the mayor of a city or town-corporate. The number of these magistrates is not limited, but is more or less according to the magnitude of the place. In London they are twenty-six; each having one of the wards of the city committed to his care. This office is for life: so that, when one of them dies, or resigns, a wardmote is called, who return the person they have chosen to the court of aldermen; which court is obliged to admit him to supply the vacancy. All the aldermen are justices of the peace, by a charter of 13 Geo. II. The aldermen of London, &c. are exempted from serving

ALCYONIUM.

Different Species of Alcyonium?

J. Pass sculp.

London. Published as the Act directs. April 25. 1807. by J. Wilkes.

serving inferior offices; nor shall they be put upon assizes, or serve on juries, so long as they continue to be aldermen.

ALDERMAN, among our Saxon ancestors, was a degree of nobility, answering to earl or count at present.

ALDERMAN was also used, in the time of king Edgar, for a judge or justice. Thus we meet with the titles of *Aldermannus totius Angliæ*, *aldermannus regis*, *comitatus*, *civitatis*, *burgi*, *castelli*, *hundredi* five *wapentachii*, et *novemdecimorum*. According to Spelman, the *aldermannus totius Angliæ* seems to have been the same officer who was afterwards styled *capitalis iudiciarius Angliæ*, or chief-justice of England; the *aldermannus regis* seems to have been an occasional magistrate, answering to our justice of assize; and the *aldermannus comitatus*, a magistrate who held a middle rank between what was afterwards called the *earl* and the *sheriff*; he sat at the trial of causes with the bishop: the latter proceeding according to ecclesiastical law, and the former declaring and expounding the common law of the land.

ALDERMASTON, Berkshire, a pretty neat village, beautifully situated on an eminence that overlooks the river Kennet. It is three miles from Silchester, the Roman station, three from Baghurst, and eight from Reading.

ALDERNEY, an island in the British channel, subject to the crown of Great Britain. It is about eight miles in compass, and is separated from Cape la Hogue, in Normandy, by a narrow freight, called the *Race of Alderney*, which is a very dangerous passage in stormy weather when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. Through this freight the French fleet made their escape after their defeat at La Hogue in 1692. It is a healthy island, has but one church, is fruitful both in corn and pasture, and is remarkable for a fine breed of cows. The inhabitants, for their greater safety, live together in a town of the same name. It has but one harbour, called *Crabby*, which is at a good distance from the town; and is only fit for small vessels. To the west lie the range of rocks called the *Caskets*, so dangerous to mariners. W. lon. 2. 17. N. lat. 49. 50.

ALDHELM (St.) bishop of Sherborne, in the time of the Saxon heptarchy. He is said to have been the son of Kenred, brother to Ina, king of the West-Saxons; but, in the opinion of William of Malmesbury, his father was no more than a distant relation to that king. Having received the first part of his education in the school at Malmesbury, he travelled into France and Italy for his improvement. At his return home, he studied some time under Adrian abbot of St. Augustine's in Canterbury, the most learned professor of the sciences who had ever been in England. In these different seminaries he acquired a very uncommon stock of knowledge; and became famous for his learning, not only in England, but in foreign countries. He was the first Englishman who wrote in the Latin language both in prose and verse, and composed a book for the instruction of his countrymen in the profody of that language. Besides this, he wrote several other treatises on various subjects; some of which are lost, and others published by Martin Delrio and Canisius. Venerable Bede, who flourished in the end of this and the beginning of the next century, gives the following character of Aldhelm: "He was a man of universal erudition, having an elegant style, and being wonderfully well acquainted with books, both on philosophical and religious subjects." King Alfred the Great declared, that Aldhelm was the best of all the Saxon poets; and that a favourite song, which was universally sung in his time, near 200 years after its author's death, was of his composition. When he was abbot of Malmesbury, having a fine voice, and great skill in music as well as poetry; and, observing the backwardness of his barbarous countrymen to listen to grave instructions, he composed a number of little poems, which he sung to them after mass in the sweetest manner; by which they were gradually instructed and civilized. After this excellent person had governed the monastery of Malmesbury, of which he was the founder, about thirty years, he

was made bishop of Sherborne, where he died A. D. 709. He wrote, 1. *De Octo Vitiis Principalibus*. This treatise is extant in *Bibliotheca Patrum* of Canisius. 2. *Ænigmaticum Versus Mille*. This, with several other of his poems, was published by Martin Delrio at Mentz, 8vo, 1601. 3. A book addressed to a certain king of Northumberland, named Alfrid, on various subjects. 4. *De Vita Monachorum*. 5. *De Laude Sanctorum*. 6. *De Arithmetica*. 7. *De Astrologia*. 8. A book against the mistake of the Britons concerning the celebration of Easter; printed by Sonius, 1576. 9. *De Laude Virginitatis*. Manuscript, in Bennet-college, Cambridge. Published among Bede's *Opuscula*. Besides many sonnets, epistles, and homilies, in the Saxon language.

ALDHUN, the first bishop of Durham, succeeded Elfisg in the bishopric of Lindisfarne, or Holy Island, in the year 990. He sat about six years in the see of Lindisfarne, during which time, that island being greatly exposed to the incursions of the Danish pirates, he resolved to remove from thence; and, after wandering about some time, he at last settled, with his followers, at Dunelm, now called Durham; where he gave rise both to the city and cathedral church. This prelate educated King Ethelred's two sons, Alfred and Edward; and, when their father was driven from his throne by Swane king of Denmark, he conducted them, and queen Emma, into Normandy, to duke Richard, the queen's brother, in 1017. The next year, the English having received a terrible overthrow in a battle with the Scots, the good bishop was so affected with the news, that he died a few days after, having enjoyed the prelacy twenty-nine years.

ALDPORT, an ancient name for Manchester. See MANCHESTER.

ALDRED, abbot of Tavistock, was promoted to the bishopric of Worcester in the year 1046. He was so much in favour with king Edward the Confessor, and had so much power over his mind, that he obliged him to be reconciled with the worst of his enemies, particularly with Swane son of the earl Goodwin, who had revolted against him, and came with an army to invade the kingdom. Aldred also restored the union and friendship between king Edward and Griffin king of Wales. He took afterwards a journey to Rome, and being returned into England, in the year 1054, he was sent ambassador to the emperor Henry II. he staid a whole year in Germany, and was very honourably entertained by Hermon archbishop of Cologne, from whom he learned many things relating to ecclesiastical discipline, which on his return he established in his own diocese. In the year 1058 he went to Jerusalem, which no archbishop nor bishop of England had ever done before. Two years after he returned to England; and Kinsius archbishop of York dying the 22d of December 1060, Aldred was elected in his stead, and thought fit to keep his bishopric of Worcester with the archbishopric of Canterbury. Aldred went soon after to Rome, in order to receive the pallium from the pope: he was attended by Toston Earl of Northumberland, Giso bishop of Wells, and Walter bishop of Hereford. The pope received Toston very honourably, and made him sit by him in the synod which he held against the Simonists. He granted to Giso and Walter their request, because they were tolerably well learned, and not accused of simony. But Aldred being by his answers found ignorant, and guilty of simony, the pope deprived him very severely of all honours and dignities; so that he was obliged to return without the pallium. On his way home he and his three fellow-travellers were attacked by some robbers, who took from them all that they had. This obliged them to return to Rome; and the pope either out of compassion, or by the threatenings of the earl of Northumberland, gave Aldred the pallium; but he was obliged to resign his bishopric of Worcester. However, as the archbishopric of York had been almost entirely ruined by the many invasions of foreigners, king Edward gave the new archbishop leave to keep twelve villages or manors which belonged to the bishopric of Worcester.

Edward

Edward the Confessor dying in 1066, Aldred crowned Harold his successor. He also crowned William the Conqueror, after he had made him take the following oath: "That he would protect the holy churches of God and their leaders; that he would establish and observe righteous laws; that he would entirely prohibit and suppress all rapines and unjust judgments." He was so much in favour with the Conqueror, that this prince looked upon him as a father; and, though imperious with regard to every body else, he yet submitted to obey this archbishop. John Brompton gives us the following instance of the king's submission, which at the same time shews the prelate's haughtiness:—It happened one day, as the archbishop was at York, that the deputy-governor or lord-lieutenant, going out of the city with a great number of people, met the archbishop's servants, who came to the town with several carts and horses loaded with provisions. The governor asked them to whom they belonged; and, they having answered they were Aldred's servants, the governor ordered that all these provisions should be carried to the king's store-house. The archbishop sent immediately some of his clergy to the governor, commanding him to deliver the provisions, and to make satisfaction to St. Peter, and to him the saint's vicar, for the injury he had done them; adding, that, if he refused to comply, he would excommunicate him. The governor, highly offended, used the messengers very ill, and returned an answer as haughty as the message was. Aldred thereupon went to London to make his complaint to the king; but in this very complaint he acted with his wonted insolence; for, meeting the king in the church of St. Peter at Westminster, he spoke to him in these words: "Hearken, O William: when thou wast but a foreigner, and God, to punish the sins of this nation, permitted thee to become master of it, after having shed a great deal of blood, I consecrated thee, and put the crown upon thy head with blessings; but now, because thou hast deserved it, I pronounce a curse over thee, instead of a blessing, since thou art become the persecutor of God's church, and of his ministers, and hast broken the promises and the oaths which thou madest to me before St. Peter's altar." The king, terrified at this discourse, fell upon his knees, and humbly begged the prelate to tell him by what crime he had deserved so severe a sentence. The noblemen, who were present, were enraged against the archbishop, and loudly cried out he deserved death, or at least banishment, for having offered such an injury to his sovereign, and they pressed him with threatenings to raise the king from the ground. But the prelate, unmoved at all this, answered calmly, "Good men, let him lie there, for he is not at Aldred's but at St. Peter's feet; he must feel St. Peter's power, since he dared to injure his viceroy." Having thus reproved the nobles by his episcopal authority, he vouchsafed to take the king by the hand, and to tell him the ground of his complaint. The king humbly excused himself, by saying he had been ignorant of the whole matter; and begged of the noblemen to intreat the prelate that he might take off the curse he had pronounced, and to change it into a blessing. Aldred was at last prevailed upon to favour the king thus far; but not without the promise of several presents and favours, and only after the king had granted him to take such revenge on the governor as he thought fit. Since that time (adds the historian) none of the noblemen ever dared to offer Aldred the least injury. It may be questioned which was most surprising here, the archbishop's haughtiness, who dared to treat his sovereign in so unbecoming a manner; or the king's stupidity, who suffered such insolence from a priest.—The Danes having made an invasion in the north of England in the year 1068, under the conduct of Harold and Canute, the sons of king Swane, Aldred was so much afflicted at it, that he died of grief the 11th of September in the same year, having besought God that he might not see the desolation of his church and country.

ALDRICH (Robert), bishop of Carlisle, was born at

Burnham, in Buckinghamshire, about the year 1493, and educated at Eaton-school; from whence, in 1507, he was elected scholar of King's-college, Cambridge, where he took his degree in arts, and was afterwards proctor of the university. In 1525, he was appointed master of Eaton-school, then became fellow of that college, and finally provost. In 1529, he went to Oxford, where, being first incorporated bachelor of divinity, in the following year he proceeded doctor in that faculty. In 1531, he was made archdeacon of Colchester; in 1534, canon of Windsor; and the same year, registrar of the order of the garter. He was consecrated bishop of Carlisle in the year 1537, and died at Horncastle in Lincolnshire in 1556.

ALDRICH (Dr. Henry), an eminent English divine and philosopher, born at London in 1647, was educated at Westminster-school under the famous Dr. Busby, and admitted of Christchurch-college, Oxford. He had a great share in the controversy with the papists in the reign of James II. and bishop Burnet ranks him among those who examined all the points of popery with a solidity of judgment, clearness of argument, depth of learning, and vivacity of writing, far beyond any who had before that time written in our language. He rendered himself so conspicuous, that, at the revolution, when Massey dean of Christchurch fled, his deanery was conferred on him. In this station he behaved in an exemplary manner, and that fabric owes much of its beauty to his ingenuity: it was Aldrich who designed the beautiful square called *Pech-water-Quadrangle*, which is esteemed an excellent piece of architecture. In imitation of his predecessor Dr. Fell, he published, yearly, a piece of some ancient Greek author, as a present to the students of his house. He published *A System of Logic*, with some other pieces; and the revising Clarendon's History of the Rebellion was intrusted to him and bishop Spratt; but it doth not appear that they made any additions, or considerable alterations, in it, as has been asserted by Mr. Oldmixon. Besides his preferments above-mentioned, Dr. Aldrich was also rector of Wem in Shropshire. He was chosen prolocutor of the convocation in 1702. This worthy person died at Christchurch, on the 14th of December, 1710, in the sixty-fourth year of his age. As to his character, he was a most universal scholar, and had a taste for all sorts of learning, especially architecture. His abilities also as a musician rank him, we are told, among the greatest masters of the science. He composed many services for the church, which are well known; as are also his anthems, nearly to the number of twenty. There are two catches of his; the one, "Hark the bonny Christchurch Bells," the other intitled, "A Smoking Catch," to be sung by four men smoking their pipes, which is not more difficult to sing than diverting to hear. His love of smoking was, it seems, so excessive as to be an entertaining topic of discourse in the university.

ALDROVANDUS (Ulysses), professor of philosophy and physic at Bologna, the place of his nativity. He was a most curious enquirer into natural history, and travelled into the most distant countries on purpose to inform himself of their natural productions. Minerals, metals, plants, and animals, were the objects of his curious researches; but he applied himself chiefly to birds, and was at great expence to have figures of them drawn from the life. Aubert le Mire says, that he gave a certain painter, famous in that art, a yearly salary of 200 crowns, for thirty years and upwards; and that he employed at his own expence Lorenzo Bennini and Cornelius Swintus, as well as the famous engraver Christopher Coriolanus. These expences ruined his fortune, and at length reduced him to the utmost necessity; and it is said that he died blind in an hospital at Bologna, at a great age, in 1605. Mr. Bayle observes, that antiquity does not furnish us with an instance of a design so extensive and so laborious as that of Aldrovandus, with regard to natural history; that Pliny has treated of more kinds of subjects, but only touches lightly on them, whereas Aldrovandus has collected all he could

could meet with. His compilation, or that compiled upon his plan, consists of thirteen volumes in folio, several of which were printed after his death. He himself published his Ornithology, or History of Birds, in three folio volumes, in 1599; and his seven books of Insects, which make another volume of the same size. The volume Of Serpents, three Of Quadrupeds, one Of Fishes, that Of exanguinous Animals, the History of Monsters, with the Supplement to that of Animals, the Treatise of Metals, and the Dendrology or History of Trees, were published at several times after his death, by the care of different persons.

ALDROVANDA, *f.* [named after Aldrovandus, a great traveller and collector.] In botany, a genus of the pentandria pentagynia class. The generic characters are—Calyx: perianthium five-parted, erect, equal, permanent. Corolla: petals five, oblong, acuminate, length of the calyx, permanent. Stamina: filaments length of the flowers; antheræ simple. Pistillum: germ globose, styles very short, stigmas obtuse. Pericarpium: a globose capsule with five blunt angles, five-valved, one-celled. Seeds: ten, longish, fixed to the inner wall of the pericarpium.—*Essential Character.* Calyx five-parted; petals five; capsule five-valved, one-celled, ten-seeded.

There is only one species, the *aldrovanda vesiculosa*, which is found in marshes both in Italy and India.

ALDUABIS, a river of Celtic Gaul, which rising from Mount Jura, separating the Sequani from the Helvetii, and running through Franche Comté, environs almost on every side the city of Besançon; and, running by Dole, falls into the Saône near Chalons. In Cæsar it is called *Alduadubis*; in Ptolemy *Dubis*; now *le Doux*.

ALE, *f.* [*ale*, Sax.] A fermented liquor obtained from an infusion of malt, and differing from beer chiefly in having a less proportion of hops, and by the first being drunk fresh or new, and the other kept until the gas sylvestre is destroyed, or incorporated with the liquor, so as to lose its elasticity, or at least a part of it. See **BREWING**. This liquor, the natural substitute of wine in such countries as could not produce the grape, was originally made in Egypt, the first planted kingdom, on the dispersion from the east, that was supposed unable to produce grapes. And, as the Noachian colonies pierced further into the west, they found, or thought they found, the same defect, and supplied it in the same manner. Thus the natives of Spain, the inhabitants of France, and the aborigines of Britain, all used an infusion of barley for their ordinary liquor; and it was called by the various names of *calia* and *ceria* in the first country, *cerevisia* in the second, and *curni* in the last; all literally importing only “the strong water.”

“All the several nations (says Pliny) who inhabit the west of Europe, have a liquor with which they intoxicate themselves, made of corn and water. The manner of making this liquor is somewhat different in Gaul, Spain, and other countries, and is called by many various names; but its nature and properties are every where the same. The people of Spain, in particular, brew this liquor so well, that it will keep good a long time. So exquisite is the cunning of mankind, in gratifying their vicious appetites, that they have thus invented a method to make water itself intoxicate.” The method in which the ancient Britons, and other Celtic nations, made their ale, is thus described by Isidorus and Orosius:—“The grain is steeped in water and made to germinate, by which its spirits are excited and set at liberty; it is then dried and grinded; after which it is infused in a certain quantity of water; which being fermented becomes a pleasant, warming, strengthening, and intoxicating, liquor.” This ale was most commonly made of barley; but sometimes of wheat, oats, and millet.

Anciently the Welch and Scots had also two kinds of ale, called *common ale* and *spiced ale*; and their value was thus ascertained by law:—“If a farmer hath no mead, he shall pay two casks of spiced ale, or four casks of common ale, for one cask of mead.” By this law, a cask of spiced

ale, nine palms in height and eighteen in diameter, was valued at a sum of money equal in efficacy to 7l. 10s. of our present money; and a cask of common ale, of the same dimensions, at a sum equal to 3l. 15s. This is a sufficient proof, that even common ale in this period was an article of luxury among the Welch, which could only be obtained by the great and opulent. Wine seems to have been quite unknown even to the kings of Wales, in this period, as it is not so much as once mentioned in their laws; though Giraldus Cambrensis, who flourished about a century after the conquest, acquaints us, that there was a vineyard in his time at Maenarper, near Pembroke, in South Wales.

Ale was a favourite liquor of the Anglo-Saxons and Danes, as it had been of their ancestors the ancient Germans. Before their conversion to Christianity, they believed that drinking large and frequent draughts of ale was one of the chief felicities which those heroes enjoyed who were admitted into the hall of Odin.

There are various sorts of ale known in Britain, particularly *pale* and *brown*. The former is brewed from malt slightly dried, and is esteemed more viscid than the latter, which is made from malt more highly dried or roasted. Pale ale brewed with hard waters, as those of springs and wells, is judged the most wholesome, in regard the mineral particles tend to prevent the cohesions of those drawn from the grain, and enable them to pass the proper secretions the better; softer waters, as those of rivers and rain, seem better suited to draw out the substance of high-dried malts, which retain many igneous particles, best absorbed in a smooth vehicle. In Staffordshire, they have a method of fining ale in a very short time. Plot conjectures it to be done by adding allum, or vinegar, in the working.

Ale is prepared various ways, and of various ingredients, as of wheat, rye, millet, oats, barley, the berries of the quick bean, &c. Some have found that the juice which bleeds from the birch or fycamore is of great use on this occasion, applied instead of water. It makes one bushel of malt go as far as four in the common way. Some have a method of preparing ale, so that it will keep, carried to the East or West Indies. The secret is, by mashing twice with fresh malt; boiling twice; and, after shipping it, putting to every five gallons two new-laid eggs whole, to remain therein. It is said, that, in a fortnight's time, the shells will be dissolved; and the eggs become like wind-eggs; and that afterwards the white would disappear, and the yolk remain untouched.

Ale is generally held to be more diuretic than beer, in regard it is smoother, more softening, and relaxing; so that where urine is to be promoted by facilitating the passage, ale is most likely to effect it.

Ale is flatulent, and so sometimes produces colics, and the cholera morbus; it is acefcent, but it does not produce calcareous diseases, as is asserted by many. It is observed that those who drink ale constantly are stronger than those who drink wine, and that those who do not drink any strong liquors cannot labour so well as those who do; but this does not appear to be the truth: men in health and accustomed to toil, but who never drink any strong liquors, undergo the most fatigue, and live longer than those who daily use them. Cordials are only designed for the infirm, and to fit the healthy for extraordinary exertions; but, as they may occasionally enable the vigorous to execute great undertakings, they also proportionably destroy the power of nature, and cause a premature old age. A constant use of wine, ale, &c. keeps up a constant fever, in most who use them freely, by which, destruction is surely the consequence, though somewhat slower than the general confessed poisons. We must observe that by the word *beer*, in common, is meant small or table beer, strong ale, or porter. The first of which, if kept to a proper age, is esteemed the best beverage to take with our food. Indeed they all ought to be kept till they have lost great part of their viscosity and sweetness; hence will they be more readily digestible, and not so apt to create disagreeable flatulence in the prime viæ, nor lay the

the foundation for visceral obstructions. However, they are all improper for delicate constitutions, whose digestive powers are in a state of debility, particularly if they are new, or recently brewed.

If malt-liquor, of any degree of strength, is become flat and tartish, as it is used, it should be drawn out of the cask into a jug, in which as many drachms of powdered chalk should be put as there are pints of liquor; thus a new ferment will be raised, a sprightly taste will be restored to the liquor, and its acidity will be destroyed. Tart liquors of this kind are apt to produce a dysury, stranguary, or a gonorrhœa, in which cases, give the person complaining a small quantity of brandy.

Ale being in some countries cheaper than wines, hath occasioned it to be medicated for the same purposes as wines so treated; and there are two ways of impregnating malt-liquors with medicinal substances:—first, by macerating the ingredients in the ale, after it is duly fermented; secondly, by adding them to the liquor while it is fermenting, that by the power of fermentation the medicinal virtues may more fully be extracted; nutmeg, for instance, one drachm of it powdered will flavour a large vat of fermenting ale, but, when the fermentation ceases, it flavours but a very small quantity.

The consumption of ale in these kingdoms is incredible. It was computed thirty years ago at the value of four millions yearly, including Great Britain and Ireland. The duties on ale and beer make a principal branch of the revenue. They were first imposed by the 12th of Car. II. and have been continued by several subsequent acts of parliament to first Geo. III. which lays an additional duty of 3d. per barrel. In the whole, the brewer of ale and beer for sale shall pay 8s. for every barrel of either, above 6s. a barrel; and for every barrel of 6s. or under, the sum of 1s. 4d.

Medicated ALE, that wherein medicinal herbs have been infused, or added during the fermentation. See **PHARMACY**.

Gill ALE, is that in which the dried leaves of gill or ground-ivy have been infused. It is esteemed absterfivè and vulnerary, and consequently good in disorders of the breast and obstructions of the viscera.

ALEA, *f.* in Roman antiquity, denotes in general all manner of games of chance; but, in a more restricted sense, was used for a particular game played with dice and tables, not unlike our backgammon.

ALEANDER (Jerome), cardinal and archbishop of Brindisi, was born in 1480, and distinguished himself at the beginning of the reformation, by the opposition he made to Luther; for, being sent into Germany as the pope's nuncio in 1519, he acted, as occasion served, both in the character of ambassador and doctor; and declaimed three hours together against Luther's doctrine before the diet of Worms, but could not prevent that celebrated reformer from being heard in that diet. He published several works, and died at Rome in 1542.

ALEANDER (Jerome), a learned man of the seventeenth century, born in the principality of Friuli, of the same family with the preceding. When he went to Rome, he was employed as secretary under cardinal Octavius Bandini, and discharged this office with great honour for almost twenty years. He afterwards, by the persuasion of Urban VIII. who had a great esteem for him, became secretary to cardinal Barberini, whom he accompanied to Rome when he went there in the character of legate *à latere*, and in whose service he died in 1631. He was one of the first members of the academy of Humourists, wrote a learned Treatise in Italian on the Device of the Society, and displayed his genius on many subjects.

ALE-CONNER, *f.* in law, is an officer who is appointed in the court-leet, sworn to look to the assize and goodness of ale and beer within the precincts of the leet. There are also four ale-conners, chosen by the liverymen of the city of London, in common-hall, on Midsummer-day,

whose office it is to inspect the measures used in public-houses.

ALE-COST, *f.* in botany. See **TANACETUM**.

ALECTO, one of the **FURIES**, daughter of Acheron and Night; or, as others would have it, of Pluto and Proserpine.

ALECTORIA, *f.* a stone said to be formed in the gall-bladders of old cocks, to which the ancients ascribed many fabulous virtues. This is otherwise called *alektorius lapis*, sometimes *alektorolithos*, in English the *cock-stone*. The more modern naturalists hold the alektorius lapis to be originally swallowed down, not generated in; the stomach or gizzard of cocks and capons. It is known that many of the fowl-kind make a practice of swallowing pebbles, as is supposed to be of service in the business of trituration and digestion.

ALECTOROLOPHUS, *f.* in botany. See **BARTSIA**, **PEDICULARIS**, and **RHINANTHUS**.

ALECTRA, *f.* in botany, a genus of the didynamia angiospermia class. The generic characters are—Calyx: perianthium one-leaved, two lipped; upper lip two-cleft, lower three-cleft; clefts ovate, obtuse, shorter than the tube. Corolla: one-petalled, tubular; tube by degrees widened a little; border expanding, five-parted; parts broad-lanceolate, obtuse. Stamina: filaments four, inserted into the tube, filiform, bearded, length of the tube; two of them are a little shorter; antheræ twin. Pistillum: germ ovate; style filiform, length of the filaments; stigma incurved, a little thicker than the style, and of the same length, striated on both sides. Pericarpium: capsule ovate, obtuse, twin, smooth, two-celled, two-valved. Seeds: solitary, ovate.—*Essential Character*. Corolla bell-shaped, filament bearded, capsule two-celled.

The only species of this genus is called *alecitra Capensis*, or Cape *alecitra*. The flowers are yellow, streaked with purple; and it is a native of the Cape of Good Hope, in grassy places near rivers, flowering in November and December.

ALECTRYOMANCY, or **ALECTOROMANCY**, *f.* [*αλεκτρυων* and *μαντις*, Gr.] Divination by a cock, of which there appears to have been different species. But that most spoken of by authors was in the following manner:—A circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat; after which, a cock being turned loose in the circle, particular notice was taken of the grains picked up by the cock, because the letters under them, being formed into a word, made the answer desired. It was thus, according to Zonaras, that Libanius and Jamblicus sought who should succeed the emperor Valens; and, the cock eating the grains answering to the spaces ΘΕΟΔ, several whose names began with those letters, as Theodotus, Theodistes, Theodulus, &c. were put to death; which did not hinder, but promote, Theodosius to the succession. But the story, however current, is but ill supported: it has been called in question by some, and refuted by others, from the silence of Marcellinus, Socrates, and other historians of that time.

A-LEE, *adv.* in the sea-language, a term only used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side; hence, when the helm is moved over to this side, it is said to be *a-lee*, or *hard a-lee*.

ALEGAMBE (Philip), a celebrated Jesuit, born at Brussels in 1592, distinguished himself by publishing a Bibliotheque of the writers of his order, and died at Rome in 1652.

ALEGAR, *f.* [from *ale* and *eager*, four.] Sour ale; a kind of acid made by ale, as vinegar by wine, which has lost its spirit.

ALEGER, *adj.* [*allegre*, Fr. *alacris*, Lat.] Gay; cheerful; sprightly: a word not now used.—Coffee, the root and

and leaf beetle, and tobacco, of which the Turks are great takers, do all condense the spirits, and make them strong and *alger*. *Bacon*.

ALEGRETTE, *f.* in botany. See **GLECOMA**.
ALE-HOUSE, *f.* A house where ale is publicly sold; a tipling-house. It is distinguished from a tavern, where they sell wine.—One would think it should be no easy matter to bring any man of sense in love with an *ale-house*; indeed of so much sense as seeing and smelling amounts to; there being such strong encounters of both, as would quickly send him packing, did not the love of good fellowship reconcile to these nuisances. *South*.

ALEHOOF, *f.* in botany. See **GLECOMA**.

ALE-HOUSE, *f.* A house where ale is publicly sold; a tipling-house. It is distinguished from a tavern, where they sell wine.—One would think it should be no easy matter to bring any man of sense in love with an *ale-house*; indeed of so much sense as seeing and smelling amounts to; there being such strong encounters of both, as would quickly send him packing, did not the love of good fellowship reconcile to these nuisances. *South*.

Thou shalt each *ale-house*, thee each gill-house, mourn,
 And answering gin-shops sower sighs return. *Pope*.

Ale-houses may be considered in the following respects:
 —1. Every inn is not an alehouse, nor is every alehouse an inn; but, if an inn uses common selling of ale, it is then also an alehouse; and, if an alehouse lodges and entertains travellers, it is also an inn.

2. By several statutes, licences to keep inns and alehouses shall be granted yearly at a general meeting of the justices of the division, on the first day of September, or within twenty days after, and at no other time; except in cities and towns corporate. And the persons licensed shall enter into recognizance to keep good order and rule. And, if any person shall sell ale without licence, he shall forfeit for the first offence 40s. for the second offence 4l. for the third and every other offence 6l. 5 Geo. III. c. 46. And by 27 Geo. III. c. 13. several excise-duties are imposed on ale and beer brewed in Great Britain, according to a schedule set forth in the act.

3. If one who keeps a common inn refuses either to receive a traveller as a guest into his house, or to find him victuals or lodging, upon his tendering him a reasonable price for the same, he is not only liable to render damages for the injury, in an action on the case at the suit of the party grieved, but also may be indicted and fined at the suit of the king. 1 *Haw. 225*.

4. An innkeeper may detain the person of the guest who eats, or the horse which eats, till payment. For it would be hard to oblige him to sue for every little debt; and a greater hardship, that he might not be able to find his guest. *Bac. Abr. Inns*.—But an horse committed to an innkeeper may be detained only for his own meat, and not for the meat of the guest, or of any other horse. Also if the innkeeper or alehouse-keeper shall refuse to give in the reckoning in particulars, or shall sell in measures unsealed, he shall not be permitted to detain for the reckoning, but shall be left to his action at law. 11 & 12 Wm. c. 15. In like manner, if the innkeeper gives credit to the party for that time, and lets him go without payment, then he hath waived the benefit of the custom, and must rely on his other agreement. 8 *Mod. 172*. An innkeeper that detains a horse for his meat cannot use him; because he detains him as in custody of the law; and, by consequence, the detention must be in the nature of a distress, which cannot be used by the distrainer. But, by custom in particular places, if the horse eats out his price, the innkeeper may take him as his own, on the reasonable appraisement of several of his neighbours; but the innkeeper has no power to sell the horse, by the general custom of the realm. *Bac. Abr. Inns*.

5. An innkeeper shall answer for those things which are stolen within his inn, though not specially delivered to him to keep; for it shall be intended to be through his negligence, or occasioned by the default of his servants. So if he puts a horse to pasture, without the direction of his

guest, and the horse is stolen, he must make satisfaction; but otherwise, if with his direction. 8 *Co. Caley's case*.

6. A guest in an inn, arising in the night, and carrying goods out of his chamber into another room, and from thence to the stable, intending to ride away with them, is guilty of felony, although there was no trespass in taking them, which is generally required in cases of felony.

ALEHOUSE-KEEPER, *f.* He that keeps ale publicly to sell.—You resemble perfectly the two *alehouse-keepers* in Holland, who were at the same time burgomasters of the town, and taxed one another's bills alternately. *Swift*.

ALEIUS CAMPUS, a plain in Cilicia, on this side the river Pyramus, near the mountain Chimera, famous for Bellerophon's wandering and perishing there, after being thrown off Pegasus; which is the reason of the appellation.

ALEKNIGHT, *f.* A pot companion; a tippler: a word now out of use.—The old *aleknights* of England were well depicted by Hanville, in the alehouse-colours of that time. *Camden*.

ALEMANIA, or **ALLEMANIA**, anciently a name of Germany, but not known before the time of the Antonines, and then used only for a part. After the Marcomanni and their allies had removed from the Rhine, a rabble, or collection of people from all parts of Gaul, as the term Alemanni denotes, prompted either by levity or poverty, occupied the Agri, called *Decumates* by Tacitus, because they held them on a tithe; now supposed to be the duchy of Wirtemberg. Such appear to be the small beginnings of Alemania, which was in aftertimes greatly enlarged; but still it was considered as a distinct part, for Caracalla, who conquered the Alemanni, assumed the surname both of Alemanicus and Germanicus.

ALEMBDAR, an officer in the court of the Grand Signior, who bears the green standard of Mahomet, when the sultan appears in public on any solemn occasion.

ALEMBERT (John le Rond d'), an eminent French mathematician and philosopher, and one of the brightest ornaments of the eighteenth century. He was perpetual secretary to the French Academy of Sciences, and a member of most of the philosophical academies and societies of Europe.

D'Alembert was born at Paris, the 16th of November, 1717. He derived his name of John le Rond from that of the church near which, after his birth, he was exposed as a foundling. But his father, informed of this circumstance, listening to the voice of nature and duty, took measures for the proper education of his child, and for his future subsistence in a state of ease and independence. His mother, it is said, was a lady of rank, the celebrated Mademoiselle Tencin, sister to cardinal Tencin, archbishop of Lyons.

He received his first education among the Jansenists, in the College of the Four Nations, where he gave early signs of genius and capacity. In the first year of his philosophical studies, he composed a Commentary on the Epistle of St. Paul to the Romans. The Jansenists considered this production as an omen, that portended to the party of Port-Royal a restoration to some part of their former splendour, and hoped to find one day in d'Alembert a second Pascal. To render this resemblance more complete, they engaged their pupil in the study of the mathematics; but they soon perceived that his growing attachment to this science was likely to disappoint the hopes they had formed with respect to his future destination; they therefore endeavoured to divert him from this line, but their endeavours were fruitless.

On his quitting the college, finding himself alone, and unconnected in the world, he sought an asylum in the house of his nurse. He hoped that his fortune, though not ample, would enlarge the subsistence, and better the condition, of her family, which was the only one he could consider as his own. It was here therefore that he fixed his residence, resolving to apply himself entirely to the study of geometry. And here he lived, during the space of forty years, with the greatest simplicity, discovering the

the augmentation of his means only by increasing displays of his beneficence, concealing his growing reputation and celebrity from these honest people, and making their plain and uncouth manners the subject of good-natured pleasantries and philosophical observation. His good nurse perceived his ardent activity; heard him mentioned as the writer of many books; but never took it into her head that he was a great man, and rather beheld him with a kind of compassion. "You will never (said she to him one day) be any thing but a philosopher—and what is a philosopher?—a fool, who toils and plagues himself all his life, that people may talk of him when he is dead."

As d'Alembert's fortune did not far exceed the demands of necessity, his friends advised him to think of some profession that might enable him to increase it. He accordingly turned his views to the law, and took his degrees in that faculty; but soon after, abandoning this line, he applied himself to the study of medicine. Geometry however was always drawing him back to his former pursuits, so that, after many ineffectual struggles to resist its attractions, he renounced all views of a lucrative profession, and gave himself up entirely to mathematics and poverty.

In the year 1741 he was admitted a member of the Academy of Sciences; for which distinguished literary promotion, at so early an age as twenty-four, he had prepared the way by correcting the errors of a celebrated work (the *Analyse Démontrée* of Reyneau), which was esteemed classical in France in the line of analytics. He afterwards set himself to examine with close attention and assiduity, what must be the motion and path of a body, which passes from one fluid into another denser fluid, in a direction oblique to the surface between the two fluids. Every one knows the phenomenon which happens in this case, and amuses children, under the denomination of *ducks and drakes*; but it was d'Alembert who first explained it in a satisfactory and philosophical manner.

Two years after his election to a place in the academy, he published his Treatise on Dynamics. The new principle developed in this treatise, consisted in establishing an equality, at each instant, between the changes that the motion of a body has undergone, and the forces or powers which have been employed to produce them; or, to express the same thing otherwise, in separating into *two parts* the action of the moving powers, and considering the *one* as producing alone the motion of the body in the second instant, and the *other* as employed to destroy that which it had in the first.

So early as the year 1744, d'Alembert had applied this principle to the theory of the equilibrium, and the motion of fluids; and all the problems before resolved in physics became in some measure its corollaries. The discovery of this new principle was followed by that of a new calculus, the first essays of which were published in a Discourse on the General Theory of the Winds, to which the prize-medal was adjudged by the Academy of Berlin in the year 1746, which proved a new and brilliant addition to the fame of d'Alembert. This new calculus of Partial Differences he applied, the year following, to the problem of vibrating chords, the resolution of which, as well as the theory of the oscillations of the air and the propagation of sound, had been but imperfectly given by the mathematicians who preceded him; and these were his masters or his rivals.

In the year 1749 he furnished a method of applying his principle to the motion of any body of a given figure. He also resolved the problem of the precession of the equinoxes; determining its quantity, and explaining the phenomenon of the nutation of the terrestrial axis discovered by Dr. Bradley.

In 1752, d'Alembert published a Treatise on the Resistance of Fluids, to which he gave the modest title of an *essay*; though it contains a multitude of original ideas and new observations. About the same time he published, in the Memoirs of the Academy of Berlin, Researches concerning the Integral Calculus, which is greatly indebted

to him for the rapid progress it has made in the present century.

While the studies of d'Alembert were confined to mere mathematics, he was little known or celebrated in his native country. His connections were limited to a small society of select friends. But his cheerful conversation, his smart and lively sallies, a happy knack at telling a story, a singular mixture of malice of speech with goodness of heart, and of delicacy of wit with simplicity of manners, rendering him a pleasing and interesting companion, his company began to be much sought after in the fashionable circles. His reputation at length made its way to the throne, and rendered him the object of royal attention and beneficence. The consequence was a pension from government, which he owed to the friendship of count d'Argenson.

But the tranquillity of d'Alembert was abated when his fame grew more extensive, and when it was known beyond the circle of his friends, that a fine and enlightened taste for literature and philosophy accompanied his mathematical genius. Our author's eulogist ascribes to envy, detraction, &c. all the opposition and censure that d'Alembert met with on account of the famous *Encyclopédie*, or Dictionary of Arts and Sciences, in conjunction with Diderot. None surely will refuse the well-deserved tribute of applause to the eminent displays of genius, judgment, and true literary taste, with which d'Alembert has enriched that great work. Among others, the preliminary discourse he has prefixed to it, concerning the rise, progress, connections, and affinities, of all the branches of human knowledge, is perhaps one of the most capital productions the philosophy of the age can boast of.

Some time after this, d'Alembert published his Philosophical, Historical, and Philological, Miscellanies. These were followed by the Memoirs of Christina queen of Sweden; in which d'Alembert shewed that he was acquainted with the natural rights of mankind, and was bold enough to assert them. His Essay on the Intercourse of Men of Letters, with Persons high in Rank and Office, wounded the former to the quick, as it exposed to the eyes of the public the ignominy of those servile chains, which they feared to shake off, or were proud to wear. A lady of the court hearing one day the author accused of having exaggerated the despotism of the great, and the submission they require, answered sily, "If he had consulted me, I would have told him still more of the matter."

D'Alembert gave elegant specimens of his literary abilities in his translations of some select pieces of Tacitus. But these occupations did not divert him from his mathematical studies; for about the same time he enriched the *Encyclopédie* with a multitude of excellent articles in that line, and composed his Researches on several Important Points of the System of the World, in which he carried to a higher degree of perfection the solution of the problem concerning the perturbations of the planets, that had several years before been presented to the academy. In 1759 he published his Elements of Philosophy: a work much extolled as remarkable for its precision and perspicuity.

The resentment that was kindled (and the disputes that followed it) by the article *Geneva*, inserted in the *Encyclopédie*, are well known. D'Alembert did not leave this field of controversy with flying colours. Voltaire was an auxiliary in the contest; but as he had no reputation to lose, in point of candour and decency; and as he weakened the blows of his enemies, by throwing both them and the spectators into fits of laughter; the issue of the war gave him little uneasiness. It fell more heavily on d'Alembert; and exposed him, even at home, to much contradiction and opposition.

It was on this occasion that the late king of Prussia offered him an honourable asylum at his court, and the office of president of his academy; and the king was not offended at d'Alembert's refusal of these distinctions, but cultivated an intimate friendship with him during the rest of

of his life. He had refused, some time before this, a proposal made by the empress of Russia to entrust him with the education of the Grand Duke;—a proposal accompanied with all the flattering offers that could tempt a man, ambitious of titles, or desirous of making an ample fortune: but the objects of his ambition were tranquillity and study.

In the year 1765, he published his Dissertation on the Destruction of the Jesuits. This piece drew upon him a swarm of adversaries, who only confirmed the merit and credit of his work by their manner of attacking it.

Beside the works already mentioned, he published nine volumes of memoirs and treatises, under the title of Opusculs; in which he has resolved a multitude of problems relating to astronomy, mathematics, and natural philosophy; of which his panegyrist, Condorcet, gives a particular account, more especially of those which exhibit new subjects, or new methods of investigation. He published also Elements of Music; and rendered, at length, the system of Rameau intelligible; but he did not think the mathematical theory of the sonorous body sufficient to account for the rules of that art.

In the year 1772 he was chosen secretary to the French Academy of Sciences. He formed, soon after this preferment, the design of writing the lives of all the deceased academicians, from 1700 to 1772; and in the space of three years he executed this design, by composing seventy eulogies.

D'Alembert died on the 29th of October, 1783, being nearly sixty-six years of age. In his moral character there were many amiable lines of candour, modesty, disinterestedness, and beneficence; which are described, with a diffusive detail, in his eulogium, by Condorcet, in the Hist. de l'Acad. Royale des Sciences, 1783.

As it may be curious and useful to have in one view an entire list of d'Alembert's writings, we shall here insert a catalogue of them, from Rozier's *Nouvelle Table des Articles contenus dans les Volumes de l'Académie Royale des Sciences de Paris*, &c. as follows:—*Traité de Dynamique*, in 4to, Paris, 1743; the second edition in 1758. *Traité de l'Équilibre et du Mouvement des Fluides*: Paris, 1744, and the second edition in 1770. *Reflexions sur la Cause Générale des Vents*; which gained the prize at Berlin in 1746, and was printed at Paris in 1747, in 4to. *Recherches sur la Précession des Équinoxes, et sur la Nutation de l'Axe de la Terre dans le Système Newtonien*: Paris, 1749, in 4to. *Essai d'une Nouvelle Théorie du Mouvement des Fluides*: Paris, 1752, in 4to. *Recherches sur différents Points Importans du Système du Monde*: Paris, 1754 and 1756, three vol. in 4to. *Elémens de Philosophie*: 1759. *Opusculs Mathématiques, ou Mémoires sur différents Sujets de Géométrie, de Mécaniques, d'Optiques, & d'Astronomie*: Paris, 9 vol. in 4to. 1761 to 1773. *Elémens de Musique, théorique & pratique, suivant les Principes de M. Rameau, éclairés, développés, & simplifiés*: 1 vol. in 8vo. à Lyon. *De la Destruction des Jésuites*: 1765.

In the Memoirs of the Academy of Paris are the following pieces by d'Alembert, viz.—*Précis de Dynamique*, 1743, Hist. 164. *Précis de l'Équilibre & du Mouvement des Fluides*, 1744, Hist. 55. *Méthode générale pour déterminer les Orbites & les Mouvements de toutes les Planètes, en ayant égard à leur action mutuelle*, 1745, p. 365. *Précis des Réflexions sur la Cause Générale des Vents*, 1750, Hist. 41. *Précis des Recherches sur la Précession des Équinoxes, et sur la Nutation de l'Axe de la Terre dans le Système Newtonien*, 1750, Hist. 134. *Essai d'une Nouvelle Théorie sur la Résistance des Fluides*, 1752, Hist. 116. *Précis des Essais d'une Nouvelle Théorie de la Résistance des Fluides*, 1753, Hist. 289. *Précis des Recherches sur les différents Points Importans du Système du Monde*, 1754, Hist. 125. *Recherches sur la Précession des Équinoxes, et sur la Nutation de l'Axe de la Terre, dans l'Hypothèse de la Dissimilitude des Méridiens*, 1754, p. 413, Hist. 116. *Reponse à un Article du Mémoire de M. l'Abbé de la Caille, sur la Théorie du Soleil*, 1757, p. 145,

VOL. I. No. 17.

Hist. 118. *Addition à ce Mémoire*, 1757, p. 567, Hist. 118. *Précis des Opusculs Mathématiques*, 1761, Hist. 86. *Précis du troisième volume des Opusculs Mathématiques*, 1764, Hist. 92. *Nouvelles Recherches sur les Verres Optiques, pour servir de suite à la théorie qui en a été donnée dans le troisième volume des Opusculs Mathématiques*: Premier mémoire, 1764, p. 75, Hist. 175. *Nouvelles Recherches sur les Verres Optiques, pour servir de suite à la théorie qui en a été donnée dans le troisième volume des Opusculs Mathématiques*: Second mémoire, 1765, p. 53. *Observations sur les Lunettes Achromatiques*, 1765, p. 53, Hist. 119. *Suite des Recherches sur les Verres Optiques*: Troisième mémoire, 1767, p. 43, Hist. 153. *Recherches sur le Calcul Intégral*, 1767, p. 573. *Accident arrivé par l'Explosion d'une Meule d'Emouleur*, 1768, Hist. 31. *Précis des Opusculs de Mathématiques, quatrième & cinquième volumes: Leur Analyse*, 1768, Hist. 83. *Recherches sur les Mouvements de l'Axe d'une Planète quelconque dans l'Hypothèse de la Dissimilitude des Méridiens*, 1768, p. 1, Hist. 95. *Suite des Recherches sur les Mouvements, &c.* 1768, p. 332, Hist. 95. *Recherches sur le Calcul Intégral*, 1769, p. 73. *Mémoire sur les Principes de la Mech.* 1769, p. 278.

And in the Memoirs of the Academy of Berlin, are the following pieces by our author, viz.—*Recherches sur le Calcul Intégral, première partie*, 1746. *Solution de quelques Problèmes d'Astronomie*, 1747. *Recherches sur la Courbe que forme une Corde Tendue, mise en Vibration*, 1747. *Suite des Recherches sur le Calcul Intégral*, 1748. *Lettre à M. de Maupertuis*, 1749. *Addition aux Recherches sur la Courbe que forme une Corde Tendue mise en Vibration*, 1750. *Addition aux Recherches sur le Calcul Intégral*, 1750. *Lettre à M. le Professeur Formey*, 1755. *Extr. de diffé. Lettres à M. de la Grange*, 1763. *Sur les Tautochrones*, 1765. *Extr. de diffé. Lettres à M. de la Grange*, 1769.

Also in the Memoirs of Turin are—*Différentes Lettres à M. de la Grange*, en 1764 & 1765, tom. 3 of these memoirs. *Recherches sur différens Sujets de Math.* t. 4.

ALEMBOIC, *f.* [from the Arabic particle *al*, and *ambic*, from *apbana*, for *arabico*, to ascend. Seneca calls it in the Latin language *miliarium*, *alemboic*, “moor's head.” It is also named *capilla*, *capitulum*.] A copper cap tinned in the inside, made like a head, in which the pipe, before worms were contrived, which passes through a tub of cold water, is fixed to receive the vapour from the heated cucurbit or body, to convey it to the receiver. Before retorts were used so commonly, the matter distilled was put into a vessel called a body, with a head placed on it to receive the vapour, whence it was conveyed by a canal, called the rostrum or beak, to the receiver; this head is properly the alemboic, and is called *alemboicus rostratus*, i. e. the beaked alemboic, to distinguish it from *alemboicus caecus*, or blind alemboic, which is without a canal, as it is to receive dry substances that are sublimed into it. The still-head is properly an alemboic; the body of the alemboic was placed over a fire or in hot water.

ALEMBROTH, *f.* in the writings of the alchemists, a word used for a sort of fixed alkaline salt, which had the power of the famous alkalest, in dissolving bodies, opening the pores of moist or all known substances, and thence, as well as by destroying sulphurs, promoting the separation of metals from their ores. It is also used for a compound of corrosive mercury and sal ammoniac. See CHEMISTRY.

ALEMOUTH, Northumberland, is a small sea-port town, situate at the mouth of the river Alne, five miles east from Alnwick, and six miles north from Warkworth. It has no market or fair; notwithstanding large quantities of corn are annually shipped from hence. This was one of the forfeited estates of Henry earl of Northumberland, which Henry IV. settled on his brother the duke of Clarence, for the better support of his dignity as lord-lieutenant of Ireland. Human bones of an uncommon magnitude having been several times dug up on the shore of

the river, near this town, has given rise to a traditional story, that a race of giants formerly resided here, and that these were some of their imperfect remains. In queen Elizabeth's time the French took possession of this town, and fortified it; as it was the first port they could safely land their supplies at for the queen mother. It affords a safe harbour for fishing vessels, and abounds with excellent fish.

ALENCON, a large handsome town of France, in Lower Normandy, with the title of a duchy. It is surrounded with good walls, and flanked with towers. The castle was formerly a place of great consequence, and has held out long sieges. It has but one parish-church, which has a bold and noble front. Among the nunneries, that of St. Clair is most remarkable. It is seated on the river Sarte, in a vast open plain, which produces all sorts of corn and fruit. Near it there are quarries of stone fit for building, wherein are found a sort like Bristol stones. The linen made at Alençon is very good, and sells at Paris. It is twenty miles north of Mans, sixty-three south-by-west of Rouen, and eighty-eight south-west of Paris. Lon. $0. 10. \text{lat. } 48. 25. \text{N.}$

ALENGTH, *adv.* [from *a* for *at*, and *length*.] At full length; along; stretched along the ground.

ALENIO, (Julius), a Jesuit, born at Brescia in the republic of Venice. He travelled into the eastern countries, and arrived at Maca in 1610, where he taught mathematics. From thence, he went to the empire of China, where he continued to propagate the Christian religion for thirty-six years. He was the first who planted the faith in the province of Xansi, and he built several churches in the province of Fokien. He died in August 1649, leaving behind him the following works, in the Chinese language: —1. The Life of Jesus Christ, in eight volumes. 2. The Incarnation of Jesus Christ. 3. Of the Sacrifice of the Mass. 4. The Sacrament of Penitence. 5. The Original of the World. 6. Proof of the Existence of a Deity. 7. Dialogues. 8. The Dialogue of St. Bernard betwixt the Soul and Body, in Chinese Verse. 9. A Treatise on the Sciences of Europe. 10. Practical Geometry, in four books. 11. The Life of P. Matthew Ricci. 12. The Life of Dr. Michael Yam, a Chinese Convert. 13. The Theatre of the World, or Cosmography.

ALENTEJO, a province of Portugal, between the rivers of Tago and Guadiana: the soil is very fertile, and the inhabitants laborious and industrious. The principal town is Évora.

ALEPPO, or **HALAB**, the capital of the Pachalic, and of all Syria, and the ordinary residence of the pacha, is situated in the vast plain which extends from the Orontes to the Euphrates, and which towards the south terminates in the desert. It is built on eight hills or eminences, on the highest of which the castle is erected, and is supposed to be the ancient Beræa. This mount is of a conic form, and seems in a great measure to be raised with the earth thrown up out of a deep broad ditch which surrounds it. The suburbs to the north-north-east are next in height to this, and those to the west-south-west are much lower than the parts adjacent, and than any other part of the city. The houses are large and commodious, having terraces on their tops, and generally sky-lights in form of a dome to let the light into the rooms, which from their loftiness, the gilding on the window-shutters, cupboard-doors, &c. have at first entrance a very grand and agreeable effect. They are all so equal in height, that there are seldom any steps to ascend or descend in going from one house to another; while several large vaulted streets increase the facility of communication, by affording a passage to every part of the city free from the embarrassment of the open streets. They are carefully paved; have gutters and a foot-pavement on each side; and the middle of the street is laid with brick, the small end upwards, for the convenience of the horses. There is also a cleanliness observed here unknown to the other cities of Turkey, and which is not attended with the trouble of our scavengers, there being

ass-drivers who go about the city and take up the rubbish and dust, which each inhabitant is obliged to sweep together; and, though the heat of the climate renders this labour more easy, the same heat obliges them to greater cleanliness in order to preserve the salubrity of the air.

The mosques in Aleppo are numerous, and some few of them magnificent. Before each of them is an area, with a fountain in the middle, designed for ablutions before prayers; and behind some of the larger there are little gardens. There are many large khans, or caravanferas, consisting of a capacious square, on all sides of which are a number of rooms, built on a ground-floor, used occasionally for chambers, warehouses, or stables. Above stairs there is a colonade or gallery on every side, in which are the doors of a number of small rooms, wherein the merchants, as well strangers as natives, transact most of their business.

The bazars or market-places are long covered narrow streets, on each side of which are a great number of small shops, just sufficient to hold the tradesman and his goods, the buyer being obliged to stand without. Each separate branch of business has a particular bazar, which is locked up, as well as the streets, an hour and a half after sunset: but the locks are of wood, though the doors are cased with iron. The slaughter-houses are in the suburbs, open to the fields. The tanners have a khan to work in near the river. To the southward in the suburbs they burn lime; and a little beyond that there is a village where they make ropes and catgut. On the opposite side of the river, to the westward, there is a glass-house, where they make a coarse white glass, in the winter only; for the greatest part of this manufacture is brought from a village thirty-five miles westward.

The situation of Aleppo, besides the advantage of a rich and fruitful soil, possesses also that of a stream of fresh water, which never becomes dry. This rivulet, which is about as large as that of the Gobelins at Paris, or the New River near London, rises in the mountains of Aentab, and terminates six leagues below Aleppo, in a morass full of wild boars and pelicans. Near Aleppo, its banks, instead of the naked rocks which line them in the upper part of its course, are covered with a fertile earth, and laid out in gardens, or rather orchards, which, in a hot country, and especially in Turkey, cannot but be delightful. The city is in itself one of the most agreeable in Syria, and is perhaps the cleanest and best built of any in Turkey. On whatever side it is approached, its numerous minarets and domes present an agreeable prospect to the eye, fatigued with the continued sameness of the brown and parched plains. In the centre is an artificial mountain surrounded by a dry ditch, on which is a ruinous fortress. From hence we have a fine prospect of the whole city, and to the north discover the snowy tops of the mountains of Bailan; and on the west, those which separate the Orontes from the sea; while to the south and east, the eye can discern as far as the Euphrates. In the time of Omar, this castle stopped the progress of the Arabs for several months, and was at last taken by treachery, but at present would not be able to resist the feeblest assault. Its slight wall, low, and without a buttress, is in ruins; its little old towers are in no better condition; and it has not four cannon fit for service, not excepting a culverine nine feet long, taken from the Persians at the siege of Bassora. Three hundred and fifty janisaries, who should form the garrison, are busy in their shops, and the aga scarcely finds room in it to lodge his retinue. It is remarkable that this aga is named immediately by the Porte, which, ever suspicious, divides as much as possible the different offices. Within the walls of the castle is a well, which, by means of a subterraneous communication, derives its water from a spring a league and a quarter distant. In the environs of the city, we find a number of large square stones, on the top of which is a turban of stone, which are so many tombs. There are many rising grounds round it, which, in case of a siege, would greatly facilitate the approaches

of the assailants. Such, among others, is that on which the house of the Derviches stands, and which commands the canal and the rivulet: Aleppo, therefore, cannot be esteemed a place of importance in war, though it be the key of Syria to the north; but, considered as a commercial city, it has a different appearance. It is the emporium of Armenia and the Diarbekar; sends caravans to Bagdad and into Persia: and communicates with the Persian Gulph and India, by Bassora, with Egypt and Mecca by Damascus, and with Europe by Scanderoon (Alexandretta) and Latakia. Commerce is there principally carried on by barter. The chief commodities are raw or spun cottons, clumsy linens fabricated in the villages; silk stuffs manufactured in the city, copper, *bourees* (coarse cloths) like those of Rouen, goats hair brought from Natolia: the gall nuts of the Kourdesian, the merchandise of India, such as shawls and muslins, and pistachio nuts of the growth of the neighbourhood. The articles supplied by Europe are the Languedoc cloths, cochineal, indigo, sugar, and some other groceries. The coffee of America, though prohibited, is introduced, and serves to mix with that of Moka. The French have at Aleppo a consul and seven counting-houses; the English and the Venetians two, and the merchants of Leghorn and Holland one. The emperor appointed a consul there in 1784, in the person of a rich Jew merchant, who shaved his beard to assume the uniform and the sword. Russia has also sent one very lately. Aleppo is not exceeded in extent by any city in Turkey, except Constantinople and Cairo, and perhaps Smyrna. The number of inhabitants has been computed at 200,000; but in these calculations certainty is impossible. However, if we observe that this city is not larger than Nantes or Marseilles, and that the houses consist only of one story, we shall perhaps not think it probable they exceed 100,000. The people of this city, both Turks and Christians, are with reason esteemed the most civilized in all Turkey; and the European merchants no where enjoy so much liberty, or are treated with so much respect.

The air of Aleppo is very dry and piercing, but at the same time very salubrious for all who are not troubled with asthmatic complaints. The city, however, and the environs, are subject to a singular endemial disorder, which is called the ringworm or pimple of Aleppo: it is in fact a pimple which is at first inflammatory, and at length becomes an ulcer of the size of the nail. The usual duration of this ulcer is one year; it commonly fixes on the face, and leaves a scar which disfigures almost all the inhabitants. It is alleged that every stranger who resides there three months is attacked with it; experience has taught that the best mode of treatment is to make use of no remedy. No reason is assigned for this malady: but M. Volney suspects it proceeds from the quality of the water, as it is likewise frequent in the neighbouring villages, in some parts of the Diarbekar, and even in certain districts near Damascus, where the soil and the water have the same appearances. Of the Christian inhabitants the greater number are Greeks, next to them the Armenians, then the Syrians, and lastly the Maronites; each of whom have a church in the city called *Judida*; in which quarter, and the parts adjacent, most of them reside. The common language is the vulgar Arabic, but the Turks of condition use the Turkish. Most of the Armenians can speak the Armenian, some few Syrians understand Syriac, and many of the Jews Hebrew; but scarcely one of the Greeks understands a word of Greek. The people in general are of a middle stature, and tolerably well proportioned; but they seem neither vigorous nor active. Both sexes are handsome when young: but the beard soon disfigures the men: and the women, as they come early to maturity, also fade very soon; females are generally married from fourteen to eighteen years of age, and many under fourteen. The people of rank here are polite and affable, making allowances for that superiority which the Mahometan religion instructs its votaries to assume over all who hold a different faith. Their bread is generally of wheat

flour made into thin cakes, but very ill prepared, and is generally eaten as soon as it comes out of the oven. The principal people have small loaves of a finer flour, which are well fermented and baked. Besides these, there are a variety of biscuits, most of which are srewed on the top with some kind of seeds. The Europeans have very good bread, baked and prepared in the French manner. All the inhabitants of both sexes smoke tobacco to great excess; even the very servants have almost constantly a pipe in their mouths. Coaches or carriages are not used here; therefore persons of quality ride on horseback in the city, with a number of servants walking before them, according to their rank: ladies of the first distinction are even compelled to walk on foot in the city, or to any place at a moderate distance; in longer journeys they are carried by mules, in a kind of a coach close covered up. There are a number of public bagnios in this city, which are used by people of all ranks, except those of the highest distinction, who commonly have baths and every other convenience in their own houses. A curious account of the domestic manners of the people of Aleppo has lately been given to the public by Dr. Russel in his Natural History of Aleppo. This gentleman availed himself of the opportunity which his profession of a physician afforded, in gratifying his own and the public curiosity by a more detailed account of the Harem, or female apartments, that characteristic object of the eastern domestic economy. From this we shall make some extracts.

"When the ladies visit one another in a forenoon, they do not immediately unveil on coming into the Harem, lest some of the men should happen to be still at home, and might see them as they pass; but, as soon as they enter the apartment of the lady to whom the visit is intended, either one of the young ladies, or a slave, assists in taking off the veil, which, being carefully folded up, is laid aside. It is a sign that the visitant intends only a short stay, when, instead of resigning the veil, she only uncovers her head, permitting the veil to hang carelessly down on the shoulders. This generally produces a friendly contest between the parties; one insisting upon taking the veil away, the other refusing to surrender it. A like contest takes place at the close of the visit. The common salutation is performed by laying the right hand on the left breast, and gently inclining the head. They sometimes salute by kissing the cheek; and the young ladies kiss the hands of their senior relations. They entertain with coffee and tobacco, but the sherbet and perfume are only produced on particular occasions. The great men are attended in the Harem, by the female slaves, in the same manner as, in the outer apartments, by the pages. They remain standing in the humble attitude of attendance, their hands crossed before them on their cincture, and their eyes fixed on the ground. The other ladies, as well as the daughters of the family, occasionally bring the pipe and coffee, but do not remain standing; they either are desired to sit down, or they retire. This however is to be understood of the grantees; for, in ordinary life, both wives and daughters minister servilely to the men: the two sexes never sitting at table together. It is seldom that all the ladies of a Harem are, by the great man, seen assembled, unless they happen, in the summer, to be surprized sitting in the Divan, where they meet to enjoy the cool air. At his approach, they all rise up, but, if desired, resume their places, (some of the slaves excepted,) and return to their work. However loquacious they may have been before he entered, a respectful silence ensues the moment he appears: a restraint which they feel the less, from their being accustomed to it almost from infancy. The Turks, in presence of their women, appear to affect a more haughty reserved air than usual, and, in their manner of speaking to them, are less courteous, and more abrupt, than they are to one another, or even to men who are much their inferiors. As this was frequently observed in persons remarkable for an affable deportment to men, it may be considered rather as their usual manner, than ascribed to the accidental presence

sence of an European; and is further confirmed by the ordinary behaviour of the boys, who talk to the women in an imperious manner, which they could only have learned from example. The men perhaps judge it politic to assume this demeanour, in a situation where dominion may be supposed to be maintained with more difficulty than among their male dependants; and therefore venture only in hours of retirement to avow that gentleness, which, as if derogatory from their dignity, they think prudent, in their general conduct, to conceal from persons whose obedience they believe can alone be secured by an air of stern authority. Persons of distinction, who are in office, leave the Harem early in the morning, and two hours after noon excepted, pass most of their time in the outer apartments. But others, who have little business, and the luxurious young men of all denominations, lounge many hours in their Harem. Some allowance, in this respect, is made to youth, for some weeks after marriage; but an effeminate character, which is by no means respectable among the men, is far from being acceptable to the women. The presence of the men, at unusual hours in the day time, lays the whole Harem under restraint, and, however some particular favourite may be gratified by the particular attention of her lord, the rest of the women are apt to lament the liberty they are deprived of, by his remaining too much at home.

"The grandees, if slightly indisposed, continue to see company in the outer apartments; but when the disorder becomes serious they retreat into the Harem, to be nursed by their women; and in this situation, besides their medical attendants and very near relations, no person whatever can have access, except on very urgent business. They make choice of the females they wish to have more immediately about their person, and one in particular is appointed to give an account to the physician of what happens in the intervals of his visits, to receive his directions, and to see them duly obeyed. Medical people, whether Europeans or natives, have access to the Harem at all times when their attendance is requisite. The physician, after being announced, is obliged to wait at the door till the way be cleared; that is, till his patient, when a female, her company, and attendants, and others who might happen to be in the courts through which he must pass, have either veiled, or retired out of sight. He is then conducted to the chamber of the sick lady by a slave, who continues in a loud voice to give warning of his approach, a precaution which does not always prevent the unveiled ladies, who have not been apprized, from accidentally crossing the court, in which case it becomes the well-bred physician to turn his eyes another way. Upon entering the chamber, he finds his patient covered with a loose veil, and, it being a vulgar notion that the malady may be discovered from the pulse, he is no sooner seated, than the naked wrist is presented for his examination. She then describes her complaints, and, if it be necessary to look at the tongue, the veil is for that purpose removed, while the assistants keep the rest of the face, and especially the crown of the head, carefully covered. The women do not hesitate to expose the neck, the bosom, or the stomach, when the case requires those parts to be inspected, but never without extreme reluctance consent to uncover the head. Ladies whom I had known very young, and who from long acquaintance were careless in concealing their faces from me, never appeared without a handkerchief or some other slight covering thrown over the head. So far as I could judge, from general practice, it seemed to be considered, in point of decorum, of more consequence to veil the head than the face. When the visit is at length concluded, notice being given to clear the way, the physician sets out, preceded as before by the slave. But it rarely happens that he is not more than once stopped, to give advice to some of the domestics, who wait his return; for, however slightly they may be indisposed, the temptation of telling their complaints to a doctor is irresistible. These damsels seldom have any other veil than a hand-

kerchief thrown over the head, one corner of which is held in the mouth; but, in order to avoid even that trouble, they frequently place themselves behind a door, or a window-shutter, half open, in which situation, thrusting out one arm, they insist on having the pulse examined. It sometimes happens, in the great Harem, that another obstacle must be encountered before regaining the gate. This arises from some of the younger ladies, or slaves, who are at work in the court, refusing peremptorily either to veil or retire; which is done merely in sport, to vex the conductress, who is obliged of course to make a halt. In vain she makes use by turns of entreaty, threats, and reproach; till, finding all in vain, she gives fair warning, and has recourse to a never-failing stratagem: she marches on, and bids the doctor follow. A complete rout ensues; the damsels scamper different ways, catch hold of whatever offers first by way of veil, or attempt to conceal themselves behind one another. But it is only when none of the men are in the Harem, that this scene of romping can take place: when the physician is conducted by the aga himself, every thing passes in orderly silence, and, in the chamber of the sick, none besides the elderly or married relations offer to join in the conversation: but it is seldom that the aga himself takes the trouble, after the few first visits, except the doctor be a stranger to the family.

"The transient manner in which the Turkish women can only be seen by a stranger, renders it difficult, if not impossible, to speak decidedly of their beauty, in comparison with that of the women of other countries, who are seen with more familiarity. Their dress and veil, which are so disadvantageous to their shape, may perhaps (the latter particularly) be of advantage to their looks. I have had occasion to see great numbers, and thought them in general handsomer than the Christian and Jewish ladies; but I was sometimes inclined to doubt whether that opinion might not in some degree be ascribed to seeing them partially, or when revealed in such a manner as to give relief to their beauty; it is certain that many whose faces I had at first thought exquisitely fine, from under a loose veil, lost considerably when more exposed."

Aleppo is seventy miles east of Scanderoon, on the sea-coast, and 175 north-by-east of Damascus. Lat. 36. 12. N. lon. 37. 40. E.

ALEPPO (the Pachalic of), one of the five governments into which Syria is divided. It comprehends the country extending from the Euphrates to the Mediterranean, between two lines, one drawn from Scanderoon to Beer, along the mountains; the other from Beles to the sea, by Mara and the bridge of Shoger. This space principally consists of two plains; that of Antioch to the west, and that of Aleppo to the east: the north and the sea-coast are occupied by considerably high mountains, known to the ancients by the names of Amanus and of Rhofus. In general, the soil of this government is fat and loamy. The lofty and vigorous plants which shoot up every where after the winter rains prove its fertility, but its actual fruitfulness is but little. The greatest part of the lands lie waste; scarcely can we trace any marks of cultivation in the environs of the towns and villages. Its principal produce consists in wheat, barley, and cotton, which are found especially in the flat country. In the mountains, they rather choose to cultivate the vine, mulberry, olive, and fig, trees. The sides of the hills towards the sea-coast are appropriated to tobacco, and the territory of Aleppo to pistachios. The pasturage is not to be reckoned, because that is abandoned to the wandering hordes of the Turkmen and Curds.

In the greater part of the pachalics the pacha is, as his title imports, at once the viceroy and farmer-general of the country; but in that of Aleppo he does not possess the latter office. This the Porte has bestowed on a *mehasfil* or collector, who is immediately accountable for what he receives. His lease is only for a year. The present rent of his farm is 800 purfes (above 40,000*l.*) but to this must be added the price of the *babouches* (Turkish slippers,) or

a present of three or four thousand pounds, to purchase the favour of the vizir and men in office. For these two sums the farmer receives all the duties of the government; which are, first, The produce of import and export duties on merchandize coming from Europe, India, and Constantinople, and on that exported in exchange. Secondly, The taxes paid by the herds of cattle brought every year by the Turkmen and Curds from Armenia and the Diarbekar, to be sold in Syria. Thirdly, The fifth of the salt-works of Djeboul. And lastly, The miri, or land-tax. These united may produce about 60,000l.

The pacha, deprived of this lucrative branch of the administration, receives a fixed allowance of about 8300l. This revenue has always been inadequate to the expences; for, besides the troops he is obliged to maintain, and the reparation of the highways and fortresses, the expences of which he is obliged to defray, he is under the necessity of making large presents to the ministers, in order to keep his place; but the Porte adds to the account the contributions he may levy on the Curds and Turkmen, and his extortions from the villages and individuals; nor do the pachas come short of this calculation. Abdi Pacha, who governed thirteen or fourteen years ago, carried off, at the end of fifteen months, upwards of 160,000l. by laying under contribution every trade, even the very cleaners of tobacco-pipes; and very lately another of the same name has been obliged to fly for similar oppressions. The former was rewarded by the divan with the command of an army against the Russians; but, if the latter has not enriched himself, he will be strangled as an extortioner. Such is the ordinary progress of affairs in Turkey!

In consequence of such wretched government, the greater part of the pachalics in the empire are impoverished and laid waste. This is the case in particular with that of Aleppo. In the ancient *defstars*, or registers of imposts, upwards of 3200 villages were reckoned; but at present the collector can scarcely find 400. Such of our merchants as have resided there twenty years, have themselves seen the greater part of the environs of Aleppo become depopulated. The traveller meets with nothing but houses in ruins, cisterns rendered useless, and fields abandoned. Those who cultivated them are fled into the towns, where the population is absorbed, but where at least the individual conceals himself among the crowd from the rapacious hand of despotism.

ALERIA, ALALIA, or ALARIA, anciently a town of Corsica, situated near the middle of the east side of the island, on an eminence, near the mouth of the river Rotanus mentioned by Ptolemy; built by the Phœceans. Afterwards Sylla led a colony thither. It is now in ruins, and called *Aleria Distrutta*.

ALERT, *adj.* [*alerte*, Fr. perhaps from *alacris*, but probably from *à part*, according to art or rule.] In the military sense, on guard; watchful; vigilant; ready at a call. In the common sense, brisk; pert; petulant; smart; implying some degree of censure and contempt.—I saw an *alert* young fellow, that cocked his hat upon a friend of his, and accosted him, Well, Jack, the old prig is dead at last. *Addison*.

ALERTNESS, *f.* The quality of being alert; sprightliness; pertness.

ALES (Alexander), a celebrated divine of the confession of Augsburg, born at Edinburgh the 23d of April 1500. He soon made a considerable progress in school-divinity, and entered the lists very early against Luther. Soon after he had a share in the dispute which Patrick Hamilton maintained against the ecclesiastics, in favour of the new faith he had imbibed at Marpurg. He endeavoured to bring him back to the Catholic religion; but this he could not effect, and even began himself to doubt about his own religion, being much affected by the discourse of this gentleman, and still more by the constancy he shewed at the stake, where David Beton archbishop of St. Andrew's caused him to be burnt. Beginning thus to waver, he was himself persecuted with so much vio-

lence, that he was obliged to retire into Germany, where he became at length a perfect convert to the Protestant religion. He was chosen professor of divinity at Leipsic, and died in March 1565. He wrote a Commentary on St. John, on the Epistles to Timothy, on the Psalms, &c.

ALESA, ALESA, or HALESA, an ancient town of Sicily, on the Tuscan sea, built, according to Diodorus Siculus, by Archonides of Herbita, in the second year of the 94th Olympiad, or 403 years before Christ; situated on an eminence about a mile from the sea: now in ruins.

ALESHAM, or AYLHAM, a small neat town in Norfolk. It is fifteen miles N. of Norwich, and 121 N. E. by N. of London. Lat. 52. 53. N. lon. 0. 30. E. This place is all copyhold, holden chiefly under the duchy of Lancaster, the manor having, by Edward III. been granted to John of Gaunt, duke of Lancaster. There are two fairs, the 23d of March, and the last Tuesday in September. It has a market on Tuesdays and Saturdays. There is a Spa about a mile from the town, the waters of which are reckoned a sovereign remedy for almost all chronic disorders.—The river from hence to Coltishall, in its course to Yarmouth, has been made navigable; distance about ten miles, in which space there are five locks. A free-school was founded here by Robert Jennys, mayor of Norwich, in 1517, and endowed with 101. a year, paid by the treasurer of the great hospital at Norwich, of which the mayor, &c. of the city are governors, and the manor of Fakenham in Shropham is bound for it; and archbishop Parker founded two scholarships in Corpus Christi, commonly called Bennet, college, in Cambridge, and appropriated them to that and Wymondham school; one of the scholars must be born in Aylsham; but it is sufficient for the other to be educated at the free-school there, and he must be sent up to college by the nomination of the mayor and court of Norwich: the other to be admitted by the college without any such nomination.

ALESIA, called *Alexia* by Livy and others; an ancient town of the Mandubii, a people of Celtic Gaul; situated, according to Cæsar, on a very high hill, whose foot was washed on two sides by two rivers. The town was of such antiquity, that Diodorus Siculus relates it was built by Hercules. It is supposed to be the city of *Alife*, in the duchy of Burgundy, not far from Dijon.

ALE SILVER, *f.* a rent or tribute annually paid to the lord mayor of London, by those that sell ale within the liberty of the city.

ALESTAKE, *f.* a stake set up at fairs on merry meetings in the country, with a sign thereon, denoting that ale is sold there.

ALET, a town of France, in Lower Languedoc. It is remarkable for its baths, and for the grains of gold and silver found in the stream which runs from the Pyrean mountains, at the foot of which it stands. It is seated on the river Aude, fifteen miles S. of Carcassone, and thirty-seven N. W. of Narbonne. E. lon. 2. 5. N. lat. 42. 59.

ALEMASTER, *f.* [from *ale* and *master*.] An officer appointed in every court leet, and sworn to look to the assize and the goodness of bread and ale, or beer, within the precincts of that lordship.

ALETRIS, *f.* [*alew*, to grind.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of lilia or liliacæ. The generic characters are—Calyx: none. Corolla: one-petalled, ovate-oblong, hexangular, funnel-shaped, semisefid, very much wrinkled; the divisions lanceolate, acuminate, spreading, erect, permanent. Stamina: filaments awl-shaped, length of the corolla, inserted into the base of the divisions: antheræ oblong, erect. Pistillum: germ ovate: style subulate, length of the stamens; stigma trifid. Pericarpium: an ovate, three-cornered, acuminate, three-celled, capsule. Seeds: very many. The stamens not being alternate, with, but opposite to, the segments of the corolla; and this being very much wrinkled, and in a manner farinaceous, these circumstances render this a genus perfectly distinct. *Essential Character.* Corolla, funnel-shaped. Stamina, inserted

inserted into the base of the segments; capsule three-celled.

Species. 1. *Aletris farinosa*, or American aletris: stemless, leaves lanceolate membranaceous, flowers alternate. This species has a tuberous root, from which arise several lanceolate leaves, and a naked stalk supporting a spike of flowers placed alternately, of a greenish white colour; these appear in June, but are rarely succeeded by seeds in England. It grows naturally in North America. The natives use it frequently in coughs, and in the pleurisy.

2. *Aletris Capensis*, or waved-leaved aletris: stemless, leaves lanceolate waved, spike ovate, flowers nodding. Justieu doubts whether this be of the same genus with the other species. Native of the Cape of Good Hope. It flowers with us from November to April; and was introduced in 1768 by Mr. William Malcolm.

3. *Aletris glauca*, or glaucous aletris: stemless, leaves lanceolate glaucous, flowers nodding with a spreading border. This differs from the foregoing in having glaucous leaves scarcely waved; whereas in that they are very much waved, and of a bright green on their upper surface. The flowers are smaller and narrower. This is also a native of the Cape of Good Hope, flowers in January, and was introduced in 1781 by Geo. Wynch, Esq.

4. *Aletris uvaria*, or great orange-flowered aletris: stemless, scape longer than the sword-shaped keeled leaves. *Aletris* or *aloe uvaria*, commonly called iris uvaria, has very long, narrow, triangular, leaves; shaped like those of the bull-rush; the flowers are produced in close thick spikes, upon stalks near three feet high. They are of an orange-colour, so that when the plants are strong, and produce large spikes, they make a fine appearance. It flowers in August and September. There is a variety of this with narrower leaves, and longer spikes of flowers. It is a native of the Cape of Good Hope, and was cultivated in the botanic garden at Chelsea in 1707.

5. *Aletris pumila*, or small orange-flowered aletris: stemless, scape shorter than the linear sharply-keeled leaves. This also is a native of the Cape, where it was discovered by Mr. Francis Masson. It was introduced in 1774, and flowers from September to November.

6. *Aletris hyacinthoides*: stemless, leaves lanceolate fleshy, flowers geminate. A variety of this species was cultivated in 1690 in the royal garden at Hampton Court, and is known by the title of *Guinea aloe*; it has thick fleshy roots like those of the flag, creeping far where they have room. The leaves arise singly from the root, and are near a foot and a half long, stiff, waved, and proceeding immediately from the root, as do also the flower-stems; which, when the roots are strong, are often a foot and a half high, adorned almost the whole length with flowers of a clear white, seldom continuing in beauty more than two or three days, and never producing seeds in England.

7. *Aletris fragrans*, or sweet-scented aletris: caulescent, leaves lanceolate loose. This species rises with an herbaceous stalk to the height of eight or ten feet, having many joints, and is adorned towards the top with a head of leaves, which are of a deep green colour, and reflex at their ends, embracing the stalks with their base. The flower-stems arise from the centre of the heads, which are generally two feet high, branching out on each side, and fully garnished with white flowers, in shape somewhat like those of the second sort; but these open only in the evening, when they emit a most fragrant odour, but close again in the morning, and are not of long duration.

8. *Aletris Cochinchinensis*: caulescent, leaves lanceolate-linear reflex, flowers paniced. Native of Cochinchina, and is cultivated in their gardens. The natives use the juice of the leaves to dye green, and eat the flowers.

Propagation and Culture. The first species is tolerably hardy, and may be preserved through the winter, if sheltered under a hot-bed frame; but, as the seeds do not ripen here, and the roots increase but slowly, the plants are at present rare in England. The roots of the second sort must be planted in pots, filled with light earth, that they

may be sheltered in a dry airy glass-case in winter, being too tender to thrive in the open air in England; therefore the pots should be removed into shelter in October, and during the winter season should be sparingly watered. In May they should be placed abroad in a sheltered situation, and in warm weather must be frequently refreshed with water; with this management the plants will flower; but, as they do not perfect their seeds here, nor increase fast by roots, the plants are scarce in England. The fourth sort is hardy enough to live abroad in mild winters, provided it be planted in a warm border, and a dry soil; but, as it is often destroyed in severe winters, some plants should be kept in pots to preserve the sort. This is propagated by seeds, which the plants generally produce in plenty; the seeds must be sown in pots soon after they are ripe, and in winter should be sheltered under a common hot-bed frame; in the spring, the plants will come up, when they should be inured to bear the open air by degrees; and, when they are large enough to be removed, some of them should be planted in pots, and the others in a warm border, where they will require to be sheltered the following winter, as they will not have acquired sufficient strength to resist the cold. The sixth sort with its varieties, and the sweet-scented aletris, are too tender to live through the winter in England, unless they are placed in a warm stove; nor will they produce their flowers, if the plants are not plunged into a tan-bed; for, although they may be preserved in a dry stove, yet they make but little progress there; in a tan-bed they will advance faster, the leaves will be much larger, and the whole plant much stronger. The Guinea aletris or aloe will sometimes flower in a dry stove, but the flower-stems will be weak, and do not produce half so many flowers as when in tan; but the fragrant aletris has not yet flowered here when kept in the dry stove. The sixth sorts propagate very fast by their creeping roots, which send up many heads; these may be cut off in June, and laid in the stove for a fortnight, that the part wounded may be healed over; they should then be planted in small pots, filled with light sandy earth, and plunged into a moderate hot-bed of tanners' bark, giving them but little water till they have put out good roots; then they must be treated like other tender succulent plants, never setting them abroad in summer. The seventh sort is easily propagated from the side-heads, which it puts out after flowering. These heads, when taken from the stems, should be laid in the stove for a week, for their wounds to heal, before they are planted in pots, when they may be treated in the same manner as the others.

ALEVAT, *f.* [from *ale* and *vat*.]—The tub in which the ale is fermented.

ALEURITES, *f.* [*αλευρίτης*, farinaceous, various parts of the tree having a meal scattered over them.] In botany, a genus of the monoecia monadelphica class, of the natural order of tricoceæ. The generic characters are—Male flowers. Calyx: perianthium three-cleft, very short; clefts ovate, obtuse. Corolla: petals five, oblong, spreading, obtuse, much longer than the calyx; nectary, five scales, somewhat cornered, very short, at the bases of the petals. Stamina: filaments numerous, connate into a conic columnar receptacle; antheræ roundish. Female flowers few, in the same corymb. Calyx, corolla, and nectary: as in the male, but larger. Pistillum: germ conic superior; style none; stigmata two, very short. Pericarpium: berry large, globose, two-seeded. Seeds: two, globose, coated with a double bark.

There is but one species, which is called *aleurites triloba*.

ALEUROMANCY, *f.* the same with what was otherwise called *alphitomantia*, and *crithomantia*; and means an ancient kind of divination, performed by means of meal or flour.

ALEW, *f.* Clamour; outcry. Used mostly in courting the hare.

ALEWASHED, *adj.* Steeped or soaked in ale: not now

J. Chapman sc.

ALEXANDER THE GREAT.

Published as the Act directs March 19. 1796.

now in use.—What a beard of the general's cut, and a horrid suit of the camp, will do among foaming battles and *alewashed* wits, is wonderful to be thought on. *Shakespeare*.

ALEWIFE, f. A woman that keeps an alehouse.

ALEXANDER the GREAT, king of Macedon, was born at Pella, the first year of the 106th Olympiad, the 398th from the building of Rome, and the 356th before the birth of Christ. His father Philip was descended from Hercules, and his mother Olympias from Achilles.

When Alexander was fifteen years of age, he was delivered to the tuition of Aristotle. He discovered very early a mighty spirit, and symptoms of that vast and immoderate ambition, which was afterwards to make him the scourge of mankind, and the pest of the world. One day, when it was told him that Philip had gained a battle, instead of rejoicing he looked much chagrined; and said, that, "if his father went on at this rate, there would be nothing left for him to do." Upon Philip's shewing some little wonder, that Alexander did not engage in the Olympic games, "Give me (said the youth) kings for my antagonists, and I will present myself at once." The taming and managing of the famous Bucephalus is always mentioned among the exploits of his early age. This remarkable horse was brought from Thessaly, and purchased at a very great price; but upon trial he was found so wild and vicious, that neither Philip nor any of his courtiers could mount or manage him. In short, he was upon the point of being sent back as an intractable and useless beast, when Alexander, expressing his grief, that so noble a creature should be rejected and set at nought, merely because nobody had the dexterity to manage him, was at length permitted to try what he could do. Alexander had perceived, that the frolicsome spirit and wildness of Bucephalus proceeded solely from the fright which the animal had taken at his own shadow; whereupon, turning his head directly to the sun, and gently approaching him with address and skill, he threw himself at length upon him; and, though Philip at first was extremely distressed and alarmed for his son, yet when he saw him safe, and perfectly master of his steed, he received him with tears of joy, saying, "O my son, thou must seek elsewhere a kingdom, for Macedonia cannot contain thee." One more instance of this very high spirit shall suffice. When Philip had repudiated Olympias for infidelity to his bed, the young prince felt the most lively resentment on the occasion; yet, being invited by his father to the nuptials with his new wife, he did not refuse to go. In the midst of the entertainment, Attalus, a favourite of Philip, had the imprudence to say, that the Macedonians must implore the gods to grant the king a lawful successor. "What, you scoundrel! do you then take me for a bastard?" says Alexander; and threw a cup that instant at his head. Philip, intoxicated with wine, and believing his son to be author of the quarrel, rushed violently towards him with his sword; but, slipping with his foot, fell prostrate upon the floor. Upon which, said Alexander insultingly, "See, Macedonians, what a general you have for the conquest of Asia, who cannot take a single step without falling;" for Philip had just before been named for this expedition in a common assembly of the Greeks, and was preparing for it, when he was murdered at a feast by Pausanias.

Alexander, now twenty years of age, succeeded his father as king of Macedon: he was also chosen, in room of his father, generalissimo, in the projected expedition against the Persians; but the Greeks, agreeably to their usual fickleness, deserted from him, taking the advantage of his absence in Thrace and Illyricum, where he began his military enterprises. He hastened immediately to Greece, when the Athenians and other states returned to him at once; but, the Thebans standing out, he directed his arms against them, slew a prodigious number, and destroyed their city; sparing nothing but the descendants of the house of Pindar, out of respect to the memory of that poet. This happened in the second year of the 3d Olym-

piad. It was about this time that he went to consult the oracle at Delphi; when, the priests pretending that it was not on some account lawful for her to enter the temple then, he, being impatient, hauled her along, and occasioned her to cry out, "Ah, my son! there is no resisting you:" upon which Alexander, seizing the words as ominous, replied, "I desire nothing farther: this oracle suffices." It was also probably at this time that the remarkable interview passed between our hero and Diogenes the cynic. Alexander had the curiosity to visit this philosopher in his tub, and complimented him with asking, "if he could do any thing to serve him?" "Nothing (said the brute) but to stand from betwixt me and the sun." The attendants were expecting what resentment would be shewn to this savage behaviour; when Alexander surprised them by saying, "Positively, if I was not Alexander, I would be Diogenes."

Having settled the affairs of Greece, and left Antipater as his viceroy in Macedonia, he passed the Hellespont, in the third year of his reign, with an army of no more than 30,000 foot, and 4,500 horse; and, with these forces, he overturned the Persian empire. His first battle was at the Granicus, a river of Phrygia, in which the Persians were routed. His second was at Issus, a city of Cilicia, where he was also victorious in an eminent degree: for the camp of Darius, with his mother, wife, and children, fell into his hands; and the humane and generous treatment which he shewed them, is justly reckoned the noblest and most amiable passage of his life.

While he was in this country, he caught a violent fever by bathing when hot in the cold waters of the river Cydnus; and this fever was made more violent from his impatience at being detained by it. The army was under the utmost consternation, and no physician durst undertake the cure. At length one Philip of Acarnan desired time to prepare a potion, which he was sure would cure him; and, while this potion was preparing, Alexander received a letter from his most intimate confidant Parmenio, informing him, that this Acarnan was a traitor, and employed by Darius to poison him at the price of a thousand talents and his sister in marriage. What a situation for a sick prince! The same greatness of soul, however, which accompanied him upon all occasions, did not forsake him here. He did not seem to his physician under any apprehensions; but, after receiving the cup into his hands, delivered the letter to the Acarnan, and with eyes fixed upon him drank it off. The medicine at first acted so powerfully, as to deprive him of his senses, and then without doubt all concluded him poisoned; however, he soon got better, and was restored to his army perfectly safe and well.

Passing through Cilicia, he marched forwards to Phœnicia, which all surrendered to him, except Tyre; and it cost him a siege of seven months to reduce that city. The vexation of Alexander, at being unseasonably detained by the obstinacy of the Tyrians, occasioned a mighty destruction and carnage; and the cruelty he exercised here is inexcusable.

When he came before the city of Gaza, he found it provided with a strong garrison, commanded by Betis, one of Darius's eunuchs. This governor, who was a brave man, and very faithful to his sovereign, defended it with great vigour against Alexander. As this was the only inlet or pass into Egypt, it was absolutely necessary for him to conquer it, and therefore he was obliged to besiege it. But although every art of war was employed, notwithstanding his soldiers fought with the utmost intrepidity, he was forced to lie two months before it. Exasperated at its holding out so long, and his receiving two wounds, he was resolved to treat the governor, the inhabitants, and soldiers, with a barbarity absolutely inexcusable; for he cut ten thousand men to pieces, and sold all the rest with their wives and children for slaves. When Betis, who had been taken prisoner in the last assault, was brought before him, Alexander, instead of using him kindly, as his valour and fidelity justly merited, this young monarch,

monarch, who otherwise esteemed bravery even in an enemy, fired on that occasion with an insolent joy, spoke thus to him: "Betis, thou shalt not die the death thou desirest; prepare therefore to suffer all the torments which revenge can invent." Betis, looking upon the king with not only a firm but a haughty air, did not make the least reply to his menaces; upon which the king, more enraged than before at his disdainful silence, "Observe (said he), I beseech you, that dumb arrogance! Has he bended his knee? Has he spoken but so much as one submissive word? But I will conquer this obstinate silence, and will force groans from him, if I can draw nothing else." At last Alexander's anger rose to fury, his conduct now beginning to change with his fortune: upon which he ordered a hole to be made through his heels, when a rope being put through them, and this being tied to a chariot, he ordered his soldiers to drag Betis round the city till he died. He boasted his having imitated upon this occasion Achilles, from whom he was descended, who, as Homer relates, caused the dead body of Hector to be dragged in the same manner round the walls of Troy; as if a man ought to pride himself for having imitated so ill an example. Both were very barbarous; but Alexander was much more so in causing Betis to be dragged alive, and for no other reason than because he had served his sovereign with bravery and fidelity, by defending a city with which he had intrusted him; a fidelity that ought to have been admired, and even rewarded, by an enemy, rather than punished in so cruel a manner.

After besieging and taking Gaza, he went to Jerusalem, where he was received by the high priest; and, making many presents to the Jews, sacrificed in their temple. He told Jadduas, for that was the priest's name, that he had seen in Macedonia a god, in appearance exactly resembling him, who had exhorted him to this expedition against the Persians, and given him the firmest assurance of success. Afterwards, entering Egypt, he went to the oracle of Jupiter Ammon, and upon his return built the city of Alexandria. It was now that he took it into his head to assume divinity, and to pretend himself the son of Jupiter Ammon. To soothe and cherish this ridiculous pretension, there were not wanting flatterers, those common pests of courts, who are more dangerous to princes than the arms of their enemies. With this view he appointed a festival, and made an incredibly pompous banquet; to which he invited the greatest lords of his court, both Macedonians and Greeks, and most of the highest quality among the Persians. With these he sat down at table for some time; after which he withdrew. Upon this Cleon, one of his flatterers, began to speak; and expatiated very much on the praises of the king, as had before been agreed upon. He made a long detail of the high obligations they had to him; all which, he observed, they might acknowledge and repay at a very easy expence, merely with two grains of incense, which they should offer him as to a god, without the least scruple, since they believed him such. To this purpose he cited the example of the Persians; and added, that, in case the rest should not care to pay this justice to Alexander's merit, he himself was resolved to shew them the way, and to worship him in case he should return into the hall. But that all of them must do their duty; especially those who professed wisdom, and ought to serve the rest as an example of the veneration due to so great a monarch. It appeared plainly that this speech was directed to Callisthenes. He was related to Aristotle, who had presented him to Alexander, his pupil, that he might attend upon that monarch in the war of Persia. He was considered, upon account of his wisdom and gravity, as the fittest person to give him such wholesome counsels as were most likely to preserve him from those excesses into which his youth and fiery temper might hurry him. This philosopher seeing that every one on this occasion continued in deep silence, and that the eyes of the whole assembly were fixed upon him, addressed himself to Cleon in the following words:—"Had the king been present

when thou madest thy speech, none among us would have attempted to answer thee; for he himself would have interrupted thee; and not have suffered thee to prompt him to assume the customs of barbarians, in casting an odium on his person and glory, by so servile an adulation. But, since he is absent, I will answer thee in his name. I consider Alexander as worthy of all the honours that can be paid a mortal; but there is a difference between the worship of the gods and that of men. The former includes temples, altars, prayers, and sacrifices; the latter is confined to commendations only, and awful respect.—We salute the latter, and look upon it as glorious to pay them submission, obedience, and fidelity; but we adore the former. We institute festivals to their honour, and sing hymns and spiritual songs to their glory. We must not therefore confound things, either by bringing down the gods to the condition of mortals, or by raising a mortal to the state of a god. Alexander would be justly offended should we pay to another person the homage due to his sacred person only; ought we not to dread the indignation of the gods as much, should we bestow upon mortals the honour due to them alone? I am sensible that our monarch is vastly superior to the rest; he is the greatest of kings, and the most glorious of all conquerors; but then he is a man, not a god.—The Greeks did not worship Hercules till after his death; and then not till the oracle had expressly commanded it. The Persians are cited as an example for our imitation; but how long is it that the vanquished have given law to the victor? Can we forget that Alexander crossed the Hellespont, not to subject Greece to Asia, but Asia to Greece?" The deep silence which all the company observed whilst Callisthenes spoke was an indication, in some measure, of their thoughts. The king, who stood behind the tapestry all the time, heard whatever had passed. He therefore ordered Cleon to be told, that, without insisting any farther, he would only require the Persians to fall prostrate, according to their usual custom; a little after which he came in, pretending he had been busied in some affair of importance. Immediately the Persians fell prostrate to adore him. Polyperchon, who stood near him, observing that one of them bowed so low, that his chin touched the ground, bade him in a rallying tone of voice to strike harder. The king, offended at this joke, threw Polyperchon into prison. As for Callisthenes, the king determined to get rid of him, and therefore laid to his charge a crime of which he was no way guilty. Accordingly, he was thrown into a dungeon, loaded with irons, and the most grievous torments were inflicted on him, in order to extort a confession of his guilt. But he insisted upon his innocence to the last, and expired in the midst of his tortures.

Nothing has reflected a greater dishonour on Alexander's memory than this unjust and cruel death of Callisthenes; and by this dreadful example he deprived all virtuous men of the opportunity of exhorting him to those things which were for his true interest. From that instant no one spoke with freedom in the council; even those who had the greatest love for the public good, and a personal affection for Alexander, thought themselves not obliged to undeceive him. After this, nothing was listened to but flattery, which gained such an ascendancy over that prince, as entirely depraved him, and justly punished him, for having sacrificed, to the wild ambition of having adoration paid him, the most virtuous man about his person. "The murder of this philosopher (says Seneca) was a crime of so heinous a nature, as entirely obliterates the glory of all his other actions."

His object now was to overtake and attack Darius in another battle; and this battle was fought at Arbela, when victory, granting every thing to Alexander, put an end to the Persian empire. Darius had offered his daughter in marriage, and part of his dominions, to Alexander, and Parmenio advised him to accept the terms: "I would (says he) if I was Alexander;" "And so would I (replied the conqueror) if I was Parmenio." The same Parmenio, counselling

counselling the prince to take the advantage of the night in attacking Darius, "No (said Alexander), I would not steal a victory." Darius owed his escape from Arbela to the swiftness of his horse; and, while he was collecting forces to renew the war, was insidiously slain by Bessus, governor of the Bactrians. Alexander wept at the fate of Darius; and, afterwards procuring Bessus to be given up to him, punished the inhuman murderer according to his deserts. From Arbela Alexander pursued his conquests eastward; and every thing fell into his hands, even to the Indies. Here he was opposed by king Porus, whom however he subdued and took. Porus was a man of spirit, and his spirit was not destroyed even by his defeat; for, when Alexander asked him, "how he would be treated," he answered very intrepidly, "like a king;" which it is said, so pleased the conqueror, that he ordered the greatest attention to be paid him, and afterwards restored him to his kingdom. Having ranged over all the east, and made a great part of the Indies provinces of his empire, he returned to Babylon, where he died in the thirty-third year of his age.

The character of this hero is equally composed of very great virtues and very great vices. He had no mediocrity in anything but his stature; in his other properties, whether good or bad, he was all extremes. His ambition rose even to madness. His father was not at all mistaken in supposing the bounds of Macedon too small for his son: for how could Macedon bound the ambition of a man, who reckoned the whole world too small a dominion? He wept at hearing the philosopher Anaxarchus say, that there was an infinite number of worlds: his tears were owing to his despair of conquering them all, since he had not yet been able to conquer one. Livy, in a short digression, has attempted to enquire into the events which might have happened, if Alexander, after the conquest of Asia, had brought his arms into Italy? Doubtless things might have taken a very different turn with him; and all the grand projects, which succeeded so well against an effeminate Persian monarch, might easily have miscarried if he had engaged with the rough hardy Roman armies. And yet the vast aims of this mighty conqueror, if seen under another point of view, may appear to have been confined in a very narrow compass; since, as we are told, the utmost wish of that great heart, for which the whole earth was not big enough, was, after all, to be praised by the Athenians; for it is related, that the difficulties he encountered in order to pass the Hydaspes forced him to cry out, "O Athenians, could you believe to what dangers I expose myself for the sake of being celebrated by you!" But Bayle affirms, that this was quite consistent with the vast unbounded extent of his ambition, as he wanted to make all future time his own, and be an object of admiration to the latest posterity; yet did not expect this from the conquest of worlds, but from books. He was perfectly in the right, says Bayle; "for, if Greece had not furnished him with good writers, he would long ago have been as much forgotten as the kings who reigned in Macedon before Amphitryon."

Alexander has been much praised upon the score of continency. Indeed, the fire of his early youth appeared so cold towards women, that his mother suspected him to be impotent; and, to satisfy herself in this point, did, with the consent of Philip, procure a very handsome courtesan to lie with him; whose caresses, however, were all to no purpose. His behaviour afterwards to the Persian captives shews him to have had a great command over himself in this particular. The wife of Darius was a finished beauty; her daughters likewise were all beauties; yet this young prince, who had them in his power, not only bestowed on them all the honours due to their high rank, but managed their reputation with the utmost delicacy. They were kept as in a cloister, concealed from the world, and secured from the reach of every dishonourable (not only attack, but) imputation. Darius, in his expiring moments, hearing the kind treatment they had met with,

could not help lifting up his dying hands towards heaven, and wishing success to so wise and generous a conqueror, who could govern his passions at so critical a time. Plutarch informs us more particularly, that the princesses lived so retired in the camp, according to their own desire, that they were not seen by any person, except their own attendants; nor did any other person dare to approach their apartments. After the first visit, which was a respectful and ceremonious one, Alexander, to avoid exposing himself to the dangers of human frailty, made a solemn resolution never to visit Darius's queen any more. He, himself, informs us of this memorable circumstance, in a letter written by him to Parmenio, in which he commanded him to put to death certain Macedonians, who had forced the wives of some foreign soldiers. In this letter was the following paragraph: "For, as to myself, it will be found, that I neither saw, nor would see, the wife of Darius; and did not suffer any one to speak of her beauty before me."

The Amazon queen Thalestris could not obtain from him a compliance with her gallant request till after a delay of thirteen days. In the mean time, what are we to conclude from his causing his favourite mistress Pancaete to be drawn naked by Apelles, though it is true he gave her to the painter, who fell in love with her? What of that immoderate love of boys, which Athenæus relates of him? What of that prodigious number of wives and concubines which he kept?

It was a custom with Alexander the Great to oblige the captive women whom he carried along with him to sing songs after the manner of their country. He happened among these women to perceive one who appeared in deeper affliction than the rest; and who by a modest, and at the same time a noble, confusion, discovered a greater reluctance than the others to appear in public. She was a perfect beauty; which was very much heightened by her bashfulness, whilst she threw her eyes on the ground, and did all she could to conceal her face. The king soon imagined, by her air and mien, that she was not of vulgar birth; and, enquiring into it, the lady answered, that she was grand-daughter to Oëtius, who not long before had swayed the Persian sceptre, and daughter of his son; that she had married Hytaspes, who was related to Darius, and general of a great army. Alexander being touched with compassion, when he heard the unhappy fate of a princess of the blood royal, and the sad condition to which she was reduced, not only gave her her liberty, but returned all her possessions; and caused her husband to be sought for, in order that she might be restored to him.

This prince shewed sometimes so tender and humane a disposition, as to be sensible of the afflictions of persons in the lowest rank. A poor Macedonian soldier was one day driving before him a mule, laden with gold for the king's use; the beast being so tired that he was not able either to go or sustain the load, the mule-driver took it up and carried it, but with great difficulty, a considerable way. Alexander seeing him just sinking under the burthen, and going to throw it on the ground, in order to ease himself from it, cried out, "Friend, do not be weary yet; try and carry it quite through to thy tent, for it is all thy own."

Olympias, Alexander's own mother, was of such an unhappy disposition, that he would never let her have any concern in the affairs of the government. She used frequently to make very severe complaints on that account; but he always submitted to her ill-humour with great mildness and patience. Antipater, one of his friends, having one day written a long letter against her, the king, after reading it, replied, "Antipater does not know that one single tear shed by a mother will obliterate ten thousand such letters as this." A behaviour like this, and such an answer, shew, at one and the same time; that Alexander was both an affectionate son and an able politician.

As Alexander drew near the city of Persepolis, he perceived a large body of men, who exhibited a memorable

example of the greatest misery. These were about four thousand Greeks, very far advanced in years; who, having been made prisoners of war, had suffered all the torments which the Persian tyranny could inflict. The hands of some had been cut off, the feet of others, and others again had lost their noses and ears; after which, the Persians, having impressed by fire barbarous characters on their faces, had the inhumanity to keep them as so many laughing-stocks, with which they sported perpetually. They appeared like so many shadows rather than men; speech being almost the only thing by which they were known to be such. Alexander could not refrain from tears at this sight; and, as they unanimously besought him to commiserate their condition, he bade them with the utmost tenderness not to despond; and assured them, that they should again see their wives and native country. This proposal, which one might suppose should naturally have filled them with joy, seemed to heighten their misery; and, with tears in their eyes, "How will it be possible (said some of them) for us to appear publicly before all Greece, in the dreadful condition to which we are reduced: a condition still more shameful than dissatisfactory? The best way to bear misery is to conceal it; and no country is so sweet to the wretched as solitude, and an oblivion of their past misfortunes." They therefore besought the king to permit them to continue in a country where they had spent so many years, and to end their days among those who were already accustomed to their misfortunes. Alexander granted their request; and presented each of them three thousand drachmas, five men's suits of clothes, the same number of women's, two couple of oxen to plough their lands, and corn to sow them. He commanded the governor of the province not to suffer them to be molested in any manner; and ordered that they should be free from taxes and tributes of every kind. Such behaviour as this was truly royal.

During his stay in Persopolis, he entertained his friends at a banquet, at which his guests drank, as usual, to excess. Among the women who were admitted to it masked, was Thais, the courtesan, a native of Attica, and at that time mistress to Ptolomy, who afterwards was king of Egypt. About the end of the feast, during which she had studiously endeavoured to please the king in the most artful and delicate manner, she said, with a gay tone of voice, "That it would be a matter of inexpressible joy to her, were she permitted (masked as she was, and in order to end the entertainment hobly) to burn the magnificent palace of Xerxes, who had burned Athens; and to set it on fire with her own hand, in order that it might be said in all parts of the world, that the women who followed Alexander, in his expedition to Asia, had taken much better vengeance on the Persians, for the many calamities they had brought on the Grecians, than all the generals who had fought for them, both by sea and land." All the guests applauded the discourse; when immediately the king rose from table, (his head being crowned with flowers,) and, taking a torch in his hand, he advanced forward to execute this mighty exploit. The whole company follow him, breaking out into loud exclamations; and afterwards, singing and dancing, they surround the palace. All the rest of the Macedonians, at this noise, ran in crowds with lighted tapers, and set fire to every part of it. However, Alexander was sorry, not long after, for what he had done; and thereupon gave orders for extinguishing the flames, but it was too late.

His excesses with regard to wine were notorious, and beyond all imagination; and he committed, when drunk, a thousand extravagancies.

Clitus was one of Alexander's best friends, an old officer, who had fought under his father Philip, and signalized himself on many occasions. At the battle of the Granicus, as Alexander was fighting bare-headed, and Rosaces had his arm raised in order to strike him behind, he covered the king with his shield, and cut off the barbarian's hand. Hellenice, his sister, had nursed Alexan-

der; and he loved her with as much tenderness as if she had been his own mother. As the king, from these several considerations, had a very great respect for Clitus, he intrusted him with the government of one of the most important provinces of his empire; and ordered him to set out the next day. In the evening, Clitus was invited to an entertainment, in which the king, after drinking to excess, began to celebrate his own exploits; and was so extremely lavish of self-commendation, that he even shocked those very persons who knew what he spoke was in general true. Clitus, who by this time, as well as the rest of the company, was equally intoxicated, began to relate the actions of Philip, and his wars in Greece, preferring them to whatever was done by Alexander. Though the king was prodigiously vexed, he nevertheless stifled his resentment; and it is probable that he would have quite suppressed his passion, had Clitus stopped there; but the latter growing more and more talkative, as if determined to exasperate and insult the king, he was commanded to leave the table. "He is in the right (says Clitus, as he rose up) not to bear free-born men at his table, who can only tell him truth. He will do well to pass his life among barbarians and slaves, who will pay adoration to his Persian girdle, and his white robe." The king, no longer able to suppress his rage, snatched a javelin from one of the guards, and would have killed Clitus on the spot, had not the courtiers withheld his arm, and Clitus been forced, with great difficulty, out of the hall. However, he returned into it that moment by another door, singing, with an air of insolence, verses reflecting highly on the prince, who, seeing the general near him, struck him with his javelin dead at his feet, crying out, at the same time, "Go now to Philip, to Parmenio, and to Attalus."

As soon as the king was capable of reflecting seriously on what he had done, his crime displayed itself to him in the blackest and most dreadful light; for, though Clitus had committed a great and inexcusable fault, yet it must be confessed, that the circumstances of the banquet extenuate in some degree, or throw, in some measure, a veil over, Clitus's conduct. When a king makes a subject his companion in a debauch, he seems, on such an occasion, to forget his dignity, and to permit his subjects to forget it also; he gives a sanction, as it were, to the liberties, familiarities, and sudden flights, which wine commonly inspires. A fault, committed under these circumstances, is always a fault; but then it ought never to be expiated with the blood of the offender. This Alexander had generosity enough to acknowledge; and at the same time perceived that he had done the vile office of an executioner, in punishing, by an horrid murder, the uttering some indiscreet words, which ought to be imputed to the fumes of wine. Upon this, he threw himself upon his friend's body, forced out the javelin, and would have dispatched himself with it, had he not been prevented by his guards. He passed that night and the next day in tears, stretched on the ground, and venting only groans and deep sighs.

Alexander, having invited several of his friends and general officers to supper, proposed a crown as a reward for him who should drink most. He who conquered on this occasion was Promachus, who swallowed fourteen measures of wine, that is, eighteen or twenty pints. After receiving the prize, which was a crown worth a talent, i. e. about a thousand crowns, he survived his victory but three days. Of the rest of his guests, forty died of their intemperate drinking.—When this same prince was at Babylon, after having spent a whole night in carousing, a second was proposed to him. He met accordingly, and there were twenty guests at table. He drank to the health of every person in company, and then pledged them severally. After this, calling for Hercules's cup, which held an incredible quantity, it was filled, when he poured it all down, drinking to a Macedonian of the company, Proteas by name; and afterwards pledged him

him again in the same furious and extravagant bumper. He had no sooner swallowed it, than he fell upon the floor. "Here then (cries Seneca, describing the fatal effects of drunkenness) this hero, unconquered by all the toils of prodigious marches, exposed to the dangers of sieges and combats, to the most violent extremes of heat and cold; here he lies subdued by his intemperance, and struck to the earth by the fatal cup of Hercules." In this condition he was seized with a fever, which, in a few days, terminated in death. He was thirty-two years and eight months old, of which he had reigned twelve. "No one (says Plutarch and Arrian) suspected then that Alexander had been poisoned; the true poison which brought him to this end was wine, which has killed many thousands besides Alexander."

In short, to sum up the character of this prince, we cannot be of opinion, that his good qualities did in any wise compensate for his bad ones. Heroes make a noise; their actions glare, and strike the senses forcibly; while the infinite destruction and misery they occasion lies more in the shade, and out of sight. One good legislator is worth all the heroes that ever did or will exist. See MACEDON.

ALEXANDER AB ALEXANDRO, a Neapolitan lawyer, of great learning, who flourished toward the end of the 15th and beginning of the 16th century. He followed the profession of the law first at Naples, afterwards at Rome; but he devoted all the time he could spare to the study of polite literature; and at length he entirely left the bar, that he might lead a more easy and agreeable life with the Muses. The particulars of his life are to be gathered from his work intitled *Genialium Dierum*. We are there informed, that he lodged at Rome, in a house that was haunted; and he relates many surprising particulars about the ghost. He says, also, that, when he was very young, he went to the lectures of Philadelphus, who explained at Rome the Tusculan questions of Cicero; he was there also when Nicholas Perot and Domitius Calderinus read their lectures upon Martial. The particular time when he died is not known; but he was buried in the monastery of the Olivets. Tiraquea wrote a learned Commentary upon his work, which was printed at Lyons in 1587, and re-printed at Leyden in 1673, with the notes of Dennis Godfrey, Christopher Colerus, and Nicholas Mercerus.

ALEXANDER (Neckham), an eminent English writer in the 12th and 13th centuries, born at St. Alban's, in Hertfordshire. In 1215 he was made abbot of Exeter, and died in 1227. He wrote several works, which were never published; but they are to be found in manuscript in the public libraries of England and other countries.

ALEXANDER (Noel), an indefatigable writer of the 17th century, born at Rouen in Normandy, in 1639. After finishing his studies at Rouen, he entered into the order of Dominican friars, and was professed there in 1655. Soon after he went to Paris, to go through a course of philosophy and divinity in the great convent, where he distinguished himself so, that he was appointed to teach philosophy there, which he did for twelve years. M. Colbert shewed him many marks of his esteem; and, being determined to omit nothing to perfect the education of his son, afterwards archbishop of Rouen, he formed an assembly of the most learned persons, whose conferences upon ecclesiastical history might be of advantage to him. Father Alexander was invited to this assembly, where he exerted himself with so much genius and ability, that he gained the particular friendship of young Colbert, who shewed him the utmost regard as long as he lived. These conferences gave rise to Alexander's design of writing an ecclesiastical history. This he executed with great assiduity, collecting and digesting the materials himself, and writing even the tables with his own hand. He completed his work in 1686. Towards the latter part of his life, he was afflicted with the loss of his sight; a most inexpressible misfortune to one whose whole pleasure was in study, yet he bore it with great patience and

resignation. He died merely of a decay of nature, in 1724, in the 86th year of his age.

ALEXANDER SEVERUS, emperor of Rome, succeeded Heliogabalus, about A. D. 222, when but sixteen years of age. His mother's name was Mammæa, and by her advice he in a great measure regulated his conduct. He applied himself to the reformation of abuses, the state having been greatly disordered by the vicious conduct of his predecessor; he was a most strict lover of justice, an encourager of learning and learned men, and favourable to the Christians. He made a successful expedition against the Persians; but, endeavouring to reform his troops, which had grown very licentious under the late bad government, they murdered him at the instigation of Maximinus in the 29th year of his age, together with his mother, A. D. 235.

ALEXANDER VI. (Pope), had four bastards when he was cardinal, for one of which he had so great affection, that he stuck at nothing to raise him. Designing to poison some cardinals, he was poisoned himself, A. D. 1503. See BORGIA.

ALEXANDER VII. (Pope). See CHIGI.

ALEXANDER, bishop of Lincoln in the reigns of Henry I. and Stephen, was a Norman by birth, and nephew of the famous Roger, bishop of Salisbury, who first made him archdeacon of Salisbury, and afterwards, by his interest with the king, raised him to the mitre. Alexander was consecrated at Canterbury, July 22, 1123. The year after his consecration, his cathedral church at Lincoln having been accidentally burnt down, he re-built it, and secured it against the like accident for the future by a stone roof. This prelate increased the number of prebends in his church, and augmented its revenues with several manors and estates. In imitation of the barons and some of the bishops, particularly his uncle the bishop of Salisbury, he built three castles; one at Banbury, another at Sleaford, and a third at Newark. He likewise founded two monasteries; one at Haverholm, for regular canons and nuns together, the other at Tame for white friars. He went twice to Rome in the years 1142 and 1144. The first time, he came back in quality of the pope's legate, for the calling a synod, in which he published several wholesome and necessary canons. In August 1147, he took a third journey to the pope, who was then in France; where he fell sick through the excessive heat of the weather, and, returning with great difficulty to England, he died in the 24th year of his prelacy.

ALEXANDER (William), earl of Stirling, an eminent Scots statesman and poet in the reigns of James VI. and Charles I. who, after travelling with the duke of Argyle as his tutor or companion, wrote a poetical complaint of his unsuccessful love of some beauty, under the title of Aurora. He then removed to the court of James VI. where he applied to the more solid parts of poetry, forming himself upon the plan of the Greek and Roman tragedians. In 1607, he published some dramatic performances, intitled The Monarchic Tragedies, dedicated to king James; who was so well pleased with them, as to call him his philosophical poet. After this, he is said to have written a Supplement to complete the third part of Sir Philip Sidney's Arcadia; and, in 1613, he produced a poem called Doomday, or the Great Day of Judgment. He was made gentleman-usher to prince Charles, and master of the requests; was knighted; and obtained a grant of Nova Scotia, where he projected the settlement of a colony, but afterwards sold it to the French. In 1626, he was made secretary of state for Scotland; was created first viscount, and then earl, of Stirling; and died in 1640.

ALEXANDER I. (St.) whom St. Ireneus reckons the fifth bishop of Rome, succeeded St. Evaristus in the year 109, and died in the year 119. There is no account of his life; and the epistles which are attributed to him are supposititious.

ALEXANDER

ALEXANDER II. king of Scotland, succeeded his father William in 1213, at sixteen years of age. He made an expedition into England, to oppose the tyranny of king John; who returned the visit, and was offered battle by Alexander, but refused it. He took the city of Carlisle from Henry III. which was afterwards exchanged for Berwick. Alexander died in 1249, in the fifty-first year of his age, and the thirty-fifth of his reign; and left for his successor his son Alexander III. who was crowned king of Scotland in 1249. The Cummings, lords of Scotland, took arms against him; and, taking him prisoner, confined him at Striveling; but he was afterwards released by his subjects. He married the daughter of Henry III. king of England; and was killed by a fall from his horse, on the 10th of April 1290, after having reigned forty-two, or according to others thirty-seven, years.

ALEXANDERS, *f.* in botany. See SMYRNIUM.

ALEXANDRETTA, by the Turks called Scanderoon, a town in Syria, at the extremity of the Mediterranean sea. It is the port of Aleppo, from which it is distant twenty-eight or thirty leagues. It is now, properly speaking, nothing else but a village, without walls, in which the tombs are more numerous than the houses, and which entirely owes its existence to the road which it commands. This is the only road, in all Syria, where vessels anchor on a solid bottom, without their cables being liable to chafe; but in other respects it has many inconveniences. It is infested, during winter, by a peculiar wind, called by the French sailors *le Ragulier*, which, rushing from the snowy summits of the mountains, frequently forces ships to drag their anchors several leagues. And, when the snow begins to cover the mountains which surround the gulph, tempestuous winds arise which prevent vessels from entering for three or four months together. The road also to Aleppo by the plain is infested by the Kurd robbers, who conceal themselves in the neighbouring rocks, and frequently attack and plunder the strongest caravans. But the worst circumstance is the extreme unwholesomeness of the air, occasioned here by stagnant waters and mephitic exhalations. It may be affirmed that this every year carries off one-third of the crews of the vessels which remain here during the summer; nay, ships frequently lose all their men in two months. The season for this epidemic disorder is principally from May to the end of September. It is an intermitting fever of the most malignant kind; and is accompanied with obstructions of the liver, which terminate in a dropsy. To this baneful epidemic, Alexandretta, from its situation, seems to be irretrievably condemned; for the plain on which the town is built is so low and flat, that the rivulets, finding no declivity, can never reach the sea. When they are swelled by the winter rains, the sea, swelled likewise by tempests, hinders their discharging themselves into it; hence their waters, forced to spread themselves, form lakes in the plain. On the approach of the summer, the waters, becoming corrupted by the heat, exhale vapours equally corrupt, and which cannot disperse, being confined by the mountains that encircle the gulph. The entrance of the bay besides lies to the west, which in those countries is the most unhealthy exposure when it corresponds with the sea.

A few years ago, M. Volney informs us, the merchants of Aleppo, disgusted with the numerous inconveniences of Alexandretta, wished to abandon that port and carry the trade to Latika. They proposed to the pacha of Tripoli to repair the harbour at their own expence, provided he would grant them an exemption from all duties for ten years. To induce him to comply with their request, the agent they employed talked much of the advantage which would, *in time*, result to the whole country:—"But what signifies it to me (replied the pacha) what may happen *in time*? I was yesterday at Marach; to-morrow, perhaps, I shall be at Djedda. Why should I deprive myself of present advantages, which are certain, for future benefits I cannot hope to partake?" The European factors were

obliged therefore to remain at Scanderoon. The only curiosity which they have to amuse strangers with consists in six or seven marble monuments, sent from England, on which you read: Here lies such a one, carried off in the flower of his age, by the fatal effects of a contagious air. The sight of these is the more distressing, as the languid air, yellow complexion, livid eyes, and dropsical bellies, of those who shew them, make it but too probable they cannot long escape the same fate.

ALEXANDRIA, now Scanderia, by Athenæus called *Xerxon*; a city of Lower Egypt, and for a long time its capital. This city was built by Alexander the Great, soon after the overthrow of Tyre, about 333 years before Christ. It is situated on the Mediterranean, twelve miles west of that mouth of the Nile anciently called *Canopicum*; and lies in E. lon. 30. 19. N. lat. 31. 10. Alexander is said to have been induced to build this city, on account of its being conveniently situated for a fine port; and so sudden was his resolution, that after he had directed where every public structure was to be placed, fixed the number of temples, and the deities to whom they should be dedicated, &c. there were no instruments at hand proper for marking out the walls, according to the custom of those times. Upon this, a workman advised the king to collect what meal was among the soldiers, and to sift it in lines upon the ground, whereby the circuit of the walls would be sufficiently marked out. This advice was followed; and the new method of marking out the walls was, by Aristander, the king's soothsayer, interpreted as a preface of the city's abounding with all the necessaries of life. Nor was he deceived in his prediction; for Alexandria soon became the staple, not only for merchandise; but also for all the arts and sciences of the Greeks.

Alexandria was a league and a half long by one-third in breadth, which made the circumference of its walls about four leagues. Lake Mareotis bathed its walls on the south, and the Mediterranean on the north. It was intersected lengthwise by straight parallel streets. This direction left a free passage to the northerly wind, which alone conveys coolness and salubrity into Egypt. A street of 2000 feet wide began at the gate of the sea, and terminated at the gate of Canopus. It was decorated by magnificent houses, by temples, and by public buildings. In this extensive range, the eye was never tired with admiring the marble, the porphyry, and the obelisks, which were destined at some future day to embellish Rome and Constantinople. This street, the handsomest in the universe, was intersected by another of the same breadth, which formed a square at their junction of half a league in circumference. From the middle of this great place, the two gates were to be seen at once, and vessels arriving under full sail from the north and from the south.

A mole of a mile in length stretched from the continent to the isle of Pharos, and divided the great harbour into two. That which is to the northward preserved its name. A dyke, drawn from the island to the rock whereon was built the Pharos, secured it from the westerly winds. The other was called *Eunostus*, or the Safe Return. The former is called at present the new, the latter the old, harbour: a bridge, that joins the mole to the city, served for a communication between them. It was raised on lofty pillars sunk into the sea, and left a free passage for ships. The palace, which advanced beyond the promontory of *Lochias*, extended as far as the dyke, and occupied more than a quarter of the city. Each of the Ptolemies added to its magnificence. It contained within its inclosure, the museum, an asylum for learned men, groves and buildings worthy of royal majesty, and a temple where the body of Alexander was deposited in a golden coffin. The infamous Selencus Cibyotæ violated this monument, carried off the golden coffin, and put a glass one in its place. In the great harbour was the little island of Anti-Rhodes, where stood a theatre, and a royal place of residence. Within the harbour of Eunostus was a smaller one, called *Kibotos*, dug by the hand of man, which communicated with Lake

Mareotis

Mareotis by a canal. Between this canal and the palace was the admirable temple of Serapis, and that of Neptune near the great place where the market was held. Alexandria extended likewise along the southern banks of the lake. Its eastern part presented to view the gymnasium, with its porticoes of more than 600 feet long, supported by several rows of marble pillars. Without the gate of Canopus was a spacious circus for the chariot races. Beyond that, the suburb of Nicopolis ran along the seashore, and seemed a second Alexandria. A superb amphitheatre was built there with a race-ground, for the celebration of the quinquennialia. Such is the description left us of Alexandria by the ancients, and above all by Strabo.

The architect employed by Alexander in this undertaking was the celebrated Dinocrates, who had acquired so much reputation by rebuilding the temple of Diana at Ephesus. The city was first rendered populous by Ptolemy Soter, one of Alexander's captains, who, after the death of the Macedonian monarch, being appointed governor of Egypt, soon assumed the title of king, and took up his residence at Alexandria, about 304 years before Christ.

In the thirtieth year of Ptolemy Soter's reign, he took his son Ptolemy Philadelphus partner with him in the empire; and by this prince the city of Alexandria was much embellished. In the first year of his reign the famous watch-tower of Pharos was finished. It had been begun several years before, by Ptolemy Soter; and, when finished, was looked upon as one of the wonders of the world. The same year, the island of Pharos itself, originally seven furlongs distant from the continent, was joined to it by a causeway. This was the work of Dexiphanes, who completed it at the same time that his son put the last hand to the tower. The tower was a large square structure of white marble; on the top of which fires were kept constantly burning, for the direction of sailors. The building cost 800 talents; which, if Attic, amounted to 165,000*l.* if Alexandrian, to twice that sum. The contrivance of the architect to usurp the glory of this great work to himself is well known.

This year also was remarkable for the bringing of the image of Serapis from Pontus to Alexandria. It was set up in one of the suburbs of the city called *Rhacotis*, where a temple was afterwards erected to his honour, suitable to the greatness of that stately metropolis, and called, from the god worshipped there, *Serapeum*. This structure, according to Ammianus Marcellinus, surpassed in beauty and magnificence all others in the world, except the capitol at Rome.—Within the verge of this temple was the famous Alexandrian library. It was founded by Ptolemy Soter, for the use of an academy he instituted in this city; and, by continual additions by his successors, became at last the finest library in the world, containing no fewer than 700,000 volumes. The method followed in collecting books for this library, was, to seize all those which were brought into Egypt by Greeks or other foreigners. The books were transcribed in the museum by persons appointed for that purpose; the copies were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Euergetes, having borrowed from the Athenians the works of Sophocles, Euripides, and Æschylus, returned them only the copies, which he caused to be transcribed in as beautiful a manner as possible; presenting the Athenians at the same time with fifteen talents (upwards of 3000*l.* sterling) for the exchange.

As the museum was at first in that quarter of the city called *Bruchion*, near the royal palace, the library was placed there likewise; but, when it came to contain 400,000 volumes, another library, within the *Serapeum*, was erected by way of supplement to it, and on that account called the *daughter* of the former. In this second library 300,000 volumes, in process of time, were deposited; and the two together contained the 700,000 volumes already mentioned. In the war carried on by Julius Cæsar against the inhabitants of this city, the library in the *Bruchion*, with the 400,000 volumes it contained, was reduced to ashes.

VOL. I. No. 18.

The library in the *Serapeum*, however, still remained; and here Cleopatra deposited 200,000 volumes of the Pergamean library, which Marc Antony presented her with. These, and others added from time to time, rendered the new library at Alexandria more numerous and considerable than the former; and, though it was often plundered during the revolutions and troubles of the Roman empire, yet it was again and again repaired, and filled with the same number of books. For 293 years Alexandria was held in subjection by the Ptolemies. Here follows a list of these princes, with the dates of their respective reigns.

Ptolemy the son of Lagus, surnamed Soter, reigned thirty-nine years, and died in the year of the world 3720. Ptolemy Philadelphus reigned thirty-nine years, and died in 3758. Ptolemy Euergetes reigned twenty-five years, and died in 3783. Ptolemy Philopator reigned seventeen years, and died in 3800. Ptolemy Epiphanes reigned twenty-four years, and died in 3824. Ptolemy Philometor reigned thirty-seven years, and died in 3861. Ptolemy Euergetes, or Physcon, reigned fifty-three years, part with his brother Philometor, and part alone. He died in 3888. Ptolemy Lathyrus reigned thirty-six years and six months. He died in 3923. Cleopatra, the daughter of Lathyrus and wife of Alexander I. reigned six months. Alexander I. the nephew of Lathyrus, was established in 3924, and died in 3943. Alexander II. the son of Alexander I. was dispossessed by the Alexandrians in 3939. Ptolemy Nothus, or Auletes, the son of Lathyrus, reigned thirteen years, and died in 3953. Ptolemy, surnamed *Dionysius* or *Bacchus*, reigned three years eight months, and died in 3957. Cleopatra reigned from 3957, and killed herself in 3974.

The city, as we have already observed, soon became extremely populous, and was embellished both by its own princes and the Romans; but, like most other noted cities of antiquity, hath been the seat of terrible massacres. About 141 years before Christ, it was almost totally depopulated by Ptolemy Physcon. That barbarous monster, without the least provocation, gave free liberty to his guards to plunder his metropolis and murder the inhabitants at their pleasure. The cruelties practised on this occasion cannot be expressed; and the few who escaped were so terrified that they fled into other countries. Upon this, Physcon, that he might not reign over empty houses, invited thither strangers from the neighbouring countries; by whom the city was repopulated, and soon recovered its former splendour. On this occasion many learned men having been obliged to fly, proved the means of reviving learning in Greece, Asia Minor, the islands of the Archipelago, and other places, where it was almost totally lost.

The new inhabitants were not treated with much more kindness by Physcon than the old ones had been; for, on their complaining of his tyrannical behaviour, he resolved on a general massacre of the young men. Accordingly, when they were one day assembled in the gymnasium, or place of their public exercises, he ordered it to be set on fire; so that they all perished, either in the flames, or by the swords of his mercenaries, whom the tyrant had placed at all the avenues.

Though Julius Cæsar was obliged to carry on a war for some time against this city, it seems not to have suffered much damage, except the burning of the library already mentioned. Before Cæsar left Alexandria, in acknowledgment of the assistance he had received from the Jews, he confirmed all their privileges there, and even engraved his decree on a pillar of brass. This, however, did not prevent the massacre of 50,000 of them in this city about the year of Christ 67.

The city of Alexandria seems to have fallen into decay soon after this, and to have forfeited many of its ancient privileges, though for what offence is not known; but when Adrian visited Egypt, about the year 141, it was almost totally ruined. He repaired both the public and private buildings, not only restoring the inhabitants to their

their ancient privileges, but heaping new favours upon them; for which they returned him their solemn thanks, and conferred upon him what honours they could while he was present; but, as soon as he was gone, they published the most bitter and virulent lampoons against him.

The fickle and satirical humour of the Alexandrians was highly disliked by Adrian, though he inflicted no punishment upon them for it; but, when they lampooned Caracalla, he did not let them escape so easily. That tyrant, in the year 215, when he visited their city, having become the subject of their foolish satires, ordered a general massacre by his numerous troops, who were dispersed all over the city. The inhuman orders being given, all were murdered, without distinction of age or sex; so that in one night's time the whole city floated in blood, and every house was filled with carcases. The monster who occasioned this had retired during the night to the temple of Serapis, to implore the protection of that deity; and, not yet fatiated with slaughter, commanded the massacre to be continued all the next day; so that very few of the inhabitants remained. As if even this had not been sufficient, he stripped the city of all its ancient privileges; suppressed the academy; ordered all strangers who lived there to depart; and, that the few who remained might not have the satisfaction of seeing one another, he cut off all communication of one street with another, by walls built for that purpose, and guarded by troops left there.

Notwithstanding this terrible disaster, Alexandria soon recovered its former splendour, as Caracalla was murdered a short time after. It was long esteemed the first city in the world, next to Rome; and we may judge of its magnificence, and the multitude of people contained in it, from the account of Diodorus Siculus, who relates, that in his time (forty-four years before Christ) Alexandria had on its rolls 300,000 freemen. Towards the middle of the sixth century, Amrou *Ebn el Aas*, Omar's general, took it by storm, after a siege of fourteen months, and with the loss of 23,000 men. Heraclius, then emperor of Constantinople, did not send a single ship to its assistance. This prince affords an example very rare in history; he had displayed some vigour in the first year of his reign, and then suffered himself to be lulled into idleness and effeminacy. Awakened suddenly from his lethargy by the noise of the conquests of Cosroes, that scourge of the east, he put himself at the head of his armies, distinguished himself as a great captain from his very first campaign, laid waste Persia for seven years, and returned to his capital covered with laurels: he then became a theologian on the throne, lost all his energy, and amused himself the rest of his life with disputing upon monotheism, whilst the Arabs were robbing him of the finest provinces of his empire. Deaf to the cries of the unfortunate inhabitants of Alexandria, as he had been to those of the people of Jerusalem, who defended themselves for two years, he left them a sacrifice to the fortunate ascendant of the indefatigable Amrou. All their intrepid youth perished with their arms in their hands. The victor, astonished at his conquest, wrote to the caliph, "I have taken the city of the west. It is of an immense extent. I cannot describe to you how many wonders it contains. There are 4000 palaces, 4000 baths, 12,000 dealers in fresh oil, 12,000 gardeners, 40,000 Jews who pay tribute, 400 comedians," &c. At this time, according to the Arabian historians, Alexandria consisted of three cities, viz. Menna, or the port, which included Pharos, and the neighbouring parts; Alexandria, properly so called, where the modern Scanderia now stands; and Nekita, probably the Necropolis of Josephus and Strabo.

At that time John, surnamed the grammarian, a famous Peripatetic philosopher, being in the city, and in high favour with Amrou Ebn al Aas the Saracen general, begged of him the royal library. Amrou replied, that it was not in his power to grant such a request; but that he would write to the khalif on that head; since, without knowing his pleasure, he dared not to dispose of a single book. He

accordingly wrote to Omar, who was then khalif, acquainting him with the request of his friend: to which the ignorant tyrant replied, That if these books contained the same doctrine with the koran, they could be of no use, since the koran contained all necessary truths; but, if they contained any thing contrary to that book, they ought not to be suffered; and therefore, whatever their contents were, he ordered them to be destroyed. Pursuant to this order, they were distributed among the public baths; where, for the space of six months, they served to supply the fires of those places, of which there was an incredible number in Alexandria.

After the city was taken, Amrou thought proper to pursue the Greeks who had fled farther up the country; and therefore marched out of Alexandria, leaving but a very slender garrison in the place. The Greeks, who had before fled on-board their ships, being apprised of this, returned on a sudden, surprised the town, and put all the Arabs they found therein to the sword: but Amrou, receiving advice of what had happened, suddenly returned, and drove them out of it with great slaughter; after which the Greeks were so intimidated, that he had nothing farther to fear from them.—A few years after, however, Amrou being deprived of his government by the khalif Othman, the Egyptians were so much displeased with his diffision that they inclined to a revolt; and Constantine the Greek emperor, having received intelligence of their disaffection, began to meditate the reduction of Alexandria. For this purpose, he sent one Manucl, an eunuch, and his general, with a powerful army, to retake the place; which, by the assistance of the Greeks in the city, who kept a secret correspondence with the imperial forces while at sea, and joined them as soon as they had made a descent, he effected without any considerable effusion of blood. The khalif, now perceiving his mistake, immediately restored Amrou to his former dignity. This step was very agreeable to the natives; who having had experience of the military skill and bravery of this renowned general, and apprehending that they should be called to an account by the Greeks for their former perfidious conduct, had petitioned Othman to send him again into Egypt.—Upon Amrou's arrival, therefore, at Alexandria, the Copts or natives, with the traitor Al-Mokawkas (who had formerly betrayed to Amrou the fortress of Mefri) at their head, not only joined him, but supplied him with all kinds of provisions, exciting him to attack the Greeks without delay. This he did; and, after a most obstinate dispute which lasted several days, drove them into the town, where, for some time, they defended themselves with great bravery, and repelled the utmost efforts of the besiegers. This so exasperated Amrou, that he swore, "If God enabled him to conquer the Greeks, he would throw down the walls of the city, and make it as easy of access as a *hawdy-house*, which lies open to every body." Nor did he fail to execute this menace; for, having taken the town by storm, he quite dismantled it, entirely demolishing the walls and fortifications. The lives of the citizens, however, were spared, at least as far as lay in the general's power; but many of them were put to the sword by the soldiers on their first entrance. In one quarter particularly, Amrou found them butchering the Alexandrians with unrelenting barbarity; to which, however, by his seasonable interposition, he put a stop, and on that spot erected a mosque, which he called the *mosque of mercy*.

From this time Alexandria never recovered its former splendour. It continued under the dominion of the khalifs till the year 924, when it was taken by the Magrebi-ans, two years after its great church had been destroyed by fire. This church was called by the Arabs *Al Kaisaria*, or *Casarea*; and had formerly been a pagan temple, erected in honour of Saturn by the famous queen Cleopatra.

The city was soon after abandoned by the Magrebi-ans; but in 928 they again made themselves masters of it; their fleet being afterwards defeated by that belonging to the khalif

khalif, *Abul Kafem* the Magrebian general retired from Alexandria, leaving there only a garrison of 300 men, of which *Thmaäl*, the khalif's admiral, being apprised, he in a few days appeared before the town, and carried off the remainder of the inhabitants to an island in the Nile called *Abuhair*. This was done to prevent *Abul Kafem* from meeting with any entertainment at Alexandria, in case he should think proper to return. According to Eutychius, above 200,000 of the miserable inhabitants perished this year.

What contributed to raise Alexandria to such a prodigious height of splendour as it enjoyed for a long time, was its being the centre of commerce between the eastern and western parts of the world. It was with the view of becoming master of this lucrative trade, that Alexander built this city, after having extirpated the Tyrians who formerly engrossed all the East-India traffic. Of the immense riches which that trade afforded, we may form an idea, from considering that the Romans accounted it a point of policy to oppress the Egyptians, especially the Alexandrians; and, after the defeat of Zenobia, there was a single merchant of Alexandria who undertook to raise and pay an army out of the profits of his trade. The Greek emperors drew prodigious tributes from Egypt, and yet the khalifs found their subjects in so good circumstances as to screw up their revenues to three hundred millions of crowns.

Though the revolutions which happened in the government of Egypt, after it fell into the hands of the Mahometans, frequently affected this city to a very great degree; yet still the excellence of its port, and the innumerable conveniences resulting from the East-India trade, to whomsoever were masters of Egypt, preserved Alexandria from total destruction, even when in the hands of the most barbarous nations. Thus, in the thirteenth century, when the barbarism introduced by the Goths, &c. began to wear off from the European nations, and they acquired a taste for the elegancies of life, the old mart of Alexandria began to revive; and the port, though far from recovering its former magnificence, grew once more famous by becoming the centre of commerce: but having fallen under the dominion of the Turks, and the passage round the Cape of Good Hope being discovered by the Portuguese in 1499, a fatal blow was given to the Alexandrian commerce, and the city has since fallen into decay.

At present, the city of Alexandria is reckoned to have about 15,000 inhabitants; a strange colluvies of different nations, as well as from various parts of the Turkish empire. They are in general given to thieving and cheating; and (like their predecessors) seditious above all others, were they not kept in awe by the severity of their government. The British and French carry on a considerable commerce with them, and have each a consul residing here. Some Venetian ships also sail thither yearly, but mostly under French colours. The subjects of those kingdoms which keep no consul here, are subjected to a tax by the Grand Signior: but the Jews have found out a method of indemnifying themselves for this disadvantage; namely, by selling their commodities cheaper than other foreigners can afford. They are also favoured by the farmers of the revenue; who know, that, if they do not pay some private regard to them, the Jews have it in their power to cause fewer merchandizes to come into their port during the two years that their farm lasts.

The present city is a kind of peninsula situated between the two ports. That to the westward was called by the ancients the *Portus Eunotus*, now the *Old Port*, and is by far the best; Turkish vessels only are allowed to anchor there: the other, called the *New Port*, is for the Christians; at the extremity of one of the arms of which stood the famous Pharos. The New Port, the only harbour for the Europeans, is clogged up with sand, inasmuch that in stormy weather ships are liable to bilge; and, the bottom being also rocky, the cables soon chafe and part; so that one vessel driving against a second, and that against a third,

they are perhaps all lost. Of this there was a fatal instance about twenty-five years ago, when forty-two vessels were dashed to pieces on the mole in a gale of wind from the north-west, and numbers have been since lost there at different times. If it be asked in Europe, Why do they not repair the New Port? the answer is, That in Turkey they destroy every thing, and repair nothing. The old harbour will be destroyed likewise, as the ballast of vessels has been continually thrown into it for the last 200 years. The spirit of the Turkish government is to ruin the labours of past ages, and destroy the hopes of future times, because the barbarity of ignorant despotism never considers to-morrow.

In time of war, Alexandria is of no importance; no fortification is to be seen; even the Farillon, with its lofty towers, cannot be defended. It has not four cannon fit for service, nor a gunner who knows how to point them. The 500 janisaries, who should form the garrison, reduced to half that number, know nothing but how to smoke a pipe. But Alexandria is a place of which the conquest would be of no value. A foreign power could not maintain itself there, as the country is without water. This must be brought from the Nile by the kalidj, or canal of twelve leagues, which conveys it thither every year at the time of the inundation. It fills the vaults or reservoirs dug under the ancient city, and this provision must serve till the next year. It is evident, therefore, that, were a foreign power to take possession, the canal would be shut, and all supplies of water cut off. It is this canal alone which connects Alexandria with Egypt; for from its situation without the Delta, and the nature of the soil, it really belongs to the deserts of Africa. Its environs are sandy, flat, and sterile, without trees and without houses; where we meet with nothing but the plant which yields the kali, and a row of palm-trees which follows the course of the kalidj or canal.

The city is governed like others in the same kingdom. (See *EGYPT*.) It hath a small garrison of soldiers, part of which are janisaries and assassins; who are very haughty and insolent, not only to strangers, but to the mercantile and industrious part of the people, though ever so considerable and useful. The government is so remiss in favour of these wretches, that Mr. Norden informs us, one of them did not hesitate to kill a farmer of the customs, for refusing to take less of him than the duty imposed, and went off unpunished; it being a common salvo among them, that what is done cannot be undone.

The present condition of Alexandria is very despicable, being now so far ruined, that the rubbish in many places overtops the houses. The famous tower of Pharos has long since been demolished, and a castle, called Farillon, built in its place. The causeway which joined the island to the continent is broken down, and its place supplied by a stone bridge of several arches. Some parts of the old walls of the city are yet standing, and present us with a masterpiece of ancient masonry. They are flanked with large towers, about 200 paces distant from each other, with small ones in the middle. Below are magnificent casemates, which may serve for galleries to walk in. In the lower part of the towers is a large square hall, whose roof is supported by thick columns of Thebaic stone. Above this are several rooms, over which there are platforms more than twenty paces square. The ancient reservoirs, vaulted with so much art, which extend under the whole town, are almost entire at the end of 2000 years.

Of Caesar's palace there remain only a few porphyry pillars, and the front, which is almost entire, and looks very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outside, supported by several fine columns. Not far from this palace are two obelisks vulgarly called *Cleopatra's Needles*. They are of Thebaic stone, and covered with hieroglyphics. One is overturned, broken, and lying under the sand; the other is on its pedestal. These two obelisks, each of them of a single stone, are about sixty feet high, by seven feet square

square at the base. Towards the gate of Rosetta, are five columns of marble on the place formerly occupied by the porticoes of the Gymnasium. The rest of the colonnade, the design of which was discoverable 100 years ago by Maillet, has since been destroyed by the barbarism of the Turks.

But what most engages the attention of travellers is the pillar of Pompey, as it is commonly called, situated at a quarter of a league from the southern gate. It is composed of red granite. The capital is Corinthian, with palm-leaves, and not indented. It is nine feet high. The shaft and the upper member of the base are of one piece of ninety feet long, and nine in diameter. The base is a square of about fifteen feet on each side. This block of marble, sixty feet in circumference, rests on two layers of stone bound together with lead; which, however, has not prevented the Arabs from forcing out several of them, to search for an imaginary treasure. The whole column is 114 feet high. It is perfectly well polished, and only a little shivered on the eastern side. Nothing can equal the majesty of this monument; seen from a distance, it overtops the town, and serves as a signal for vessels. Approaching it nearer, it produces an astonishment mixed with awe. One can never be tired with admiring the beauty of the capital, the length of the shaft, nor the extraordinary simplicity of the pedestal. This last has been somewhat damaged by the instruments of travellers, who are curious to possess a relic of this antiquity; and one of the volutes of the column was immaturely brought down about twelve years ago, by a prank of some English captains, which is thus related by Mr. Irwin.

These jolly sons of Neptune had been pushing about the can on-board one of the ships in the harbour, until a strange freak entered into one of their brains. The eccentricity of the thought occasioned it immediately to be adopted; and its apparent impossibility was but a spur for the putting of it into execution. The boat was ordered; and with proper implements for the attempt these enterprising heroes pushed ashore, to drink a bowl of punch on the top of Pompey's pillar! At the spot they arrived; and many contrivances were proposed to accomplish the desired point. But their labour was vain; and they began to despair of success, when the genius who struck out the frolic happily suggested the means of performing it. A man was dispatched to the city for a paper kite. The inhabitants were by this time apprized of what was going forward, and flocked in crowds to be witnesses of the address and boldness of the English. The governor of Alexandria was told that these seamen were about to pull down Pompey's pillar. But whether he gave them credit for their respect to the Roman warrior, or to the Turkish government, he left them to themselves; and politely answered, that the English were too great patriots to injure the remains of Pompey. He knew little, however, of the disposition of the people who were engaged in this undertaking. Had the Turkish empire rose in opposition, it would hardly have deterred them. The kite was brought, and flown so directly over the pillar, that, when it fell on the other side, the string lodged upon the capital. The chief obstacle was now overcome. A two-inch rope was tied to one end of the string, and drawn over the pillar, by the end to which the kite was affixed. By this rope one of the seamen ascended to the top; and in less than an hour, a kind of shroud was constructed, by which the whole company went up, and drank their punch amid the shouts of the astonished multitude. To the eye below, the capital of the pillar does not appear capable of holding more than one man upon it; but our seamen found it could contain no less than eight persons very conveniently. It is astonishing that no accident befel these madcaps, in a situation so elevated, that would have turned a landman giddy in his sober senses. The only detriment which the pillar received, was the loss of the volute before mentioned; which came down with a thundering sound, and was carried to England by one of the captains, as a present to a lady who commissioned him for a piece of the pillar. The

discovery which they made amply compensated for this mischief; as, without their evidence, the world would not have known at this hour, that there was originally a statue on this pillar, one foot and ancle of which are still remaining. The statue must have been of a gigantic size, to have appeared of a man's proportion at so great an height.

There are circumstances in this story which might give it an air of fiction, were it not demonstrated beyond all doubt. Besides the testimonies of many eye-witnesses, the adventurers themselves have left us a token of the fact, by the initials of their names, which are very legible in black paint just beneath the capital.

Learned men and travellers have made many fruitless attempts to discover in honour of what prince it was erected. The best informed have concluded, that it could not be in honour of Pompey, since neither Strabo nor Diodorus Siculus have spoken of it. The Arabian Abulfeda, in his description of Egypt, calls it the *pillar of Severus*. And history informs us, that this emperor "visited the city of Alexandria: That he granted a senate to its inhabitants, who until that time, under the subjection of a single Roman magistrate, had lived without any national council, as under the reign of the Ptolemies, when the will of the prince was their only law: That he did not confine his benefactions there; he changed several laws in their favour." This column, therefore, Mr. Savary concludes to have been erected by the inhabitants as a mark of their gratitude to Severus. And in a Greek inscription, now half effaced, but visible on the west side when the sun shines upon it, and which probably was legible in the time of Abulfeda, he supposes the name of Severus to have been preserved. He further observes, that this was not the only monument erected to him by the gratitude of the Alexandrians: for there is still seen in the ruins of Antinoë, built by Adrian, a magnificent pillar, the inscription on which is still remaining, dedicated to Alexander Severus.

On the south-west side of the city, at a mile distant, are situated the catacombs, the ancient burial place of Alexandria: and although they cannot be compared to those of the ancient Memphis, which the Arabs will not permit to be visited, in order to make the better market of their mummies, it is probable that, the method of embalming being the same, the form of these catacombs can only differ in their proportions.—The Baron de Tott, in describing these, observes, "that Nature not having furnished this part of Egypt with a ridge of rocks, like that which runs parallel with the Nile above Delta, the ancient inhabitants of Alexandria could only have an imitation by digging into a bed of solid rock; and thus they formed Necropolis, or 'City of the Dead.' The excavation is from thirty to forty feet wide, 200 long, and twenty-five deep, and is terminated by gentle declivities at each end. The two sides, cut perpendicularly, contain several openings, about ten or twelve feet in width and height, hollowed horizontally; and which form, by their different branches, subterranean streets. One of these, which curiosity has disencumbered from the ruins and sands that render the entrance of others difficult or impossible, contains no mummies, but only the places they occupied. The order in which they were ranged is still to be seen. Niches, twenty inches square, sunk six feet horizontally, narrowed at the bottom, and separated from each other by partitions in the rocks, seven or eight inches thick, divide into checkers the two walls of this subterranean vault. It is natural to suppose, from this disposition, that each mummy was introduced with the feet foremost into the cell intended for its reception; and that new streets were opened, in proportion as these dead inhabitants of Necropolis increased." This observation, he adds, which throws a light on the catacombs of Memphis, may perhaps likewise explain the vast size and multitude, as well as the different elevations, of the pyramids in the Higher and Lower Egypt.

About seventy paces from Pompey's pillar is the khalis, or the canal of the Nile, which was dug by the ancient Egyptians, to convey the water of the Nile to Alexandria.

dria, and fill the cisterns under the city. On the side of the khalis are gardens full of orange and lemon trees, and the fields are full of caper and palm trees. On the top of a hill is a tower, on which a centinel is always placed, to give notice, by means of a flag, of the ships that are coming into the port. From this hill may be seen the sea, the whole extent of the city, and the parts round it.

In going along the sea-coast, there is a large basin cut out of the rock that lines the shore. On the sides of this basin, two beautiful saloons are hewn out by the chissel, with benches that run across them. A canal made zigzag, for the purpose of stopping the sand by its different windings, conveys into them the water of the sea, as pure and transparent as crystal. Seated on the stone bench, the water rises a little above the waist; while the feet softly repose on a fine sand. The waves of the sea are heard roaring against the rock, and foaming in the canal. The swell enters, raises you up, and leaves you; and thus, alternately entering and retiring, brings a continual fresh supply of water, and a coolness which is truly delicious under a burning sky. This place is vulgarly called the Bath of Cleopatra. Some ruins announce that it was formerly ornamented. Alexandria is about fifty leagues north of Cairo. Lat. 31. 12. N. lon. 31. 15. E.

ALEXANDRIA, a mountain of Myfia, on the sea-coast, forming a part of mount Ida, where Paris gave judgment on the three goddesses.

ALEXANDRIA, a strong and considerable city of Italy, belonging to the duchy of Milan, with a good castle, built in 1178 in honour of pope Alexander III. This pope made it a bishopric, with several privileges and exemptions. Prince Eugene of Savoy took this city in 1706, after three days siege. The French took it in 1745; but the king of Sardinia, to whom it belongs by the treaty of Utrecht, re-took it in 1746. The fortifications of the town are trifling, but the citadel is considerable. It is fifteen miles south-east of Cassal, thirty-five north-by-west of Genoa, and forty south-by-west of Milan. Lat. 44. 53. N. lon. 8. 40. E. The country about this town is called the Alexandrin.

ALEXANDRIA, a city of Arachosia, called also Alexandropolis, on the river Arachotus.—Another Alexandria in Gedrosia, built by Leonatus, by order of Alexander.—A third Alexandria in Aria, situated at the lake Arias; but, according to Pliny, built by Alexander on the river Arius.—A fourth in the Bactriana.—A fifth Alexandria, an inland town of Carmania.—A sixth Alexandria, or Alexandropolis, in the Sogdiana.—A seventh in India, at the confluence of the Arcefines and Indus.—An eighth, called also Alexandretta, near the Sinus Illicus, on the confines of Syria and Cilicia, now Scanderoon, the port-town to Aleppo.—A ninth Alexandria of Margiana, which, being demolished by the barbarians, was re-built by Antiochus the son of Seleucus, and called Antiochia of Syria; watered by the river Margus, which is divided into several channels, for the purposes of watering the country, which was called Zotale. The city was seventy stadia in circuit, according to Pliny; who adds, that, after the defeat of Crassus, the captives were conveyed to this place by Orodes, the king of the Parthians.—A tenth, of the Oxiana, built on the Oxus by Alexander, on the confines of Bactria.—An eleventh, built by Alexander at the foot of mount Paropamisus, which was called Caucasus.—A twelfth Alexandria in Troas, called also Troas and Antigonion.—A thirteenth on the Iaxartes, the boundary of Alexander's victories towards Scythia, and the last that he built on that side.

ALEXANDRIAN, *adj.* in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria. In this sense, Clemens is denominated Alexandrinus, though born at Athens. The same may be said of Apion, who was born at Oasis; and Arostarchus, by birth a Samothracian. The chief Alexandrian philosophers were, Ammonius, Plotinus, Origen, Porphyry, Jamblicus, Sopater, Maximus, and Dexippus.

Vol. I. No. 13.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus after his deification. Lampridius relates, that, notwithstanding Severus was killed by Maximin, the senate prosecuted his apotheosis; and, for regularity of worship, founded an order of priests, or *sodales*, under the denomination of *Alexandrin*.

ALEXANDRIAN LAUREL, *f.* in botany. See *Ruscus*.

ALEXANDRIAN MANUSCRIPT, a famous copy of the Scriptures, consisting of four volumes in a large quarto size; which contains the whole Bible in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum. It was sent as a present to king Charles I. from Cyrillus Lucaris, patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the Grand Signior, about the year 1628. Cyrillus brought it with him from Alexandria, where probably it was written.

ALEXANDRINE, *f.* A kind of verse borrowed from the French, first used in a poem called Alexander. They consist, among the French, of twelve and thirteen syllables, in alternate couplets; and, among us, of twelve.—Our numbers should, for the most part, be lyrical. For variety, or rather where the majesty of thought requires it, they may be stretched to the English heroic of five feet, and to the French alexandrine of six. *Dryden*.

Then, at the last and only couplet fraught
With some unmeaning thing they call a thought,
A needless alexandrine ends the song,
That, like a wounded snake, drags its slow length along.

Pope.

ALEXICACUS, *adj.* something that preserves the body from harm or mischief. The word amounts to much the same as *alexiterial*.

ALEXICACUS, in antiquity, was an attribute of Neptune, whom the tunny-fishers used to invoke under this appellation, that their nets might be preserved from the *ξίφας*, or sword fish, which used to tear them; and that he might prevent the assistance which it was pretended the dolphins used to give the tunnies on this occasion.

ALEXIPHARMIC, *adj.* [from *αλεξω*, to repel or drive away, and *φαρμακον*, poison; called also *antipharmaca*, and *caco alexiteria*.] Medicines, supposed fit to preserve the body against the power of poisons, or to correct or expel those taken into the machine. The words *alexiteria* and *antidota* have the same import, as also has the term *theriaca*; hence sudorifics and diaphoretics may be considered of this class; and perhaps the whole power of the alexipharmics can only be of any service by acting in one of these modes. The term has been also applied for *amulets*.

ALEXIS, a Piedmontese. There is a book of "Secrets," which for a long time has gone under his name. It was printed at Basil in 1536, and translated from Italian into Latin by Wecher; it has also been translated into French, and printed several times with additions. There is a preface to the piece, wherein Alexis informs us, that he was born of a noble family; that he had from his most early years applied himself to study; that he had learned the Greek, the Latin, the Hebrew, the Chaldean, the Arabian, and several other languages; that, having an extreme curiosity to be acquainted with the secrets of nature, he had collected as much as he could during his travels for fifty-seven years; that he piqued himself upon not communicating his secrets to any person; but that, when he was eighty-two years of age, having seen a poor man who had died of a sickness which might have been cured had he communicated his secret to the surgeon who took care of him, he was touched with such a remorse of conscience, that he lived almost like a hermit; and it was in this solitude that he ranged his secrets in order for publication.

ALEXITERICAL, or ALEXITERIC, *adj.* [from *αλεξω*, Gr.] That which drives away poison; that which resists fevers.

ALEYN (Charles), an English poet in the reign of Charles I. In 1631, he published two poems on the famous victories of Cressy and Poitiers. He succeeded his father as clerk of the ordnance, and was commissary-general of the artillery to the king at the battle of Edgehill. The next piece he wrote was a poem in honour of Henry VII. and the victory that gained him the crown of England. In 1639, the year before he died, he translated the history of Eurialus and Lucretia from the Latin epistles of *Æneas Sylvius*.

ALFANDIGA, the name of the custom-house at the city of Lisbon.

ALFAQUES, *f.* among the Moors, the name generally used for their clergy, or those who teach the Mahometan religion; in opposition to the Morabites, who answer to monks among Christians.

ALFATERNA, the last town of Campania, beyond Vesuvius; the same with **NOCERA**, which see.

ALFDOUCH, *f.* a name given by the Moors to a sort of vermicelli, which they make of flour and water, and are very fond of it in their entertainments.

ALFET, *f.* in our old customs, denotes a cauldron full of boiling water, wherein an accused person, by way of trial or purgation, plunged his arm up to the elbow.

ALFORD, a town in Lincolnshire, with a market on Tuesdays for provisions and corn; and two fairs, on Whit-Tuesday and November 8, for cattle and sheep. It is seated on a small brook that runs through the town, and is a compact place. A salt-spring was discovered here in 1670, from the pigeons which flew thither in great numbers to drink the water; those birds being known to be fond of salt. It contains a purging-salt, together with a portion of sea-salt. It is strongly purgative. It is recommended as cooling, cleansing, and attenuating. As a good remedy in the scurvy, jaundice, and other glandular obstructions. It also promotes urine and sweat, and therefore is good in gravelly and other disorders of the kidneys and bladder; and in complaints arising from obstructed perspiration. Alford is six miles from the sea, twenty-five north of Boston, and 142 from London. Lat. 53.30. N. lon. 0.15. E.

ALFRAGAN, **ALFERGANI**, or **FARGANI**, a celebrated Arabic astronomer, who flourished about the year 800. He was so called from the place of his nativity, Fergan, in Sogdiana, now called Maracanda, or Samarcand, anciently a part of Bactria. He is also called Ahmed (or Muhammed) ben-Cothair, or Katir. He wrote the Elements of Astronomy, in thirty chapters or sections. In this work the author chiefly follows Ptolemy, using the same hypotheses, and the same terms, and frequently citing him. There are three Latin translations of Alfragan's work; the best of which was made by Golius, professor of mathematics and Oriental languages at Leyden: this work, which came out in 1669, after the death of Golius, is accompanied with the Arabic text, and many learned notes.

ALFRED, or **ÆLFRED**, the Great, king of England, was the fifth and youngest son of Æthelwolf king of the West Saxons, and was born at Wantage in Berkshire, in 849. He distinguished himself, during the reign of his brother Ethelred, in several engagements against the Danes; and upon his death succeeded to the crown, in the year 871, and the twenty-second of his age. At his ascending the throne he found himself involved in a dangerous war with the Danes, and placed in such circumstances as called for the greatest valour, resolution, and all the other virtues with which he was adorned. The Danes had already penetrated into the heart of his kingdom; and, before he had been a month upon the throne, he was obliged to take the field against those formidable enemies. After many battles gained on both sides, he was at length reduced to the greatest difficulties, and was entirely abandoned by his subjects.

In this universal defection, Alfred vainly attempted to

remind them of the duty they owed their country and their king; but, finding his remonstrances ineffectual, he was obliged to submit to the wretched necessity of the times. Accordingly he assumed a disguise most likely to conceal him, and, after having properly disposed of his family, and settled a method of communication with some trusty friends, he engaged himself in the service of his own cow-herd. The wife of the herdsmen was ignorant of the rank of her royal guest, and seeing him one day busied by the fire-side, in trimming his bow and arrows, she desired him to take care of some cakes that were baking at the fire, while she was employed in other domestic affairs; but Alfred, whose thoughts were otherwise engaged, forgot the cakes, and the woman, on her return, finding them burnt, chid the king very severely, telling him, that he was always willing enough to eat her hot cakes, though he was so negligent in turning them.

Alfred soon after this retired to the isle of Æthelingey in Somersetshire, where he built a fort for the security of himself, his family, and the few faithful servants who repaired thither to him. When he had been about a year in this retreat, having been informed that some of his subjects had routed a great army of the Danes, killed their chiefs, and taken their magical standard, he issued his letters, giving notice where he was, and inviting his nobility to come and consult with him. Before they came to a final determination, Alfred, putting on the habit of a harper, went into the enemy's camp, where, without suspicion, he was every where admitted, and had the honour to play before their princes. Having thereby acquired an exact knowledge of their situation, he returned in great secrecy to his nobility, whom he ordered to their respective homes, there to draw together each man as great a force as he could; and upon a day appointed there was to be a general rendezvous at the great wood, called Selwood, in Wiltshire. This affair was transacted so secretly and expeditiously, that, in a little time, the king, at the head of an army, approached the Danes, before they had the least intelligence of his design. Alfred, taking advantage of the surprise and terror they were in, fell upon them, and totally defeated them, at Æthendune, now Eddington. Those who escaped fled to a neighbouring castle, where they were soon besieged, and obliged to surrender at discretion. Alfred granted them better terms than they could expect. He agreed to give up the whole kingdom of the East-Angles to such as would embrace the Christian religion, on condition they would oblige the rest of their countrymen to quit the island, and, as much as it was in their power, prevent the landing of any more foreigners. For the performance thereof he took hostages; and when, in pursuance of the treaty, Guthrum the Danish captain came, with thirty of his chief officers, to be baptized, Alfred answered for him at the font, and gave him the name of Æthelstane; and certain laws were drawn up betwixt the king and Guthrum for the regulation and government of the Danes settled in England. In 884, a fresh number of Danes landed in Kent, and laid siege to Rochester; but, the king coming to the relief of that city, they were obliged to abandon their design. Alfred had now great success; which was chiefly owing to his fleet, an advantage of his own creating. Having secured the sea-coasts, he fortified the rest of the kingdom with castles and walled towns; and he besieged and recovered from the Danes the city of London, which he resolved to repair, and to keep as a frontier.

The Danes had possessed themselves of London in the time of his father; and had held it till now as a convenient place for them to land at, and fortify themselves in; neither was it taken from them but by a close siege. However, when it came into the king's hands, it was in a miserable condition, scarcely habitable, and all its fortifications ruined. The king, moved by the importance of the place, and the desire of strengthening his frontier against the Danes, restored it to its ancient splendour.

And

And observing, that, through the confusion of the times, many, both Saxons and Danes, lived in a loose disorderly manner, without owning any government, he offered them now a comfortable establishment, if they would submit and become his subjects. This proposition was better received than he expected; for multitudes, growing weary of a vagabond kind of life, joyfully accepted such an offer.

After some years respite, Alfred was again called into the field; for a body of Danes, being worsted in the west of France, came with a fleet of 250 sail on the coast of Kent; and, having landed, fixed themselves at Apple-tree: shortly after, another fleet of eighty vessels coming up the Thames, the men landed, and built a fort at Middelton. Before Alfred marched against the enemy, he obliged the Danes, settled in Northumberland and Essex, to give him hostages for their good behaviour. He then moved towards the invaders, and pitched his camp between their armies, to prevent their junction. A great body, however, moved off to Essex; and, crossing the river, came to Farnham in Surrey, where they were defeated by the king's forces. Meanwhile the Danes settled in Northumberland, in breach of treaty, and notwithstanding the hostages given, equipped two fleets; and, after plundering the northern and southern coasts, sailed to Exeter, and besieged it. The king, as soon as he received intelligence, marched against them; but, before he reached Exeter, they had got possession of it. He kept them, however, blocked up on all sides; and reduced them at last to such extremities, that they were obliged to eat their horses, and were even ready to devour each other. Being at length rendered desperate, they made a general sally on the besiegers; but were defeated, though with great loss on the king's side. The remainder of this body of Danes fled into Essex, to the fort they had built there, and to their ships. Before Alfred had time to recruit himself, another Danish leader, whose name was Laf, came with a great army out of Northumberland, and destroyed all before him, marching on to the city of Werheal in the west, which is supposed to be Chester, where they remained the rest of that year. The year following they invaded North Wales; and, after having plundered and destroyed every thing, they divided, one body returning to Northumberland, another into the territories of the East-Angles; from whence they proceeded to Essex, and took possession of a small island called Merefig. Here they did not long remain; for, having parted, some sailed up the river Thames, and others up the Lea-road; where, drawing up their ships, they built a fort not far from London, which proved a great check upon the citizens, who went in a body and attacked it, but were repulsed with great loss: at harvest-time the king himself was obliged to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the excursions of the Danes. As he was one day riding by the side of the river Lea, after some observations, he began to think that the Danish ships might be laid quite dry: this he attempted, and succeeded; so that the Danes deserted their fort and ships, and marched away to the banks of the Severn. This contrivance of the king's is thought to have produced the meadow between Hertford and Bow; for at Hertford was the Danish fort, and from thence they made frequent excursions on the inhabitants of London. Authors are not agreed as to the method the king pursued in laying dry the Danish ships: Dugdale supposes that he did it by straitening the channel; but Henry of Huntingdon alleges, that he cut several canals, which exhausted its water. Such of the Danish ships as could be got off, the Londoners carried into their own road; the rest they burnt and destroyed.

Alfred enjoyed a profound peace during the three last years of his reign, which he chiefly employed in establishing and regulating his government, for the security of himself and his successors, as well as the ease and benefit of his subjects in general. After a troublesome reign of twenty-eight years, he died on the 28th of October, A. D.

900; and was buried at Winchester, in Hyde-abbey, under a monument of porphyry.

All our historians agree in distinguishing him as one of the most valiant, wisest, and best, of kings, that ever reigned in England; and it is also generally allowed, that he not only digested several particular laws still in being, but that he laid the first foundation of our present happy constitution. There is great reason to believe that we are indebted to this prince for trials by juries; and the Domesday-book, which is preserved in the exchequer, is thought to be no more than another edition of Alfred's Book of Winchester, which contained a survey of the kingdom. It is said also, that he was the first who divided the kingdom into shires: what is ascribed to him is not a bare division of the country, but the settling a new form of judicature; for, after having divided his dominions into shires, he subdivided each shire into three parts, called *trythings*. There are some remains of this ancient division in the ridings of Yorkshire, the laths of Kent, and the three parts of Lincolnshire. Each trything was divided into hundreds or wapentakes; and these again into tythings or dwellings of ten householders: each of these householders stood engaged to the king, as a pledge for the good behaviour of his family, and all the ten were mutually pledges for each other; so that, if any one of the tythings was suspected of an offence, if the head-boroughs or chiefs of the tything would not be security for him, he was imprisoned; and, if he made his escape, the tything and hundred were fined to the king. Each shire was under the government of an earl, under whom was the reeve, his deputy; since, from his office, called *shire-reeve* or *sheriff*. And so effectual were these regulations, that it is said he caused bracelets of gold to be hung up in the highways, as a challenge to robbers, and they remained untouched.

The merit of this prince, both in private and public life, may with advantage be set in opposition to that of any monarch or citizen which the annals of any age or any nation can present to us. He seems, indeed, to be the complete model of that perfect character, which, under the denomination of a sage or wise man, the philosophers have been fond of delineating, rather as a fiction of their imagination, than in hopes of ever seeing it reduced to practice: so happily were all his virtues tempered together, so justly were they blended, and so powerfully did each prevent the other from exceeding its proper bounds. He knew how to conciliate the most enterprising spirit with the coolest moderation; the most obstinate perseverance with the easiest flexibility; the most severe justice with the greatest lenity; the greatest vigour in command with the greatest affability of deportment; the highest capacity and inclination for science, with the most shining talents for action. His civil and his military virtues are almost equally the objects of our admiration, excepting only, that the former, being more rare among princes, as well as more useful, seem chiefly to challenge our applause. Nature also, as if desirous that so bright a production of her skill should be set in the fairest light, had bestowed on him all bodily accomplishments, vigour of limbs, dignity of shape and air, and a pleasant, engaging, and open, countenance. Fortune alone, by throwing him into that barbarous age, deprived him of historians worthy to transmit his fame to posterity; and we wish to see him delineated in more lively colours, and with more particular strokes, that we may at least perceive some of those small specks and blemishes, from which, as a man, it is impossible he could be entirely exempted.

In private life, Alfred was the most amiable man in his dominions; of so equal a temper, that he never suffered either sadness or unbecoming gaiety to enter his mind; but appeared always of a calm yet cheerful disposition, familiar to his friends, just even to his enemies, kind and tender to all. He was a remarkable economist of his time; and Asserius has given us an account of the method he took for dividing and keeping an account of it: he caused six wax-candles to be made, each of twelve

inches length, and of as many ounces weight; on the candles the inches were regularly marked, and, having found that one of them burnt just four hours, he committed them to the care of the keepers of his chapel, who from time to time gave him notice how the hours went: but, as in windy weather the candles were wasted by the impression of the air on the flame, to remedy this inconvenience, he invented lanthorns, there being then no glass in his dominions.

A jewel, richly wrought, was dug up in the island of Æthelinge, which was some time the king's retreat when he fled from the Danes. This curious relic is still preserved in the Ashmolean collection of curiosities; and, besides its excellent workmanship, hath a Saxon inscription to this purpose: *ÆLFREDUS ME JUSSIT FABRICARI*—"Alfred directed this to be made." In his kingdom the industrious foreigner found a generous welcome; inventors, artists, mechanics, were all courted to repair to it, and none departed unrewarded.

This prince, we are told, was twelve years of age before a master could be procured in the western kingdom to teach him the alphabet; such was the state of learning when Alfred began to reign. He had felt the misery of ignorance, and determined even to rival his cotemporary Charlemagne in the encouragement of literature. He is supposed to have appointed persons to read lectures at Oxford, and is thence considered as the founder of that university. By other proper establishments, and by a general encouragement to men of abilities, he did every thing in his power to diffuse knowledge throughout his dominions. Nor was this end promoted more by his countenance and encouragement than by his own example and his writings. For, notwithstanding the lateness of his initiation, he had acquired extraordinary erudition; and, had he not been illustrious as a king, he would have been famous as an author. His works are, 1. *Breviarium quoddam collectum ex Legibus Trojanorum*, &c. lib. I. A Breviary collected out of the Laws of the Trojans, Greeks, Britons, Saxons, and Danes, in one book. Leland saw this book in the Saxon tongue, at Christchurch in Hampshire. 2. *Visi-Saxonum Leges*, lib. I. The laws of the West-Saxons, in one book. Pitts tells us, that it is in Bennet-college library, at Cambridge. 3. *Instituta quedam*, lib. I. Certain Institutes, in one book. This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. 4. *Contra Judices iniquos*, lib. I. An Invektive against unjust Judges, in one book. 5. *Acta Magistratum suorum*, lib. I. Acts of his Magistrates, in one book. This is supposed to be the book of judgments mentioned by Horne; and was, in all probability, a kind of reports, intended for the use of succeeding ages. 6. *Regum Fortunæ variæ*, lib. I. The various Fortunes of Kings, in one book. 7. *Dicta Sapientum*, lib. I. The Sayings of Wise Men, in one book. 8. *Parabolæ et Sales*, lib. I. Parables and Pleasant Sayings, in one book. 9. *Collectiones Chronicorum*: Collection of Chronicles. 10. *Epistolæ ad Wulfsigium Episcopum*, lib. I. Epistles to Bishop Wulfsig, in one book. 11. *Manuale Meditationum*: A Manual of Meditations.

Besides these original works, he translated many authors from the Latin, &c. into the Saxon language, viz. 1. Bede's History of England. 2. Paulinus Orosius's History of the Pagans. 3. St. Gregory's Pastoral, &c. The first of these, with his prefaces to the others, together with his laws, were printed at Cambridge, 1644. His laws are likewise inserted in Spelman's Councils. 4. *Boethius de Consolatione*, lib. V. Boethius's Consolations of Philosophy, in five books. Dr. Plot tells us, king Alfred translated it at Woodstock, as he found in a MS. in the Cotton Library. 5. *Æsop's Fables*, which he is said to have translated from the Greek both into Latin and Saxon. 6. *Psalterium Davidicum*, lib. I. David's Psalter, in one book. This was the last work the king attempted, death surprising

him before he had finished it; it was, however, completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman. Several others are mentioned by Malmſbury; and the old History of Ely asserts, that he translated the Old and New Testaments.

The life of this great king was first written by Afferius Menevenſis; and first published by archbishop Parker, in the old Saxon character, at the end of his edition of Haddingham's history, printed in 1674, fol.

The annexed Portrait of Alfred the Great, is taken from the only original painting of that monarch, preserved in the Bodleian Library, in the University of Oxford.

ALFRETON, Derbyshire, is situated in a very plentiful coal-country, and is supposed to take its name from king Alfred, who resided here; there being still some remains of the palace. It is a considerable market for corn, particularly oats: market-day chartered for Monday, but held on Friday. There are three fairs; one at Easter, one at Whitfuntide, and the other on the last day of July. Alfreton, according to history, is famous for nappy ale. It is situated from Nottingham sixteen miles, Derby sixteen, Chesterfield ten, Mansfield nine, Workworth ten, Bakewell seventeen, Matlock-bath eight, and London 141. Adjacent towns are, Southwimfield, Ashover, Shirland, Tibshelf, and Hardwick. It has two free-schools, one at Swanwick, another at Hallfield-gate; also a manufactory of stockings, and brown earthenware: its annual return amounts to 50,000l. Here is one church, and one dissenting meeting-house; and there is a canal about two miles off, which goes from Cronford into the Erewash canal. About two or three miles from this place begin those moors which extend a great way into the country, and are very dangerous to travellers, by reason of the rocks and bogs.

ALGA, *f.* in botany, the trivial name of the lichen, fucus, and several other plants of the cryptogamia class.

ALGÆ, *f.* in botany. See CRYPTOGRAMIA.

ALGAGIOLA, a small sea-port town in the island of Corfica, fortified with walls and bastions. It was almost destroyed by the malcontents in 1731, but has since been repaired. Lat. 42. 20. N. lon. 9. 45. E.

ALGAROT, *f.* in chemistry, an Arabic term for an emetic powder, prepared from regulus of antimony, dissolved in acids, and separated by repeated lotions in warm water.

ALGAROTI, commonly called Count Algaroti, a celebrated Italian of the present century, well skilled in architecture and the Newtonian philosophy, &c. Algaroti was born at Padua, but in what year has not been mentioned. Led by curiosity, as well as a desire of improvement, he travelled early into foreign countries; and was very young when he arrived in France in 1736. It was here that he composed his Newtonian Philosophy for the Ladies, as Fontenelle had done his Cartesian Astronomy, in the work intitled The Plurality of Worlds. He was much noticed by the king of Prussia, who conferred on him many marks of his esteem. He died at Pisa the 23d of May, 1764, and gave orders for his own mausoleum, with this inscription upon it; *Hic jacet Algarotus, sed non omnis*. He was esteemed to be well skilled in painting, sculpture, and architecture. His works, which are numerous, and upon a variety of subjects, abound with vivacity, elegance, and wit; a collection of them has lately been made and printed at Leghorn.

ALGARVA, a province in the kingdom of Portugal, sixty-seven miles in length and twenty in breadth; bounded on the west and south by the sea, on the east by the river Guadiana, and on the north by Alentejo. It is very fertile in figs, almonds, dates, olives, and excellent wines; besides, the fishery brings in large sums. The capital town is Pharo. It contains four cities, twelve towns, sixty-seven parishes, and 61,000 inhabitants.

J. Chapman sculp.

ALFRED the GREAT.

London: Published as the Act directs March 5 1796. by J. Wilkes.

A L G E B R A,

A GENERAL method of resolving mathematical problems by means of equations. Or, it is a method of performing the calculations of all sorts of quantities by means of general signs or characters. At first, numbers and things were expressed by their names at full length; but afterwards these were abridged, and the initials of the words used instead of them; and, as the art advanced farther, the letters of the alphabet came to be employed as general representations of all sorts of quantities; and other marks were gradually introduced, to express all sorts of operations and combinations; so as to entitle it to different appellations—*universal arithmetic*, and *literal arithmetic*, and the *arithmetic of signs*. And since its operations in the resolution of problems are performed by taking them always backwards in the contrary order, it hence becomes a species of the analytic art, and is called the *modern analysis*, in contradistinction to the *ancient analysis*, which chiefly respected geometry and its applications.

The etymology of the name, *algebra*, is given in various ways. It is an Arabic word, and by the Arabians is coupled with the word *macabelah*, signifying opposition and comparison, to express what we properly call algebra. Some derive it from Gebar, a celebrated philosopher, chemist, and mathematician, whom the Arabs call *Giaber*; but others, with more probability, derive it from *geber*, by prefixing the article *al*, which properly signifies the reduction of fractions to a whole number.

As to the origin of the analytic art, of which algebra is a species, it is doubtless as old as any science in the world, being the natural method by which the mind investigates truths, causes, and theories, from their observed effects and properties. Accordingly, traces of it are observable in the works of the earliest philosophers and mathematicians, the subject of whose researches most of any required the aid of such an art. The oldest treatise, however, which has come down to us, is that of Diophantus of Alexandria, who flourished about the year 350 after Christ, and who wrote, in the Greek language, thirteen books of Algebra or Arithmetic, though only six of them have hitherto been printed; and an imperfect book on Multangular Numbers, in a Latin translation, by Xilander, in the year 1575, and afterwards in 1621 and 1670 in Greek and Latin by Gaspar Bachet. These books however do not contain a treatise on the elementary parts of algebra, but only collections of difficult questions relating to square and cube numbers, and other curious properties of numbers, with their solutions.

But, although Diophantus was the first author on algebra that we now know of, it was not from him, but from the Moors or Arabians, that we received the knowledge of algebra in Europe, as well as that of most other sciences. And it is matter of dispute who were the first inventors of it; some ascribing the invention to the Greeks, while others say that the Arabians had it from the Persians, and these from the Indians, as well as the arithmetical method of computing by ten characters, or digits; but the Arabians themselves say it was invented amongst them by *Mahomet ben Musa*, or son of Moses, who it seems flourished about the 8th or 9th century. It is more probable, however, that Mahomet was not the inventor, but only a person well skilled in the art; and it is farther probable, that the Arabians drew their first knowledge of it from Diophantus or other Greek writers, as they did that of geometry and other sciences, which they improved and translated into their own language; and from them it was that we received these sciences, before the Greek authors were known to us, after the Moors settled in Spain, and after the Europeans began to hold communications with them, and that our countrymen began to travel amongst them to learn the sciences. And according to the testi-

mony of Abulpharagius, the Arithmetic of Diophantus was translated into Arabic by Mahomet ben-yahya Baziani. But whoever were the inventors and first cultivators of algebra, it is certain that the Europeans first received the knowledge, as well as the name, from the Arabians or Moors, in consequence of the close intercourse which subsisted between them for several centuries. And it appears that the art was pretty generally known, and much cultivated, at least in Italy, if not in other parts of Europe also, long before the invention of printing, as many writers upon the art are still extant in the libraries of manuscripts; and the first authors, presently after the invention of printing, speak of many former writers on this subject, from whom they learned the art.

It was chiefly among the Italians that this art was first cultivated in Europe. And the first author whose works we have in print, was Lucas Pacioli, or Lucas de Burgo, a Cordelier, or Minorite Friar. He wrote several treatises of Arithmetic, Algebra, and Geometry, which were printed in the years 1470, 1476, 1481, 1487, and in 1494. His principal work, intitled *Summa de Arithmetica, Geometria, Proportioni, et Proportionalita*, is a very masterly and complete treatise on those sciences, as they then stood. In this work he mentions various former writers, as Euclid, St. Augustine, Sacrobosco or Halifax, Boetius, Prodocimo, Giordano, Biagio da Parma, and Leonardus Pisanus, from whom he learned those sciences.

After Pacioli appeared Stifelius and Scheubelius, German authors; and after them came Scipio Ferreus, Cardan, Tartalea, and several others, whose works reached as far as the solution of some cubic equations. Ramus and Bombelli followed these, and went a little farther. At last came Nunnius, Stevinus, Schoner, Salignac, Clavius, &c. who all of them took different courses, but none of them went beyond quadratics.

In 1599, Vieta introduced what he called his "*Specious Arithmetic*," which consists in denoting the quantities, both known and unknown, by symbols or letters. He also introduced an ingenious method of extracting the roots of equations by approximations; since greatly improved and facilitated by Raphson, Halley, Maclaurin, Simpson, and others.

Vieta was followed by Oughtred, who, in his *Clavis Mathematica*, printed in 1631, improved Vieta's method, and invented several compendious characters, to shew the sums, differences, rectangles, squares, cubes, &c.

Harriot, another Englishman, cotemporary with Oughtred, left several treatises at his death; and, among the rest, an Analysis, or Algebra, which was printed in 1631, where Vieta's method is brought into a still more commodious form, and is much esteemed to this day.

In 1637, Des Cartes published his geometry, wherein he made use of the literal calculus and the algebraic rules of Harriot; and as Oughtred in his *Clavis*, and Marin Ghetaldus in his books of mathematical composition and resolution published in 1630, applied Vieta's arithmetic to elementary geometry, and gave the construction of simple and quadratic equations; so Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher, equations.

Des Cartes's rule for constructing cubic and biquadratic equations was farther improved by Thomas Baker, in his *Clavis Geometrica Catholica*, published in 1684; and the foundation of such constructions, with the application of algebra to the quadratures of curves, questions of *maximis et minimis*, the centrobaryc method of Guldhus, &c. was given by R. Slusius, in 1668; as also by Fermat in his *Opera Mathematica*, Roberval in the *Mém. de Mathem. et de Physique*, and Barrow in his *Lect. Geomet.* In 1708, algebra

was applied to the laws of chance and gaming, by R. de Montmort; and since by de Moivre and James Bernouilli.

The elements of the art were compiled and published by Kersey, in 1671; wherein the specious arithmetic, and the nature of equations, are largely explained, and illustrated by a variety of examples; the whole substance of Diaphantus is here delivered, and many things added concerning mathematical composition and resolution from Ghetaldus. The like has been since done by Prestet in 1694, and by Ozanam in 1703. But these authors omit the application of algebra to geometry; which defect is supplied by Guisnee in a French treatise expressly on the subject published in 1704, and l'Hopital in his analytical treatise of the Conic Sections in 1707. The rules of algebra are also compendiously delivered by Sir Isaac New-

ton, in his *Arithmetica Universalis*, first published in 1707, which abounds in select examples, and contains several rules and methods invented by the author.

Algebra has since been much improved, and applied to the consideration and calculus of infinities, by Dr. Brooke Taylor, Nicole, Sterling, Campbell, Wolfius, Clairaut, Fontaine, Emerson, Landen, Euler, Malbranche, Waring, Hales, and others; from whence a new and extensive branch of knowledge has arisen, called the *Doktrine of Fluxions*, or *Analysis of Infinites*, or the *Calculus Differentialis*.

A very useful work, on the Principles of the Mathematics, in 4 vols. containing the elements of Algebra, Fluxions, Optics, &c. was lately published in the university of Cambridge, by J. Wood, B. D. and the Rev. Mr. Vince; on the plan of which the following treatise is given:

P A R T I.

DEFINITIONS AND EXPLANATIONS OF SIGNS.

KNOWN or determined quantities are usually represented by the first letters of the alphabet, a, b, c, d , &c. and unknown or undetermined quantities by the last, as w, x, y , &c. And the following signs are made use of to express the relations which these quantities bear to each other:

Plus $+$ signifies that the quantity to which it is prefixed must be added. Thus $a+b$ signifies that the quantity represented by b is to be added to that represented by a ; if a represents 5, and b 7, $a+b$ represents 12. If no sign be placed before a quantity the sign $+$ is understood. Thus a , signifies $+a$. Such quantities are called *positive* quantities.

Minus $-$ signifies that the quantity to which it is prefixed must be subtracted. Thus $a-b$, signifies that b must be taken from a ; if a be 7, and b 5, $a-b$ expresses 7 diminished by 5, or 2. Quantities to which the sign $-$ is prefixed are called *negative* quantities.

Into $\times$ signifies that the quantities between which it stands are to be multiplied together. Thus $a \times b$ signifies that the quantity represented by a is to be multiplied by the quantity represented by b ; for, since quantities may in each particular case be represented by numbers, we may without impropriety speak of the multiplication, division, &c. of quantities by each other. This sign is frequently omitted, thus abc signifies $a \times b \times c$. Or a full point is used instead of it; thus $1 \times 2 \times 3$ and $1.2.3$ signify the same thing. If in multiplication the same quantity be repeated any number of times, the product is usually expressed by placing above the quantity the number which represents how often it is repeated, thus $a, a \times a, a \times a \times a, a \times a \times a \times a$, and a^1, a^2, a^3, a^4 , have respectively the same signification. These quantities are called *powers*, thus a^1 , is called the first power of a ; a^2 , the second power or square; a^3 , the third power or cube of a , &c. The numbers 1, 2, 3, &c. are called the *indices* of a .

Divided by $\div$ signifies that the former of the quantities between which it is placed is to be divided by the latter. Thus $a \div b$ signifies that the quantity a is to be divided by b . The division of one quantity by another is frequently represented by placing the dividend over the divisor with a line between them, in which case the expression is called a fraction. Thus, $\frac{a}{b}$ signifies a divided by b , and a is

also the numerator and b the denominator of the fraction; $\frac{a+b+c}{e+f+g}$ signifies that a, b , and c , added together, are to be divided by e, f , and g , added together. A quantity in the denominator of a fraction is also expressed by placing it in the numerator, and prefixing the negative sign to its index; thus, $a^{-1}, a^{-2}, a^{-3}, a^{-n}$, signify $\frac{1}{a}, \frac{1}{a^2}, \frac{1}{a^3}, \frac{1}{a^n}$, respectively; these are called *negative powers* of a .

The sign $\sim$ between two quantities signifies their *difference*; $a \sim x$, is $a-x$ or $x-a$, according as a or x is the greater.

A line drawn over several quantities signifies that they are to be taken collectively, and it is called a *vinculum*.

Thus $\overline{a-b+c} \times d-e$ signifies that the quantity represented by $a-b+c$ is to be multiplied by the quantity represented by $d-e$. Let a stand for 6; b , 5; c , 4; d , 3; and e , 1; then $\overline{a-b+c}$ is $6-5+4$, or 5; and $d-e$ is $3-1$, or 2; therefore $\overline{a-b+c} \times d-e$ is 5×2 , or 10; $\overline{ab-cd} \times \overline{ab-cd}$ or $\overline{ab-cd}^2$ signifies that the quantity represented by $ab-cd$, is to be multiplied by itself.

Equal $=$ signifies that the quantities between which it is placed are equal to each other; thus $ax-by=cd+ad$ signifies that the quantity $ax-by$ is equal to the quantity $cd+ad$.

The *square root* of any proposed quantity is that quantity whose square or second power gives the proposed quantity. The *cube root* is the quantity whose cube gives the

proposed quantity, &c. $\sqrt{\quad}$ or $\sqrt[2]{\quad}$, $\sqrt[3]{\quad}$, $\sqrt[4]{\quad}$, &c. are used to express the square, cube, biquadrate, &c. roots of the quantities

before which they are placed: as, $\sqrt[2]{a^2}=a$, $\sqrt[3]{a^3}=a$, $\sqrt[4]{a^4}=a$, &c. If these roots cannot be exactly determined, the quantities are called *irrational* or *surds*.

Points are made use of to denote proportion, thus $a:b::c:d$, signifies that a bears the same proportion to b that c bears to d .

The number prefixed to any quantity, and which shews how often it is to be taken, is called its *coefficient*. Thus, 7, 6, and 3, are called the coefficients of $7ax$, $6by$, and $3dz$, respectively. When no number is prefixed, the quantity is to be taken once, or the coefficient 1 is understood. These numbers are sometimes represented by letters, which are also called coefficients.

Similar or *like* algebraical quantities are such as differ only in their coefficients; $4a$, $6ab$, $9a^2$, $3a^2bc$, are respectively similar to $15a$, $3ab$, $12a^2$, $15a^2bc$, &c. *Unlike* quantities are different combinations of letters; thus, ab , a^2b , ab^2 , abc , &c. are unlike.

A quantity is said to be a *multiple* of another, when it contains it a certain number of times exactly; thus $16a$ is a multiple of $4a$, as it contains it exactly four times. A quantity is called a *measure* of another when it is contained in it a certain number of times exactly; thus $4a$ is a measure of $16a$.

A *simple* algebraical quantity is one which consists of a single term, as a^2bc . A *binomial* is a quantity consisting of two terms, as $a+b$, or $2a-3bx$. A *trinomial* is a quantity consisting of three terms, as $2a+bd-3c$.

The following examples will serve to illustrate the method of representing quantities algebraically:

Let $a=8$, $b=7$, $c=6$, $d=5$, and $e=1$; then
 $3a-2b+4c-e=24-14+24-1=33$.

$$ab+cc-bd=56+6-35=27.$$

$$\frac{a+b}{c-e} = \frac{3b-2c}{a-d} = \frac{8+7}{6-1} = \frac{21-12}{8-5} = \frac{15}{5} = \frac{9}{3} = 6.$$

$$d^2 \times a - c - 3ce + d^2 = 25 \times 2 - 18 + 125 = 50 - 18 + 125 = 157.$$

AXIOMS.

If equal quantities be added to equal quantities the wholes will be equal.

If equal quantities be taken from equal quantities the remainders will be equal.

If equal quantities be multiplied by the same or equal quantities the products will be equal.

If equal quantities be divided by the same or equal quantities the quotients will be equal.

If the same quantity be added to and subtracted from another the value of the latter will not be altered.

If a quantity be both multiplied and divided by another its value will not be altered.

ADDITION of ALGEBRAICAL QUANTITIES.

To add quantities together is to connect them with their proper signs, uniting into one sum those that can be so united. Ex. 1. If the following quantities are to be added:

$\begin{array}{r} ax \\ -by \\ +e^2 \\ -cd \\ \hline \end{array}$	Ex. 2. $\begin{array}{r} a+2b-c \\ d-5e+f \\ \hline \text{Sum } a+2b-c+d-5e+f \end{array}$

Sum is $ax-by+e^2-cd$

It is immaterial in what order the quantities are set down, if we take care to prefix to each its proper sign. When any terms are similar they may be incorporated, and the general expression for the sum shortened.

First, When similar quantities have the *same* sign, their sum is found by taking the sum of the coefficients with that sign and annexing the common letters.

Ex. 3. $\begin{array}{r} 5a-3b \\ 4a-7b \\ \hline \text{Sum } 9a-10b \end{array}$	Ex. 4. $\begin{array}{r} 4a^2c-10bde \\ 6a^2c-9bde \\ 11a^2c-3bde \\ \hline \text{Sum } 21a^2c-22bde \end{array}$

The reason is evident; $5a$ to be added together with $4a$ to be added makes $9a$ to be added; and $3b$ to be subtracted together with $7b$ to be subtracted is $10b$ to be subtracted.

Secondly, If similar quantities have *different* signs, their sum is found by taking the difference of the coefficients with the sign of the greater and annexing the common letters as before.

Ex. 5.

$$\begin{array}{r} 7a+3b \\ -5a-9b \\ \hline \text{Sum } 2a-6b \end{array}$$

In the first part of the operation we have 7 times a to add, and 5 times a to take away, therefore upon the whole we have 2 to add. In the latter part, we have 3 times b to add, and 9 times b to take away, i. e. we have upon the whole 6 times b to take away; and thus the sum of all the quantities is $2a-6b$.

Ex. 6.

$$\begin{array}{r} a+b \\ a-b \\ \hline \text{Sum } 2a \end{array}$$

If several similar quantities are to be added together, some with positive and some with negative signs, take the difference between the sum of the positive coefficients and the sum of the negative, prefix the sign of the greater sum and annex the common letters.

Ex. 7.

$$\begin{array}{r} 3a^2+4bc-e^2+10 \\ -5a^2+6bc+2e^2-15 \\ -4a^2-9bc-10e^2+21 \\ \hline \text{Sum } -6a^2+bc-9e^2+16 \end{array}$$

The method of reasoning in this case is the same as in the last example.

SUBTRACTION.

Subtraction, or the taking away of one quantity from another, is performed by changing the sign of the quantity to be subtracted, and then adding it to the other.

Ex. 1. From $2bx$ take cy , and the difference is properly represented by $2bx-cy$; because the sign $-$ prefixed to cy , shews that it is to be subtracted from the other; and $2bx-cy$ is the sum of $2bx$ and $-cy$.

Ex. 2. Again from $2bx$ take $-cy$, and the difference is $2bx+cy$, because $2bx=-2bx+cy-cy$. Take away $-cy$ from these equal quantities, and the differences will be equal, i. e. the difference between $2bx$ and $-cy=2bx+cy$, the quantity which arises from adding $+cy$ to $2bx$.

Ex. 3. $\begin{array}{r} a+b \\ \text{Take } a-b \\ \hline \text{Difference } +2b \end{array}$	Ex. 4. $\begin{array}{r} 6a-12b \\ \text{Take } -5a-10b \\ \hline \text{Diff. } 11a-2b \end{array}$

Ex. 5. $\begin{array}{r} \text{From } 5a^2+4ab-6xy \\ \text{Take } 11a^2+6ab-4xy \\ \hline \text{Diff. } -6a^2-2ab-2xy \end{array}$	Ex. 6. $\begin{array}{r} 4a-3b+6c-11 \\ 10x+a-15-2y \\ \hline -10x+3a-3b+4+6c+2y \end{array}$

MULTIPLICATION.

The multiplication of simple algebraical quantities is performed thus: $a \times b$ or ab represents the product of a multiplied by b ; abc the product of the three quantities a , b , and c . It is also indifferent in what order they are placed, $a \times b$ and $b \times a$ being equal. For $1 \times a = a \times 1$ or one taken a times is the same with a taken once; also b taken a times, or $b \times a$, is b times as great as 1 taken a times, and a taken b times, or $a \times b$, is b times as great as a taken once; therefore $b \times a = a \times b$. Also $abc = cab = bac = acb$, &c. for, as in the former case, $1 \times a \times b = a \times b \times 1$ and $c \times a \times b$ is c times as great as $1 \times a \times b$, also $a \times b \times c$ is c times as great as $a \times b \times 1$, therefore $a \times b \times c = c \times a \times b$.

To determine the *sign* of the product observe the following rule:—If the multiplier and multiplicand have the same sign, the product is positive: if they have different signs, it is negative.

First, $+a \times +b = +ab$; because in this case a is to be taken positively b times, therefore the product ab must be positive.

Secondly, $-a \times +b = -ab$; because $-a$ is to be taken b times, that is, we must take $-ab$.

Thirdly, $+a \times -b = -ab$; for a quantity is said to be multiplied by a negative number $-b$, if it be subtracted b times; and a subtracted b times is $-ab$.

Fourthly, $-a \times -b = +ab$. Here $-a$ is to be subtracted b times, that is $-ab$ is to be subtracted, but subtracting $-ab$ is the same as adding $+ab$; therefore we have to add $+ab$.

The second and fourth cases may be thus proved: $a - a = 0$; multiply both sides by b , and $a \times b$ together with $-a \times b$ must be equal to $b \times 0$, or nothing; therefore, $-a$ multiplied by b must give $-ab$, a quantity which when added to ab makes the sum nothing. Again, $a - a = 0$; multiply both sides by $-b$, then $-ab$ together with $-a \times -b$ must be $= 0$, therefore $-a \times -b = +ab$.

If the quantities to be multiplied have coefficients, these must be multiplied together as in common arithmetic; the sign and the literal product being determined by the preceding rules. Thus $3a \times 5b = 15ab$; because $3 \times a \times 5 \times b = 3 \times 5 \times a \times b = 15ab$; $4x \times -11y = -44xy$; $-9b \times -5c = +45bc$; $-6d \times 4m = -24md$.

The powers of the same quantity are multiplied together by adding the indices; thus $a^2 \times a^3 = a^5$, for $aa \times aaa = aaaaa$. In the same manner $a^m \times a^n = a^{m+n}$; $-3a^2 \times 3 \times 5axy = -15a^3x^2y^2$.

If the multiplier or multiplicand consist of several terms, each term of the latter must be multiplied by every term of the former, and the sum of all the products taken, for the whole product of the two quantities.

Mult.

$$\begin{array}{r} \text{Mult. } a+b \\ \text{By } c+d \\ \hline \text{Prod. } ac+bc+ad+bd \end{array}$$

Here $a+b$ is to be added to itself $c+d$ times, i. e. c times and d times.

$$\begin{array}{r} \text{Mult. } a+b \\ \text{By } c-d \\ \hline \text{Prod. } ac+bc-ad-bd \end{array}$$

Here $a+b$ is to be taken $c-d$ times, that is c times wanting d times, or c times positively and d times negatively.

$$\begin{array}{r} \text{Ex. 1. Mult. } a+b \\ \text{By } a+b \\ \hline a^2+ab \\ +ab+b^2 \\ \hline \text{Prod. } a^2+2ab+b^2 \end{array}$$

$$\begin{array}{r} \text{Ex. 2. Mult. } a+b \\ \text{By } a-b \\ \hline a^2+ab \\ -ab-b^2 \\ \hline \text{Prod. } a^2-b^2 \end{array}$$

$$\begin{array}{r} \text{Ex. 3. Mult. } 3a^2-5bd \\ \text{By } -5a^2+4bd \\ \hline -15a^3+25a^2bd \\ +12a^2bd-20b^2d^2 \\ \hline \text{Prod. } -15a^3+37a^2bd-20b^2d^2 \end{array}$$

SCHOLIUM. The method of determining the sign of a product from the consideration of abstract quantities has been found fault with by some algebraical writers, who contend that $-a$, without reference to other quantities, is imaginary and consequently not the object of reason or demonstration. In answer to this objection we may observe; that whenever we make use of the notation $-a$, and say it signifies a quantity to be subtracted, we make a tacit reference to other quantities, and mean, that wherever a is concerned it is to be taken from the collective sum of those magnitudes with which it is connected; and when we speak of $-a$ being taken b times, or a subtracted b times, we must understand that it is to be taken b times from some other quantities.—If in the solution of any problem it should appear that a quantity results which is to be subtracted, and there is nothing to subtract it from, we must either conclude that the problem itself involves an absurdity, or, that some supposition made in the operation is inconsistent with the conditions of the problem. Vid. Simpson's Alg. p. 23.

DIVISION.

To divide one quantity by another, is to determine how often the latter is contained in the former, or what quantity multiplied by the latter will give the former. Thus to divide ab by a is to determine how often a must be taken to make up ab , that is, what quantity multiplied by a will give ab , which we know is b . From this consideration are derived all the rules for the division of algebraical quantities.

If the divisor and dividend be affected with like signs, the sign of the quotient is $+$; but, if their signs be unlike, the sign of the quotient is $-$. If $-ab$ be divided by $-a$, the quotient is $+b$, because $-a \times +b$ gives $-ab$; and a similar proof may be applied to the other cases.

In the division of simple quantities, if the coefficient and literal product of the divisor be found in the dividend, the other part of the dividend with the sign determined by the last rule is the quotient.

Thus $\frac{abc}{ab} = c$, because ab multiplied by c gives abc .

If we first divide by a and then by b , the result will be the same; for $\frac{abc}{a} = bc$, and $\frac{bc}{b} = c$ as before.

COR. Hence any power of a quantity is divided by any other power of the same quantity by taking the index of the divisor from the index of the dividend.

Thus, $\frac{a^5}{a^3} = a^2$; $\frac{a^5}{a^6} = \frac{1}{a}$; $\frac{a^m}{a^n} = a^{m-n}$.

If only a part of the product which forms the divisor be

contained in the dividend, the division must be represented as follows, and the quantities contained in both the divisor and dividend expunged.

Thus, $15a^3b^2c$ divided by $-3a^2bx$ or $\frac{15a^3b^2c}{-3a^2bx} = \frac{-5abc}{x}$.

First, divide by $-3a^2b$ and the quotient is $-5abc$; this quantity is still to be divided by x ; and, as x is not contained in it, the division can only be represented in the usual way, that is, $\frac{-5abc}{x}$ is the quotient.

If the dividend consist of several terms, and the divisor be a simple quantity, every term of the dividend must be divided by it.

Thus, $\frac{a^3x^2-5abx^3-6ax^4}{ax^2} = a^2-5bx-6x^2$.

When the divisor also consists of several terms, arrange both the divisor and dividend according to the powers of some one letter contained in them, then find how often the first term of the divisor is contained in the first term of the dividend, and write down this quantity for the first term in the quotient; multiply the whole divisor by it, subtract the product from the dividend, and bring down to the remainder as many other terms of the dividend as the case may require, and repeat the operation till all the terms are brought down.

Ex. If $a^2-2ab+b^2$ be divided by $a-b$, the operation will be as follows:

$$\begin{array}{r} a-b \overline{) a^2-2ab+b^2} \\ \underline{a^2-ab} \\ -ab+b^2 \\ \underline{-ab+b^2} \\ 0 \end{array}$$

The reason of this, and the preceding rule, is, that as the whole dividend is made up of all its parts, the divisor is contained in the whole as often as it is contained in all the parts. In the preceding operation we inquire first how often a is contained in a^2 , which gives a for the first term of the quotient; then multiplying the whole divisor by it, we have a^2-ab to be subtracted from the dividend, and the remainder is $-ab+b^2$, with which we are to proceed as before.

On the Transformation of Fractions to others of equal Value.

If the signs of all the terms both in the numerator and denominator of a fraction be changed, its value will not be altered. For $\frac{-ab}{-a} = +b = \frac{+ab}{+a}$.

If the numerator and denominator of a fraction be both multiplied or both divided by the same quantity, its value is not altered. For $\frac{ac}{bc} = \frac{a}{b}$. Hence a fraction is reduced to its lowest terms, by dividing both the numerator and denominator by the greatest quantity that measures them both.

The greatest common measure of two quantities is found by arranging them according to the powers of some letter, and then dividing the greater by the less, and the preceding divisor always by the last remainder, till the remainder is nothing; the last divisor will be the greatest common measure required.

Let a and b be the two quantities, and let b be contained in a , p times with a remainder c ; again let c be contained in b , q times with a remainder d , and so on till nothing remains; let d be the last divisor, and it will be the greatest common measure of a and b . The truth of this rule depends upon these two principles;

1. If one quantity measure another, it will also measure any multiple of it. Let x measure y by the units in n , then it will measure cy by the units in nc .

2. If a quantity measure two others, it will measure their sum or difference. Let a be contained in x , m times, and in

in y , n times, then $ma = x$ and $na = y$, therefore $x \pm y = ma \pm na = m \pm n \cdot a$, i. e. a is contained in $x \pm y$, $m \pm n$ times, or it measures $x \pm y$ by the units in $m \pm n$.

Now it appears that $a - pb = c$, and $b - qc = d$; every quantity therefore which measures a and b , measures pb , and $a - pb$ or c ; hence also it measures qc , and $b - qc$ or d ; that is, every common measure of a and b measures d . It appears also from the division, that $a = pb + c$, $b = qc + d$, $c = rd$, therefore d measures c , and qc , and $qc + d$ or b , hence it measures pb and $pb + c$ or a . Every common measure then of a and b measures d , and d measures a and b , therefore d is their greatest common measure.

Ex. To find the greatest common measure of $a^2 - x^2$ and $a^2 - a^2x - ax^2 + x^3$, and reduce $\frac{a^2 - x^2}{a^2 - a^2x - ax^2 + x^3}$ to its lowest terms.

$$\begin{array}{r} a^2 - a^2x - ax^2 + x^3 \quad a^2 - x^2 (a + x) \\ a^2 - a^2x - a^2x^2 + ax^3 \\ \hline a^3x + a^2x^2 - ax^3 - x^4 \\ a^2x - a^2x^2 - ax^3 + x^4 \\ \hline 2a^2x^2 - 2x^4 \end{array}$$

leaving out $2x^2$, which is found in each term of the remainder, the next divisor is $a^2 - x^2$.

$$\begin{array}{r} a^2 - x^2 \quad a^3 - a^2x - ax^2 + x^3 (a - x) \\ a^3 - ax^2 \\ \hline -a^2x + x^3 \\ -a^2x + x^3 \\ \hline * \quad * \end{array}$$

$a^2 - x^2$ is therefore the greatest common measure of the two quantities, and, if they be respectively divided by it, the fraction is reduced to $\frac{a^2 + x^2}{a - x}$ its lowest terms. The

quantity, $2x^2$, found in every term of one of the divisors, $2a^2x^2 - 2x^4$, but not in every term of the dividend, $a^3 - a^2x - ax^2 + x^3$, must be left out; otherwise the quotient will be fractional, which in the proof of the rule is supposed to be integral; and, by omitting this part, $2x^2$, no common measure of the divisor and dividend is left out, because, by the supposition, no part of $2x^2$ is found in all the terms of the dividend. If $2x^2$ be retained in the operation, and $a^3 - x^4$, or $a^3 - a^2x - ax^2 + x^3$ be divided by the last divisor thus obtained, the quotient will be fractional.

To find the greatest common measure of three quantities, a , b , c , take the greatest common measure d , of a and b , and also the greatest measure e , of b and c ; then the greatest measure of d and e is the greatest common measure required. Because every common measure of a , b , and c , measures d and e ; and every measure of d and e measures a , b , and c ; therefore the greatest common measure of d and e must be the greatest common measure of a , b , and c .

If one number be divided by another, and the preceding divisor by the remainder, the remainder will at length be less than any quantity that can be assigned. For $a = pb + c$; and b , and consequently pb , is greater than c , therefore $pb + c$ or a is greater than $2c$, and $\frac{a}{2}$ is greater than c ; there-

fore from a a quantity greater than its half has been taken; in the same manner, when c is the dividend, more than its half is taken away, and so on: but if from any quantity there be taken more than its half, and from the remainder more than its half, and so on, there will at length remain a quantity less than any that can be assigned.

If $\frac{a}{c}$ be a fraction in its lowest terms, and $\frac{b}{c}$ also in its lowest terms, $\frac{ab}{c}$ is in its lowest terms. If possible, let ab and c have a common measure m , and let $ab = mr$, and $c = ms$, then $\frac{a}{c} = \frac{mr}{ms}$ a whole number, and since $\frac{a}{c}$ is in its lowest terms, $\frac{mr}{ms}$ and ms have no common measure, there-

fore the factor m , in $\frac{mr}{b}$ is taken out by b , or m and b have a common measure, hence ms and b , that is, c and b have a common measure, which is contrary to the supposition; therefore ab and c have no common measure.

If b be supposed equal to a , it follows that a^2 and c have no common measure, or $\frac{a^2}{c}$ is a fraction in its lowest terms. In the same manner likewise $\frac{a^3}{c}$, $\frac{a^4}{c}$, &c. are in their lowest terms.

DEF. When two numbers have no common measure but unity, they are said to be *prime* to each other.

Fractions are changed to others of equal value, with a common denominator, by multiplying each numerator by every denominator except its own, for the new numerator; and all the denominators together for the common denominator.

Let $\frac{a}{b}$, $\frac{c}{d}$, $\frac{e}{f}$, be the proposed fractions; then $\frac{adf}{bdf}$, $\frac{cbf}{bdf}$, $\frac{edb}{bdf}$ are fractions of the same value with the former, having the common denominator bdf : for $\frac{adf}{bdf} = \frac{a}{b}$, $\frac{cbf}{bdf} = \frac{c}{d}$, and $\frac{edb}{bdf} = \frac{e}{f}$; the numerator and denominator of each fraction having been multiplied by the same quantity, viz. the product of the denominators of all the other fractions.

On the Addition and Subtraction of Fractions.

If the fractions to be added have a common denominator, their sum is found by adding the numerators together and retaining the common denominator; thus $\frac{a}{b} + \frac{c}{b} = \frac{a+c}{b}$.

If the fractions have not a common denominator, they must be transformed to others of the same value which have a common denominator, and then the addition may take place as before. Ex. $\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{bc}{bd} = \frac{ad+bc}{bd}$.

If two fractions have a common denominator, their difference is found by taking the difference of the numerators and retaining the common denominator. Thus, $\frac{a}{b} - \frac{c}{b} = \frac{a-c}{b}$.

If they have not a common denominator, they must be transformed to others of the same value which have a common denominator, and then the subtraction may take place as before. Ex. $\frac{a}{b} - \frac{c}{d} = \frac{ad}{bd} - \frac{bc}{bd} = \frac{ad-bc}{bd}$.

On the Multiplication and Division of Fractions.

A fraction is multiplied by any quantity, by multiplying the numerator by that quantity and retaining the denominator. Thus, $\frac{a}{b} \times c = \frac{ac}{b}$; for, if the quantity to be divided be c times as great as before, and the divisor the same, the quotient must be c times as great.

COR. 1. $\frac{a}{b} \times b = \frac{ab}{b} = a$. That is, if a fraction be multiplied by its denominator, the product is the numerator.

COR. 2. The result is the same whether the numerator be multiplied by a given quantity, or the denominator divided by it. Let the fraction be $\frac{ad}{bc}$, and let its numerator be multiplied by c , the result then is $\frac{adc}{bc}$, or $\frac{ad}{b}$, being the quantity which arises from dividing its denominator by c .

The product of two fractions is found by multiplying

the numerators together for a new numerator, and the denominators for a new denominator. Let $\frac{a}{b}$ and $\frac{c}{d}$ be the two fractions, then $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$. For if $\frac{a}{b} = x$, and $\frac{c}{d} = y$, by multiplying the equal quantities $\frac{a}{b}$ and x by b , $a = bx$; in the same manner $c = dy$, and by the same axiom $ac = bdx$; dividing these equal quantities, ac and bdx , by bd , we have $\frac{ac}{bd} = xy = \frac{a}{b} \times \frac{c}{d}$.

To divide a fraction by any quantity, multiply the denominator by that quantity, and retain the numerator. The fraction $\frac{a}{b}$ divided by c is $\frac{a}{bc}$. Because $\frac{a}{b} = \frac{ac}{bc}$, and each part of this is $\frac{a}{bc}$; the quantity to be divided being each part of what it was before, and the divisor the same.

COR. The result is the same whether the denominator is multiplied by the quantity or the numerator divided by it.

Let the fraction be $\frac{ac}{bd}$; if the denominator be multiplied by c , it becomes $\frac{ac}{bdc}$ or $\frac{a}{bd}$, the quantity which arises from dividing the numerator by c .

To divide one fraction by another, invert the numerator and denominator of the divisor, and proceed as in multiplication. Let $\frac{a}{b}$ and $\frac{c}{d}$ be the two fractions, then $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c} = \frac{ad}{bc}$. Proof. Let $\frac{a}{b} = x$, and $\frac{c}{d} = y$; then $a = bx$, and $c = dy$, also $ad = bdx$, and $bc = bdy$; therefore, $\frac{ad}{bc} = \frac{bdx}{bdy} = \frac{x}{y} = \frac{a}{b} \div \frac{c}{d}$.

On Involution and Evolution.

If a quantity be continually multiplied by itself, it is said to be involved or raised; and the power to which it is raised is expressed by the number of times the quantity has been employed in the multiplication. Thus $a \times a$, or a^2 , is called the second power of a ; $a \times a \times a$, or a^3 , the third power; a^n , the n th power.

If the quantity to be involved be negative, the signs of the even powers will be positive, and the signs of the odd powers negative. For $-a \times -a = a^2$; $-a \times -a \times -a = -a^3$, &c.

A simple quantity is raised to any power by multiplying the index of every factor in the quantity by the exponent of the power, and prefixing the proper sign determined by the last article. Thus a^m , raised to the n th power, is a^{mn} . Because $a^m \times a^m \times a^m \dots$ to n factors, by the rule for multiplication, is a^{mn} ; $(ab)^n = ab \times ab \times ab \times \dots$ to n factors, or $a \times a \times a \dots$ to n factors, $\times b \times b \times b \dots$ to n factors, $= a^n \times b^n$; $a^m b^c$ raised to the fifth power is $a^{5m} b^{5c}$. Also $-a^m$ raised to the n th power is $\pm a^{mn}$, where the positive or negative sign is to be prefixed according as n is even or odd.

If the quantity to be involved be a fraction, both the numerator and denominator must be raised to the proposed power.

If the quantity proposed be a compound one, the involution may either be represented by the proper index, or it may actually take place.

Let $a+b$ be the quantity to be raised to any power.

$$\begin{array}{r} a+b \\ a+b \\ \hline a^2+ab \\ +ab+b^2 \\ \hline a+b)^2 \text{ or } a^2+2ab+b^2 \text{ the square, or second power.} \\ a+b \\ \hline a^3+2a^2b+ab^2 \\ +a^2b+2ab^2+b^3 \\ \hline a+b)^3 \text{ or } a^3+3a^2b+3ab^2+b^3 \text{ the third power.} \end{array}$$

$a+b)^3$ or $a^3+3a^2b+3ab^2+b^3$ the third power.

$a+b$

$$\frac{a^3+3a^2b+3ab^2+b^3}{a+b}$$

$a+b)^4$ or $a^4+4a^3b+6a^2b^2+4ab^3+b^4$ the fourth power.

If b be negative, or the quantity to be involved $a-b$, whenever an odd power of b enters, the sign of the term must be negative; hence $a-b)^4 = a^4-4a^3b+6a^2b^2-4ab^3+b^4$.

Evolution, or the extraction of roots, is the method of determining a quantity, which, raised to a proposed power, will produce a given quantity.

Since the n th power of a^m is a^{mn} , the n th root of a^{mn} must be a^m ; i. e. to extract any root of a simple quantity, we must divide the index of the proposed quantity by the index of the root required.

COR. The square, cube, fourth, n th, root of a , are properly represented by $a^{\frac{1}{2}}$, $a^{\frac{1}{3}}$, $a^{\frac{1}{4}}$, $a^{\frac{1}{n}}$; and in like manner the same roots of any compound quantity; a^2+x^2 , are properly represented by $\overline{a^2+x^2}^{\frac{1}{2}}$, $\overline{a^2+x^2}^{\frac{1}{3}}$, $\overline{a^2+x^2}^{\frac{1}{4}}$, $\overline{a^2+x^2}^{\frac{1}{n}}$; also the n th root of the m th power of a , is expressed by $a^{\frac{m}{n}}$, of $a+x$, by $\overline{a+x}^{\frac{m}{n}}$, &c. and the square, cube, fourth, &c. root of $\frac{a}{b}$ or a^{-1} , by $a^{-\frac{1}{2}}$, $a^{-\frac{1}{3}}$, $a^{-\frac{1}{4}}$, &c. and of

$\frac{1}{a^2+x^2}$ or $\overline{a^2+x^2}^{-1}$, by $\overline{a^2+x^2}^{-\frac{1}{2}}$, $\overline{a^2+x^2}^{-\frac{1}{3}}$, $\overline{a^2+x^2}^{-\frac{1}{4}}$, &c. Here we suppose the rule for the multiplication of the powers of the same quantity to extend to roots; and since, according to this rule, $a^{\frac{1}{2}} \times a^{\frac{1}{2}} = a^1$, the square root of a^1 , or a , is properly represented by $a^{\frac{1}{2}}$. Again, $a^{-\frac{1}{3}} \times a^{-\frac{1}{3}} \times a^{-\frac{1}{3}} = a^{-1}$, therefore $a^{-\frac{1}{3}}$ represents the cube root of a^{-1} ; and the same reasoning extends to the other examples.

If the root to be extracted be represented by an odd number, the sign of the root will be the same with the sign of the proposed quantity. If the root to be extracted be represented by an even number, and the quantity proposed positive, the root may be either positive or negative. Because either a positive or negative quantity, raised to such a power, is positive.

If the root proposed to be extracted be represented by an even number, and the sign of the proposed quantity be negative, the root cannot be extracted; because no quantity raised to an even power can produce a negative result. Such roots are called *impossible*.

Any root of a product may be found by taking that root of each factor, and multiplying the roots, so taken, together. Thus $\overline{ab}^{\frac{1}{n}} = a^{\frac{1}{n}} \times b^{\frac{1}{n}}$; because $a^{\frac{1}{n}} \times b^{\frac{1}{n}}$ raised to the n th power is ab .

Any root of a fraction may be found by taking that root of both the numerator and denominator. Thus, the cube root of $\frac{a^2}{b^2}$ is $\frac{a^{\frac{2}{3}}}{b^{\frac{2}{3}}}$ or $a^{\frac{2}{3}} \times b^{-\frac{2}{3}}$; $\overline{\frac{a^2}{b^2}}^{\frac{1}{3}} = \frac{a^{\frac{2}{3}}}{b^{\frac{2}{3}}}$.

The method of extracting the root of a compound quantity will be understood by attending to the involution. The square root of $a^2+2ab+b^2$ is known to be $a+b$. In order then to establish a general rule for the extraction of the square root, observe in what manner a and b may be determined from $a^2+2ab+b^2$.

Having arranged the terms according to the dimensions of one letter, (a), the square root of the first term a^2 is a , the first factor in the root; subtract its square from the whole quantity, and bring down the remainder $2ab+b^2$; divide $2ab$ by $2a$, and the result is b , the other factor in the root; then multiply the sum of twice the first factor and the second ($2a+b$) by

$$\begin{array}{r} a^2+2ab+b^2(a+b) \\ a^2 \\ \hline 2a+b)2ab+b^2 \\ 2ab+b^2 \\ \hline * * * \end{array}$$

by the second (b), and subtract this product ($2ab + b^2$) from the remainder. If there be more terms, proceed as before, always dividing the remainder by twice the root already obtained, for a new factor in the root; and, for a new subtrahend, multiply this factor by twice the sum of the former factors increased by this factor.

Ex. 1. To extract the square root of $a^2 - ax + \frac{x^2}{4}$.

$$\begin{array}{r} a^2 - ax + \frac{x^2}{4} \\ \underline{a^2} \phantom{- ax + \frac{x^2}{4}} \\ -ax + \frac{x^2}{4} \\ \underline{-ax + \frac{x^2}{4}} \\ * * * \end{array}$$

It appears from this example, that a trinomial $a^2 - ax + \frac{x^2}{4}$, in which four times the product of the first and last terms is equal to the square of the middle term, is a complete square.

The method of extracting the cube root is discovered in the same manner. The cube root of $a^3 + 3a^2b + 3ab^2 + b^3$ is $a + b$.

Having arranged the terms as before, the cube root of the first term a^3 is a , the first factor in the root; subtract its cube from the whole quantity, and divide the first term of the remainder by $3a^2$, the result is b , the second factor in the root; then subtract $3a^2b + 3ab^2 + b^3$ from the remainder, and the whole cube of $a + b$ has been subtracted. If any quantity be left, proceed with $a + b$ as a new a , and divide the last remainder by $3 \cdot a + b^2$ for a third factor in the root; and thus any number of factors may be obtained.

$$\begin{array}{r} a^3 + 3a^2b + 3ab^2 + b^3 \\ \underline{a^3} \\ 3a^2b + 3ab^2 + b^3 \\ \underline{3a^2b + 3ab^2 + b^3} \\ * * * \end{array}$$

SCHOLIUM. These rules for the extraction of the roots of compound quantities, are but little used in algebraical or fluxional operations; but it was necessary to give them at full length, for the purpose of investigating rules for the extraction of the square and cube roots in numbers.

The square root of 100 is 10, of 10,000 is 100, of 1,000,000 is 1,000, &c. from which consideration it follows that the square root of a number less than 100 must consist of only one figure, of a number between 100 and 10,000 of two places of figures, of any number from 10,000 to 1,000,000 of three places of figures, &c. If then a point be made over every second figure in any number, beginning with the units, the number of points will shew the number of figures or places in the square root. Thus the square root of 4357 consists of two figures, the square root of 56478, of three figures, &c. Ex. Let the square root of 4357 be required.

Having pointed it according to the direction, it appears that the root consists of two places of figures; let $a + b$ be the root, where a is the value of the figure in the ten's place, and b of that in the unit's; then is a the nearest square root of 4300, which does not exceed the true root, this appears to be 60; subtract the square of 60 (a^2) from the given number, and the remainder is 757; divide this remainder by 120 ($2a$), and the quotient is 6 (the value of b), and the subtrahend, or quantity to be taken from the last remainder 757, is 126×6 ($2a + b \cdot b$) or 756.

It is said that a must be the greatest number whose square does not exceed 4300. It evidently cannot be a greater number than this, and if possible let it be some quantity

(x) less than this; then since x is in the ten's place, and b in the unit's, $x + b$ is less than a , therefore the square of $x + b$, whatever be the value of b , must be less than a^2 , and consequently $x + b$ less than the true root.

If the root consists of three places of figures, let a represent the hundreds, and b the tens; then, having obtained a and b as before, let the new value of a be the hundreds and tens together, and find a new value of b for the units; and thus the process may be continued if there be more places of figures in the root.

The cyphers being omitted for the sake of expedition, the following rule is obtained from the foregoing process:

Point every second figure beginning with the unit's place, dividing by this means the whole number into several periods; find the greatest number whose square is contained in the first period, this is the first figure in the root; subtract its square from the first period, and to the remainder bring down the next period; divide this quantity, omitting the last figure, by twice the part of the root already obtained, and annex the result to the root and also to the divisor; then multiply the divisor as it now stands by the part of the root last obtained, for the subtrahend. If there be more periods to bring down, the process must be repeated.

In extracting the square root of a decimal, the pointing must be made the contrary way, beginning with the place of hundredths; or care must be taken to have an even number of decimal places, because, if the root has 1, 2, 3, 4, &c. decimal places, the square must have 2, 4, 6, 8, &c. places.

Ex. To extract the square root of 64.853.

$$\begin{array}{r} 64.8530(8.053 \text{ \&c.} \\ \underline{64} \\ 1605) 8530 \\ 8025 \\ 50500 \\ 48309 \\ 2191 \text{ \&c.} \end{array}$$

For every pair of cyphers which we suppose annexed to the decimal, another figure is obtained in the root.

The cube root of 1,000 is 10, of 1,000,000 is 100, &c. therefore the cube root of a number less than 1,000 consists of one figure, of any number between 1,000 and 1,000,000 of two places of figures, &c. If then a point be made over every third figure contained in any number, beginning with the units, the number of points will shew the number of places in its cube root.

Let the cube root of 405224 be required.

$$\begin{array}{r} 405224(70+4 \\ \underline{a^3 = 343000} \\ 3a^2 = 14700) 62224 \text{ the first remainder.} \\ 58800 = 3a^2b \\ 3360 = 3ab^2 \\ 64 = b^3 \\ 62224 \text{ subtrahend.} \end{array}$$

By pointing the number according to the direction, it appears, that the root consists of two places; let a be the value of the figure in the ten's place, and b of that in the unit's. Then a is the greatest number whose cube is contained in 405000, or 70; subtract its cube from the whole quantity, and the remainder is 62224; divide this remainder by $3a^2$, or 14700, and the quotient 4, or b , is the second term in the root; then subtract the cube of 74 from the original number, and, as the remainder is nothing, 74 is the cube root required. Observe, that the cyphers may be omitted in the operation; and that, as a^3 was at first subtracted, if, from the first remainder, $3a^2b + 3ab^2 + b^3$ be taken, the whole cube of $a + b$ will be taken from the original quantity.

In extracting the cube root of a decimal, care must be taken that the decimal places be three, or some multiple of three, before the operation is begun; because there are three times as many decimal places in the cube as there are in the root.

On Simple Equations.

If one quantity be equal to another, or to nothing, and this equality be expressed algebraically, it constitutes an equation. Thus $x - a = b - x$ is an equation, of which $x - a$ forms one side and $b - x$ the other.

An equation, in any of whose terms the first power of one unknown quantity only is contained, is called a *simple equation*, or an equation of one dimension; if the *square* of an unknown quantity be in any way involved, it is called a *quadratic*, or equation of two dimensions; and, in general, if the index of the highest power of the unknown quantity be n , it is called an *equation of n dimensions*.

In any equation, quantities may be transposed from one side to the other, if their signs be changed, and the two sides will still be equal. Let $x + 10 = 15$, then by subtracting 10 from both sides, $x + 10 - 10 = 15 - 10$, or $x = 15 - 10$.

Let $x - 4 = 6$, by adding 4 to both sides, $x - 4 + 4 = 6 + 4$, or $x = 6 + 4$.

If $x - a + b = y$, adding $a - b$ to both sides, $x - a + b + a - b = y + a - b$, or $x = y + a - b$.

COR. Hence, if the signs of all the terms on each side be changed, the two sides will still be equal. Let $x - a = b - 2x$; by transposition, $-b + 2x = -x + a$; or $a - x = 2x - b$.

If every term on each side be multiplied by the same quantity, the results will be equal.

COR. An equation may be cleared of fractions by multiplying every term, successively, by the denominators of those fractions. Let $3x + \frac{5x}{4} = 34$; multiplying by 4, $12x + 5x = 136$.

An equation may be cleared of fractions at once, by multiplying both sides by the product of all the denominators, or by any quantity which is a multiple of them all.

Let $\frac{x}{2} + \frac{x}{3} + \frac{x}{4} = 13$; multiplying by $2 \times 3 \times 4$, $3 \times 4 \times x + 2 \times 4 \times x + 2 \times 3 \times x = 2 \times 3 \times 4 \times 13$, or $12x + 8x + 6x = 312$; that is, $26x = 312$.

If both sides be multiplied by 12, which is a multiple of 2, 3, and 4, the equation will become $\frac{12x}{2} + \frac{12x}{3} + \frac{12x}{4} = 156$, or $6x + 4x + 3x = 156$; that is, $13x = 156$.

If each side of an equation be divided by the same quantity, the results will be equal. Let $17x = 136$, then $x = \frac{136}{17} = 8$.

If each side of an equation be raised to the same power, the results will be equal. Let $x^2 = 9$, then $x = 9 \times 9 = 81$.

Also, if the same root be extracted on both sides, the results will be equal. Let $x = 81$, then $x^{\frac{1}{4}} = 9$.

To find the value of the unknown quantity in a simple equation, let the equation first be cleared of fractions, then transpose all the terms which involve the unknown quantity to one side of the equation, and the known quantities to the other; divide both sides by the coefficient, or sum of the coefficients, of the unknown quantity, and the value required is obtained.

Ex. To find the value of x in the equation $3x - 5 = 23 - x$.

By transp. $3x + x = 23 + 5$

Or $4x = 28$

By division $x = \frac{28}{4} = 7$

If there be two independent simple equations involving two unknown quantities, they may be reduced to one which involves only one of the unknown quantities, by either of the following methods:

First, In either equation find the value of one of the unknown quantities in terms of the other and known quantities, and for it substitute this value in the other equation, which will then only contain one unknown quantity, whose value may be found by the rules before laid down.

Let $x + y = 10$

And $2x - 3y = 5$

From the first equat. $x = 10 - y$ and $2x = 20 - 2y$

By sub. $20 - 2y - 3y = 5$

$20 - 5 = 2y + 3y$

$15 = 5y$

$y = \frac{15}{5} = 3$

Hence also $x = 10 - y = 10 - 3 = 7$.

Secondly, If either of the unknown quantities have the same coefficient in both equations, it may be exterminated by subtracting or adding the equations according as the sign of the unknown quantity, in the two cases, is the same or different.

Let $\begin{cases} x + y = 15 \\ x - y = 7 \end{cases}$ To find x and y .

By subtraction, $2y = 8$, and $y = 4$

By addition, $2x = 22$, and $x = 11$.

If the coefficients of the unknown quantity to be exterminated be different, multiply the terms of the first equation by the coefficient of that unknown quantity in the second, and the terms of the second equation by its coefficient in the first, then add or subtract the resulting equations as in the former case.

Let $\begin{cases} 3x - 5y = 13 \\ 2x + 7y = 81 \end{cases}$ To find x and y .

Multiply the terms of the first equation by 2, and the terms of the other by 3,

Then $6x - 10y = 26$

$6x + 21y = 243$

By subtraction, $-31y = -217$

And $y = \frac{217}{31} = 7$

Also $3x - 5y = 13$ or $3x - 35 = 13$

Therefore $3x = 13 + 35 = 48$

And $x = \frac{48}{3} = 16$.

If there be three independent simple equations, and three unknown quantities, reduce two of the equations to one, containing only two of the unknown quantities, by the preceding rules; then reduce the third equation and either of the former to one, containing the same two unknown quantities; and, from the two equations thus obtained, the unknown quantities which they involve may be found. The third quantity may be found by substituting their values in any of the proposed equations.

Ex. Let $\begin{cases} 2x + 3y + 4z = 16 \\ 3x + 2y - 5z = 8 \\ 5x - 6y + 3z = 6 \end{cases}$ To find x , y , and z .

From the two first equat. $6x + 9y + 12z = 48$

$6x + 4y - 10z = 16$

By subtr. $5y + 22z = 32$

From the first and third, $10x + 15y + 20z = 80$

$10x - 12y + 6z = 12$

By subtr. $27y + 14z = 68$

And $5y + 22z = 32$

Hence $135y + 70z = 340$

And $135y + 594z = 864$

By subtr. $524z = 524$

$z = 1$

$5y + 22z = 32$

That is, $5y + 22 = 32$

$5y = 32 - 22 = 10$

$y = \frac{10}{5} = 2$

$2x + 3y + 4z = 16$

That is, $2x + 6 + 4 = 16$

$2x = 16 - 6 - 4 = 6$

$x = 3$.

The same method may be applied to any number of simple equations.

That the unknown quantities may have definite values, there must be as many independent equations as unknown quantities. When there are more equations than unknown quantities, the value of any one of these quantities may be determined from different equations; and should the values, thus found, differ, the equations are incongruous; should they be the same, one or more of the equations are unnecessary. When there are fewer equations than unknown quantities, one of these quantities cannot be found, but in terms which involve some of the rest, whose value may be assumed at pleasure; and in such cases the number of answers is indefinite. Thus, if $x+y=a$, $x=a-y$; and, assuming y at pleasure, we obtain a value of x , such, that $x+y=a$.

These equations must also be independent, that is, not deducible one from another.

Let $x+y=a$, and $2x+2y=2a$; this latter equation being deducible from the former, involves no different supposition, or requires any thing more for its truth than that $x+y=a$ should be a just equation.

Problems which produce Simple Equations.

From certain quantities which are known, to investigate others which have a given relation to them, is the business of algebra. When a question is proposed to be resolved, we must first consider fully its meaning and conditions. Then, substituting for such unknown quantities as appear most convenient, we must proceed as if they were already determined, and we wished to try whether they would answer all the proposed conditions or not, till as many independent equations arise as we have assumed unknown quantities, which will always be the case if the question be properly limited; and, by the solution of these equations, the quantities sought will be determined.

PROB. 1. A bankrupt owes A twice as much as he owes B , and C as much as he owes A and B together; out of 300l. which is to be divided amongst them, what must each receive?

Let x represent what B must receive;
Then $2x$ is equal to what A must receive,
And $x+2x$, or $3x$, is equal to what C must receive.
Amongst them they receive 300l. therefore,

$$x+2x+3x=300$$

$$6x=300$$

$$x=\frac{300}{6}=50, \text{ what } B \text{ must receive.}$$

$$2x=100, \text{ what } A \text{ must receive.}$$

$$3x=150, \text{ what } C \text{ must receive.}$$

PROB. 2. A workman was employed for sixty days, on condition that for every day he worked he should receive 15 pence, and for every day he played he should forfeit 5 pence; at the end of the time he had 20s. to receive; required the number of days he worked.

Let x be the number of days he worked;

Then $60-x$ is the number he played.

15x his pay, in pence.

300-5x, sum forfeited.

15x-300+5x=240, by the question.

$$20x=240+300=540$$

$$x=27, \text{ the days he worked.}$$

$$60-x=33, \text{ the days he played.}$$

PROB. 3. A and B play at bowls, and A bets B three shillings to two upon every game; after a certain number of games it appears that A has won three shillings, but had he ventured to bet five shillings to two, and lost one game more out of the same number, he would have lost thirty shillings: how many games did they play?

Let x be the number of games A won;

y the number B won.

Then $2x$ is what A won of B ,

And $3y$ what B won of A .

$$2x-3y=3, \text{ by the question;}$$

$x-1.2 A$ would win on the 2d supposition.

$y+1.5 B$ would win.

$$5y+5-2x+2=30$$

$$5y-2x=30-5-2=23$$

Therefore, $2x-3y=3$

And $5y-2x=23$

By addition, $5y-3y=26$

$$2y=26$$

$$y=13$$

$$2x=3+3y=3+39=42$$

$$x=21$$

$$x+y=34; \text{ the number of games.}$$

On Quadratic Equations.

When the terms of an equation involve the square of the unknown quantity, but the first power does not appear, the value of the square is obtained by the preceding rules; and, by extracting the square root on both sides, the quantity itself is found.

Ex. Let $5x^2-45=0$; to find x .

By transf. $5x^2=45$

$$x^2=9$$

Therefore, $x=\sqrt{9}=\pm 3$.

The signs $+$ and $-$ are both prefixed to the root, because the square root of a quantity may be either positive or negative. The sign of x may also be negative, but still x will be either equal to $+3$ or -3 .

Ex. Let $ax^2=bcd$; to find x .

$$x^2=\frac{bcd}{a}$$

$$x=\pm\sqrt{\frac{bcd}{a}}$$

If both the first and second powers of the unknown quantity be found in an equation, arrange the terms according to the dimensions of the unknown quantity, beginning with the highest, and transpose the known quantities to the other side; then, if the square of the unknown quantity be affected with a coefficient, divide all the terms by this coefficient, and, if its sign be negative, change the signs of all the terms; that the equation may be reduced to this form, $x^2\pm px=\pm q$. Then add to both sides the square of half the coefficient of the first power of the unknown quantity, by which means the first side of the equation is made a complete square, and the other consists of known quantities; and, by extracting the square root on both sides, a simple equation is produced, from which the value of the unknown quantity may be found.

Ex. 1. Let $x^2+px=q$; now we know that $x^2+px+\frac{p^2}{4}$ is the square of $x+\frac{p}{2}$; add therefore $\frac{p^2}{4}$ to both sides, and we have.

$x^2+px+\frac{p^2}{4}=q+\frac{p^2}{4}$; then, by extracting the square root on both sides,

$$x+\frac{p}{2}=\pm\sqrt{q+\frac{p^2}{4}}; \text{ and by transposition,}$$

$$x=-\frac{p}{2}\pm\sqrt{q+\frac{p^2}{4}}$$

In the same manner, if $x^2-px=q$, x is found to be $\frac{p}{2}\pm\sqrt{q+\frac{p^2}{4}}$.

Ex. 2. Let $x^2-12x+35=0$; to find x .

By transf. $x^2-12x=-35$, and, adding the square of 6 to both sides of the equation,

$x^2-12x+36=36-35=1$; then, extracting the square root on both sides,

$$x-6=\pm 1$$

And $x=6\pm 1=7$, or 5 ; either of which, substituted

stituted for x in the original equation, answers the condition, that is, makes the whole equal to nothing.

It should be particularly observed, that, since $+x \times +y$ is equal to $-x \times -y$, in the multiplication and involution of quantities, new values are always introduced, which, if not again excluded by the nature of the question, will at length appear.

Every equation, where the unknown quantity is found in two terms, and its index in one is twice as great as in the other, may be resolved as follows:

Ex. 3. Let $z + 4z^{\frac{1}{2}} = 21$

$$z + 4z^{\frac{1}{2}} + 4 = 21 + 4 = 25$$

$$z^{\frac{1}{2}} + 2 = \pm 5$$

$$z^{\frac{1}{2}} = \pm 5 - 2 = 3, \text{ or } -7.$$

Therefore, $z = 9$, or 49 .

When there are more equations and unknown quantities than one, a single equation, involving only one of the unknown quantities, may sometimes be obtained by the rules laid down for the solution of simple equations; and, one of the unknown quantities being discovered, the others may be obtained by substituting its value in the preceding equations.

Ex. 4. Let $\begin{cases} x - \frac{x-y}{2} = 4 \\ y - \frac{x+3y}{x+2} = 1 \end{cases}$ To find x and y .

From the first equation, $2x - x + y = 8$

$$x + y = 8$$

$$\text{And } x = 8 - y$$

From the 2d equation, $xy + 2y - x - 3y = x + 2$

$$\text{Or } xy - 2x - y = 2$$

By substitution, $8 - y \times y - 2 \times 8 - y - y = 2$

$$8y - y^2 - 16 + 2y - y = 2$$

$$9y - y^2 = 16 + 2 = 18.$$

$$y^2 - 9y = -18$$

$$y^2 - 9y + \frac{81}{4} = \frac{81}{4} - 18 = \frac{9}{4}$$

$$y - \frac{9}{2} = \pm \frac{3}{2}$$

$$y = \frac{9 \pm 3}{2} = 6, \text{ or } 3$$

$$x = 8 - y = 2, \text{ or } 5.$$

The solution will often be rendered more simple by particular artifices, the proper application of which can only be learned by experience.

Problems producing Quadratic Equations.

Prob. 1. A person bought a certain number of oxen for eighty guineas, and, if he had bought four more for the same sum, they would have cost a guinea a-piece less; required the number of oxen and price of each.

Let x be the number

Then $\frac{80}{x}$ is the price of each

And $\frac{80}{x+4}$ the price of each on the second supposition

$$\frac{80}{x+4} = \frac{80}{x} - 1, \text{ by the question,}$$

$$80 = \frac{80x + 320}{x} - x - 4$$

$$80x = 80x + 320 - x^2 - 4x$$

$$x^2 + 4x = 320$$

$$x^2 + 4x + 4 = 324$$

$$x + 2 = \pm 18$$

$$x = \pm 18 - 2 = 16, \text{ or } -20.$$

$$\frac{80}{16} = 5 \text{ guineas, the price of each.}$$

In this and in many other cases, especially in the solution of philosophical questions, we deduce, from the alge-

braical process, answers which do not correspond with the conditions. The reason seems to be, that the algebraical expression is more general than the common language, and the equation which is a proper representation of the conditions will also express other conditions and answer other suppositions. In the foregoing instance, since x may either represent a positive or a negative quantity, the equation

$\frac{80}{x+4} = \frac{80}{x} - 1$, when x is negative or represents the diminution of stock, will be a proper expression for the solution of the following problem. A person sells a certain number of oxen for 80 guineas, had he sold four less for the same sum he would have received a guinea a-piece more for them; required the number sold.

Prob. 2. To divide a line of 20 inches into two parts, such, that the rectangle under the whole and one part may be equal to the square of the other.

Let x be the greater part; then will $20 - x$ be the less,

And $x^2 = 20 - x \cdot 20 = 400 - 20x$, by the question,

$$x^2 + 20x = 400$$

$$x^2 + 20x + 100 = 400 + 100 = 500$$

$$x + 10 = \pm \sqrt{500}$$

$$x = \pm \sqrt{500} - 10 \text{ or } -\sqrt{500} - 10.$$

The observation contained in the preceding article may be applied here; and it is to be remarked, that the negative values thus deduced are not insignificant or useless. Here the negative value shews, that, if the line be produced $\sqrt{500} + 10$ inches, the square of the part produced is equal to the rectangle under the line given, and the line made up of the whole and part produced.

On Ratios.

Ratio is the relation which one quantity bears to another in respect of magnitude, the comparison being made by considering how often one contains, or is contained by, the other.

Thus, in comparing 6 with 3, we observe that it has a certain magnitude with respect to it, as it contains it twice; again, in comparing it with 2, we see that it has a different relative magnitude, for it contains 2 three times, or it is greater when compared with 2 than it is when compared with 3. The ratio of a to b is usually expressed by two points placed between them, thus, $a : b$; and the former is called the *antecedent* of the ratio, the latter the *consequent*.

COR. 1. When one antecedent is the same multiple, part, or parts, of its consequent, that another antecedent is of its consequent, the ratios are equal. Thus the ratio of 4 : 6 is equal to the ratio of 2 : 3, i. e. 4 has the same magnitude when compared with 6, that 2 has when compared

with 3, since $\frac{4}{6} = \frac{2}{3}$; also the ratio of $a : b$ is equal to the ratio of $c : d$ if $\frac{a}{b} = \frac{c}{d}$, because $\frac{a}{b}$ and $\frac{c}{d}$ represent the multiple, part, or parts, that a is of b , and c of d .

COR. 2. If the terms of a ratio be multiplied or divided by the same quantity, the ratio is not altered. For $\frac{a}{b} = \frac{ma}{mb}$.

COR. 3. That ratio is greater than another, whose antecedent is the greater multiple, part, or parts, of its consequent. Thus the ratio of 7 : 4 is greater than the ratio of 8 : 5, because $\frac{7}{4}$, or $\frac{35}{20}$, is greater than $\frac{8}{5}$, or $\frac{32}{20}$. These conclusions follow immediately from our idea of ratio.

A ratio is called a ratio of *greater inequality*, of *less inequality*, or of *equality*, according as the antecedent is greater, less than, or equal to, the consequent.

A ratio of greater inequality is diminished, and of less inequality increased, by adding any quantity to both its terms. If to the terms of the ratio 7 : 4, 1 be added, it becomes the ratio of 8 : 5, which is less than the former. And, in general, let x be added to the ratio $a : b$, and it becomes

becomes $a+x:b+x$, which is greater or less than the former, according as $\frac{a+x}{b+x}$ is greater or less than $\frac{a}{b}$, or by reducing them to a common denominator, as $\frac{ab+bx}{b \cdot b+x}$ is greater or less than $\frac{ab+ax}{b \cdot b+x}$, that is, as b is greater or less than a .

Hence a ratio of greater inequality is increased, and of less inequality diminished, by taking from the terms a quantity less than either of them.

If the antecedents of any ratios be multiplied together, and also the consequents, a new ratio results which is said to be compounded of the former. Thus $ac:bd$ is said to be compounded of the two, $a:b$ and $c:d$. It is also sometimes called the sum of the ratios; and, when the ratio $a:b$ is compounded with itself, the resulting ratio $a^2:b^2$ is called the double of the ratio of $a:b$; and, if three of these ratios be compounded together, the result, $a^3:b^3$, is called the triple of the first, &c. Also the ratio of $a:b$ is said to be one third of the ratio of $a^3:b^3$; and $\frac{1}{m}a:\frac{1}{m}b$ is said to be an m th part of the ratio of $a:b$.

If the consequent of the preceding ratio be the antecedent of the succeeding one, and any number of such ratios be taken, the ratio which arises from their composition is that of the first antecedent to the last consequent. Let $a:b, b:c, c:d$, &c. be the ratios, the compound ratio is $a \times b \times c : b \times c \times d$; or, dividing by $b \times c$, $a:d$.

A ratio of greater inequality compounded with another increases, and a ratio of less inequality diminishes, it. Let the ratio of $x:y$ be compounded with the ratio of $a:b$, the resulting ratio $ax:by$ is greater or less than the ratio $a:b$, according as $\frac{ax}{by}$ is greater or less than $\frac{a}{b}$, i. e. according as x is greater or less than y .

On Proportion.

Four quantities are said to be *proportionals*, when the first is the same multiple, part, or parts, of the second, that the third is of the fourth. That is, when $\frac{a}{b} = \frac{c}{d}$, the four quantities, a, b, c, d , are called proportionals. This is usually expressed by saying, a is to b as c is to d ; and thus represented, $a:b::c:d$. The terms a and d are called the *extremes*, and b and c the *means*.

When four quantities are proportionals, the product of the extremes is equal to the product of the means. Let a, b, c, d , be the four quantities; then, since they are proportionals, $\frac{a}{b} = \frac{c}{d}$, and, by multiplying both sides by bd , $ad=bc$.

COR. 1. If the first be to the second as the second to the third, the product of the extremes is equal to the square of the mean.

COR. 2. Any three terms in a proportion being given, the fourth may be determined from the equation $ad=bc$.

If the product of two quantities be equal to the product of two others, the four are proportionals, making the terms of one product the means, and the terms of the other the extremes. Let $xy=ab$; then, dividing by ay , $\frac{x}{a} = \frac{b}{y}$, or $x:a::b:y$.

If $a:b::c:d$, and $c:d::e:f$, then will $a:b::e:f$; because $\frac{a}{b} = \frac{c}{d}$, and $\frac{c}{d} = \frac{e}{f}$, therefore $\frac{a}{b} = \frac{e}{f}$, or $a:b::e:f$.

If four quantities be proportionals, they are also proportionals when taken *inversely*. If $a:b::c:d$, then $b:a::d:c$. For $\frac{a}{b} = \frac{c}{d}$, and dividing unit by each of these

equal quantities, or taking their reciprocals, $\frac{b}{a} = \frac{d}{c}$; i. e. $b:a::d:c$.

If four quantities be proportionals, they are also proportionals when taken *alternately*. If $a:b::c:d$, then $a:c::b:d$. Because the quantities are proportionals, $\frac{a}{b} = \frac{c}{d}$; and, multiplying by $\frac{b}{c}$, $\frac{a}{c} = \frac{b}{d}$; or $a:c::b:d$. Unless the four quantities are of the same kind, the alternation cannot take place, because this supposes the first to be some multiple, part, or parts, of the third. One line may have to another line the same ratio that one weight has to another; but a line has no relation, in respect of magnitude, to a weight. In cases of this kind, if the four quantities be represented by numbers, or other quantities which are similar, the alternation may take place, and the conclusions drawn from it will be just.

When four quantities are proportionals, the first together with the second is to the second as the third together with the fourth is to the fourth.

Let $a:b::c:d$, then *componendo*, $a+b:b::c+d:d$.

Because $\frac{a}{b} = \frac{c}{d}$, by adding one to both sides, $\frac{a}{b} + 1 = \frac{c}{d} + 1$, that is, $\frac{a+b}{b} = \frac{c+d}{d}$, or $a+b:b::c+d:d$.

Also *dividendo*, $a-b:b::c-d:d$.

Because $\frac{a}{b} = \frac{c}{d}$, by subtracting one from both sides, $\frac{a}{b} - 1 = \frac{c}{d} - 1$, that is $\frac{a-b}{b} = \frac{c-d}{d}$, or $a-b:b::c-d:d$.

Again *convertendo*, $a-a-b::c-c-d$. By the last article, $\frac{a-b}{b} = \frac{c-d}{d}$, and $\frac{b}{a} = \frac{d}{c}$, therefore $\frac{a-b}{b} \times \frac{b}{a} = \frac{c-d}{d} \times \frac{d}{c}$, or $\frac{a-b}{a} = \frac{c-d}{c}$; that is, $a-b:a::c-d:c$, and, inversely, $a:a-b::c:c-d$.

When any number of quantities are proportionals, as one antecedent is to its consequent, so are all the antecedents taken together to all the consequents taken together.

Let $a:b::c:d::e:f$, &c.

Then $a:b::a+c+e:b+d+f$.

Because $\frac{a}{b} = \frac{c}{d}$, $ad=bc$; in the same manner, $af=be$, also $ab=ba$; hence $ab+ad+af=ba+bc+be$, or $a \cdot b + d + f = b \cdot a + c + e$, and $a:b::a+c+e:b+d+f$.

When four quantities are proportionals, if the first and second be multiplied, or divided, by any quantity, as also the third and fourth, the resulting quantities will be proportionals:

Let $a:b::c:d$, then will $ma:mb::\frac{c}{n}:\frac{d}{n}$. For $\frac{a}{b} = \frac{c}{d}$; therefore, $\frac{ma}{mb} = \frac{\frac{c}{n}}{\frac{d}{n}}$, or $ma:mb::\frac{c}{n}:\frac{d}{n}$.

If the first and third be multiplied, or divided, by any quantity, and also the second and fourth, the resulting quantities will be proportionals.

For $\frac{a}{b} = \frac{c}{d}$, therefore $\frac{ma}{b} = \frac{mc}{d}$, and $\frac{ma}{\frac{1}{n} \cdot b} = \frac{mc}{\frac{1}{n} \cdot d}$, or $ma:\frac{b}{n}::mc:\frac{d}{n}$.

COR. Hence in any proportion, if, instead of the second and fourth terms, quantities proportional to them be substituted, we have still a proportion. For $\frac{b}{n}$ and $\frac{d}{n}$ are in the same proportion with b and d .

In two ranks of proportionals, if the corresponding terms be multiplied together, the products will be proportionals.

Let $a:b::c:d$

And $e:f::g:h$

Then will $ae:bf::cg:dh$.

Because $\frac{a}{b}=\frac{c}{d}$ and $\frac{e}{f}=\frac{g}{h}$, therefore $\frac{ae}{bf}=\frac{cg}{dh}$, or $ae:bf::cg:dh$.

This is called *compounding* the proportions. The proposition is true if applied to any number of proportions.

On Variable Quantities.

In the investigation of the relation which varying and dependent quantities bear to each other, the conclusions are more easily obtained, by expressing only two terms in each proportion, than by retaining the four. But though, in considering the variations of such quantities, two terms only are expressed, it will be necessary for the learner to keep constantly in mind that four are supposed, and that the operations which this method admits are in reality the operations of proportions.

DEF. 1. One quantity is said to *vary directly* as another, when their magnitudes depend wholly upon each other, and in such a manner, that, if one be changed, the other is changed in the same proportion. Let A and B be mutually dependent upon each other, in such a way, that if A be changed to any other value a , B must be changed to another value b , such, that $A:a::B:b$, then A is said to vary directly as B . This sign $\propto$, placed between two quantities, shews that they vary as each other.

DEF. 2. One quantity is said to *vary inversely* as another, when one cannot be changed in any manner, but the reciprocal of the other is changed in the same proportion. A

varies inversely as B , ($A \propto \frac{1}{B}$), if, when A is changed to a , B be changed to b , in such a manner that $A:a::\frac{1}{B}:\frac{1}{b}$, or $A:a::b:B$.

DEF. 3. One quantity is said to *vary as two others jointly*, if, when the former is changed in any manner, the product of the other two be changed in the same proportion. Thus, A varies as B and C jointly, ($A \propto BC$), when A cannot be changed to a , but the product BC must be changed to bc , such, that $A:a::BC:bc$.

DEF. 4. One quantity is said to *vary directly* as a second, and *inversely* as a third, when the first cannot be changed in any manner, but the second multiplied by the reciprocal of the third is changed in the same proportion. A

varies directly as B , and inversely as C , ($A \propto \frac{B}{C}$), when $A:a::\frac{B}{C}:\frac{b}{c}$; A, B, C , and a, b, c , being corresponding values of the three quantities.

In the following articles, A, B, C , &c. represent corresponding values of any quantities, and a, b, c , &c. any other corresponding values of the same quantities.

If one quantity vary as a second, and that second as a third, the first varies as the third. Let $A:a::B:b$, and $B:b::C:c$, then $A:a::C:c$; that is $A \propto C$. In the same manner, if $A \propto B$ and $B \propto \frac{1}{C}$, then $A \propto \frac{1}{C}$.

If two quantities vary respectively as a third, their sum, or difference, or the square root of their product, will vary as the third. Let $A \propto C$ and $B \propto C$, then $A \pm B \propto C$, or $\sqrt{AB} \propto C$. By the supposition $A:a::C:c$; $B:b$, therefore $A:a::B:b$, alternately $A:B::a:b$, and by composition or division $A \pm B:B::a \pm b:b$, alt. $A \pm B:a \pm b::B:b$; that is, $C \propto A \pm B$.

Again, $A:a::C:c$

And $B:b::C:c$

Therefore, $AB:ab::C^2:c^2$

And $\sqrt{AB}:\sqrt{ab}::C:c$; that is, $C \propto \sqrt{AB}$.

If one quantity vary as two others jointly, either of the latter varies as the first directly and the other inversely.

Let $V \propto FT$, then

$$F \propto \frac{V}{T} \text{ or } T \propto \frac{V}{F}.$$

COR. If the product of the two quantities be invariable, they vary inversely as each other.

Let $B \times P$ be constant, or $B \propto \frac{1}{P}$; by division, $B \propto \frac{1}{P}$.

If four quantities be always proportionals, and one or two of them be invariable, we may find how the others vary.

Ex. Let p, q, r, s , be always proportionals, and p invariable, then $s \propto qr$. Because $ps=qr$, $p \propto qr$, and, since p is constant, $s \propto qr$.

When the increase or decrease of one quantity depends upon the increase or decrease of two others, and it appears, that, if either of these latter be invariable, the first varies as the other; when they both vary, the first is as their product.

Let $S \propto V$ when T is given,

And $S \propto T$ when V is given.

When neither T nor V is given, $S \propto TV$. The variation of S depends upon the variations of the two quantities T and V ; let the changes take place separately, and whilst T is changed to t , let S be changed to s' , then, by the supposition, $S:S'::T:t$; but this value, s' , will again be changed to s , by the variation of V , and in the same proportion that V is changed, that is, $S':s::V:v$; and, by compounding this with the last proportion, $S:S::TV:tv$, or $S:S::TV:tv$.

In the same manner, if there be any number of magnitudes, P, Q, R, S , each of which varies as another, V , when the rest are constant; when they are all changed, V varies as their product.

On Arithmetical Progression.

Quantities are said to be in *arithmetical progression*, when they increase or decrease by a common difference. Thus, 1, 3, 5, 7, 9, &c. $a, a+b, a+2b, a+3b$, &c. $a, a-b, a-2b, a-3b$, &c. are in arithmetical progression. Hence it is manifest that if a be the first term, and $a+b$ the second, $a+2b$ is the third, $a+3b$ the fourth, &c. and $a+n-1.b$ the n th term.

The sum of a series of quantities in arithmetical progression is found by multiplying the sum of the first and last terms by half the number of terms. Let a be the first term, b the common difference, n the number of terms, and s the sum of the series. Then

$$\begin{array}{c} a \quad +a+b \quad +a+2b \quad \dots \quad a+n-1.b=s. \\ \text{Or } a+n-1.b+a+n-2.b+a+n-3.b \quad \dots \quad +a=s. \end{array}$$

Sum $2a+n-1.b+2a+n-1.b+2a+n-1.b$ &c. to n terms, $=2s$.

$$\text{Or } 2a+n-1.b \times n=2s$$

$$\text{And } s=2a+n-1.b \times \frac{n}{2}.$$

COR. Any three of the quantities, s, a, n, b , being given, the fourth may be found, from the equation $s=2a+n-1.b \times \frac{n}{2}$.

Ex. 1. To find the sum of 14 terms of the series, 1, 3, 5, 7, &c. Here $a=1, b=2, n=14$; therefore, $s=2+26 \times 7=196$.

Ex. 2. Required the sum of 9 terms of the series, 11, 9, 7, 5, &c. In this case, $a=11, b=-2, n=9$; therefore, $s=22-16 \times \frac{9}{2}=6 \times \frac{9}{2}=27$.

Ex.

Ex. 3. If the first term of an arithmetical progression be 14, and the sum of 8 terms 28, what is the common difference?

$$\text{Since } 2a + n - 1 \cdot b \times \frac{n}{2} = s$$

$$2a + n - 1 \cdot b = \frac{2s}{n}$$

$$\frac{n-1 \cdot b}{n} = \frac{2s-2an}{n}$$

Therefore $b = \frac{2s-2an}{n-1}$. In the case proposed, $s=28$,

$$a=14, n=8; \text{ therefore, } b = \frac{56-224}{8 \times 7} = \frac{7-28}{7} = -3.$$

Hence the series is, 14, 11, 8, 5, &c.

On Geometrical Progression.

Quantities are said to be in *geometrical progression*, or continual proportion, when the first is to the second as the second to the third, and as the third to the fourth, &c. that is, when every succeeding term is a certain multiple, or part, of the preceding. If a be the first term, ar the second, the series will be, a, ar, ar^2, ar^3, ar^4 , &c. For $a : ar :: ar : ar^2 :: ar^2 : ar^3$, &c.

The constant multiplier is called the *common ratio*, and it may be found by dividing the second term by the first.

If the two extremes, and the number of terms in a geometrical progression be given, the means may be found.

Let a and b be the extremes, n the number of terms, and r the common ratio; then the progression is $a, ar, ar^2, ar^3, \dots, ar^{n-1}$, and, since b is the last term, $ar^{n-1} = b$,

and $r^{n-1} = \frac{b}{a}$, therefore $r = \sqrt[n-1]{\frac{b}{a}}$; and, r being known, the terms of the progression ar, ar^2, ar^3 , &c. are known.

To find the sum of a series of quantities in geometrical progression, subtract the first term from the product of the last term and common ratio, and divide the remainder by the difference between the common ratio and unity. Let a be the first term, r the common ratio, n the number of terms, y the last term, and s the sum of the series:

Then $a + ar + ar^2 + \dots + ar^{n-2} + ar^{n-1} = s$; and multiplying both sides by r ,

$$\text{Sub. } \begin{array}{r} ar + ar^2 + ar^3 + \dots + ar^{n-1} + ar^n = rs \\ a + ar + ar^2 + ar^3 + \dots + ar^{n-1} = s \end{array}$$

$$\text{Rem. } -a + ar^n = rs - s = r-1 \times s.$$

$$\text{Or } s = \frac{ar^n - a}{r - 1} = \frac{ry - a}{r - 1}.$$

COR. 1. From the equation $s = \frac{ry - a}{r - 1}$, any three of the quantities, s, r, y, a , being given, the fourth may be found.

COR. 2. When r is a proper fraction, as n increases, the value of r^n , or of ar^n , decreases, and when n is increased without limit, ar^n becomes less, with respect to a , than any magnitude that can be assigned; and therefore $s =$

$\frac{-a}{r-1} = \frac{a}{1-r}$. This quantity, $\frac{a}{1-r}$ is the limit to which the sum of the terms approaches, but never actually attains; yet, as it differs from the sum by a quantity less than any that can be assigned, it may always be substituted for it without error.

Ex. To find the sum of 20 terms of the series, 1, 2, 4, 8, &c.

Here $a=1, r=2, n=20$;

$$\text{Therefore } s = \frac{1 \times 2^{20} - 1}{2 - 1} = 2^{20} - 1.$$

Recurring decimals are quantities in geometrical progression, where $\frac{1}{10}, \frac{1}{100}, \frac{1}{1000}$, &c. is the common ratio, according as one, two, three, &c. figures recur; and

the vulgar fraction, corresponding to such a decimal, is found by summing the series.

Ex. Required the vulgar fraction corresponding to the decimal .123123123, &c.

Let .123123123, &c. $= s$; then, multiply both sides by 1000, and 123.123123123 , &c. $= 1000s$; and, by subtracting the former equation from the latter, $123 = 999s$; therefore, $s = \frac{123}{999} = \frac{41}{333}$.

On Permutations and Combinations.

The different arrangements that any quantities admit, are called their *permutations*. Thus the permutations of a, b, c , taken two and two together, are ab, ba, ac, ca, bc, cb .

The *combinations* of quantities are the different collections that can be formed out of them, without regarding the order in which they are placed. Thus ab, ac, bc , are the combinations of the quantities, a, b, c , taken two and two; ab and ba , though different permutations, forming the same combination.

The number of permutations which n quantities admit, taken two and two together, is $n \cdot n - 1$; taken three and three together, is $n \cdot n - 1 \cdot n - 2$. In n things, a, b, c, d , &c. a may be placed before each of the rest, and thus form $n - 1$ permutations; in the same manner, there are $n - 1$ permutations where b stands first, and so of the rest; therefore, there are upon the whole $n \cdot n - 1$ permutations of this kind, ab, ba, ac, ca , &c.

Again, of $n - 1$ things, b, c, d , &c. taken two and two together, there are $n - 1 \cdot n - 2$ permutations, by the former part of the article, and, by prefixing a to each of these, there are $n - 1 \cdot n - 2$ permutations, taken three and three, where a stands first; the same may be said of b, c, d , &c. therefore there are upon the whole $n \cdot n - 1 \cdot n - 2$ such permutations.

COR. By following the same method, it appears, that in n things, if r of them be always taken together, there are $n \cdot n - 1 \cdot n - 2 \cdot n - 3 \cdot \dots \cdot n - r + 1$ permutations.

The number of combinations that can be formed out of n things, taken two and two together, is $\frac{n \cdot n - 1}{2}$; or, taken three and three together, the number is $\frac{n \cdot n - 1 \cdot n - 2}{2 \cdot 3}$.

The number of permutations in the first case is $n \cdot n - 1$, but each combination ab , admits of two permutations, ab, ba ; therefore there are twice as many permutations as combinations, or the number of combinations is $\frac{n \cdot n - 1}{2}$.

Again, there are $n \cdot n - 1 \cdot n - 2$ permutations in n things, taken three and three together; and each combination of three things admits of $3 \cdot 2 \cdot 1$ permutations; therefore there are $3 \cdot 2 \cdot 1$ times as many permutations as combinations, and consequently the number of combinations is $\frac{n \cdot n - 1 \cdot n - 2}{1 \cdot 2 \cdot 3}$.

COR. In the same manner it appears, that the number of combinations in n things, each of which contains r of them, is $\frac{n \cdot n - 1 \cdot n - 2 \cdot \dots \cdot n - r + 1}{1 \cdot 2 \cdot 3 \cdot \dots \cdot r}$.

On the Binomial Theorem.

The method of raising a binomial to any power, by repeated multiplication, has already been laid down, under *Involution and Evolution*. A general rule by which this may be done much more expeditiously was first discovered by Sir I. Newton. Let $x + a$ be the given binomial; the n th power of it is $x^n + nax^{n-1} + \frac{n \cdot n - 1}{2} a^2 x^{n-2} + \frac{n \cdot n - 1 \cdot n - 2}{2 \cdot 3} a^3 x^{n-3} + \dots$. Where the index of x , beginning from n , is diminished by unity, and the index of a , beginning from

from a , is increased by unity, in every succeeding term. Also the coefficient of each term is found by multiplying the coefficient of the preceding term, by the index of x in that term, and dividing by the index of a increased by unity.

$$\text{Thus, } (x+a)^6 = x^6 + 6ax^5 + \frac{6 \cdot 5}{2} a^2 x^4 + \frac{6 \cdot 5 \cdot 4}{2 \cdot 3} a^3 x^3 + \frac{6 \cdot 5 \cdot 4 \cdot 3}{2 \cdot 3 \cdot 4} a^4 x^2 + \frac{6 \cdot 5 \cdot 4 \cdot 3 \cdot 2}{2 \cdot 3 \cdot 4 \cdot 5} a^5 x + \frac{6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} a^6 = x^6 + 6ax^5 + 15a^2x^4 + 20a^3x^3 + 15a^4x^2 + 6a^5x + a^6.$$

To investigate this theorem, suppose n quantities, $x+a$, $x+b$, $x+c$, &c. multiplied together; it is manifest that the first term of the product will be x^n , and that x^{n-1} , x^{n-2} , &c. the other powers of x , will all be found in the remaining terms, with different combinations of a , b , c , d , &c.

Let $x+b \cdot x+c \cdot x+d$, &c. $= x^{n-1} + Px^{n-2} + Qx^{n-3} + \&c.$ and $x+a \cdot x+b \cdot x+c \cdot x+d$, &c. $= x^n + Ax^{n-1} + Bx^{n-2} + \&c.$ then $x^n + Ax^{n-1} + Bx^{n-2} + \&c.$ and $x+a \times (x^{n-1} + Px^{n-2} + Qx^{n-3} + \&c.)$ or $x^n + Px^{n-1} + Qx^{n-2} + \&c.$ are the same series;

$+ax^{n-1} + aPx^{n-2} + \&c.$ } therefore $A=P+a$, $B=Q+aP$, &c. that is, by introducing one factor, $x+a$, into the product, the coefficient of the second term is increased by a , and by introducing $x+b$ into the product, that coefficient is increased by b , &c. therefore the whole value of A is $a+b+c+d$, &c. Again, by the introduction of one factor, $x+a$, the coefficient of the third term, Q , is increased by aP , i. e. by a multiplied by the preceding value of A , or by $a \times b+c+d$, &c. and the same may be said with respect to the introduction of every other factor; therefore, upon the whole,

$$B = a \cdot b + c + d + \&c.$$

$$+ b \cdot c + d + \&c.$$

$$+ c \cdot d + \&c.$$

In the same manner,

$$C = a \cdot b \cdot c + d + \&c.$$

$$+ a \cdot c \cdot d + \&c.$$

$$+ b \cdot c \cdot d + \&c.$$

and so on; that is, A is the sum of the quantities a , b , c , &c. B , the sum of the products of any two; C , the sum of the products of any three, &c.

If either term of the binomial be negative, its odd powers will be negative, and consequently the signs of the terms, in which those odd powers are found, will be changed.

$$\text{Ex. } (a-x)^8 = a^8 - 8a^7x + 28a^6x^2 - 56a^5x^3 + 70a^4x^4 - 56a^3x^5 + 28a^2x^6 - 8ax^7 + x^8.$$

The trinomial $a+b+c$ may be raised to any power by considering two terms as one factor, and proceeding as before.

Thus, $(a+b+c)^n = a^n + n \cdot b+c \cdot a^{n-1} + n \cdot \frac{n-1}{2} \cdot (b+c)^2 \cdot a^{n-2} + \&c.$ and the powers of $b+c$ may be determined by the binomial theorem.

The theorem by which a multinomial may be raised to any power is given by M. Demoivre, *Analyt.* p. 37.

On Surds.

A quantity may be reduced to the form of a given surd, by raising it to the power whose root the surd expresses, and affixing the radical sign. Thus, $a = \sqrt[n]{a^n} = \sqrt[n]{a^n}$ &c.

$a+x = \sqrt[n]{a+x}^m$. In the same manner, the form of any surd may be altered; thus, $\sqrt[n]{a+x}^{\frac{1}{2}} = \sqrt[n]{a+x}^{\frac{2}{4}} = \sqrt[n]{a+x}^{\frac{3}{6}}$, &c. The quantities are here raised to certain powers, and the same roots of those powers taken, therefore the values of the quantities are not altered.

If two surds have the same index, their product is found by taking the product of the quantities under the

signs, and retaining the common index. Thus, $\sqrt[n]{a} \times \sqrt[n]{b} = \sqrt[n]{ab}$; $\sqrt{2} \times \sqrt{3} = \sqrt{6}$; $\sqrt[n]{a+b} \times \sqrt[n]{a-b} = \sqrt[n]{a^2-b^2}$.

If the surds have coefficients, the product of these coefficients must be prefixed. Thus, $a\sqrt{x} \times b\sqrt{y} = ab\sqrt{xy}$.

We must observe, that $\sqrt{-a^2} \times \sqrt{-a^2}$, or the square of $\sqrt{-a^2}$, is $-a^2$; because it is that quantity whose square root is $\sqrt{-a^2}$.

COR. Hence $x-a + \sqrt{-b^2} \times x-a - \sqrt{-b^2} = x^2 - 2ax + a^2 + b^2$.

If the indices of two surds have a common denominator, let the quantities be raised to the powers expressed by their respective numerators, and their product may be found as before.

$$\text{Example. } 2^{\frac{2}{3}} \times 3^{\frac{1}{3}} = 8^{\frac{1}{3}} \times 3^{\frac{1}{3}} = 24^{\frac{1}{3}}; \sqrt[n]{a+x}^{\frac{1}{2}} \times \sqrt[n]{a-x}^{\frac{1}{2}} = \sqrt[n]{a+x \cdot a-x}^{\frac{1}{2}}$$

If the indices have not a common denominator, they must be transformed to others of the same value, with a common denominator, and their product found by the last rule.

$$\text{Example. } \sqrt[n]{a-x}^{\frac{1}{4}} \times \sqrt[n]{a-x}^{\frac{1}{2}} = \sqrt[n]{a-x}^{\frac{1}{4}} \times \sqrt[n]{a-x}^{\frac{2}{4}} = \sqrt[n]{a-x \cdot a-x}^{\frac{3}{4}}; 2^{\frac{1}{2}} \times 3^{\frac{1}{3}} = 2^{\frac{2}{6}} \times 3^{\frac{2}{6}} = 8 \times 9^{\frac{1}{6}}.$$

If two surds have the same rational quantity under the radical signs, their product is found by making the sum of the indices the index of that quantity.

$$\text{Thus, } \sqrt[n]{a} \times \sqrt[n]{a} = \sqrt[n]{a^n} \times \sqrt[n]{a^n} = \sqrt[n]{a^{m+n}}.$$

If the indices of two quantities have a common denominator, the quotient of one divided by the other is obtained by raising them, respectively, to the powers expressed by the numerators of their indices, and extracting that root of the quotient which is expressed by the common denominator.

$$\text{For, } \frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}; \text{ and } \frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \frac{a^{\frac{1}{n}}}{b^{\frac{1}{n}}} = \sqrt[n]{\frac{a}{b}}.$$

$$\text{Ex. } 4^{\frac{1}{2}} \div 2^{\frac{3}{2}} = \sqrt[4]{\frac{4}{8}} = \frac{1}{\sqrt{2}}; \sqrt[n]{p}^{\frac{1}{m}} \div \sqrt[n]{q}^{\frac{2}{m}} = \sqrt[n]{\frac{ps^{\frac{1}{m}}}{qr^{\frac{2}{m}}}}.$$

If the indices have not a common denominator, reduce them to others of the same value, with a common denominator, and proceed as before.

$$\text{Ex. } \sqrt[n]{a^2-x^2}^{\frac{1}{2}} \div \sqrt[n]{a^4-x^4}^{\frac{1}{3}} = \sqrt[n]{a^2-x^2}^{\frac{3}{6}} \div \sqrt[n]{a^4-x^4}^{\frac{2}{6}} = \sqrt[n]{\frac{a^6-x^6}{a^8-x^8}}.$$

If two surds have the same rational quantity under the radical signs, their quotient is obtained by making the difference of the indices the index of that quantity.

$$\text{Thus, } \sqrt[n]{a} \div \sqrt[n]{a} = \sqrt[n]{a^{\frac{1}{n}}} \div \sqrt[n]{a^{\frac{n}{n}}} = \sqrt[n]{a^{\frac{1-n}{n}}}.$$

$$\text{Ex. } 2^{\frac{1}{2}} \div 2^{\frac{1}{3}} = 2^{\frac{3}{6}} \div 2^{\frac{2}{6}} = 2^{\frac{1}{6}}.$$

The square root of a quantity cannot be partly rational and partly irrational. If possible, let $\sqrt{n} = a + \sqrt{m}$; then by squaring both sides, $n = a^2 + 2a\sqrt{m} + m$, and $2a\sqrt{m} = n - a^2 - m$; therefore, $\sqrt{m} = \frac{n-a^2-m}{2a}$, a rational quantity, which is contrary to the supposition.

In any equation, $x + \sqrt{y} = a + \sqrt{b}$, consisting of rational quantities and quadratic surds, the rational parts on each side are equal, and also the irrational parts. If x be not equal to a , let $x = a + m$, then $a + m + \sqrt{y} = a + \sqrt{b}$, or $m + \sqrt{y} = \sqrt{b}$;

$\sqrt{b}$; that is, $\sqrt{b}$ is partly rational and partly irrational, which is impossible; therefore $x=a$, and consequently $\sqrt{y}=\sqrt{b}$.

If two surds, $\sqrt{x}$ and $\sqrt{y}$, cannot be reduced to others which have the same irrational part, their product is irrational.

If possible, let $\sqrt{xy}=x+n$, then $xy=x^2+2nx+n^2$, and $y=x+\frac{2nx+n^2}{x}$; and, since x and y are integers, $\frac{2nx+n^2}{x}$ is an integer, or n is a multiple of x ; let $n=rx$, then $y=x+2rx+r^2x=1+2r+r^2$, and $\sqrt{y}=1+r\sqrt{x}$, i. e. $\sqrt{y}$ and $\sqrt{x}$ may be reduced to the same irrational part, which is contrary to the supposition.

One surd, $\sqrt{x}$ cannot be made up of two others, $\sqrt{m}$ and $\sqrt{n}$, which have not the same irrational part.

If possible, let $\sqrt{x}=\sqrt{m}+\sqrt{n}$; then, by squaring both sides, $x=m+n+2\sqrt{mn}$, and $x-m-n=2\sqrt{mn}$, a rational quantity equal to an irrational one, which is absurd.

Let $\frac{1}{a+b}=\frac{1}{x+y}$, where a is an even number, a a rational quantity, b a quadratic surd, x and y one or both of them quadratic surds, then $\frac{1}{a-b}=\frac{1}{x-y}$.

By involution, $a+b=x^c+cx^{c-1}y+c\frac{c-1}{2}x^{c-2}y^2+\dots$ and, since c is even, the odd terms of the series are rational, and the even terms irrational; therefore, $a=x^c+c\frac{c-1}{2}x^{c-2}y^2+\dots$ and $b=cx^{c-1}y+c\frac{c-1}{2}\frac{c-2}{3}x^{c-3}y^3+\dots$ hence $a-b=x^c-cx^{c-1}y+c\frac{c-1}{2}x^{c-2}y^2-c\frac{c-1}{2}\frac{c-2}{3}x^{c-3}y^3+\dots$ and, consequently, $\frac{1}{a-b}=\frac{1}{x-y}$.

If c be an odd number, a and b , one or both, quadratic surds, and x and y involve the same surds that a and b do, respectively, when $\frac{1}{a+b}=\frac{1}{x+y}$, then $\frac{1}{a-b}=\frac{1}{x-y}$.

By involution, $a+b=x^c+cx^{c-1}y+c\frac{c-1}{2}x^{c-2}y^2+\dots$ and, where the odd terms involve the same surd that x does, because c is an odd number, and the even terms the same surd that y does; and, since no part of a can consist of y , or its parts, $a=x^c+c\frac{c-1}{2}x^{c-2}y^2+\dots$ and $b=cx^{c-1}y+c\frac{c-1}{2}\frac{c-2}{3}x^{c-3}y^3+\dots$ hence $a-b=x^c-cx^{c-1}y+c\frac{c-1}{2}x^{c-2}y^2-c\frac{c-1}{2}\frac{c-2}{3}x^{c-3}y^3+\dots$ therefore, by evolution, $\frac{1}{a-b}=\frac{1}{x-y}$.

The square root of a binomial, one of whose factors is a quadratic surd, and the other rational, may sometimes be expressed by a binomial, one or both of whose factors are quadratic surds.

Let $a+\sqrt{b}$ be the given binomial, and suppose $\sqrt{a+\sqrt{b}}=x+y$, where x and y are one or both quadratic surds,

Then $\sqrt{a-\sqrt{b}}=x-y$

By multiplication, $\sqrt{a^2-b}=x^2-y^2$

Also, by squaring both sides of the first equation,

$$a+\sqrt{b}=x^2+2xy+y^2$$

And $a-\sqrt{b}=x^2-y^2$

By addition, $a+\sqrt{a^2-b}=2x^2$

By subtraction, $a-\sqrt{a^2-b}=2y^2$, and the root $x+y$

$$\sqrt{\frac{a+\sqrt{a^2-b}}{2}} + \sqrt{\frac{a-\sqrt{a^2-b}}{2}}$$

From this conclusion it appears that the square root of $a+\sqrt{b}$ can only be expressed by a binomial of the form $x+y$, one or both of which are quadratic surds, when a^2-b is a perfect square.

The values of x and y are $\pm\sqrt{\frac{a+\sqrt{a^2-b}}{2}}$ and $\pm\sqrt{\frac{a-\sqrt{a^2-b}}{2}}$; there are therefore four different values of $x+y$.

Ex. 1. Required the square root of $3+2\sqrt{2}$.

In this case, $a=3$, $\sqrt{b}=2\sqrt{2}$, and $a^2-b=9-8=1$; hence, $x=\sqrt{\frac{3+1}{2}}=\sqrt{2}$, and $y=\sqrt{\frac{3-1}{2}}=1$; therefore, $x+y=\sqrt{2}+1$.

Ex. 2. Required the square root of $7-2\sqrt{10}$.

Here $a=7$, $\sqrt{b}=2\sqrt{10}$, $a^2-b=49-40=9$, and $x=\sqrt{\frac{7+3}{2}}=\sqrt{5}$; also $y=\sqrt{\frac{7-3}{2}}=\sqrt{2}$; therefore, $x-y=\sqrt{5}-\sqrt{2}$, the root required.

Ex. 3. Required the square root of $4\sqrt{5}-1$.

Here $a=-1$, $\sqrt{b}=4\sqrt{5}$, $a^2-b=1-80=-79$, and $x=\sqrt{\frac{-1+9}{2}}=2$; also, $y=\sqrt{\frac{-1-9}{2}}=\sqrt{-5}$; therefore, the root required is $2+\sqrt{-5}$.

PART II.

ON THE NATURE OF EQUATIONS.

ANY equation, involving the powers of one unknown quantity, may be reduced to the form $x^n-px^{n-1}+qx^{n-2}-\dots+Q=0$; where the whole expression is made equal to nothing, the terms are arranged according to the dimensions of the unknown quantity, the coefficient of the highest dimension is unity, and the coefficients, $p, q, r, \&c.$ are affected with their proper signs.

An equation, where the index of the highest power of the unknown quantity is n , is said to be of n dimensions; and, in speaking simply of an equation of n dimensions, we understand one reduced to the above form, unless the contrary be expressed.

Any quantity, $x^n-px^{n-1}+qx^{n-2}-\dots+Px-Q$, may be supposed to arise from the multiplication of $x-a, x-b, x-c, \&c.$ continued to n factors. For, by actually multiplying the factors together, we obtain a quantity of n dimensions, similar to the proposed quantity, $x^n-px^{n-1}+qx^{n-2}-\dots+Q$, and, if $a, b, c, d, \&c.$ can be so assumed that the coefficients of the corresponding terms in the two quantities become equal, the whole expressions coincide. And these coefficients may be made equal, because we shall have n equations to determine the n quantities, $a, b, c, d, \&c.$ If then the quantities, $a, b, c, d, \&c.$ be properly assumed, the equation $x^n-px^{n-1}+qx^{n-2}-\dots+Q=0$, is the same with $x-a, x-b, x-c, \&c.=0$.

This proof, however, though usually given, is imperfect; for, if the n equations be reduced to one, containing only

only one of the quantities, a , this equation is $a^n - pa^{n-1} + qa^{n-2} - \&c. = 0$, which exactly coincides with the proposed equation; in supposing, therefore, that a can be found, we take for granted the proposition to be proved. The subject has exercised the skill of the most eminent algebraical writers, but their reasonings upon it are of too abstruse a nature to be introduced in this place. The learner must, at present, take for granted, that an equation may be made up of as many simple factors as it has dimensions.

The quantities, $a, b, c, d, \&c.$ are called *roots* of the equation, or *values* of x , because, if any one of them be substituted for x , the whole expression becomes nothing, which is the only condition proposed by the equation.

Every equation has as many roots as it has dimensions. If $x^n - px^{n-1} + qx^{n-2} - \&c. = 0$, or $x - a, x - b, x - c, \&c.$ to n factors $= 0$; there are n quantities, $a, b, c, \&c.$ each of which, when substituted for x , makes the whole $= 0$; but any quantity different from these, as e , when substituted for x , gives the product $e - a, e - b, e - c, \&c.$ which does not vanish, that is, e will not answer the condition which the equation requires.

When one of the roots, a , is obtained, the equation $x - a, x - b, x - c, \&c. = 0$, or $x^n - px^{n-1} + qx^{n-2} - \&c. = 0$, is divisible by $x - a$, without a remainder, and is thus reducible to $x - b, x - c, \&c. = 0$, an equation one dimension lower, whose roots are $b, c, \&c.$

Ex. One root of the equation $y^3 + 1 = 0$, is -1 , and the equation may be depressed to a quadratic, in the following manner:

$$\begin{array}{r} y+1 \quad y^3+1 \quad (y^2-y+1) \\ \underline{y^3+y^2} \\ -y^2 \\ \underline{-y^2-y} \\ +y+1 \\ \underline{y+1} \\ * \end{array}$$

Hence the other two roots are the roots of the quadratic $y^2 - y + 1 = 0$.

If two roots a and b be obtained, the equation is divisible by $x - a, x - b$; and thus it may be reduced two dimensions lower.

Ex. Two roots of the equation $x^6 - 1 = 0$, are $+1$ and -1 , therefore it may be depressed to a biquadratic by dividing by $x - 1, x + 1$, or by $x^2 - 1$.

$$\begin{array}{r} x^2-1 \quad x^6-1 \quad (x^4+x^2+1) \\ \underline{x^6-x^4} \\ +x^2-1 \\ \underline{+x^2+1} \\ x^2+1 \\ \underline{x^2+1} \\ * \end{array}$$

Hence the equation $x^4 + x^2 + 1 = 0$, contains the other four roots of the proposed equation.

Conversely, if the equation be divisible by $x - a$, without a remainder, a is a root; if by $x - a, x - b$, a and b are both roots, &c. Let Q be the quotient arising from the division, then the equation is $x - a, x - b, Q = 0$, in which, if a or b be substituted for x , the whole vanishes.

COR. 1. If $a, b, c, \&c.$ be the roots of an equation, that equation is $x - a, x - b, x - c, \&c. = 0$. Thus the equation, whose roots are, $1, 2, 3, 4$, is $x - 1, x - 2, x - 3, x - 4 = 0$, or $x^4 - 10x^3 + 35x^2 - 50x + 24 = 0$. The equation whose roots are $1, 2$, and -3 , is $x - 1, x - 2, x + 3 = 0$, or $x^3 - 7x + 6 = 0$.

COR. 2. If the last term of an equation vanish, it is of the form $x^n - px^{n-1} + qx^{n-2} - \dots - Px = 0$, which is divisible by x , or $x - 0$, without remainder, therefore 0 is one

of its roots; if the two last terms vanish, it is divisible by x^2 without remainder, or by $x - 0, x - 0$, that is, two of its roots are $0, \&c.$

The coefficient of the second term of an equation, is the sum of the roots with their signs changed; the coefficient of the third term, is the sum of the products of every two roots, with their signs changed; the coefficient of the fourth term, the sum of the products of every three roots, with their signs changed, &c. and the last term is the product of all the roots, with their signs changed.

COR. If the roots be all positive, the signs of the terms will be alternately $+$ and $-$. For the product of an odd number of negative quantities is negative, and of an even number, positive. But, if the roots be all negative, the signs of all the terms will be positive, because the equation arises from the multiplication of the positive quantities, $x + a, x + b, x + c, \&c.$

The roots, $a, b, c, \&c.$ of an equation are *impossible*, when, as is frequently the case, they involve the square root of a negative quantity.

Impossible roots enter equations by pairs. If $a + \sqrt{-b^2}$ be a root of the equation $x^n - px^{n-1} + \&c. = 0$, $a - \sqrt{-b^2}$ is also a root.

For x in the equation, substitute $a + \sqrt{-b^2}$, and the result will consist of two parts, possible quantities, which involve the powers of a and the even powers of $\sqrt{-b^2}$, and impossible quantities which involve the odd powers of $\sqrt{-b^2}$; call the sum of the possible quantities A , and of the impossible quantities B , then $A + B$ is the whole result. Let now, $a - \sqrt{-b^2}$, be substituted for x , and the possible part of the result will be the same as before, and the impossible part which arises from the odd powers of $-\sqrt{-b^2}$, will only differ from the former impossible part by its sign; therefore the result is $A - B$; and since by the supposition $a + \sqrt{-b^2}$ is a root of the equation, $A + B = 0$, in which, as no part of A can be destroyed by B , $A = 0$ and $B = 0$, therefore $A - B = 0$; that is, the result, arising from the substitution of $a - \sqrt{-b^2}$ for x , is nothing, or $a - \sqrt{-b^2}$ is a root of the equation.

COR. 1. Hence it follows that an equation of an odd number of dimensions must have, at least, one possible root, unless some of the coefficients are impossible; in which case the equation may have an odd number of impossible roots.

COR. 2. By the same mode of reasoning it appears, that, when the coefficients are rational, surd roots of the form $\pm\sqrt{b}$, or $a \pm \sqrt{b}$, enter equations by pairs.

On the Transformation of Equations.

If the signs of all the terms in an equation be changed, its roots are not altered. Let $x - a, x - b, x - c, \&c. = 0$; then $-x + a, -x + b, -x + c, \&c. = 0$, when $x = a, b, c, \&c.$

If the signs of the alternate terms, beginning with the second, be changed, the signs of all the roots are changed. Let $x^n - px^{n-1} + qx^{n-2} + \&c. = 0$, be an equation whose roots are $a, b, c, \&c.$ for x substitute $-y$, and, when n is an even number, $y^n + py^{n-1} - qy^{n-2} - \&c. = 0$; but when n is an odd number, $-y^n - py^{n-1} + qy^{n-2} + \&c. = 0$; or, changing all the signs, $y^n + py^{n-1} - qy^{n-2} - \&c. = 0$, as before; and since $x = -y$, or $y = -x$, the values of y are, $-a, -b, -c, \&c.$

Ex. Let it be required to change the signs of the roots of the equation, $x^3 - qx + r = 0$. This equation with all its terms is $x^3 + 0 - qx + r = 0$, and, changing the signs of the alternate terms, we have $x^3 - 0 - qx - r = 0$, or $x^3 - qx - r = 0$, an equation whose roots differ from the roots of the former only in their signs.

To transform an equation into one whose roots are greater or less than the corresponding roots of the original equation by any given quantity. Let the roots of the equation

equation $x^3 - px^2 + qx - r = 0$, be a, b, c ; to transform it into one whose roots are $a + e, b + e, c + e$.

$$\left. \begin{aligned} \text{Assume } x + e = y, \text{ or } x = y - e; \text{ then} \\ x^3 = y^3 - 3ey^2 + 3e^2y - e^3 \\ -px^2 = -py^2 + 2pey - pe^2 \\ +qx = +qy - qe \\ -r = -r \end{aligned} \right\} = 0.$$

$$\left. \begin{aligned} x^n &= y^n + ney^{n-1} + \frac{n(n-1)}{2}e^2y^{n-2} + \dots + ne^{n-1}y + e^n \\ -px^{n-1} &= -py^{n-1} - \frac{n-1}{1}pey^{n-2} - \dots - \frac{n-1}{1}pe^{n-2}y - pe^{n-1} \\ +qx^{n-2} &= +qy^{n-2} + \dots + \frac{n-2}{2}qe^{n-3}y + qe^{n-2} \\ &\&c. = &c. \end{aligned} \right\} = 0.$$

and, since $y = x + e$, the values of y are $a + e, b + e, c + e$, &c.

We may observe, that the last term of the transformed equation, $e^n - pe^{n-1} + qe^{n-2} - \&c.$ is the original quantity, with e in the place of x ; the coefficient of the last term but one is obtained by multiplying every term of $e^n - pe^{n-1} + qe^{n-2} - \&c.$ by the index of e in that term, and diminishing the index by unity; the coefficient of the last term but two, $\frac{n-1}{2}e^{n-2} - \frac{n-1}{2}pe^{n-3} + \frac{n-2}{2}qe^{n-4} - \&c.$ is obtained in the same manner from the coefficient of the last term but one, and dividing every term by 2, &c.

One use of this transformation is, to take away any term out of an equation. Thus, to transform an equation into one which shall want the second term, e must be so assumed that $ne - p = 0$, or $e = \frac{p}{n}$, (where p is the coefficient of the second term with its sign changed, and n the index of the highest power of the unknown quantity;) and, if the roots of the transformed equation can be found, the roots of the original equation may also be found; because, $x = y + \frac{p}{n}$.

Ex. To transform the equation $x^3 - 9x^2 + 7x + 12 = 0$ into one which shall want the second term.

Assume $x = y + 3$, then

$$\left. \begin{aligned} x^3 &= y^3 + 9y^2 + 27y + 27 \\ -9x^2 &= -9y^2 - 54y - 81 \\ +7x &= +7y + 21 \\ +12 &= +12 \end{aligned} \right\} = 0.$$

That is, $y^3 - 20y - 21 = 0$; and, if the values of y be a, b, c , the values of x are $a + 3, b + 3$, and $c + 3$.

To transform an equation into one whose roots are the reciprocals of the roots of the given equation. Let the roots of the equation, $x^n - px^{n-1} + qx^{n-2} - \dots - Px + Q = 0$, be a, b, c , &c. to transform it into one whose roots are $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$, &c.

Assume $y = \frac{1}{x}$, or $x = \frac{1}{y}$; then, by substitution, $\frac{1}{y^n} - \frac{p}{y^{n-1}} + \frac{q}{y^{n-2}} - \dots - \frac{P}{y} + Q = 0$, or multiplying by y^n , $1 - py + qy^2 - \dots - Py^{n-1} + Qy^n = 0$, that is, $Qy^n - Py^{n-1} + \dots + qy^2 - py + 1 = 0$; and since $y = \frac{1}{x}$, the values of y are, $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$, &c.

COR. 1. If any term in the given equation be wanting, the corresponding term will be wanting in the transformed equation; thus, if the original equation want the second term, the transformed equation will want the last term but one, &c. because the coefficients in the transformed equation are the coefficients in the original equation in an inverted order.

COR. 2. If the coefficients of the terms, taken from the beginning of an equation, be the same with the coefficients of the terms, taken from the end, the equation will be palindromic.

In this last equation, since $y = x + e$, the values of y are $a + e, b + e, c + e$.

If $y + e$ be substituted for x , the values of y in the resulting equation will be $a - e, b - e, c - e$.

In general, let the roots of the equation $x^n - px^{n-1} + qx^{n-2} - \&c. = 0$, be a, b, c , &c. Assume $y = x - e$, or $x = y + e$, and, by substitution,

the corresponding terms, taken from the end, with the same signs, the transformed equation will coincide with the original, and their roots will therefore be the same. Let a, b, c , be roots of the equation $x^n - px^{n-1} + qx^{n-2} - \dots + qx^2 - px + 1 = 0$; the transformed equation will be $y^n - py^{n-1} + qy^{n-2} - \dots + qy^2 - py + 1 = 0$, and, a, b, c , must also be roots of this equation, but the roots of this equation are the reciprocals of the roots of the original equation; therefore, $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$, are also roots of the original equation.

Ex. The roots of the equations, $x^4 - px^3 + qx^2 - px + 1 = 0$; $x^4 + qx^2 + 1 = 0$; and $x^4 + 1 = 0$, are of the form $a, b, \frac{1}{a}, \frac{1}{b}$.

COR. 3. If the equation be of an odd number of dimensions, or if the middle term of an equation of an even number of dimensions be wanting, the same thing will hold when the signs of the corresponding terms, taken from the beginning and end, are different.

Ex. The roots of the equation $x^3 - px^2 + px - 1 = 0$, are of the form $1, a, \frac{1}{a}$. For, in this case, if the signs of all the terms of the transformed equation be changed, it will coincide with the original equation; and, by changing the signs of all the terms, we do not alter the roots.

The equations described in the two last corollaries are called *recurring equations*.

COR. 4. One root of a recurring equation of an odd number of dimensions, will be $+1$, or -1 , according as the sign of the last term is $-$ or $+$; and the rest will be of the form $a, \frac{1}{a}, b, \frac{1}{b}$, &c. For, if $+1$ in the former case, and -1 in the latter, be substituted for the unknown quantity, the whole vanishes; and, if a, b, c , &c. be roots of the equation, $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$, are also roots.

To transform an equation into one whose roots are the squares of the roots of the given equation. Let $x^n - px^{n-1} + qx^{n-2} - \dots + qx^2 - px + 1 = 0$; by transposition, $x^n + qx^{n-2} + \dots + qx^2 = px^{n-1} - 1$, and, by squaring both sides, $x^{2n} + 2qx^{2n-2} + \dots + q^2x^4 + 2qx^2 + 1 = p^2x^{2n-2} - 2px^{n-1} + 1$, and again, by transposition, $x^{2n} - p^2x^{2n-2} - 2qx^{2n-2} + q^2x^4 + 2qx^2 + 1 = 2px^{n-1} - 2$, &c. = 0; assume $y = x^2$, then $y^n - p^2y^{n-2} - 2qy^{n-2} + q^2y^2 + 2qy + 1 = 2py^{n-1} - 2$, &c. = 0, in which equation the values of y are the squares of the values of x .

COR. If the roots of the original equation be a, b, c , &c. then $p^2 - 2q = a^2 + b^2 + c^2 + \&c.$ $q^2 - 2pr + 2s = a^2b^2 + a^2c^2 + b^2c^2 + \&c.$

Those who wish to see other transformations, may consult Dr. Waring's *Meditationes Algebraicæ*.

On the Limits of the Roots of Equations.

If $a, b, c, -d$, &c. be the roots of an equation taken in order, that is, a greater than b , b greater than c , &c. the equation is $x - a.x - b.x - c.x + d$, &c. = 0; and, if a quantity

quantity greater than a be substituted for x , as every factor is, on this supposition, positive, the result will be positive; if a quantity less than a , but greater than b , be substituted, the result will be negative, because one factor will be negative and the rest positive. If a quantity between b and c be substituted, the result will again be positive, because two factors are negative and the rest positive, and so on. Thus, quantities which are limits to the roots of an equation, if substituted for the unknown quantity, give results alternately positive and negative.

Conversely, if two magnitudes, when substituted for the unknown quantity, give results affected with different signs, an odd number of roots must lie between them; and if a series of quantities can be found, which give as many results, alternately positive and negative, as the equation has dimensions, these must be limits to the roots of the equation; because an odd number of roots lies between each two succeeding terms of the series, and there are as many terms as the equation has dimensions; therefore this odd number cannot exceed one.

If the results arising from the substitution of two magnitudes for the unknown quantity, be both positive or both negative, either no root of the equation, or an even number of roots, lies between them.

COR. If m , and every quantity greater than m , when substituted for the unknown quantity, give positive results, m is greater than the greatest root of the equation.

To find a limit greater than the greatest root of an equation. Let the roots of the equation be a, b, c , &c. transform it into one whose roots are $a-e, b-e, c-e$, &c. and if, by trial, such a value of e be found, that every term of the transformed equation is positive, all its roots are negative, and consequently e is greater than the greatest root of the proposed equation.

Ex. 1. To find a number greater than the greatest root of the equation $x^3-5x^2+7x-1=0$.

Assume $x=y+e$, and we have

$$\left. \begin{array}{r} y^3+3y^2+3e^2y+e^3 \\ -5y^2-10ey-5e^2 \\ +7y+7e \\ -1 \end{array} \right\} = 0.$$

in which equation, if 3 be substituted for e , each of the quantities, e^3-5e^2+7e-1 , $3e^2-10e+7$, $3e-5$, is positive, or all the values of y are negative; therefore, 3 is greater than the greatest value of x .

Ex. 2. In any cubic equation of this form, $x^3-qx+r=0$, $\sqrt[3]{q}$ is greater than the greatest root.

By transforming the equation, as before,

$$\left. \begin{array}{r} y^3+3y^2+3e^2y+e^3 \\ -qy-qe \\ +r \end{array} \right\} = 0.$$

and, substituting $\sqrt[3]{q}$ for e , $y^3+3\sqrt[3]{q}y^2+2qy+r=0$, every term of which is positive; therefore, $\sqrt[3]{q}$ is greater than the greatest value of x .

If the equation have both positive and negative roots, and $-d$ be the least root; when d is greater than the greatest root, it is greater than $\sqrt{\frac{p^2-2q}{n}}$, or

$$\sqrt{\frac{q^2-2pr+2s}{n-1}}.$$

The original equation has as many positive roots, and as many negative, as the limiting equation, and one more, which will be positive or negative according to the nature of the equation.

Every equation whose roots are possible, has as many changes of signs from $+$ to $-$, and from $-$ to $+$, as it has positive roots; and as many continuations of the same sign, from $+$ to $+$, and from $-$ to $-$, as it has negative roots. Let $x^n-px^{n-1}+\dots\pm Sx^2+Px\pm Q=0$, the equation of limits is $nx^{n-1}-n-1.p x^{n-2}+\dots\pm 2Sx\pm P$

$=0$, which, as far as it goes, has the same signs with the former; and therefore the original equation will have one more change of signs, or one more continuation of the same sign, than the limiting equation, according as the signs of P and Q are different, or the same.

Suppose α, β, γ , &c. to be the roots of the limiting equation; $a, b, c, \pm d$, the roots of the original equation; then $P=-\alpha\times-\beta\times-\gamma\times\&c.$ and $Q=-\alpha\times-\beta\times-\gamma\times\&c.$ which rectangles will have the same sign when the multiplier d is positive, or the root $(-d)$ negative, and different signs when that root is positive. It appears then, that if the original equation have one more change of signs than the limiting equation, it has one more positive root, and, if it have one more continuation of the same sign, it has one more negative root; therefore, if the equation $Ax^{n-1}-Bx^{n-2}+\&c.=0$ have as many changes of signs as it has positive roots, and as many continuations of the same sign as it has negative roots, the same rule will be true in the next superior equation $x^n-px^{n-1}+qx^{n-2}-\&c.=0$. Now, in every simple equation, $x-a=0$, or $x+a=0$, the rule is true, therefore it is true in every quadratic $x^2\pm px\pm q=0$; and if it be true in every quadratic, it is true in every cubic, and so on; that is, the rule is true in all cases.

In the demonstration, each root, $\pm d$, is supposed to be a distinct possible quantity. Hence, when all the roots are possible, the number of positive roots is exactly known.

When any coefficient vanishes, it may be considered either as positive or negative, because the value of the whole expression is the same on either supposition.

Ex. 1. The equation $x^3+x^2-14x+8=0$, has two positive and one negative root; because the signs are $+$, $+$, $-$, $+$, in which there are two changes, one from $+$ to $-$, and the other from $-$ to $+$, and one continuation of the sign $+$.

Ex. 2. If the roots of the equation $x^3-qx+r=0$ be possible, two of them are positive and the third negative; for there are two changes of signs in the equation $x^3\pm 0-qx+r=0$, and one continuation of the same sign.

To find between which of the roots of a proposed equation, any given number lies. Let the roots of the proposed equation be diminished by the given number, and the number of negative roots in the transformed equation will shew its place among the roots of the original equation.

Ex. To find between which of the roots of the equation $x^3-9x^2+23x-15=0$, the number 2 lies.

Assume $x=y+2$, then,

$$\left. \begin{array}{r} y^3+6y^2+12y+8 \\ -9y^2-36y-36 \\ +23y+46 \\ -15 \end{array} \right\} = 0,$$

or $y^3-3y^2-y+3=0$, which has one negative root; and the roots of the proposed equation are all positive; therefore two of them are greater, and one less, than 2.

In general, the last term and the coefficients of the other terms of the transformed equation are found by substituting the number, by which the roots are to be diminished, for x , in the quantities,

$$\left. \begin{array}{l} x^n-px^{n-1}+qx^{n-2}-\&c. \\ nx^{n-1}-n-1.px^{n-2}+n-2.qx^{n-3}-\&c. \\ n-1.x^{n-2}-n-1.p x^{n-3}+n-2.qx^{n-4}-\&c. \end{array} \right\}$$

And by substituting, successively, different numbers for x , the limits of the roots of the proposed equation may be found.

On the Depression and Solution of Equations.

If an equation contain equal roots, these may be found, and the equation reduced as many dimensions lower as there are equal roots. Let the roots of the equation $x^n-px^{n-1}+qx^{n-2}-\&c.=0$, be a, b, c, d , &c. then,

$$nx^{n-1}-$$

$$\left. \begin{array}{l} nx^{n-1} - (n-1).px^{n-2} + \\ n-2.qx^{n-3} - \&c. \end{array} \right\} = \left\{ \begin{array}{l} x-a.x-b.x-c. \&c. \\ +x-a.x-b.x-d. \&c. \\ +x-a.x-c.x-d. \&c. \\ +x-b.x-c.x-d. \&c. \end{array} \right.$$

Suppose $a=b$, then

$$\left. \begin{array}{l} nx^{n-1} - (n-1).px^{n-2} + \\ n-2.qx^{n-3} - \&c. \end{array} \right\} = \left\{ \begin{array}{l} x-a.x-a.x-c. \&c. \\ +x-a.x-a.x-d. \&c. \\ +x-a.x-c.x-d. \&c. \\ +x-a.x-c.x-d. \&c. \end{array} \right.$$

the whole of which is divisible by $x-a$ without remainder, that is, a is a root of the equation $nx^{n-1} - (n-1).px^{n-2} + n-2.qx^{n-3} - \&c. = 0$.

If three roots, a, b, c , be equal, $x-a.x-a.x-a$ will be found in every product; therefore the equation is divisible by $x-a.x-a.x-a$ without remainder, or two of its roots are a, a . In the same manner, if the original equation have m equal roots, the equation $nx^{n-1} - (n-1).px^{n-2} + n-2.qx^{n-3} - \&c. = 0$, has $m-1$ of those roots. Hence it appears, that when there are m equal roots, the two equations have a common measure of the form $(x-a)^{m-1}$ and m roots of the original equation known. Divide this equation by $(x-a)^m$, and the resulting equation, of $n-m$ dimensions, contains the other roots.

Ex. Let the equation $x^3 - px^2 + qx - r = 0$, have two equal roots; then $3x^2 - 2px + q = 0$ has one of them, and the two equations have a common measure which is a simple equation; also the quantities $3x^2 - 3px^2 + 3qx - 3r$, and $3x^2 - 2px + q$, have the same common measure, which is thus found,

$$\begin{array}{r} 3x^2 - 2px + q \quad 3x^2 - 3px^2 + 3qx - 3r \quad x - \frac{p}{3} \\ \underline{3x^3 - 2px^2 + qx} \\ -px^2 + 2qx - 3r \\ \underline{-px^2 + \frac{2p^2x}{3} - \frac{pq}{3}} \\ 6q - 2p^2 \quad x - \frac{9r - pq}{3} \end{array}$$

Hence $\frac{6q-2p^2}{3}x - \frac{9r-pq}{3}$ is a divisor of the equation $x^3 - px^2 + qx - r = 0$; that is, $\frac{6q-2p^2}{3}x - \frac{9r-pq}{3} = 0$, and $x = \frac{9r-pq}{6q-2p^2}$.

Thus two roots of the equation are discovered; and, since r is the product of all the roots, r divided by $\left(\frac{9r-pq}{6q-2p^2}\right)^2$ is the third root.

Let the proposed equation be $x^2 - 4x^2 + 5x - 2 = 0$. Here $p=4, q=5, r=2$; and $\frac{9r-pq}{6q-2p^2} = 1$. If then the equation have two equal roots, each of them is 1, and the third root is 2.

But it must be observed, that though 1 be a root of the proposed equation, it has not another root also 1, unless 1 be a root of the depressed equation $3x^2 - 8x + 5 = 0$.

If two roots of an equation be of the form $+a, -a$, differing only in their signs, they may be found, and the equation depressed. Change the signs of the roots, and the resulting equation has two roots $+a, -a$; thus we have two equations with a common measure, $x^2 - a^2$, which may be found, and the equation depressed, as in the preceding case.

Ex. Required the roots of the equation $x^3 + 3x^2 - 7x^2 - 27x - 18 = 0$, two of which are of the form $+a, -a$.

By changing the signs of the alternate terms we obtain the equation $x^3 - 3x^2 - 7x^2 + 27x - 18 = 0$, which has two roots of the form $+a, -a$; their common quadratic divisor is $x^2 - 9 = 0$, hence $x = \pm 3$. To obtain the other roots, divide $x^3 + 3x^2 - 7x^2 - 27x - 18 = 0$, by $x^2 - 9 = 0$, and the roots of the resulting equation, $x^2 + 3x + 2 = 0$, are the roots sought.

By this method surd roots, of the form $\pm \sqrt{a}$, may be constantly discovered; because they are always of this form when the coefficients are rational.

Solution of Recurring Equations.

The roots of a recurring equation, of an even number of dimensions, exceeding a quadratic, may be found by the solution of an equation of half the number of dimensions. Let $x^n - px^{n-1} - \dots - px + 1 = 0$; its roots are of the form $a, \frac{1}{a}, b, \frac{1}{b}, \&c.$ or it may be conceived to be

made up of quadratic factors, $\frac{x-a.x-\frac{1}{a}}{a}, \frac{x-b.x-\frac{1}{b}}{b}, \&c.$ i. e. if $m=a+\frac{1}{a}, n=b+\frac{1}{b}, \&c.$ of the quadratic

factors, $x^2 - mx + 1, x^2 - nx + 1, \&c.$ Then, by multiplying these together, and equating the coefficients with those of the proposed equation, the values of $m, n, \&c.$ may be found. Moreover, since n is only of one dimension, where x is of two, the equation for determining the value of m will rise only to half as many dimensions as x rises to in the original equation.

If the recurring equation be of an odd number of dimensions, $+1$, or -1 , is a root; and the equation may therefore be reduced to one of the same kind, of an even number of dimensions, by division.

Ex. Let $x^3 - 1 = 0$. Unity is one root of this equation, and, by dividing $x^3 - 1$ by $x - 1$, the equation $x^2 + x + 1 = 0$ is obtained, which contains the other two, $\frac{-1 \pm \sqrt{-3}}{2}$ and $\frac{-1 - \sqrt{-3}}{2}$.

$$\begin{array}{l} x^2 + x + 1 = 0 \\ x^2 + x + \frac{1}{4} - \frac{1}{4} = -\frac{3}{4} \\ x + \frac{1}{2} = \pm \frac{\sqrt{-3}}{2} \end{array}$$

or $x = \frac{-1 \pm \sqrt{-3}}{2}$; that is, the three roots of the equation $x^3 - 1 = 0$, or the three cube roots of 1, are 1, $\frac{-1 + \sqrt{-3}}{2}$ and $\frac{-1 - \sqrt{-3}}{2}$.

In the same manner the roots of the equation $x^3 + 1 = 0$ are found to be $-1, \frac{1 + \sqrt{-3}}{2}$ and $\frac{1 - \sqrt{-3}}{2}$.

Solution of a Cubic Equation by Cardan's Rule.

Let the equation be reduced to the form $x^3 - qx + r = 0$, where q and r may be positive or negative. Assume $x = a + b$, then the equation becomes $(a+b)^3 - q(a+b) + r = 0$, or $a^3 + b^3 + 3ab(a+b) - q(a+b) + r = 0$; and, since we have two unknown quantities, a and b , and have made only one supposition respecting them, viz. that $a+b=x$, we are at liberty to make another; let $3ab - q = 0$, then the equation becomes $a^3 + b^3 + r = 0$; also, since $3ab - q = 0, b = \frac{q}{3a}$, and, by substitution, $a^3 + \frac{q^3}{27a^3} + r = 0$, or $a^6 + ra^3 + \frac{q^3}{27} = 0$, an equation of a quadratic form; and, by completing

pleting the square, $a^6 + 7a^3 + \frac{r^2}{4} = \frac{r^2}{4} - \frac{q^2}{27}$, and $a^3 + \frac{r}{2} =$

$\pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}$, therefore, $a^3 = -\frac{r}{2} \pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}$, and $a =$

$\sqrt[3]{-\frac{r}{2} \pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}}$. Also, since $a^3 + b^3 + r = 0$, $b^3 =$

$-\frac{r}{2} \mp \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}$, and $b = \sqrt[3]{-\frac{r}{2} \mp \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}}$; there-

fore $x = a + b = \sqrt[3]{-\frac{r}{2} \pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}} +$

$\sqrt[3]{-\frac{r}{2} \mp \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}}$.

We may observe that when the sign of $\sqrt{\frac{r^2}{4} - \frac{q^2}{27}}$ in one part of the expression is positive, it is negative

in the other, that is $x = \sqrt[3]{-\frac{r}{2} + \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}} +$

$\sqrt[3]{-\frac{r}{2} - \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}}$.

Since $b = \frac{q}{3a}$, the value of x is also

$\sqrt[3]{-\frac{r}{2} \pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}} + \frac{q}{\sqrt[3]{-\frac{r}{2} \pm \sqrt{\frac{r^2}{4} - \frac{q^2}{27}}}}$

Ex. Let $x^3 + 6x - 20 = 0$; here $q = -6$, $r = -20$, $x =$
 $\sqrt[3]{10 + \sqrt{108}} + \sqrt[3]{10 - \sqrt{108}} = 2.73 - .73 = 2.$

COR. 1. Having obtained one value of x , the equation may be depressed to a quadratic, and the other roots found.

COR. 2. The possible values of a and b being discovered, the other roots are known without the solution of a quadratic.

The values of the cube roots of a^3 are $a, \frac{-1 + \sqrt{-3}}{2}a,$
 $\frac{-1 - \sqrt{-3}}{2}a$; and the values of the cube root of b^3 are $b,$
 $\frac{-1 + \sqrt{-3}}{2}b, \frac{-1 - \sqrt{-3}}{2}b.$

Hence it appears that there are nine values of $a + b$, three only of which can answer the conditions of the equation, the others having been introduced by involution. These values are,

1. $a + b$
2. $a + \frac{-1 + \sqrt{-3}}{2}b$
3. $a + \frac{-1 - \sqrt{-3}}{2}b$
4. $\frac{-1 + \sqrt{-3}}{2}a + b$
5. $\frac{-1 + \sqrt{-3}}{2}a + \frac{-1 + \sqrt{-3}}{2}b$
6. $\frac{-1 + \sqrt{-3}}{2}a + \frac{-1 - \sqrt{-3}}{2}b$
7. $\frac{-1 - \sqrt{-3}}{2}a + b$

$$8. \frac{-1 - \sqrt{-3}}{2}a + \frac{-1 + \sqrt{-3}}{2}b$$

$$9. \frac{-1 - \sqrt{-3}}{2}a + \frac{-1 - \sqrt{-3}}{2}b$$

In the operation we assume $3ab = q$, that is, the product of the corresponding values of a and b is supposed to be possible. This consideration excludes the second, third, fourth, fifth, seventh, and ninth, values of $a + b$, or x ; therefore, the three roots of the equation are $a + b,$
 $\frac{-1 + \sqrt{-3}}{2}a + \frac{-1 - \sqrt{-3}}{2}b,$ and $\frac{-1 - \sqrt{-3}}{2}a +$
 $\frac{-1 + \sqrt{-3}}{2}b.$

COR. 3. This solution only extends to those cases in which the cubic has two impossible roots. For if the roots be $m + \sqrt{3n}$, $m - \sqrt{3n}$ and $-2m$, then $-q$, (the sum of the products of every two with their signs changed,) $= -3m^2 - 3n$, and $\frac{q}{27} = m^2 + n$; also r , the product of all the roots with their signs changed, $= 2m^3 - 6mn$, and $\frac{r}{2} = m^3 - 3mn$. And, by involution,

$$\frac{r^2}{4} = m^6 - 6m^2n + 9m^2n^2$$

$$\frac{q^3}{27} = m^6 + 3m^2n + 3m^2n^2 + n^3$$

$$\text{Hence } \frac{r^2}{4} - \frac{q^3}{27} = -9m^2n + 6m^2n^2 - n^3 =$$

$$-n \times 9m^2 - 6m^2n + n^3, \text{ and } \sqrt{\frac{r^2}{4} - \frac{q^3}{27}} = \sqrt{-n} \times \sqrt{3m^2 - n},$$

a quantity manifestly impossible, unless n is negative; that is, unless two roots of the proposed cubic are impossible.

Solution of a Biquadratic by Des Cartes's Method.

Any biquadratic may be reduced to the form $x^4 + qx^2 + rx + s = 0$, by taking away the second term. Suppose this to be made up of the two quadratics, $x^2 + ex + f = 0$, and $x^2 - ex + g = 0$, where $+e$ and $-e$ are made the coefficients of the second terms, because the second term of the biquadratic is wanting, that is, the sum of the roots is 0. By multiplying these quadratics together, we have $x^4 + g + f - e^2 \cdot x^2 + eg - ef \cdot x + fg = 0$, which equation is made to coincide with the former by equating their coefficients, or making $g + f - e^2 = q$, $eg - ef = r$, and $fg = s$; hence $g + f = q + e^2$, also $g - f = \frac{r}{e}$, and, by taking the sum

and difference of these equations, $2g = q + e^2 + \frac{r}{e}$, and $2f = q + e^2 - \frac{r}{e}$; therefore $4fg = q^2 + 2qe^2 + e^4 - \frac{r^2}{e^2} = 4s$, and multiplying by e^2 , and arranging the terms according to the dimensions of e , $e^6 + 2qe^4 + q^2e^2 - 4s \times e^2 - r^2 = 0$; or, making $y = e^2$, $y^3 + 2qy^2 + q^2y - 4sy - r^2 = 0$.

By the solution of this cubic, a value of y , and therefore of $\sqrt{y}$, or e , is obtained; also f and g , which are

respectively equal to $\frac{q + e^2 - \frac{r}{e}}{2}$ and $\frac{q + e^2 + \frac{r}{e}}{2}$, are known;

the biquadratic is thus resolved into two quadratics, whose roots may be found. It may be observed, that whichever value of y is used, the same values of x are obtained.

This solution can only be applied to those cases, in which two roots of the biquadratic are possible, and two impossible. Let the roots be $a, b, c, -a - b - c$; then, since e , the coefficient of the second term of one of the reducing quadratics,

quadratics, is the sum of two roots, its different values are $a+b$, $a+c$, $b+c$, $-a+b$, $-a+c$, $-b+c$, and the values of e , or y , are $a+b$, $a+c$, $b+c$; all of which being possible, the cubic cannot be solved by any direct method. Suppose the roots of the biquadratic to be $a+b\sqrt{-1}$, $a-b\sqrt{-1}$, $-a+c\sqrt{-1}$, $-a-c\sqrt{-1}$; the values of e are $2a$, $b+c\sqrt{-1}$, $b-c\sqrt{-1}$, $-b-c\sqrt{-1}$, $-b+c\sqrt{-1}$, and $-2a$; and the three values of y are, $2a$, $-b+c$, $-b-c$, which are all possible, as in the preceding case. But if the roots of the biquadratic be $a+b\sqrt{-1}$, $a-b\sqrt{-1}$, $-a+c$, $-a-c$, the values of y are $2a$, $c+b\sqrt{-1}$, $c-b\sqrt{-1}$, two of which are impossible; therefore the cubic may be solved by Cardan's rule.

Dr. Waring's Solution of a Biquadratic.

Let the proposed biquadratic be $x^4+2px^2=qx^2+rx+s$; now $x^2+px+n = x^2+2px^2+p^2+2n.x^2+2pnx+n^2$, if therefore $p^2+2n.x^2+2pnx+n^2$ be added to both sides of the proposed biquadratic, the first part is a complete square, x^2+px+n , and the latter part, $p^2+2n+q.x^2+2pn+r.x+n^2+s$, is a complete square, if $4 \times p^2+2n+q \times n^2+s = 2pn+r$; that is, multiplying and arranging the terms according to the dimensions of n , if $8n^3+4qn^2+8s-4rp.n+4qs+4p^2s-r^2=0$. From this equation let a value of n be obtained and substituted in the equation $x^2+px+n = p^2+2n+q.x^2+2pn+r.x+n^2+s$, then extracting the square root on both sides, $x^2+px+n = \pm \sqrt{p^2+2n+q.x^2+2pn+r.x+n^2+s}$ when $2pn+r$ is positive, or $x^2+px+n = \pm \sqrt{p^2+2n+q.x^2+2pn+r.x+n^2+s}$, when $2pn+r$ is negative, and from these two quadratics the four roots of the given biquadratic may be determined.

Ex. Let $x^4-6x^3+5x^2+2x-10=0$ be the proposed equation. By comparing this with the equation $x^4+2px^2=qx^2+rx+s=0$, we have $2p=-6$ or $p=-3$, $q=5$, $r=2$, $s=-10$; and $8n^3+4qn^2+8s-4rp.n+4qs+4p^2s-r^2=0$, is $8n^3-20n^2+56n+156=0$, or $2n^3-5n^2+14n+39=0$, one of whose roots is $-\frac{3}{2}$; hence $x^2-3x-\frac{3}{2} = x^2+7x+\frac{49}{4}$, and $x^2-3x-\frac{3}{2} = \pm x+\frac{7}{2}$, or $x^2-4x-5=0$, and $x^2-2x+2=0$; the roots of these quadratics, $-1, 5, 1+\sqrt{-1}, 1-\sqrt{-1}$, are the roots of the proposed biquadratic.

This solution can only be applied to those cases in which two roots of the biquadratic are possible, and two impossible. Let the roots be a, b, c, d , then $n = \sqrt{n^2+s}$, the last term of one of the quadratics to which the equation is reduced, is the product of two of them, as ab ; therefore, $n-ab = \sqrt{n^2+s}$, and, squaring both sides, $n^2-2nab+a^2b^2 = n^2+s$, or $-2nab+a^2b^2 = s = -abcd$, and dividing both sides by $-ab$, $2n-ab=cd$, or $2n=ab+cd$, and $n = \frac{ab+cd}{2}$; the other values of n are $\frac{ac+bd}{2}$, and $\frac{ad+bc}{2}$; therefore, when a, b, c, d , are possible, the values of n are possible. Also, when these quantities are all impossible, the values of n are all possible; in neither case, therefore, can the value of n be obtained by Cardan's rule; but, if two roots of the biquadratic be possible, and two impossible, two values of n will be impossible, and the cubic may be solved; and consequently the roots of the proposed equation may be found.

The Method of Divisors.

Since the last term of an equation is the product of all the roots with their signs changed, if any root be a whole number it must be found amongst the divisors of the last term.

Ex. Suppose $x^3-4x^2-6x+12=0$; the divisors of the last term are 1, -1, 2, -2, 3, -3, 4, -4, 6, -6, 12, -12; and, by substituting these successively for x , we find that -2 is a root of the equation.

When the last term admits of many divisors, the number of trials may be lessened by finding the limits between which the roots of the equation lie; or, by increasing or diminishing the roots of the equation, and thus lessening the number of divisors of the last term.

The number of trials may also be lessened by substituting three or more terms of the arithmetical progression 1, 0, -1, &c. for the unknown quantity, and forming the divisors of the results, taken in order, into arithmetical progressions, in which the common difference is unity; as it will only be necessary to try those divisors of the last term of the equation which are terms in these progressions.

Let $x+a.Q=0$ be the equation, one factor of which is $x+a$, and Q the product of the rest; if 1, 0, -1, be successively substituted for x , the results are respectively divisible by $a+1$, a , and $a-1$; therefore amongst the divisors of the results, formed into arithmetical progressions in which the common difference is unity, is found the decreasing progression $a+1, a, a-1$; and, if all the terms corresponding to a , with their signs changed, be substituted in the equation for x , the integral values of x will be discovered.

Ex. Let the proposed equation be $x^3-4x^2-6x+12=0$.

Supp.	Results.	Divisors.	Progr.
$x=1$	3	1, 3	3
$x=0$	12	1, 2, 3, 4, 6, 12	2
$x=-1$	13	1, 13	1

The only decreasing progression that can be formed out of the divisors is 3, 2, 1; therefore if one root of the equation be a whole number, -2 is that root, and on trial it is found to succeed.

If the highest power of the unknown quantity be affected with a coefficient, let $mx+a \times Q=0$ be the equation, and substitute 1, 0, -1, successively for x , then $a+m$, a , and $a-m$ are divisors of the results, if the equation have a factor of the form $mx+a$, or a root $-\frac{a}{m}$. Also m , the common difference in the arithmetical progression $a+m, a, a-m$, is a divisor of the coefficient of the first term of the equation. In this case, therefore, all the decreasing progressions must be taken, out of the divisors of the resulting quantities, in which the common difference is unity, or some divisor of the coefficient of the highest term of the equation, and amongst them is the progression $a+m, a, a-m$; therefore, by making trial of the progressions thus obtained, successively, the factor $mx+a$, which divides the equation without remainder, will be found.

Ex. To find a divisor of the equation $8x^3-26x^2+11x+10=0$, if it admit one of the form $mx+a$.

Sup.	Ref.	Divisors.	Progress.
$x=1$	3	1, 3, -1, -3	3, 3, -3
$x=0$	10	1, 2, 5, 10, -1, -2, -5, -10	1, 2, -5
$x=-1$	-35	1, 5, 7, 35, -1, -5, -7, -35	-1, 1, -7

The decreasing progressions, in which the common difference is a divisor of 8, formed out of the divisors, are 3, 1, -1; 3, 2, 1; and -3, -5, -7; therefore the factors to be tried are $2x+1$, $x+2$, and $2x-5$, the last of which succeeds, and consequently $2x-5=0$, or $x=\frac{5}{2}$.

If an equation be of four or more dimensions, though it admit of no divisor of the form $mx+a$, it may admit one of the form $\pm mx^2 \pm nx \pm r$. To find when this is the case, let $\pm mx^2 + nx + r \times Q = 0$ be the equation; and for x substitute, successively, $p+e$, p , $p-e$, &c. then $\pm m.p+e^2 + n.p+e+r$, $\pm mp^2 + np+r$, $\pm m.p-e^2 + n.p-e+r$ &c. are divisors of the resulting quantities; and, if they be respectively subtracted from, or added to, $m.p+e^2$, $m.p^2$, $m.p-e^2$, &c. the remainders, or sums, are $n.p+e+r$, $np+r$, $n.p-e+r$, &c. which form a decreasing arithmetical progression whose common difference is ne . When

$p=0$, and $e=1$, this progression becomes $n+r$, r , $-n+r$, &c. and in all cases m is a divisor of the first term of the equation. Let therefore 1, 0, -1, -2, &c. be substituted for x in the proposed equation, and the differences and sums of the divisors of the results, and m , 0, m , $4m$, &c. taken; then if all the arithmetical progressions possible be formed out of these quantities, in order, amongst them will be found the progression $n+r$, r , $-n+r$, &c. therefore, by trial, the divisor $mx^2 + nx + r$ will be discovered, if the equation admit one of a quadratic form.

Let the proposed equation be $3x^3 + 4x^2 + 3x - 2x + 2 = 0$.

Sup.	Ref.	Divisors.	Sq.	Sums and Differences.	Progress.
$x=1$	10	1, 2, 5, 10	3	-7, -2, 1, 2, 4, 5, 8, 13	-2, 1
$x=0$	2	1, 2	0	-2, -1, 1, 2	2, -1
$x=-1$	6	1, 2, 3, 6	3	-3, 0, 1, 2, 4, 5, 6, 9	6, -3
$x=-2$	34	1, 2, 17, 34	12	-22, -5, 10, 11, 13, 14, 29, 46	10, -5

From the first progression $n=-4$, $r=2$; from the other, $n=2$, and $r=-1$; therefore, since m may either be positive or negative, the divisors to be tried are $\pm 3x^2 - 4x + 2$, and $\pm 3x^2 + 2x - 1$; of which $-3x^2 + 2x - 1$, or $3x^2 - 2x + 1$ succeeds; consequently the roots of the equation $3x^2 - 2x + 1 = 0$, are two roots of the proposed biquadratic.

The Method of Approximation.

The most useful and general method of discovering the possible roots of numeral equations, is approximation. Find by trial two numbers, which substituted for the unknown quantity give, one a positive, and the other a negative, result; and an odd number of roots lies between these two quantities, that is, one possible root, at least, lies between them; then, by increasing one of the limits, and diminishing the other, an approximation may be made to the root; substitute this approximate value, increased or diminished by v , for the unknown quantity in the equation, neglect all the powers of v above the first, as being small when compared with the other terms, and a simple equation is obtained for determining v nearly; thus a nearer approximation is made to the root, and, by repeating the operation, the approximation may be made to any required degree of exactness.

Ex. Let the roots of the equation $y^3 - 3y + 1 = 0$ be required. When 1 is substituted for x the result is -1, and when 2 is substituted, the result is +3, therefore one root lies between 1 and 2; try 1.5, and the result is -.125, or the root lies between 1.5 and 2.

Let $1.5 + v = y$, then

$$\left. \begin{aligned} y^3 &= 3.375 + 6.75v + 4.5v^2 + v^3 \\ -3y &= -4.5 - 3v \\ +1 &= +1 \end{aligned} \right\} = 0,$$

that is, $-.125 + 3.75v + 4.5v^2 + v^3 = 0$, and, neglecting the two last terms, $-.125 + 3.75v = 0$, or $v = \frac{.125}{3.75} = .033$

nearly, and $y = 1.5 + v = 1.533$ nearly; again, suppose $1.533 + v = y$; by proceeding as before we find $.003686437 + 4.050267v = 0$, and $v = \frac{.003686437}{4.050267} = .0009101$, &c.

hence $y = 1.532089$ nearly. The other roots may be found by the solution of a quadratic.

If two roots $a+m$, $a+n$, be nearly equal to each other and to a , the quantities m and n , must both be determined; therefore the third term of the equation must be retained, or a quadratic, $P - Qv + Rv^2 = 0$, solved.

When m and n are much less than r , s , &c. and both positive or both negative, then $\frac{P}{Q} = \frac{1}{\frac{1}{m} + \frac{1}{n}} = \frac{m}{1 + \frac{m}{n}}$, nearly,

ly, which is an approximation to m the less of the two; but, if one of these quantities be positive and the other ne-

gative, $\frac{1}{m} + \frac{1}{n}$ may be either positive or negative, and

greater, equal to, or less, than $\frac{1}{r} + \frac{1}{s} + \&c.$ and conse-

quently $\frac{P}{Q}$ is not necessarily an approximation to any of the quantities m , n , r , s , &c.

Let $P - Qv + Rv^2 = 0$; the roots of this equation will be m and n nearly. For if m , n , r , s , be the roots of the equation $P - Qv + Rv^2 = Sv^3 + \&c. = 0$, $P = mnrs$, $Q = mns + mur + mrs + nrs$, $R = mn + mr + ms + nr + ns + rs$, and since m and n are small when compared with r and s , $Q = mrs + nrs$ nearly, and $R = rs$ nearly; therefore the equation $P - Qv + Rv^2 = 0$ becomes $mns - mrs + nrs.v + rs.v^2 = 0$; hence $v^2 - m + n.v + mn = 0$, whose roots are m and n . By the solution then of this quadratic a much nearer approximation is made to the root $a+m$ than by the former method, and at the same time an approximation is also made to the root $a+n$; but in this case, as in the former, m and n must both be positive or both negative, otherwise mns and mur do not necessarily vanish with respect to $mrs + nrs$, which is supposed in determining the value of Q .

On the Reversion of Series.

If two quantities $Ax + Bx^2 + Cx^3 + \&c.$ and $ax + bx^2 + cx^3 + \&c.$ be always equal, the invariable coefficients of the corresponding terms are equal. For if these equal quantities be divided by x , we have $A + Bx + Cx^2 + \&c. = a + bx + cx^2 + \&c.$ or when x is indefinitely small, $A=a$, and A and a are invariable; therefore, in all cases, $A=a$. Hence also $Bx + Cx^2 + \&c. = bx + cx^2 + \&c.$ or, dividing by x , $B + Cx + \&c. = b + cx + \&c.$ and when x is indefinitely small, $B=b$, therefore in all cases $B=b$. In the same manner $C=c$, &c.

COR. If $A + Bx + Cx^2 + \&c. = 0$ in all cases, then $A=0$, $B=0$, $C=0$, &c.

Approximation may be made to a root of an equation by assuming for it a series, involving the powers of that quantity in terms of which it is sought, with indeterminate coefficients; this series being substituted for the unknown quantity in the proposed equation, the coefficients may be found by making each term equal to 0, and thus the series which expresses the value of the unknown quantity may be determined.

Ex. Let $y^3 - 3y + x = 0$; required the value of y in terms of x .

$$\left. \begin{aligned} \text{Let } y &= ax + bx^2 + cx^3 + dx^4 + \&c. \text{ then} \\ y^3 &= a^3x^3 + 3a^2bx^4 + 3a^2cx^5 + 3ab^2x^7 + \&c. \\ -3y &= -3ax - 3bx^2 - 3cx^3 - 3dx^4 - \&c. \\ +x &= +x \end{aligned} \right\} = 0,$$

and, supposing each term to vanish, $-3a + 1 = 0$, or $a = \frac{1}{3}$

$$a = \frac{1}{3}; a^3 - 3b = 0, b = \frac{a^3}{3} = \frac{1}{27}; 3a^2b - 3c = 0, \text{ and } c = a^2b = \frac{1}{81}, \&c. \text{ therefore}$$

$$y = \frac{x}{3} + \frac{x^3}{3^4} + \frac{x^5}{3^6} + \&c. \text{ and when } x=1, y = \frac{1}{3} + \frac{1}{3^4} + \frac{1}{3^6} + \&c. = .347 \&c. \text{ which is one root of the equation } y^3 - 3y + 1 = 0.$$

If for y , the series $ax + bx^2 + cx^3 + dx^4 + \&c.$ had been assumed, the quantities $b, d, \&c.$ would have been found $= 0$, therefore the even terms are unnecessary.

COR. The less x is assumed, the faster will this series converge, and the more accurately will y be obtained.

This method of approximation is similar to the former, in this respect, that the series will have a slow degree of convergency, except one value of y is much less than any other. If this be not the case, find m , an approximate value of y , by trial, and assume $m \pm v = y$; then when one value of v is much less than any other it may be found by this reversion, and consequently that value of y known, which is nearest to m .

On the Sums of the Powers of the Roots of an Equation.

Let $a, b, c, \&c.$ be the roots of the equation $x^n - px^{n-1} + qx^{n-2} - \dots + wx^{n-m} - \&c. = 0$, and $A, B, C, \dots P, Q, R, S$, the sum of the roots, sum of their squares, cubes, $\dots m-3, m-2, m-1, m$, powers respectively; then will $A = p, B = pA - 2q, C = pB - qA + 3r, \&c.$ and $S = pR - qQ + rP - \dots - mw$; where $+w$ is the coefficient of the $m+1$ th term. Then,

$$\frac{nx^{n-1} - n-1.p x^{n-2} + n-2.q x^{n-3} - \dots + n-m.w x^{n-m-1} - \&c.}{x^n - p x^{n-1} + q x^{n-2} - \dots + w x^{n-m} - \&c.}$$

$$= \frac{1}{x-a} + \frac{1}{x-b} + \frac{1}{x-c} + \&c. \text{ whatever be the value of } x;$$

and, by actual division,

$$\frac{1}{x-a} = \frac{1}{x} + \frac{a}{x^2} + \frac{a^2}{x^3} + \dots + \frac{a^m}{x^{m+1}} + \&c.$$

$$\frac{1}{x-b} = \frac{1}{x} + \frac{b}{x^2} + \frac{b^2}{x^3} + \dots + \frac{b^m}{x^{m+1}} + \&c.$$

$$\frac{1}{x-c} = \frac{1}{x} + \frac{c}{x^2} + \frac{c^2}{x^3} + \dots + \frac{c^m}{x^{m+1}} + \&c.$$

and if x be supposed greater than any of the magnitudes $a, b, c, \&c.$ no quantity is lost in the division; therefore, by addition,

$$\frac{nx^{n-1} - n-1.p x^{n-2} + n-2.q x^{n-3} - \dots + n-m.w x^{n-m-1} - \&c.}{x^n - p x^{n-1} + q x^{n-2} - \dots + w x^{n-m} - \&c.}$$

$$= \frac{n}{x} + \frac{A}{x^2} + \frac{B}{x^3} + \dots + \frac{P}{x^{m-2}} + \frac{Q}{x^{m-1}} + \frac{R}{x^m} + \frac{S}{x^{m+1}} + \&c.$$

and multiplying by $x^n - p x^{n-1} + q x^{n-2} - \dots + w x^{n-m} - \&c.$

$$nx^{n-1} - n-1.p x^{n-2} + n-2.q x^{n-3} - \dots + n-m.w x^{n-m-1} - \&c. =$$

$$\left. \begin{aligned} &nx^{n-1} + Ax^{n-2} + Bx^{n-3} + \dots + Sx^{n-m-1} + \&c. \\ &- np x^{n-2} - pAx^{n-3} - \dots - pR x^{n-m-1} + \&c. \\ &+ nq x^{n-3} + \dots + qQ x^{n-m-2} + \&c. \\ &\dots - rP x^{n-m-1} + \&c. \\ &+ nwx^{n-m-1} + \&c. \end{aligned} \right\}$$

and by equating the coefficients, $A - np = -n-1.p$, and $A = p$; $B - pA + nq = n-2.q$, or $B = pA - 2q, \&c.$ $S - pR + qQ - rP + \dots + nw = n-m.w$, or $S = pR - qQ + rP - \dots - mw$.

Ex. Let $x^3 + 5x^2 - 6x - 8 = 0$; then, by comparing the terms of this with the terms of the equation $x^n - p x^{n-1} + q x^{n-2} - \&c. = 0$, we have $p = -5, q = -6, r = 3$.

Hence the sum of the roots $= p = -5 = A$.

Sum of the squares $= pA - 2q = 25 + 12 = 37 = B$.

Sum of the cubes $= pB - qA + 3r = -185 - 30 + 24 = -191 = C, \&c.$

The proposition also admits of the following proof. The same notation being retained, let m and n be equal, and since $a, b, c, \&c.$ are roots of the equation,

$$\begin{aligned} a^n - p a^{n-1} + q a^{n-2} - \dots + w &= 0 \\ b^n - p b^{n-1} + q b^{n-2} - \dots + w &= 0 \\ c^n - p c^{n-1} + q c^{n-2} - \dots + w &= 0 \\ \&c. \end{aligned}$$

$$\text{By add. } S - pR + qQ - \dots + nw = 0 \\ \text{Or } S = pR - qQ + \dots - nw.$$

If m be greater than n , multiply the proposed equation by x^{m-n} , then $x^m - p x^{m-1} + q x^{m-2} - \dots + w x^{m-n} = 0$; which equation has the roots $a, b, c, \&c.$ and $m-n$ roots, each equal to 0; therefore the sum of the m th powers of the roots of this equation is equal to the sum of the m th powers of the roots of the former; that is, $S = pR - qQ + \&c.$ to n terms.

When m is less than n , the sum of the m th powers of the roots may be expressed in terms of $p, q, r, \dots w$, where w is the coefficient of the $m+1$ th term of the equation. For p^2 contains $a^2 + b^2 + c^2 + \&c.$ with other combinations of the roots, as $ab, ac, bc, \&c.$ which combinations are contained in a multiple of q ; also p^3 contains $a^3 + b^3 + c^3 + \&c.$ with other combinations, such as $a^2b, a^2c, b^2a, \&c. abc, acd, bcd, \&c.$ and these combinations may be made up of p, q , and r ; for $p \times q$ contains the quantities $a^2b, a^2c, b^2a, \&c.$ and r is the sum of the quantities $abc, acd, bcd, \&c.$ In the same manner it appears, that $a^4 + b^4 + c^4 + \&c.$ may be found in terms of p, q, r , and s ; and, in general, $a^m + b^m + c^m + \&c.$ may be expressed in terms of $p, q, r, \dots w$. Also, the number of combinations of any particular form, as a^2b , cannot be altered by the introduction of the root c ; consequently, the coefficient of the product pq , by which the combinations of that form are taken away, is the same, whatever be the number of roots. Hence the expression for $a^m + b^m + c^m + \&c.$ in the equation $x^n - p x^{n-1} + q x^{n-2} - \dots + w x^{n-m} - \&c. = 0$, is the same with the expression for the sum of the m th powers of the roots of the equation $x^m - p x^{m-1} + q x^{m-2} - \dots + w = 0$; that is $S = pR - qQ + \dots - mw$.

This rule was given by Sir I. Newton for the purpose of approximating to the greatest root of an equation. Suppose the roots all possible, and one greater than the rest, the powers of this root increase in a higher ratio than those of any other, and the m th power of this root will approach nearer and nearer to a ratio of equality with the sum of the m th powers of the roots, as m increases; therefore, by extracting the m th root of this sum, an approximation is made to the greatest positive or least negative root.

On the Impossible Roots of an Equation.

It has before been shewn, that there are as many positive roots in an equation as it has changes of signs, and as many negative roots as continuations of the same sign, when the roots are all possible. But this rule cannot be applied to impossible roots; as appears by the consideration, that an impossible quantity cannot be termed either positive or negative.

If then it appear from the terms of an equation that some roots may either be called positive or negative, according to the above rule, they must be impossible. Thus two roots of the equation $x^3 + qx + r = 0$, or $x^3 \pm 0 + qx + r = 0$, are impossible; because it has two changes of signs or none, according as the second term is supposed to be -0 or $+0$. In the same manner, if any term of an equation be wanting, and the signs of the adjacent terms be both positive, or both negative, the equation has, at least, two impossible roots; and, if two succeeding terms be wanting, it must always have, at least, two impossible roots.

Impossible roots enter equations by pairs; they also lie under the form of two positive or two negative roots.

Let $\pm a + \sqrt{-b^2}$, and $\pm a - \sqrt{-b^2}$, be the roots; then $x \mp a - \sqrt{-b^2} \times x \mp a + \sqrt{-b^2} = x^2 \mp 2ax + a^2 + b^2 = 0$, which equation shews either two positive or two negative roots.

COR.

COR. Hence, if the last term of an equation of an even number of dimensions be negative, it will have at least two possible roots, one positive and the other negative.

Let an equation be transformed into one whose roots are the squares of the roots of the former; then as many negative roots as the transformed equation contains, so many impossible roots, at least, are in the original equation, because the square of a possible quantity is always positive.

If any series of magnitudes be substituted for the unknown quantity in an equation, there can only be as many changes of signs in the results, as the equation contains possible roots. Let $x^2 - 2ax + a^2 + b^2 \times x - c \cdot x - d \cdot \&c. = 0$, be an equation whose roots are $a + \sqrt{-b^2}$, $a - \sqrt{-b^2}$, c , d , &c. whatever magnitude is substituted for x , the quantity $x^2 - 2ax + a^2 + b^2$, which is the sum of two squares $x - a)^2 + b^2$, is positive; therefore, the changes of signs can only arise from the substitution of quantities for x in the rectangle $x - c \cdot x - d \cdot \&c.$ which changes are as many as there are possible roots c , d , &c.

The limiting equation has at least as many possible roots as the original, wanting one.

Let $x^2 - 2ax + a^2 + b^2 \times x - c \cdot x - d \cdot \&c. = 0$ be the proposed equation, the limiting equation is

$$\left. \begin{array}{l} x^2 - 2ax + a^2 + b^2 \times x - c \cdot \&c. \\ + x^2 - 2ax + a^2 + b^2 \times x - d \cdot \&c. \\ + x - a + \sqrt{-b^2} \times x - c \cdot x - d \cdot \&c. \\ + x - a - \sqrt{-b^2} \times x - c \cdot x - d \cdot \&c. \end{array} \right\} = 0,$$

Or by adding the two last terms together, it is

$$\left. \begin{array}{l} x^2 - 2ax + a^2 + b^2 \times x - c \cdot \&c. \\ + x^2 - 2ax + a^2 + b^2 \times x - d \cdot \&c. \\ + 2 \cdot x - a \cdot x - c \cdot x - d \cdot \&c. \end{array} \right\} = 0,$$

In which if c , d , &c. be successively substituted for x , the results are $+$, $-$, &c. therefore there are possible roots in this latter equation which lie between c , d , &c. or it contains, at least, as many possible roots, wanting one, as the original equation. It may contain more.

COR. 1. Hence it follows that there are, at least, as many impossible roots in the original equation as in the equation of limits. There may be more; therefore, from the number of impossible roots in the limiting equation we cannot determine exactly the number in the original equation.

COR. 2. Hence also it appears, that if the possible roots of the limiting equation be substituted successively in the

original equation, we know from the signs of the results, what possible roots it contains. For roots of the limiting equation lie between the possible roots of the proposed equation.

Ex. Let $x^{n+3} - a^{n+1}x^2 + b^2d^{n+1} = 0$.

Its limit is $n+3 \cdot x^{n+2} - 2a^{n+1}x = 0$; whose possible roots

when n is an odd number are $-\frac{2}{n+3} \sqrt[n+1]{\frac{1}{a}}$, 0 , and

$\frac{2}{n+3} \sqrt[n+1]{\frac{1}{a}}$; which substituted in the original equation

give the results either $-$, $+$, $-$, or $+$, $+$, $+$; therefore it has either four possible roots or none. When n is even, the possible roots of the limiting equation are 0 and

$\frac{2}{n+3} \sqrt[n+1]{\frac{1}{a}}$; therefore the equation itself will have one

possible root, or three, according as $\frac{2}{n+3} \sqrt[n+1]{\frac{1}{a}}$, when substituted for x , gives a positive or a negative result.

The roots of a quadratic equation are impossible, if the square of the middle term be less than four times the product of the extremes.

Let $ax^2 + bx + c = 0$; then $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$, which

expression becomes impossible when b^2 is less than $4ac$.

There are impossible roots in an equation, whenever there are impossible roots in its limiting equation. In the same manner, if the next limit be taken, there are impossible roots in the original equation, whenever there are impossible roots in this limit; and, if the limit be thus brought down to a quadratic, when the roots of the quadratic are impossible, there are impossible roots in the original equation corresponding to them. On this principle the following rule of Sir H. Newton's is founded, for discovering impossible roots in any equation.

Let the proposed equation be $x^n - px^{n-1} + \dots + Dx^{n-r+1} - Ex^{n-r} + Fx^{n-r-1} - \dots = 0$. To obtain a limiting equation, which shall be a quadratic corresponding to the terms $Dx^{n-r+1} - Ex^{n-r} + Fx^{n-r-1}$, let the succeeding terms be taken away, by multiplying by the terms of the arithmetical progressions n , $n-1$, $n-2$, $\dots$, 2 , 1 , 0 ; $n-1$, $n-2$, $\dots$, 2 , 1 , 0 ; $n-2$, $n-3$, $\dots$, 2 , 1 , 0 , &c. and, let the preceding terms be taken away, by multiplying by the terms of the progressions 0 , 1 , 2 , $\dots$, $r+1$; 0 , 1 , 2 , $\dots$, r , &c. as follows:

$$\begin{array}{cccccccc} x^n & -px^{n-1} & +qx^{n-2} & \dots & +Dx^{n-r+1} & -Ex^{n-r} & +Fx^{n-r-1} & \dots = 0 \\ n, & n-1, & n-2, & \dots & n-r+1, & n-r, & n-r-1, & \dots \\ n-1, & n-2, & n-3, & \dots & n-r, & n-r-1, & n-r-2, & \dots \\ n-2, & n-3, & n-4, & \dots & n-r-1, & n-r-2, & n-r-3, & \dots \\ \&c. & & & & \&c. & & & \\ & & & & 4, & 3, & 2, & \\ & & & & 3, & 2, & 1, & \\ 0, & 1, & 2, & \dots & r-1, & r, & r+1, & \\ & 0, & 1, & \dots & r-2, & r-1, & r, & \\ & & 0, & \dots & r-3, & r-2, & r-1, & \\ & & & & \&c. & & & \\ & & & & \dots & 2, & 3, & 4, \\ & & & & \dots & 1, & 2, & 3, \end{array}$$

$$* \quad * \quad * \quad +n-r+1 \cdot n-r \cdot Dx^2 - 2 \cdot n-r \cdot rEx + r+1 \cdot rF \quad * = 0$$

The respective products being taken, and those quantities left out which are found in every product, we obtain a limiting quadratic $n-r+1 \cdot n-r \cdot Dx^2 - 2 \cdot n-r \cdot rEx + r+1 \cdot rF = 0$, corresponding to the three terms $Dx^{n-r+1} - Ex^{n-r} + Fx^{n-r-1}$; and, if two roots of this quadratic be impossible, that is, if $\frac{n-r}{r} \times r^2 E^2$ be less than $n-r+1$.

$n-r+1 \cdot rDF$, or $\frac{n-r \cdot r}{n-r+1 \cdot r+1} E^2$ less than DF , there

are impossible roots in the proposed equation corresponding to them.

Write down, therefore, a series of fractions $\frac{n}{1}, \frac{n-1}{2}, \frac{n-2}{3}, \dots, \frac{n-r+1}{r}, \frac{n-r}{r+1}$; divide each fraction by that

which precedes it, and place the results $\frac{n-1}{2n}, \frac{n-2}{n-1 \cdot 3}, \dots$

... $\frac{n-r}{n-r+1}$, over the succeeding terms of the equation, beginning with the second; also, place the sign + under the first and last terms, and under every other term + or - according as the square of that term multiplied by the fraction which stands over it is greater or less than the product of the adjacent terms; then there will be as many impossible roots in the equation as there are changes of these signs from + to - and from - to +.

Ex. Let the proposed equation be $x^3 - 4x^2 + 4x - 6 = 0$.

In the series of fractions $\frac{3}{1}, \frac{2}{2}, \frac{1}{3}$, if each term be divided by that which precedes it, we obtain $\frac{1}{3}, \frac{1}{3}$, to be placed over the terms of the equation;

$$\begin{array}{ccccccc} x^3 & - & 4x^2 & + & 4x & - & 6 = 0 \\ + & + & & & & & \\ - & 4 & & & & & \end{array}$$

and since $\frac{1}{3}$, or $\frac{16}{3}$, is greater than 4×1 , the sign + must be placed under the second term; but $\frac{4}{3}$, or $\frac{16}{3}$, is less than -4×-6 , or 24, therefore the sign - must be placed under the third term; and + being placed under the first and last terms, there are two changes of signs; therefore the equation contains two impossible roots.

SCHOLIUM. The discovery of the number of impossible roots in an equation has given great trouble to algebraists, and their researches, hitherto, have not been attended with any great success. In a cubic equation $x^3 - qx + r = 0$ two roots are impossible or not, according as $\frac{r^2}{4} - \frac{q^3}{27}$ is positive or negative. A biquadratic, $x^4 + qx^2 + rx + s = 0$, has two impossible roots when two roots of the equation $y^3 + 2qy^2 + q^2y - r^2 = 0$, are impossible; and all its roots are impossible, when the roots of this cubic are all possible and two of them negative.

Dr. Waring has given rules for determining the number of impossible roots in equations of five and six dimensions, but the investigation of these rules cannot possibly be introduced within our limits.

Sir If. Newton's rule, specified as above, is general and easily applied, but as it is deduced from the nature of the inferior limits, it will not always detect impossible roots. The proof also is defective, as it does not extend to that part of the rule which respects the number of impossible roots. Thus far, however, it may be depended upon, that it never shews impossible roots, but when there are such in the proposed equation.

PART III.

ON UNLIMITED PROBLEMS.

WHEN there are more unknown quantities than independent equations, the number of corresponding values which those quantities admit is indefinite. This number may be lessened by rejecting all the values which are not integers; it may be farther lessened by rejecting all the negative values; and still farther, by rejecting all values which are not square or cube numbers, &c. By restrictions of this kind the number of answers may be confined within definite limits.

If a simple equation expresses the relation of two unknown quantities, and their corresponding integral values be required, divide the whole equation by the coefficient which is the less of the two, and suppose that part of the quotient, which is in a fractional form, equal to some whole number; thus a new simple equation is obtained, with which we may proceed as before; let the operation

VOL. I. No. 20.

be repeated till the coefficient of one of the unknown quantities is unity, and the coefficient of the other a whole number; then an integral value of the former may be obtained by substituting nothing, or any whole number, for the other; and, from the preceding equations, integral values of the quantities proposed may be found.

Ex. 1. Let $5x + 7y = 29$; to find the corresponding integral values of x and y . Dividing the whole equation by 5, the less coefficient,

$$x + y + \frac{2y}{5} = 5 + \frac{4}{5}$$

$$\text{Or } x = 5 - y + \frac{4 - 2y}{5}$$

$$\text{Assume } \frac{4 - 2y}{5} = p, \text{ or } 4 - 2y = 5p.$$

$$\text{Then } 2 - y = 2p + \frac{p}{2}$$

$$y = 2 - 2p - \frac{p}{2}$$

Let $p = 2s$, then $y = 2 - 5s$, and $x = 5 - y + p = 3 + 5s + 2s = 3 + 7s$.

If $s = 0$, then $x = 3$ and $y = 2$, the only positive whole numbers which answer the condition of the equation; for if $s = 1$, then $x = 10$ and $y = -3$; and if $s = -1$, then $x = -4$ and $y = 7$.

If the simple equation contain more unknown quantities, their corresponding integral values may be found in the same manner.

Ex. 2. Let $4x + 3y + 10 = 5v$; to find the corresponding integral values of x , y , and v . Dividing the whole equation by 3, the least coefficient,

$$x + y + 3 + \frac{x + 1}{3} = v + \frac{2v}{3}$$

$$y = v - x - 3 + \frac{2v - x - 1}{3}$$

$$\text{Assume } \frac{2v - x - 1}{3} = p, \text{ or } 2v - x - 1 = 3p$$

$$\text{Then } x = 2v - 3p - 1$$

And $y = v - 2v + 3p + 1 - 3 + p = 4p - v - 2$, and substituting for p and v nothing, or any whole numbers, integral values of x and y are known. If $v = 3$, and $p = 1$, then $x = 2$ and $y = -1$; if $v = 4$ and $p = 0$, then $x = 7$ and $y = -6$, &c.

Ex. 3. To find what numbers are divisible by 3 without remainders.

Let a, b, c, d , &c. be the digits, or figures in the unit's, ten's, hundred's, thousand's, &c. place of any number, then the number is $a + 10b + 100c + 1000d + \&c.$ this divided by 3 is $\frac{a}{3} + 3b + \frac{b}{3} + 33c + \frac{c}{3} + 333d + \frac{d}{3} + \&c.$ or

$$\frac{a + b + c + d + \&c.}{3} + 3b + 33c + 333d + \&c. \text{ which is a whole number when } \frac{a + b + c + d + \&c.}{3} \text{ is a whole number.}$$

Thus 111, 252, 7851, &c. are divisible by 3. In the same manner, any number is divisible by 9 if the sum of its digits be divisible by 9.

$$\text{For } \frac{a + 10b + 100c + 1000d + \&c.}{9} = \frac{a}{9} + b + \frac{b}{9} + 11c + \frac{c}{9} + 111d + \frac{d}{9} + \&c. = \frac{a + b + c + d + \&c.}{9} + b + 11c + 111d + \&c. \text{ which is a whole number when } \frac{a + b + c + d + \&c.}{9} \text{ is a whole number.}$$

Thus 684, 6588, &c. are divisible by 9.

COR. 1. Hence, if any number and the sum of its digits be each divided by 9, the remainders are equal.

COR. 2. From this property of 9 may be deduced the rule

rule which is usually given for discovering when the multiplication of two numbers is not just.

Let $9a+x$ be the multiplicand

$9b+y$ the multiplier

Then $81ab+9bx+9ay+xy$ is the product;

and, if the sum of the digits in the multiplicand be divided by 9, the remainder is x ; if the sum of the digits in the multiplier be divided by 9, the remainder is y ; and, if the sum of the digits in the product be divided by 9, the remainder is the same as when the sum of the digits in xy is divided by 9, unless the work is wrong.

No general rule can be laid down for finding integral corresponding values when the final equation is not a simple one, almost every particular case requiring a different process.

On Continued Fractions.

To represent $\frac{a}{b}$ in a continued fraction.

Let b be contained in a , p times, with a remainder c ; again, let c be contained in b , q times, with a remainder d , and so on, then we have,

$$\begin{array}{l} b)a(p \\ c)b(q \\ d)c(r \\ \text{\&c.} \end{array}$$

$$\begin{array}{l} a=pb+c \\ b=qc+d \\ c=rd+\text{\&c.} \end{array}$$

$$\text{Or } \frac{a}{b}=p+\frac{c}{b}=p+\frac{c}{qc+d}$$

$$=p+\frac{1}{q+\frac{d}{c}}$$

$$=p+\frac{1}{q+\frac{1}{r+\frac{e}{d}}}$$

$$=p+\frac{1}{q+\frac{1}{r+\frac{1}{\text{\&c.}}}}$$

$$\text{That is, } \frac{a}{b}=p+\frac{1}{q+\frac{1}{r+\frac{1}{\text{\&c.}}}}$$

COR. 1. An approximation may thus be made to the value of a fraction whose numerator and denominator are in too high terms, and, the farther the division is continued, the nearer will the approximation be to the true value.

COR. 2. This approximation is alternately less and greater than the true value. Thus p is less than $\frac{a}{b}$, and $p+\frac{1}{q}$ is greater, because a part of the denominator of the fraction is omitted; also $q+\frac{1}{r}$ is too great for the denominator, therefore $p+\frac{1}{q+\frac{1}{r}}$ is less than $\frac{a}{b}$, &c.

Ex. To find a fraction which shall nearly express $\frac{314159}{100000}$.

$$\begin{array}{r} 100000)314159(3 \\ \underline{300000} \\ 14159)100000(7 \\ \underline{99113} \\ 887)14159(15 \\ \underline{887} \\ 5289 \\ \underline{4435} \\ 854)887(1 \\ \underline{854} \\ 33 \text{ \&c.} \end{array}$$

Here $p=3$, $q=7$, $r=15$, $s=1$, &c. therefore $\frac{314159}{100000}$

$$=3+\frac{1}{7+\frac{1}{15+\text{\&c.}}}$$

The first approximation is 3, which is too little; the next is $3+\frac{1}{7}=\frac{22}{7}$, too great; the next is $3+\frac{1}{7+\frac{1}{15}}=3+\frac{15}{106}$

$\frac{15}{106}=\frac{333}{106}$, too little; and so on. This fraction expresses, nearly, the circumference of a circle in terms of its diameter; therefore the circumference is greater than 3 diameters, less than $\frac{22}{7}$ diameters, and greater than $\frac{333}{106}$, &c.

To find the value of a continued fraction when the denominators q , r , s , &c. recur in any certain order.

$$\text{EX. 1. Let } \frac{1}{q+\frac{1}{r+\frac{1}{q+\frac{1}{r+\text{\&c.}}}}}=x; \text{ then } \frac{1}{q+\frac{1}{r+x}}$$

$=x$, or $\frac{r+x}{qr+qx+1}=x$; hence $r+x=qrx+qx^2+x$, and $x^2+rx-\frac{r}{q}=0$, from the solution of which quadratic the value of x may be obtained.

$$\text{EX. 2. Let } \sqrt{a+\frac{b}{\sqrt{a+\frac{b}{\sqrt{a+\text{\&c.}}}}}}=x; \text{ by squaring}$$

both sides, $a+\frac{b}{\sqrt{a+\frac{b}{\sqrt{a+\text{\&c.}}}}}=x^2=a+\frac{b}{x}$; and $x^3-ax-b=0$; whence the value of x may be found.

In the same manner may the values of other quantities, which run on *in infinitum*, be found, if the factors recur.

EX. 1. To find the value of $\sqrt{a\sqrt{a\sqrt{a\sqrt{a\text{\&c.}}}}}$ in infinitum.

Let $\sqrt{a\sqrt{a\sqrt{a\sqrt{a\text{\&c.}}}}}=x$; by squaring both sides, $a\sqrt{a\sqrt{a\sqrt{a\text{\&c.}}}}=x^2$, that is, $ax=x^2$, or $x=a$.

EX. 2. Required the value of $\sqrt{a+\sqrt{b+\sqrt{a+\sqrt{b+\text{\&c.}}}}}$ in infinitum.

Let $\sqrt{a+\sqrt{b+\sqrt{a+\sqrt{b+\text{\&c.}}}}}=x$, by squaring both sides, $a+\sqrt{b+\sqrt{a+\sqrt{b+\text{\&c.}}}}=x^2$, and

$$\sqrt{b+\text{\&c.}}$$

$\sqrt{b+\sqrt{a+\sqrt{b+\&c.}}} = x^2 - a$; therefore

$b+\sqrt{a+\sqrt{b+\&c.}} = x^2 - 2ax^2 + a^2$, or $b+x = x^4 - 2ax^2 + a^2$; hence $x^4 - 2ax^2 - x + a^2 - b = 0$; from which equation x may be found.

To find the least common multiple of two quantities; or the least quantity which is divisible by each of them without remainder. The product of the two quantities divided by their greatest common measure is their least common multiple. Let a and b be two quantities, x their greatest common measure, m their least common multiple, and let m contain a , p times, and b , q times, that is, let $m = pa = qb$; then $\frac{a}{b} = \frac{q}{p}$, and since m is the least possible,

p and q are the least possible, therefore $\frac{q}{p}$ is the fraction $\frac{a}{b}$ in its lowest terms, and $q = \frac{a}{x}$; hence $m = qb = \frac{ab}{x}$.

Ex. What is the least common multiple of 18 and 12? Their greatest common measure is 6; therefore their least common multiple is $\frac{12 \times 18}{6} = 36$.

Every other common multiple of a and b is a multiple of m . Let n be any other common multiple of the two quantities; and, if possible, let m be contained in n , r times, with a remainder s , which is less than m ; then $n - rm = s$, and since a and b measure n and rm , they measure $n - rm$ or s , that is, they have a common multiple less than m , which is contrary to the supposition.

To find the least common multiple of three quantities, a , b , and c , take m the least common multiple of a and b , and n the least common multiple of m and c ; then n is the least common multiple sought. For every common multiple of a and b is a multiple of m ; therefore, every common multiple of a , b , and c , is a multiple of m and c ; also, every multiple of m and c is a multiple of a , b , and c ; consequently, the least common multiple of a , b , and c is the least common multiple of m and c .

Three quantities are said to be in *harmonical proportion*, when the first is to the third, as the difference of the first and second is to the difference of the second and third. Any magnitudes, A, B, C, D, E , &c. are said to be in *harmonical progression*, if $A:C::A-B:B-C$; $B:D::B-C:C-D$; $C:E::C-D:D-E$, &c.

The reciprocals of quantities in harmonical progression are in arithmetical progression.

Let A, B, C , &c. be in harmonical progression, then $A:C::A-B:B-C$, therefore $AB-AC=AC-BC$, and dividing both sides by ABC , $\frac{1}{C} - \frac{1}{B} = \frac{1}{B} - \frac{1}{A}$.

Again, $B:D::B-C:C-D$; therefore $BC-BD=BD-DC$, and, dividing by BCD , $\frac{1}{D} - \frac{1}{C} = \frac{1}{C} - \frac{1}{B}$; and $\frac{1}{C} - \frac{1}{B}$ has been proved equal to $\frac{1}{B} - \frac{1}{A}$; therefore the quantities $\frac{1}{A}, \frac{1}{B}, \frac{1}{C}, \frac{1}{D}$, &c. have a common difference, that is, they are in arithmetical progression.

On Binomial Surds.

To extract the root of a binomial, one or both of whose factors are quadratic surds. If the index of the root to be extracted be an even number, the square root may be found by the method before given on *Surds*, when it can be expressed by a binomial of the same description; and, if half the index be an even number, the square root may again be taken, and so on, till the root remaining to be extracted is expressed by an odd number.

Let the cube root of the binomial $a+\sqrt{-b^2}$ be required.

Assume $\sqrt[3]{a+\sqrt{-b^2}} = x+\sqrt{-y^2}$;

Then $\sqrt[3]{a-\sqrt{-b^2}} = x-\sqrt{-y^2}$;

By mult. $\sqrt[3]{a^2+b^2} = x^2+y^2 = m$, by substitution; Therefore, $y^2 = m - x^2$; also from the first equation, $a+\sqrt{-b^2} = x+\sqrt{-y^2}$ $^3 = x^3 + 3x^2\sqrt{-y^2} - 3xy^2 - y^2\sqrt{-y^2}$; therefore $x^3 - 3xy^2 = a$; or substituting for y^2 its value $m - x^2$, $x^3 - 3mx + 3x^3 = a$, that is, $4x^3 - 3mx - a = 0$, a cubic equation whose roots may be found by approximation; hence y , and consequently $x+\sqrt{-y^2}$, the root required, may be determined.

In the same manner it appears, that the c th root may be extracted by the solution of an equation of c dimensions.

Let $A+B$ be the given binomial surd, in which both terms are possible and A greater than B , its c th root, or the c th root of $A+B$, $\sqrt[c]{Q}$, a quantity of the same description, may sometimes be found in the form $a+\sqrt{b}$, or $\sqrt{a}+\sqrt{b}$, where a and b are whole numbers.

Let $\sqrt[c]{A+B} \times \sqrt[c]{Q} = x+y$, where x and y involve the same surds that $A\sqrt[c]{Q}$ and $B\sqrt[c]{Q}$ do, respectively.

Then since $\sqrt[c]{A+B} \times \sqrt[c]{Q} = x+y$

$$\sqrt[c]{A-B} \times \sqrt[c]{Q} = x-y,$$

By mult. $\sqrt[c]{A^2-B^2} \times Q = x^2-y^2$; let Q be so assumed that $A^2-B^2 \times Q$ may be a perfect c th power $=n^c$, then $x^2-y^2=n$; take $r=(x+y)^c \sqrt[c]{A+B} \times \sqrt[c]{Q}$ in the nearest integer number; then $\frac{x^2-y^2}{x+y} = x-y = \frac{n}{r}$, and $x+\frac{n}{r}$

$y=r$; therefore $2x=r+\frac{n}{r}$, or $x=\frac{r+\frac{n}{r}}{2}$; suppose s to

be the surd which $A\sqrt[c]{Q}$ and x involve; also let t be the rational part of x , and such that ts does not differ from $r+\frac{n}{r}$ by $\frac{1}{2}$, then if the root of the binomial be of the form $x+y$, the value of x is ts ; also $x^2-y^2=n$, or $y^2 = x^2 - n = t^2s^2 - n$; therefore $y = \sqrt{t^2s^2 - n}$, and $\sqrt[c]{A+B} \times \sqrt[c]{Q} = ts + \sqrt{t^2s^2 - n}$, or $\sqrt[c]{A+B} = \frac{ts + \sqrt{t^2s^2 - n}}{2^c \sqrt[c]{Q}}$.

By assuming r , the nearest integer to $\sqrt[c]{A+B} \times \sqrt[c]{Q}$, the value of x is accurately determined.

Let $x+y=r+q$ exactly, or $x+y-q=r$; then $\frac{x^2-y^2}{x+y-q} = \frac{n}{r} = x-y + \frac{q \times x-y}{x+y-q}$, and $r+\frac{n}{r} = 2x-q + \frac{q \times x-y}{x+y-q}$, which

differs from $2x$ by $q - \frac{q \times x-y}{x+y-q}$, i. e. by the difference of two fractions, each of which is less than 1, when x and y are positive, x greater than y , and $x+y$ greater than 1; therefore the value of $2x$ does not differ from the truth by 1, nor the value of x or ts by $\frac{1}{2}$; and s is known, consequently, the nearest integer to t , that is, t , which is an integer, is known.

COR. If the c th root of $A-B$ be required; find, by the rule $\frac{x+y}{2^c \sqrt[c]{Q}}$, the c th root of $A+B$; and $\frac{x-y}{2^c \sqrt[c]{Q}}$, is the c th root of $A-B$.

On Logarithms.

If there be a series of magnitudes $a^0, a^1, a^2, a^3, \dots a^x$; $a^{-1}, a^{-2}, a^{-3}, \dots a^{-y}$, the indices, 0, 1, 2, 3, $\dots x$; $-1, -2, -3, \dots -y$, are called the measures of the ratios of those magnitudes to 1, or the *logarithms* of the magnitudes. Thus x , the logarithm of any number c , is such a quantity that $a^x = c$. Here a may be assumed at pleasure; and, for every different value so assumed, a different system of logarithms will be formed. In the common tabular logarithms a is 10, and consequently 0, 1, 2, 3, $\dots x$, are the logarithms of 1, 10, 100, 1000, $\dots 10^x$.

COR. 1. Since the tabular logarithm of 10 is 1, the logarithm of a number between 1 and 10 is less than 1; and, in the same manner, the logarithm of a number between 10 and 100 is between 1 and 2; of a number between 100 and 1000, is between 2 and 3, &c. If x be the logarithm of 5, then $10^x = 5$; let $\frac{2}{3}$ be substituted for x , and $10^{\frac{2}{3}}$ is found to be less than 5, therefore $\frac{2}{3}$ is less than the logarithm of 5; but $10^{\frac{3}{4}}$ is greater than 5, or $\frac{3}{4}$ is greater than the logarithm of 5; the logarithm found in the tables is .69897, and $10^{.69897} = 5$ nearly.

COR. 2. If quantities be in geometrical progression, a^x, a^{2x}, a^{3x} , &c. their logarithms, $x, 2x, 3x$, &c. are in arithmetical progression.

The method of finding the logarithms of the natural numbers, or forming a table, will be explained in the Doctrine of Fluxions.

The sum of the logarithms of two numbers is the logarithm of their product; and the difference of the logarithms is the logarithm of their quotient. Let $x = \log. of c$, and $y = \log. of d$; then $a^x = c$, and $a^y = d$; hence $a^{x+y} = dc$, and $a^{x-y} = \frac{c}{d}$; or $x+y$ is the log. of dc , and $x-y$ the log. of $\frac{c}{d}$.

Ex. 1. Log. of $3 \times 7 = \log. of 3 + \log. of 7$.

Ex. 2. Log. of $pqr = \log. of pq + \log. of r = \log. of p + \log. of q + \log. of r$.

Ex. 3. Log. of $\frac{5}{7} = \log. of 5 - \log. of 7$.

If the logarithm of a number be multiplied by n , the product is the logarithm of that number raised to the n th power. Let d be the number whose log. is x , or $a^x = d$; then $a^{nx} = d^n$, that is, nx is the logarithm of d^n .

Exs. Log. of $\sqrt[3]{13} = \frac{1}{3} \times \log. 13$. Log. $b^z = z \times \log. b$.

If the logarithm of a number be divided by n , the quotient is the logarithm of the n th root of that number. Let $a^x = d$, then $\frac{x}{n} = \log. of \sqrt[n]{d}$, or $\frac{x}{n}$ is the log. of $\sqrt[n]{d}$.

Ex. Log. of $\sqrt[3]{5} = \frac{1}{3} \times \log. of 5$.

The utility of a table of logarithms in arithmetical calculations will from hence be manifest; the multiplication and division of numbers being performed by the addition and subtraction of these artificial representatives; and the involution or evolution of numbers, by multiplying or dividing their logarithms by the indices of the powers or roots required.

Let the value of $\sqrt[5]{7\sqrt{2} \times 3\sqrt{3}}$ be required.

$$\text{Log. of } 7 = .845098$$

$$\frac{1}{2} \log. of 2 = .150515$$

$$\frac{1}{3} \log. of 3 = .1590404$$

$$5) 1.1546534 \text{ sum}$$

.2309306 log. of 1.70188, &c. the value required.

On Interest and Annuities.

Interest is the consideration paid for the use or forbearance of money. The *rate* of interest is the consideration paid for the use of a certain sum for a certain time, as of 11. for one year. When the interest of the *principal* alone, or sum lent, is taken, it is called *simple* interest; but, if the interest, as soon as it becomes due, be considered as principal, and interest charged upon it, it is called *compound* interest. The *amount* is the whole sum due at the end of any time, interest and principal together. *Discount* is the abatement made for the payment of money before it becomes due.

To find the amount of a given sum in any time at simple interest.

Let P be the principal,

r , the interest of one pound for one year,

n , the time for which the interest is to be calculated,

M , the amount.

Then since the interest of a given sum must be proportional to the time, 1 (year) : n (years) :: r : nr the interest of 11. for n years, and the interest of P must be P times as great, or nrP ; therefore the amount $M = P + nrP$.

In this simple equation, any three of the quantities P, n, r, M , being given, the fourth may be found; thus $P = \frac{M}{1 + nr}$.

Ex. What sum must be paid down to receive 600l. at the end of nine months, allowing 5 per cent. discount? Or, which is the same thing, what principal P will in nine months be equivalent, or amount, to 600l. allowing 5 per cent. interest?

In this case $M = 600$, $n = \frac{3}{4}$, or .75, $r = \frac{5}{100} = .05$; hence

$$P = \frac{M}{1 + nr} = \frac{600}{1 + .75 \times .05} = 578.313 \text{ \&c. l.}$$

To find the amount of an annuity or pension left unpaid any number of years, allowing simple interest upon each sum or pension from the time it becomes due. Let A be the annuity; then at the end of the first year A becomes due, and, at the end of the second year, the interest of the first annuity is rA ; at the end of this year the principal becomes $2A$, therefore the interest due at the end of the third year is $2rA$; in the same manner, the interest due at the end of the fourth year is $3rA$, &c. hence the whole interest is

$$rA + 2rA + 3rA + \dots + n-1 \cdot rA = n \cdot \frac{n-1}{2} rA; \text{ and the sum of the annuities is } nA; \text{ therefore the whole amount } M = nA + n \cdot \frac{n-1}{2} rA.$$

Required the present value of an annuity to continue a certain number of years, allowing simple interest for the money. Let P be the present value; then if P and the annuity, at the same rate of interest, amount to the same sum, they are upon the whole of equal value. The amount of P in n years is $P + nrP$, and the amount of the annuity in the same time is $nA + n \cdot \frac{n-1}{2} rA$; therefore,

$$P + nrP = nA + n \cdot \frac{n-1}{2} rA, \text{ and } P = \frac{nA + n \cdot \frac{n-1}{2} rA}{1 + nr}.$$

In this equation, any three of the four quantities, P , A , n , r , being given, the other may be found.

COR. Let n be infinite, then $P = \frac{nA}{2}$ an infinite quantity; therefore, for a finite annuity to continue for ever, an infinite sum ought, according to this calculation, to be paid; a conclusion which shews the necessity of estimating the value of an annuity upon different principles.

To find the amount of a given sum at compound interest. Let $R=1$, together with its interest for a year; then at the end of the first year R becomes the principal or sum due; therefore,

$1 : R :: R : R^2$, the amount in two years;

$1 : R :: R^2 : R^3$, the amount in three years, &c.

in the same manner R^n is the amount in n years, and if P be the principal, the amount must be P times as great, or $PR^n=M$.

COR. 1. From this equation we have $P = \frac{M}{R^n}$.

Ex. What sum must be paid down to receive 600l. at the end of three years, allowing 5 per cent. per ann. compound interest?

In this case $R=1.05$, $n=3$, $M=600$; and consequently $P = \frac{M}{R^n} = \frac{600}{1.05^3} = 518.3021$.

COR. 2. If P , R , and M , be given to find n , we have $\log. P + n \times \log. R = \log. M$, or $n = \frac{\log. M - \log. P}{\log. R}$.

To find the amount of an annuity in any number of years, at compound interest. Let A be the annuity, or sum due at the end of the first year; then $1 : R :: A : RA$, its amount at the end of the second year; therefore $A + RA$ is the sum due at the end of the second year; in the same manner $1 : R :: 1 + R \times A : R + R^2 \times A$, the amount of the two payments at the end of the third year; and $1 + R + R^2 \times A$ is the whole sum due at the end of the third year; in the same manner $1 + R + R^2 + \dots + R^{n-1} \times A$ is the sum due at the end of n years, that is, $\frac{R^n - 1}{R - 1} \times A = M$.

COR. In this equation any three quantities being given, the fourth may be found.

To find the present value of an annuity to be paid for n years, allowing compound interest. Let P be the present value, A the annuity; then since PR^n is the amount of P in n years, and $\frac{R^n - 1}{R - 1} \times A$ the amount of A in the same

time; by the question, $PR^n = \frac{R^n - 1}{R - 1} \times A$, and $P = \frac{1 - \frac{1}{R^n}}{R - 1} \times A$.

COR. 1. Any three of the quantities, P , A , R , n , being given, the fourth may be found.

COR. 2. If the number of years be infinite, R^n is infinite, and $\frac{1}{R^n}$ vanishes, therefore $P = \frac{A}{R - 1}$.

Ex. If the annual rent of a freehold estate be 11. what is its value; allowing 5 per cent. compound interest? In this case $A=11$, $R=1.05$; therefore the present value $P = \frac{11}{.05} = 220$ l. or 20 years purchase.

COR. 3. The present value of an annuity, to commence at the expiration of p years, and to continue q years, is the difference between its present value for $p+q$ years, and its present value for p years.

SCHOLIUM. The method of determining the present value of an annuity at simple interest, as given above, has been decried by several eminent arithmeticians, and in its stead a solution of the question has been proposed upon the

following principle: "If the present value of each payment be determined separately, the sum of these values must be the value of the whole annuity."

Let x be the value or price paid down for the annuity, a the yearly payment, n the number of years for which it is to be paid, r the interest of 1 for one year. The present value of the first payment is $\frac{a}{1+r}$ the present value of

the second payment, or of a l. to be paid at the end of two years, is $\frac{a}{1+2r}$ and so on; therefore $x = \frac{a}{1+r} + \frac{a}{1+2r} + \dots + \frac{a}{1+nr}$.

These different conclusions arise from a circumstance which the opponents seem not to have attended to. According to the former solution, no part of the interest of the price paid down is employed in paying the annuity, till the principal is exhausted. Whatever calculation be adopted, x is the sum out of which the seller can exactly pay the annuities according to the proposed mode of calculation. Let the annuity be always paid out of the principal x ; then x , $x-a$, $x-2a$, $x-3a$, &c. are the sums in hand during the first, second, third, fourth, &c. years, the interest arising from which is rx , $rx-a$, $rx-2a$, $rx-3a$, &c.

that is, the whole interest is $nrx - 1 + 2 + 3 + \dots + n-1 \times ra$, or $nrx - n \cdot \frac{n-1}{2} ra$, which, together with the principal x , is equal to the sum of all the annuities; therefore,

$$\frac{na + n \cdot \frac{n-1}{2} ra}{1 + nr} - x - n \cdot \frac{n-1}{2} ra = na, \text{ and } x = \frac{na + n \cdot \frac{n-1}{2} ra}{1 + nr}.$$

According to the other calculation, part of the interest, as it arises, is employed in paying the annuity, but not the whole. Thus the first payment is made by a part of the principal, and the interest of that part, which together amount to the annuity; and the other payments are made in the same manner; this is, in effect, allowing interest upon that part of the whole interest which is incorporated with the principal. According to either calculation the seller has the advantage, since the whole or a part of the interest will remain at his disposal till the last annuity is paid off.

If the whole interest, as it arises, be incorporated with the principal, and employed in paying the annuity, compound interest is, in effect, allowed upon the whole. Let x be the price paid for the annuity, n the number of years for which it is granted, R , 1l. together with its interest for one year. Then x in one year amounts to Rx , out of which the annuity being paid, $Rx-a$ is the sum in hand at the end of the first year; R^2x-Ra is the amount of this sum at the end of the second year, therefore $R^2x-Ra-a$ is the sum in hand at the end of the second year; in the same manner, $R^3x-R^2a-Ra-a-a \dots -a$ is the sum left after paying the last annuity, which ought to be nothing; therefore $R^n x = R^{n-1}a + R^{n-2}a + \dots + a = \frac{R^n a - a}{R - 1}$, and $x = \frac{R^n a - a}{R^n \times R - 1}$.

On the Summation of Series.

We have before seen the method of determining the sums of quantities in arithmetical and geometrical progression; but when the terms increase or decrease according to other laws, different artifices must be used to obtain general expressions for their sums. The methods chiefly adopted, and which may be considered as belonging to algebra, are, 1. The method of subtraction. 2. The summation of Recurring Series, by the scale of relation. 3. The Differential Method. 4. The Method of Increments. The investigation of series whose sums are known by subtraction.

Ex. 1. Let $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \&c.$ in inf. = S

Then $\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \&c.$ in inf. = S - 1

By subtraction, $\frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c.$ in inf. = 1.

Ex. 2. Let $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \&c.$ in inf. = S

Then $\frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \&c.$ in inf. = S - $\frac{3}{2}$

By sub. $\frac{2}{1.3} + \frac{2}{2.4} + \frac{2}{3.5} + \frac{2}{4.6} + \&c.$ in inf. = $\frac{3}{2}$

Or $\frac{1}{1.3} + \frac{1}{2.4} + \frac{1}{3.5} + \frac{1}{4.6} + \&c.$ = $\frac{3}{4}$

Ex. 3. Let $\frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c.$ = S

Then $\frac{1}{2.3} + \frac{1}{3.4} + \frac{1}{4.5} + \&c.$ = S - $\frac{1}{2}$

By sub. $\frac{2}{1.2.3} + \frac{2}{2.3.4} + \frac{2}{3.4.5} + \&c.$ = $\frac{1}{2}$

And $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \&c.$ = $\frac{1}{4}$

Ex. 4. To find the sum of the series $\frac{1}{2.4.6} + \frac{1}{4.6.8} + \frac{1}{6.8.10} + \&c.$ in inf.

Take away the last factor out of each denominator, and assume the resulting series equal to S; that is, Let

$\frac{1}{2.4} + \frac{1}{4.6} + \frac{1}{6.8} + \&c.$ = S

Then $\frac{1}{4.6} + \frac{1}{6.8} + \frac{1}{8.10} + \&c.$ = S - $\frac{1}{8}$

By sub. $\frac{4}{2.4.6} + \frac{4}{4.6.8} + \frac{4}{6.8.10} + \&c.$ = $\frac{1}{8}$

And $\frac{1}{2.4.6} + \frac{1}{4.6.8} + \frac{1}{6.8.10} + \&c.$ = $\frac{1}{32}$

Ex. 5. Let $\frac{1}{m} + \frac{1}{m+r} + \frac{1}{m+2r} + \&c.$ = S

Then $\frac{1}{m+r} + \frac{1}{m+2r} + \frac{1}{m+3r} + \&c.$ = S - $\frac{1}{m}$

By sub. $\frac{r}{m.m+r} + \frac{r}{m+r.m+2r} + \frac{r}{m+2r.m+3r} + \&c.$ = $\frac{1}{m}$

Hence $\frac{1}{m.m+r} + \frac{1}{m+r.m+2r} + \frac{1}{m+2r.m+3r} + \&c.$ = $\frac{1}{rm}$

By Ex. 5, $\frac{1}{m.m+r} + \frac{1}{m+r.m+2r} + \frac{1}{m+2r.m+3r} + \&c.$ = $\frac{1}{mr}$

Or $\frac{1}{m.m+2r} + \frac{1}{m+r.m+3r} + \frac{1}{m+2r.m+4r} + \&c.$ = $\frac{1}{mr}$

By Ex. 6, $\frac{2r}{m.m+r.m+2r} + \frac{2r}{m+r.m+2r.m+3r} + \frac{2r}{m+2r.m+3r.m+4r} + \&c.$ = $\frac{1}{2mr}$

By sub. $\frac{r}{m.m+r.m+2r} + \frac{2r}{m+r.m+2r.m+3r} + \frac{3r}{m+2r.m+3r.m+4r} + \&c.$ = $\frac{1}{2mr}$

Mult. by $\frac{b}{r}$, $\frac{b}{m.m+r.m+2r} + \frac{2b}{m+r.m+2r.m+3r} + \frac{3b}{m+2r.m+3r.m+4r} + \&c.$ = $\frac{b}{2mr^2}$

Also, $\frac{a}{m.m+r.m+2r} + \frac{a}{m+r.m+2r.m+3r} + \frac{a}{m+2r.m+3r.m+4r} + \&c.$ = $\frac{a}{2mr.m+r}$

By add. $\frac{a+b}{m.m+r.m+2r} + \frac{a+2b}{m+r.m+2r.m+3r} + \frac{a+3b}{m+2r.m+3r.m+4r} + \&c.$ = $\frac{1}{2mr} \times \frac{b}{r} + \frac{a}{m+r}$

Let $m=r=1$; then the series becomes $\frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c.$ in inf. = 1. After n terms the series is $\frac{1}{n+1.n+2}$

$+ \frac{1}{n+2.n+3} + \frac{1}{n+3.n+4} + \&c.$ whose sum in infin. is

$\frac{1}{n+1}$; therefore, $\frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c.$ to n terms, = $1 - \frac{1}{n+1} = \frac{n}{n+1}$

Ex. 6. Let $\frac{1}{m.m+r} + \frac{1}{m+r.m+2r} + \&c.$ = S

Then $\frac{1}{m+r.m+2r} + \frac{1}{m+2r.m+3r} + \&c.$ = S - $\frac{1}{m.m+r}$

By sub. $\frac{2r}{m.m+r.m+2r} + \frac{2r}{m+r.m+2r.m+3r} + \&c.$ = $\frac{1}{m.m+r}$

Or $\frac{1}{m.m+r.m+2r} + \frac{1}{m+r.m+2r.m+3r} + \&c.$ = $\frac{1}{2rm.m+r}$

Let $m=r=1$; then $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \&c.$ in inf. = $\frac{1}{4}$. After n terms the series becomes $\frac{1}{n+1.n+2.n+3}$

$+ \frac{1}{n+2.n+3.n+4} + \&c.$ in infinitum, whose sum is

$\frac{1}{2.n+1.n+2}$; therefore, $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \&c.$ to n terms, = $\frac{1}{4} - \frac{1}{2.n+1.n+2}$

A series of this kind may be summed when there are any number of factors in the denominator.

Ex. 7. To find the sum of the series $\frac{a+b}{m.m+r.m+2r} +$

$\frac{a+2b}{m+r.m+2r.m+3r} + \frac{a+3b}{m+2r.m+3r.m+4r} + \&c.$ in infinity,

by the above examples 5 and 6.

Let $a=3$, $b=m=r=1$; then $\frac{4}{1.2.3} + \frac{5}{2.3.4} + \frac{6}{3.4.5}$
 $+ \&c. = \frac{1}{2} \times 1 + \frac{3}{2} = \frac{5}{2}$.

Let $a=0$, $b=1$, $m=1$, $r=2$; then $\frac{1}{1.3.5} + \frac{2}{3.5.7} + \frac{3}{5.7.9} + \&c. = \frac{1}{8}$. Vid. Philoſophical Tranſactions, vol. lxxii. page 389.

Ex. 8. Let $1 + \frac{a}{b} + \frac{ac}{bd} + \frac{ace}{bdf} + \&c.$ be a deſcending ſeries, and ſuppoſe

$$1 + \frac{a}{b} + \frac{ac}{bd} + \frac{ace}{bdf} + \&c. = S$$

$$\text{Then } \frac{a}{b} + \frac{ac}{bd} + \frac{ace}{bdf} + \frac{aceg}{bdfh} + \&c. = S - 1$$

$$\text{By ſub. } 1 - \frac{a}{b} + \frac{a}{b} \times 1 - \frac{c}{d} + \frac{ac}{bd} \times 1 - \frac{c}{f} + \&c. = 1$$

$$\text{Or } \frac{b-a}{b} + \frac{a}{b} \times \frac{d-c}{d} + \frac{ac}{bd} \times \frac{f-c}{f} + \&c. = 1$$

$$\begin{array}{l} \text{Aſſume } a=n \quad b=m \\ c=n+1 \quad d=m+1 \\ e=n+2 \quad f=m+2 \\ \&c. \quad \&c. \end{array}$$

$$\text{Then } \frac{m-n}{m} + \frac{n}{m} \times \frac{m-n}{m+1} + \frac{n. n+1. m-n}{m. m+1. m+2} + \&c. = 1; \text{ or}$$

$$\frac{1}{m} + \frac{n}{m. m+1} + \frac{n. n+1}{m. m+1. m+2} + \&c. = \frac{1}{m-n}; \text{ if } n=2, \text{ then}$$

$$\frac{1}{m} + \frac{2}{m. m+1} + \frac{2.3}{m. m+1. m+2} + \&c. = \frac{1}{m-2}.$$

Similar to the method of ſubtraction is the following, given by De Moivre, Miſcell. Anal. p. 130. Aſſume a ſeries whoſe terms converge to 0, involving the powers of an indeterminate quantity x ; call the ſum of the ſeries S , and multiply both ſides of the equation by a binomial, trinomial, &c. which involves the powers of x and invariable coefficients; then if x be ſo aſſumed that the binomial, trinomial, &c. may vaniſh, and ſome of the firſt terms be tranſpoſed, the ſum of the remaining ſeries is equal to the terms ſo tranſpoſed.

$$\text{Ex. 1. Let } 1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \&c. = S$$

Multiplying both ſides by $x-1$, we have

$$\left. \begin{array}{l} x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \&c. \\ -1 - \frac{x}{2} - \frac{x^2}{3} - \frac{x^3}{4} - \frac{x^4}{5} - \&c. \end{array} \right\} = x-1.S$$

$$\text{Or } -1 + \frac{x}{1.2} + \frac{x^2}{2.3} + \frac{x^3}{3.4} + \&c. = x-1.S; \text{ and if } x=1,$$

$$\text{then } -1 + \frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c. = 0; \text{ or } \frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + \&c. = 1.$$

Ex. 2. Aſſume $1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \&c. = S$, and multiply both ſides by x^2-1 ; then

$$\left. \begin{array}{l} x^2 + \frac{x^3}{2} + \frac{x^4}{3} + \frac{x^5}{4} + \&c. \\ -1 - \frac{x}{2} - \frac{x^2}{3} - \frac{x^3}{4} - \frac{x^4}{5} - \&c. \end{array} \right\} = x^2-1 \times S,$$

$$\text{Or } -1 - \frac{x}{2} + \frac{2x^2}{1.3} + \frac{2x^3}{2.4} + \frac{2x^4}{3.5} + \&c. = x^2-1 \times S.$$

Let $x^2-1=0$, then $x=1$, or -1 ; if $x=1$, then

$$-1 - \frac{1}{2} + \frac{2}{1.3} + \frac{2}{2.4} + \frac{2}{3.5} + \&c. = 0$$

$$\text{That is, } \frac{2}{1.3} + \frac{2}{2.4} + \frac{2}{3.5} + \&c. = \frac{3}{2},$$

$$\text{And } \frac{1}{1.3} + \frac{1}{2.4} + \frac{1}{3.5} + \&c. = \frac{3}{4}$$

If $x=-1$, then

$$-1 + \frac{1}{2} + \frac{2}{1.3} - \frac{2}{2.4} + \frac{2}{3.5} - \&c. = 0,$$

$$\text{And } \frac{1}{1.3} - \frac{1}{2.4} + \frac{1}{3.5} - \&c. = \frac{1}{4}$$

Ex. 3. Let $1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \&c. = S$, and multiply both ſides by $2x-1$; then

$$-1 + \frac{3x}{1.2} + \frac{4x^2}{2.3} + \frac{5x^3}{3.4} + \&c. = 2x-1.S; \text{ let } 2x-1=0,$$

or $x=\frac{1}{2}$, and

$$-1 + \frac{3}{1.2.2} + \frac{4}{2.3.2^2} + \frac{5}{3.4.2^3} + \&c. = 0,$$

$$\text{Or } \frac{3}{1.2.2} + \frac{4}{2.3.2^2} + \frac{5}{3.4.2^3} + \&c. = 1.$$

If both ſides of the equation be multiplied by a binomial, each term of the ſeries obtained will have two factors in its denominator; if by a trinomial, each term will have three factors, &c.

$$\text{Ex. 4. Let } 1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \&c. = S,$$

Multiply both ſides by $2x-1.x-1$, or $2x^2-3x+1$; then

$$\left. \begin{array}{l} 2x^2 + \frac{2x^3}{2} + \frac{2x^4}{3} + \&c. \\ -3x - \frac{3x^2}{2} - \frac{3x^3}{3} - \frac{3x^4}{4} - \&c. \\ +1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \frac{x^4}{5} + \&c. \end{array} \right\} = 2x^2-3x+1.S$$

$$\text{Or } 1 - \frac{5x}{2} + \frac{5x^2}{1.2.3} + \frac{6x^3}{2.3.4} + \frac{7x^4}{3.4.5} + \&c. = 2x^2-3x+1.S$$

$$\text{If } x=1, \text{ then } 1 - \frac{5}{2} + \frac{5}{1.2.3} + \frac{6}{2.3.4} + \&c. = 0,$$

$$\text{And } \frac{5}{1.2.3} + \frac{6}{2.3.4} + \frac{7}{3.4.5} + \&c. = \frac{3}{2}. \text{ If } x=\frac{1}{2}, \text{ then}$$

$$1 - \frac{5}{4} + \frac{5}{1.2.3.2^2} + \frac{6}{2.3.4.2^3} + \frac{7}{3.4.5.2^4} + \&c. = 0, \text{ or}$$

$$\frac{5}{1.2.3.2^2} + \frac{6}{2.3.4.2^3} + \frac{7}{3.4.5.2^4} + \&c. = \frac{1}{4}.$$

$$\text{Ex. 5. Let } \frac{1}{m} + \frac{x}{m+r} + \frac{x^2}{m+2r} + \&c. = S;$$

Multiply both ſides by the binomial $ax-b$; then

$$\left. \begin{array}{l} \frac{ax}{m} + \frac{ax^2}{m+r} + \frac{ax^3}{m+2r} + \&c. \\ -b - \frac{bx}{m+r} - \frac{bx^2}{m+2r} - \frac{bx^3}{m+3r} - \&c. \end{array} \right\} = ax-b.S,$$

$$\text{Or } -\frac{b}{m} + \frac{m+r.a-mb}{m.m+r} \times x + \frac{m+2r.a-m+r.b}{m+r.m+2r} \times x^2 + \&c. = ax-b.S.$$

Let $ax-b=0$, and tranſpoſe $-\frac{b}{m}$; then

$$\frac{m+r.a-mb}{m.m+r} \times x + \frac{m+2r.a-m+r.b}{m+r.m+2r} \times x^2 + \&c. = \frac{b}{m}.$$

If the terms of this series can be made to coincide with the terms of a proposed series, the sum of the latter may be found. Thus, let the sum of the infinite series

$$\frac{2}{1.3} \times \frac{1}{3} + \frac{3}{3.5} \times \frac{1}{3^2} + \frac{4}{5.7} \times \frac{1}{3^3} + \&c. \text{ be required.}$$

In this case $a = \frac{1}{3}$, therefore $\frac{a}{3} - b = 0$, or $a = 3b$; also $m = 1$, $r = 2$, and $m + r.a - mb = 2$, that is, $3a - b$, or $9b - b = 2$; hence $b = \frac{1}{4}$, $a = \frac{3}{4}$; and, if these values be substituted in the succeeding terms, the general series coincides with the proposed one, whose sum is therefore $\frac{b}{m}$, or $\frac{1}{4}$.

After the first n terms the series becomes

$$\frac{n+2}{2n+1.2n+3} \times \frac{1}{3^{n+1}} + \frac{n+3}{2n+3.2n+5} \times \frac{1}{3^{n+2}} + \&c. \text{ or } \frac{1}{3^n} \times \frac{n+2}{2n+1.2n+3} + \frac{n+3}{2n+3.2n+5} \times \frac{1}{3^2} + \&c. \text{ and, by com-}$$

paring this with the general series, we find $x = \frac{1}{3}$, and

$$a = 3b; \text{ also } m = 2n+1, r = 2, m+r.a - mb = n+2, \text{ or } 2n+3.3b - 2n+1.b = n+2; \text{ therefore } 4n+8.b = n+2, \text{ and } b = \frac{1}{4}, a = 3b = \frac{3}{4}; \text{ hence } \frac{n+2}{2n+1.2n+3} \times \frac{1}{3} + \frac{n+3}{2n+3.2n+5} \times \frac{1}{3^2} + \&c. = \frac{b}{m} = \frac{1}{4.2n+1}, \text{ and } \frac{1}{3^n} \times$$

$$\frac{n+2}{2n+1.2n+3} \times \frac{1}{3} + \frac{n+3}{2n+3.2n+5} \times \frac{1}{3^2} + \&c. = \frac{1}{4.2n+1.3^n}, \text{ the sum of the series after the first } n \text{ terms; also the sum of the whole series is } \frac{1}{4}; \text{ therefore the sum of the first } n \text{ terms is } \frac{1}{4} - \frac{1}{4.2n+1.3^n}.$$

COR. Since the sum of the series after the first n terms is $\frac{1}{4.2n+1.3^n}$, if $n=0$, we get the sum of the whole series $= \frac{1}{4.1.3^0} = \frac{1}{4}$.

Ex. 6. To find the sum of $\frac{19}{1.2.3} \times \frac{1}{4} + \frac{28}{2.3.4} \times \frac{1}{8} + \frac{39}{3.4.5} \times \frac{1}{16} + \frac{52}{4.5.6} \times \frac{1}{32} + \&c. \text{ in infinitum.}$
Because the factors in the denominators increase by 1, and begin from 1, assume $1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \frac{x^4}{5} + \&c. = S$, and multiply both sides by $ax^2 - bx + c$; then

$$\left. \begin{aligned} & ax^2 + \frac{ax^3}{2} + \frac{ax^4}{3} + \&c. \\ & - bx - \frac{bx^2}{2} - \frac{bx^3}{3} - \frac{bx^4}{4} - \&c. \\ & + c + \frac{cx}{2} + \frac{cx^2}{3} + \frac{cx^3}{4} + \frac{cx^4}{5} + \&c. \end{aligned} \right\} = ax^2 - bx + c \times S,$$

$$\text{Or } c + \frac{c-2b}{1.2} \times x + \frac{6a-3b+2c}{1.2.3} \times x^2 + \frac{12a-8b+6c}{2.3.4} \times x^3 + \frac{20a-15b+12c}{3.4.5} \times x^4 + \&c. = ax^2 - bx + cS; \text{ and since } ax^2 - bx + c = 0, \text{ and one value of } x \text{ must be } \frac{1}{2}, \text{ because the}$$

powers of $\frac{1}{2}$ are involved in the terms of the proposed series, we have $\frac{a}{4} - \frac{b}{2} + c = 0$; also $6a - 3b + 2c = 19$, and

$12a - 8b + 6c = 28$; from which three equations it appears, that $a=6$, $b=7$, $c=2$; and, if these values be substituted in the general series, we have $2 - 3 + \frac{19}{1.2.3} \times \frac{1}{4} + \frac{28}{2.3.4} \times$

$$\frac{1}{8} + \frac{39}{3.4.5} \times \frac{1}{16} + \frac{52}{4.5.6} \times \frac{1}{32} + \&c. = 0, \text{ or } \frac{19}{1.2.3} \times \frac{1}{4} + \frac{28}{2.3.4} \times \frac{1}{8} + \frac{39}{3.4.5} \times \frac{1}{16} + \&c. = 1.$$

On Recurring Series.

If each succeeding term of a decreasing series bear an invariable relation to a certain number of the preceding terms, the sum of the series may be found.

Let $a+bx+cx^2+\&c.$ be the proposed series; call its terms $A, B, C, D, \&c.$ and let $C=fxB+gx^2A$, $D=fxC+gx^3B$, $\&c.$ where $f+g$ is the scale of relation; then, by the supposition,

$$\begin{aligned} A &= A \\ B &= B \\ C &= fxB + gx^2A \\ D &= fxC + gx^3B \\ E &= fxD + gx^4C \\ \&c. & \quad \&c. \end{aligned}$$

and if the whole sum $A+B+C+D+\&c. = S$, we have

$$\begin{aligned} S &= A+B+fx \times S - A+gx^2 \times S, \text{ or} \\ S - fxB - gx^2S &= A+B-fxA; \text{ therefore } S = \frac{A+B-fxA}{1-fx-gx^2}. \end{aligned}$$

In the same manner, if the scale of relation be $f+g+\&c.$ to n factors, the sum of the series is

$$\frac{A+B+C+\dots(n)-fx \times A+B+\dots(n-1)-gx^2 \times A+\dots(n-2) \&c.}{1-fx-gx^2-hx^3-\dots(n+1)}$$

Ex. 1. To find the sum of the infinite series $1+2x+3x^2+4x^3+\&c.$ when x is less than 1.

$$\text{Here } f=2, g=-1, \text{ and the sum } = \frac{1+2x-2x^2}{1-2x+x^2} = \frac{1}{1-x}.$$

If x be equal to or greater than 1, the series is infinite; yet we know that it arises from the division of 1 by $1-x^2$, and the sum of n terms may be accurately determined.

The series after the n first terms becomes $n+1.x^n + n+2.x^{n+1} + n+3.x^{n+2} + \&c.$ in which the scale of relation, as before, is $2-1$; and therefore it arises from the fraction $\frac{n+1.x^n + n+2.x^{n+1} - 2.n+1.x^{n+1}}{1-2x+x^2}$, or $\frac{n+1.x^n - nx^{n+1}}{1-x^2}$;

therefore, $1+2x+3x^2+\&c.$ to n terms, $= \frac{1-n+1.x^n + nx^{n+1}}{1-x^2}$.

Ex. 2. To find the sum of n terms of the series $1+3x+5x^2+7x^3+\&c.$ Suppose $f+g$ the scale of relation; then $3f+g=5$, and $5f+3g=7$; hence $f=2$, and $g=-1$; and by trial it appears that the scale of relation is properly determined; hence $S = \frac{1+3x-2x^2}{1-2x+x^2} = \frac{1+x}{1-x}$. After n

terms the series becomes $\frac{2n+1.x^n + 2n+3.x^{n+1} + 2n+5.x^{n+2} + \&c.}{1-2x+x^2}$ which arises from the fraction $\frac{2n+1.x^n + 2n+3.x^{n+1} - 2.2n+1.x^{n+1}}{1-2x+x^2}$; or $\frac{2n+1.x^n - 2n-1.x^{n+1}}{1-x^2}$; hence $1+3x+5x^2+7x^3+\&c.$

$$\text{to } n \text{ terms, } = \frac{1+x-2n+1.x^n + 2n-1.x^{n+1}}{1-x^2}.$$

Ex. 3. To find the sum of n terms of the series $n-1 \cdot x + n-2 \cdot x^2 + n-3 \cdot x^3 + \&c.$

In the series $n-1 \cdot x + n-2 \cdot x^2 + n-3 \cdot x^3 + \&c.$ the scale of relation is $2-1$; therefore its sum in infinitum is $\frac{n-1 \cdot x + n-2 \cdot x^2 - 2 \cdot n-1 \cdot x^2}{1-x}$, or $\frac{n-1 \cdot x - nx^2}{1-x}$. After n

terms the series becomes $-x^{n+1} - 2x^{n+2} - \&c.$ the sum of which is found in the same manner to be $\frac{-x^{n+1}}{1-x}$; therefore

$$\frac{n-1 \cdot x + n-2 \cdot x^2 + n-3 \cdot x^3 + \&c.}{1-x} = \frac{n-1 \cdot x - nx^2}{1-x} - \frac{x^{n+1}}{1-x}$$

Hence $\frac{n-1 \cdot x}{n} + \frac{n-2 \cdot x^2}{n} + \&c.$ to n terms, $= \frac{n-1 \cdot x - nx^2 + x^{n+1}}{n \cdot 1-x}$.

Ex. 4. To find the sum of n terms of the series $1^2 + 2^2 x + 3^2 x^2 + 4^2 x^3 + \&c.$

Let the scale of relation be $f+g+h$; then

$$\begin{aligned} 9f + 4g + h &= 16 \\ 16f + 9g + 4h &= 25 \\ 25f + 16g + 9h &= 36 \end{aligned}$$

From these equations we obtain $f=3, g=-3, h=1$, which values, when substituted, produce the successive terms of the proposed series; therefore $S = \frac{1+x}{1-3x+3x^2-x^3}$, the sum of the series in inf. when x is less than 1.

After the first n terms the series becomes $\frac{n+1}{1-x} \times x^n + \frac{n+2}{1-x} \times x^{n+1} + \frac{n+3}{1-x} \times x^{n+2} + \&c.$ which arises from the fraction $\frac{n+1}{1-x} \times x^n + \frac{n+2}{1-x} \times x^{n+1} + \frac{n+3}{1-x} \times x^{n+2} + \&c.$

$$\frac{-3 \cdot \frac{n+1}{1-x} x^{n+1} - 3 \cdot \frac{n+2}{1-x} x^{n+2} + 3 \cdot \frac{n+1}{1-x} x^{n+2}}{1-3x^2-x^3}, \text{ or } \frac{-3x^2-x^3}{n+1} \cdot x^n - \frac{2n^2+2n-1}{1-x} \times x^{n+1} + \frac{n^2 x^{n+2}}{1-x}; \text{ and conse-}$$

quently the sum of n terms of the series is $\frac{1+x-n+1}{1-x} x^n + \frac{2n^2+2n-1}{1-x} \times x^{n+1} - \frac{n^2 x^{n+2}}{1-x}$.

On the Differential Method.

In any series of quantities, $a, b, c, d, e, f, \&c.$ if each term be taken from that which follows it, and the differences of these differences be taken, and so on, the following ranks of differences will be obtained:

- 1st Diff. $b-a, c-b, d-c, e-d, f-e, \&c.$
- 2d Diff. $c-2b+a, d-2c+b, e-2d+c, f-2e+d, \&c.$
- 3d Diff. $d-3c+3b-a, e-3d+3c-b, f-3e+3d-c, \&c.$
- 4th Diff. $e-4d+6c-4b+a, f-4e+6d-4c+b, \&c.$
- 5th Diff. $f-5e+10d-10c+5b-a, \&c.$

Hence it appears, that the coefficients of the quantities $a, b, c, d, \&c.$ in the first term of the n th differences are the coefficients of the terms in the binomial raised to the n th power, and that their signs are alternately positive and negative.

Let $d^1, d^{11}, d^{111}, d^{1111}, \&c.$ represent the first terms in the first, second, third, fourth, $\&c.$ orders of differences; then

$$\begin{aligned} d^1 &= b-a \\ d^{11} &= c-2b+a \\ d^{111} &= d-3c+3b-a \\ d^{1111} &= e-4d+6c-4b+a \\ &\&c. \end{aligned}$$

And, by transposition,
VOL. I. No. 20.

$$\begin{aligned} b &= a + d^1 \\ c &= 2b - a + d^{11} = a + 2d^1 + d^{11} \\ d &= 3c - 3b + a + d^{111} = a + 3d^1 + 3d^{11} + d^{111} \\ e &= 4d - 6c + 4b - a + d^{1111} = a + 4d^1 + 6d^{11} + 4d^{111} + d^{1111} \\ &\&c. \end{aligned}$$

From which it is manifest, that the coefficients of $d, d^1, d^{11}, d^{111}, \&c.$ in the expression for the $n+1$ th term of the series $a, b, c, d, \&c.$ are the coefficients of the terms of a binomial raised to the n th power; that is, the $n+1$ th term of the series is $a + nd^1 + n \cdot \frac{n-1}{2} d^{11} + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} d^{111} + \&c.$

COR. 1. The n th term of the series is $a + n-1 d^1 + n-1 \cdot \frac{n-2}{2} d^{11} + n-1 \cdot \frac{n-2}{2} \cdot \frac{n-3}{3} d^{111} + \&c.$

Ex. Required the n th term of the series, 1, 3, 5, 7, $\&c.$

$$\begin{array}{cccc} 1 & 3 & 5 & 7 \\ & 2 & 2 & 2 \\ & & 0 & 0 \end{array}$$

Here $a=1, d^1=2, d^{11}=0$; therefore the n th term is $1 + n-1 \cdot 2 = 2n-1$.

COR. 2. If the differences at length vanish, the n th term of the series will be exactly determined; but, if the differences do not vanish, we can only approximate to it; and the less the differences become when compared with the former differences, and with n , the nearer will the approximation be to the true value of that term.

Let the proposed series be $a, a+b, a+b+c, a+b+c+d, \&c.$ then

- 1st Diff. $a, b, c, d, \&c.$
- 2d Diff. $b-a, c-b, d-c, \&c.$
- 3d Diff. $c-2b+a, d-2c+b, \&c.$
- 4th Diff. $d-3c+3b-a, \&c.$

Let $b-a=d^1, c-2b+a=d^{11}, d-3c+3b-a=d^{111}, \&c.$ then the $n+1$ th term of the series, that is, $a+b+c+d+\&c.$ to n terms, is $na + n \cdot \frac{n-1}{2} d^1 + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} d^{11} + \&c.$

If therefore $a, b, c, d, \&c.$ be the terms of any series, whose first, second, third, $\&c.$ differences are represented by $d^1, d^{11}, d^{111}, \&c.$ the sum of n terms of this series is $na + n \cdot \frac{n-1}{2} d^1 + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} d^{11} + \&c.$

Ex. 1. Required the sum of n terms of the series $1+3+5+7+\&c.$

$$\begin{array}{cccc} 1 & 3 & 5 & 7 \\ & 2 & 2 & 2 \\ & & 0 & 0 \end{array}$$

In this case $a=1, d^1=2, d^{11}=0$; hence the sum is $n + n \cdot \frac{n-1}{2} = n^2$.

Ex. 2. Required the sum of n terms of the series $1^2+2^2+3^2+\&c.$

$$\begin{array}{cccc} 1 & 4 & 9 & 16 \\ & 3 & 5 & 7 \\ & & 2 & 2 \\ & & & 0 \end{array}$$

Here $a=1, d^1=3, d^{11}=2, d^{111}=0$; therefore the sum $= n + n \cdot \frac{n-1}{2} \times 3 + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \times 2 = \frac{n \cdot 2n^2 + 3n + 1}{1 \cdot 2 \cdot 3} = \frac{n \cdot n + 1 \cdot 2n + 1}{1 \cdot 2 \cdot 3}$.

Ex. 3. To find the sum of the series $1^3+2^3+3^3+\&c.$ to n terms.

$$\begin{array}{ccccccc} 1 & 8 & 27 & 64 & 125 \\ & 7 & 19 & 37 & 61 \\ & & 12 & 18 & 24 \\ & & & 6 & 6 \\ & & & & 0 \end{array}$$

3 L

Here

Here $a=1$, $d^1=7$, $d^{11}=12$, $d^{111}=6$, $d^{1111}=0$; therefore the sum $= n + n \cdot \frac{n-1}{2} \times 7 + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \times 12 + n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \cdot \frac{n-3}{4} \times 6 = \frac{n^3 + 2n^2 + n^2}{4} = n \cdot \frac{n+1}{2}$.

Sometimes the sum may be more readily obtained by beginning the series with one or more cyphers; thus, to find the sum of n terms of the series $1^3 + 2^3 + 3^3 + \&c.$ take $n+1$ terms of the series $0 + 1^3 + 2^3 + 3^3 + \&c.$

$$\begin{array}{ccccccc} 0, & 1, & 8, & 27, & 64 \\ & 1, & 7, & 19, & 37 \\ & & 6, & 12, & 18 \\ & & & 6, & 6 \end{array}$$

Here $a=0$, $d^1=1$, $d^{11}=6$, $d^{111}=6$; and the sum of $n+1$ terms is $\frac{n}{2} + \frac{n+1 \cdot n \cdot n-1}{1 \cdot 2 \cdot 3} \times 6 + \frac{n+1 \cdot n \cdot n-1 \cdot n-2}{1 \cdot 2 \cdot 3 \cdot 4} \times 6$

$$\times 6 = \frac{n+1 \cdot n \cdot 2 + n+1 \cdot n \cdot n-1 \cdot 4 + n+1 \cdot n \cdot n-1 \cdot n-2}{4} = \frac{n+1 \cdot n \cdot 2 + 4n^2 - 4n + n^2 - 3n + 2}{4} = \frac{n+1 \cdot n \cdot n^2 + n}{4}$$

$$= \frac{n \cdot n + 1}{2}$$

The differential method may also be applied to the interpolation of series, and the quadrature of curves.

On the Method of Increments.

Any variable quantity is called an *integral*. The magnitude by which it is increased at one step is called the *increment*. Thus $1+2+3 \dots + m = n \cdot \frac{m+1}{2}$, and the magnitude by which it increases at one step is $m+1$, which is called the increment of the integral $n \cdot \frac{m+1}{2}$. When the quantity decreases, the increment becomes negative.

If two quantities begin to increase together, and their corresponding increments be always in the same ratio, their integrals, or the whole quantities generated, will be in that ratio. Let the corresponding increments be $A, B, C, \&c.$ and $a, b, c, \&c.$ and let $A:a::B:b::C:c \&c.::m:n$; then $A+B+C+\&c.::a+b+c+\&c.::m:n$.

COR. When $m=n$, or the increments are equal, the integrals are also equal.

If an integral be represented by the product of quantities in arithmetical progression, as $n \cdot m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$, where r is constant, and m is increased at every step by r , the increment of this integral is $nr \times m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$.

The first value of the integral is $m \cdot m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$, and the succeeding value is $m+r \cdot m + 2r \cdot m + 3r \cdot m + 4r \dots m + nr$, whose difference, that is, the increment of the integral, is $nr \times m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$.

COR. 1. Since an invariable quantity C has no increment, the increment of $m \cdot m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r \pm C$ is also $nr \times m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$.

COR. 2. Hence if the increment of an integral be represented by $nr \times m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$, the integral is $m \cdot m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r \pm C$; where the invariable quantity C must be determined by the nature of the equation.

COR. 3. If the increment be $A \times m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r$, when A is invariable, the integral is $\frac{A}{nr} \times m \cdot m + r \cdot m + 2r \cdot m + 3r \dots m + n-1 \cdot r \pm C$.

If A be the constant increment, and m the number of times it has been taken, the integral is $m \cdot A \pm C$. To find therefore the integral of any increment, let the increment be reduced to the products of arithmetical progressions whose common difference is the quantity by which the variable magnitude is increased at every step, and the integral of each increment will be found by multiplying it by the preceding term in the progression, and dividing it by the number of terms thus increased, and by the common difference.

The constant quantity which is to be added to or subtracted from this result, in order to obtain the correct integral, must be determined by the nature of the question; thus, when x , the integral obtained by the rule, is a , suppose the true integral is known to be b ; then since $x+C$ is in all cases the integral, $a+C=b$, or $C=b-a$; therefore, the correct integral is $x+b-a$.

Ex. 1. To find the sum of n terms of the series $1+2+3+\&c.$

The n th term is n , and the increment of the sum is $n+1$, whose integral according to the rule is $\frac{n \cdot n+1}{2}$. And this is the correct integral, because when $n=1$, the sum is $\frac{1 \cdot 2}{2}=1$, as it ought to be.

Ex. 2. What is the n th term of the series $7, 9, 11, \&c.$

Here the increment is 2 , and the integral $2n+C$, but when $n=1$, the integral is 7 , therefore $2+C=7$, and $C=5$; therefore the correct integral is $2n+5$, the n th term of the proposed series.

Ex. 3. To find the sum of n terms of the series $1^2+2^2+\dots+\&c.$

The increment of this sum is $\frac{n+1}{2} = \frac{n \cdot n+1 + n+1}{2}$, and the integral or sum is $\frac{n-1 \cdot n \cdot n+1}{3} + \frac{n \cdot n+1}{2} = \frac{2n+1 \cdot n \cdot n+1}{2 \cdot 3}$; which needs no correction.

Ex. 4. To find the sum of n terms of the series $1^2+3^2+\dots+\&c.$

The increment of the sum is $\frac{2n+1}{2} = \frac{4n^2+4n+1}{2}$, whose integral is $\frac{4 \cdot n-1 \cdot n \cdot 2n+1}{3} + n$; which needs no correction.

Ex. 5. To find the sum of n terms of the series $1^3+2^3+\dots+\&c.$

The increment of the sum is $\frac{n+1}{4} = \frac{n^3+3n^2+3n+1}{4}$, whose integral is $\frac{n-1 \cdot n \cdot n+1 \cdot n+2}{4} + \frac{n \cdot n+1}{2} = \frac{n \cdot n+1}{2}$; the sum required; which needs no correction.

The following table of figurate numbers is formed by making the n th term of each succeeding rank equal to the sum of n terms of the preceding:

1st Order,	1,	1,	1,	1,	1
2d	1,	2,	3,	4,	5
3d	1,	3,	6,	10,	15
4th	1,	4,	10,	20,	35
5th	1,	5,	15,	35,	70
&c.	&c.	&c.	&c.	&c.	&c.

Ex. 6. To find the sum of n terms of the m th order of figurate numbers.

The

The sum of n terms of the first order is n ; therefore $n+1$ is the increment of the sum of n terms of the second order, and its integral $\frac{n+1}{2}$ is the n th term of the third order; consequently, $\frac{n \cdot n+1 \cdot n+2}{2}$ is the $n+1$ th term, or increment of the sum of n terms of the third order, and its integral $\frac{n \cdot n+1 \cdot n+2}{2 \cdot 3}$ is the sum of n terms of the third order, or the n th term of the fourth order, &c.

Thus it appears, that $\frac{n \cdot n+1 \cdot \dots \cdot n+m-1}{1 \cdot 2 \cdot \dots \cdot m}$ is the sum which was to be found; the integrals requiring no correction.

Ex. 7. To find the sum of n terms of the series $1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \&c.$

The $n+1$ th term, or increment of the sum, is $n+1 \cdot n+2$, and consequently the integral, or sum, is $\frac{n \cdot n+1 \cdot n+2}{3}$; which needs no correction.

Ex. 8. To find the sum of the n first terms of a series whose n th term is $an^2 + bn + c + d$; a, b, c, d , being given quantities.

Assume $A \cdot n \cdot n+1 \cdot n+2 + B \cdot n \cdot n+1 + C \cdot n + D = a \cdot n+1^3 + b \cdot n+1^2 + c \cdot n+1 + d$; or

$$\left. \begin{array}{l} An^3 + 3An^2 + 2An + D \\ + Bn^2 + Bn \\ + Cn \end{array} \right\} = \left\{ \begin{array}{l} an^3 + 3an^2 + 3an + a \\ + bn^2 + 2bn + b \\ + cn + c \\ + d \end{array} \right.$$

and, by equating the coefficients, $A=a$; $3A+B=3a+b$, or $3a+B=3a+b$, that is, $B=b$; $2A+B+C=3a+2b+c$, or $2a+b+C=3a+2b+c$, hence $C=a+b+c$; also $D=a+b+c+d$; therefore the increment of the sum is $a \cdot n \cdot n+1 \cdot n+2 + b \cdot n \cdot n+1 + a+b+c \cdot n + a+b+c+d$, and the integral $\frac{a \cdot n \cdot n+1 \cdot n+2}{4} + \frac{b \cdot n \cdot n+1}{3} + \frac{a+b+c \cdot n}{2} + \frac{a+b+c+d \cdot n}{1}$; which requires no correction.

Though in general it is convenient to reduce an increment to the products of arithmetical progressions, in order to obtain its integral; yet, if a quantity of any other form can be found, whose increment coincides with the increment proposed, this quantity, when properly corrected, is the integral.

Ex. 1. To find the sum of n terms of the series $5+6+7+\&c.$

Let $An+Bn^2+Cn^3+\&c.$ be the sum required; its increment is $A \cdot n+1 + B \cdot n+1^2 + C \cdot n+1^3 + \&c.$ $-An-Bn^2-Cn^3-\&c.$ and the increment of the sum is also $n+5$; therefore, $A+2Bn+B+3Cn^2+3Cn+C+\&c. = n+5$; and, by equating the coefficients, $C=0$; $2B=1$, or $B=\frac{1}{2}$;

$A+B=5$, or $A=\frac{9}{2}$; hence the sum required is $\frac{9n+n^2}{2}$; which needs no correction.

Ex. 2. To find the number of shot in a pyramidal pile upon a square base whose side is known.

Let n be the number in one side of the base; then n^2 is the number contained in the first square; also, since one shot in the next square will lie between every two of the former, $n-1$ is the number contained in the side of the second square, and $n-1^2$ the number in that square, &c. therefore the number of shot is $n^2 + n-1 + n-2^2 + \dots + 2^2 + 1^2$, or $1^2 + 2^2 + 3^2 + \dots + n^2$.

Suppose $An+Bn^2+Cn^3$ to be the sum of the series; its increment is $A \cdot n+1 + B \cdot n+1^2 + C \cdot n+1^3 - An-Bn^2-$

Cn^3 ; and the increment of the series is also $n+1^2$; therefore,

$$\left. \begin{array}{l} 3Cn^2 + 3Cn + C \\ + 2Bn + B \\ + A \end{array} \right\} = n^2 + 2n + 1;$$

and, by equating the coefficients, $3C=1$, or $C=\frac{1}{3}$; $3C+2B=2$, or $B=\frac{1}{2}$; $C+B+A=1$, or $\frac{1}{3} + \frac{1}{2} + A=1$, hence $A=\frac{1}{6}$; and the sum of the series is $\frac{n}{6} + \frac{n^2}{2} + \frac{n^3}{3}$; which requires no correction.

If $An+Bn^2+Cn^3+Dn^4+\&c.$ be assumed for the sum of the series, it is evident, from the process, that D and the coefficient of every succeeding term vanishes.

Those who wish to prosecute this subject farther may consult Dr. Waring's Fluxions, Sterling's Summation of Series, and Emerfon's Method of Increments.

On Chances.

If an event may take place in n different ways, and each of these be equally likely to happen, the probability that it will take place in a specified way is properly represented by $\frac{1}{n}$, certainty being represented by unity. Or, which is the same thing, if the value of certainty be unity, the value of the expectation that the event will happen in a specified way is $\frac{1}{n}$. For the sum of all the probabilities is certainty, or unity, because the event must take place in some one of the ways, and the probabilities are equal; therefore each of them is $\frac{1}{n}$.

COR. If the value of certainty be a , the value of the expectation is $\frac{a}{n}$. But in the following articles we will suppose the value of certainty to be unity.

If an event may happen in a ways, and fail in b ways, any of these being equally probable, the chance of its happening is $\frac{a}{a+b}$, and the chance of its failing is $\frac{b}{a+b}$. The chance of its happening must, from the nature of the supposition, be to the chance of its failing, as a to b ; therefore the chance of its happening: chance of its happening, together with the chance of its failing :: $a : a+b$; and the event must either happen or fail, consequently the chance of its happening together with the chance of its failing is certainty; hence the chance of its happening: certainty :: $a : a+b$; and the chance of its happening $= \frac{a}{a+b}$. Also since the chance of its happening together with the chance of its failing is certainty, which is represented by unity, $1 - \frac{a}{a+b}$, that is, $\frac{b}{a+b}$ is the chance of its failing.

Ex. 1. The probability of throwing an ace with a single die in one trial is $\frac{1}{6}$; the probability of not throwing an ace is $\frac{5}{6}$; the probability of throwing either an ace or a deuce is $\frac{2}{6}$, &c.

Ex. 2. If n balls a, b, c, d , &c. be thrown promiscuously into a bag, and a person draw out one of them, the probability that it will be a is $\frac{1}{n}$; the probability that it will be a or b is $\frac{2}{n}$.

Ex. 3. The same supposition being made, if two balls

be drawn out, the probability that these will be a and b is $\frac{2}{n \cdot n-1}$.

From the Bills of Mortality in different places, tables have been constructed which shew how many persons, upon an average, out of a certain number born, are left at the end of each year, to the extremity of life. From such tables, the probability of life, under any proposed circumstances, is known.

Ex. To find the probability that an individual of a given age will live one year. Let A be the number, in the tables, of the given age, B the number left at the end of the year; then $\frac{B}{A}$ is the probability that the individual

will live one year; and $\frac{A-B}{A}$ the probability that he will die in that time. In Dr. Halley's Tables, out of 586 of the age of 22, 579 arrive at the age of 23; hence the probability that an individual aged 22 will live one year is $\frac{579}{586}$ or $\frac{83}{84}$ nearly; and $\frac{7}{586}$, or $\frac{1}{84}$ nearly, is the probability that he will die in that time.

If two events be independent of each other, and the probability that one will happen be $\frac{1}{m}$, and the probability that the other will happen be $\frac{1}{n}$, the probability that they both will happen is $\frac{1}{mn}$. For each of the m ways in which the first can happen or fail, may be combined with each of the n ways in which the other can happen or fail, and thus form mn combinations, and there is only one in which both happen; therefore the probability that this will be the case is $\frac{1}{mn}$.

Required the probability of throwing an ace, with a single die, in two trials. The chance of failing the first time is $\frac{5}{6}$, and the chance of failing the next is $\frac{5}{6}$; therefore the chance of failing twice together is $\frac{25}{36}$, and the chance of not failing both times is $1 - \frac{25}{36}$, or $\frac{11}{36}$.

In how many trials may a person undertake, for an even wager, to throw an ace with a single die? Let x be the number of trials; then, as the chance of failing x times together is $\left(\frac{5}{6}\right)^x$, and this by the question is equal to the

chance of happening, or $\left(\frac{5}{6}\right)^x = \frac{1}{2}$; hence $x \times \log. \frac{5}{6} = \log. \frac{1}{2}$, or $x \times \log. 5 - \log. 6 = \log. 1 - \log. 2$, and $x = \frac{\log. 1 - \log. 2}{\log. 5 - \log. 6} = \frac{\log. 2}{\log. 5 - \log. 6}$ since $\log. 1 = 0$.

RULE. To find the probability that two individuals, P and Q , whose ages are known, will live a year.

Let the probability that P will live a year be $\frac{1}{m}$; and the probability that Q will live a year $\frac{1}{n}$; then the probability that they will both be alive at the end of that time is $\frac{1}{m} \times \frac{1}{n}$, or $\frac{1}{mn}$.

RULE. To find the probability that one of them, at least, will be alive at the end of any number of years.

The probability that P will die in a year is $\frac{m-1}{m}$, and

the probability that Q will die is $\frac{n-1}{n}$; therefore, the pro-

bability that they will both die is $\frac{m-1}{m} \cdot \frac{n-1}{n}$, and the pro-

bability that they will not both die is $1 - \frac{m-1}{m} \cdot \frac{n-1}{n}$, or $\frac{m+n-1}{mn}$.

In the same manner, if $\frac{1}{p}$ be the probability that P will live t years, and $\frac{1}{q}$ the probability that Q will live the same time; the probability that one of them at least will be alive at the end of the time is $1 - \frac{p-1}{p} \cdot \frac{q-1}{q}$, or $\frac{p+q-1}{pq}$.

If the probability of an event's happening in one trial be represented by $\frac{a}{a+b}$, to find the probability of its happening once, twice, three times, &c. exactly, in n trials. The probability of its happening in any one particular trial being $\frac{a}{a+b}$, the probability of its failing in all the other $n-1$ trials is $\frac{b^{n-1}}{(a+b)^{n-1}}$; therefore the probability of its happening in one particular trial and failing in the rest is $\frac{ab^{n-1}}{(a+b)^n}$; and, since there are n trials, the probability that it will happen in some one of these and fail in the rest is n times as great, or $\frac{nab^{n-1}}{(a+b)^n}$. The probability of its happening in any two particular trials and failing in all the rest is $\frac{a^2b^{n-2}}{(a+b)^n}$, and there are $n \cdot \frac{n-1}{2}$ ways in which it may happen twice in n trials and fail in all the rest; therefore the probability that it will happen twice in n trials is $\frac{n \cdot \frac{n-1}{2} a^2b^{n-2}}{(a+b)^n}$. In the same manner, the probability of its

happening exactly three times is $\frac{n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} a^3b^{n-3}}{(a+b)^n}$; and the probability of its happening exactly t times is $\frac{n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \dots \frac{n-t+1}{t} a^t b^{n-t}}{(a+b)^n}$.

COR. 1. The probability of the event's failing exactly t times in n trials is $\frac{n \cdot \frac{n-1}{2} \cdot \frac{n-2}{3} \dots \frac{n-t+1}{t} a^{n-t} b^t}{(a+b)^n}$.

COR. 2. The probability of the event's happening at least t times in n trials is $\frac{a^n + na^{n-1}b + n \cdot \frac{n-1}{2} a^{n-2}b^2 + \dots + n \cdot \frac{n-1}{2} a^{n-t+1}b^t}{(a+b)^n}$.

For if it happen every time, or fail only once, twice, . . . $n-t$ times, it happens t times; therefore the whole probability of its happening at least t times is the sum of the probabilities of its happening every time, of failing only once, twice, . . . $n-t$ times; and the sum of these probabilities

probabilities is

$$a^n + na^{n-1}b + n \cdot \frac{n-1}{2} a^{n-2}b^2 \dots \text{to } n-t+1 \text{ terms}$$

$$\frac{a+b)^n}{a+b)^n}$$

Ex. What is the probability of throwing an ace, twice in three trials, with a single die?

In this case $n=3$, $t=2$, $a=1$, $b=5$; and the probability required is $\frac{1+3 \cdot 5}{6 \cdot 6 \cdot 6} = \frac{16}{216} = \frac{2}{27}$.

SCHOLIUM. Much might be said on a subject so extensive as the doctrine of chances; the learner will however find the principal grounds of calculation in the above rules; and, if he wish for farther information, he must consult De Moivre's work on this subject. It may not be improper to caution him against applying principles which on the first view may appear self-evident, as there is no subject in which he will be so likely to mistake as in the calculation of probabilities. A single instance will shew the danger of forming a hasty judgment even in the most simple cases. The probability of throwing an ace with

one die is $\frac{1}{6}$, and, since there is an equal probability of throwing an ace in the second trial, it might be supposed that the probability of throwing an ace in two trials is $\frac{2}{6}$.

This is not a just conclusion; for, it would follow, by the same mode of reasoning, that in six trials a person could not fail to throw an ace. The error, which is not easily seen, arises from a tacit supposition that there must necessarily be a second trial, which is not the case if an ace be thrown in the first.

On Life Annuities.

To find the present value of an annuity of 1*l.* to be continued during the life of an individual of a given age, allowing compound interest for the money. Let r be the amount of 1*l.* in one year; A the number of persons, in the tables of the given age; B, C, D , &c. the number left at the end of 1, 2, 3, &c. years; then $\frac{B}{A}$ is the value of the life for one year, $\frac{C}{A}$, $\frac{D}{A}$, &c. its value for 2, 3, &c. years; and this series must be continued to the end of the tables. Now the present value of 1*l.* to be paid at the end of one year is $\frac{1}{r}$; but it is only to be paid on condition that the annuitant is alive at the end of the year, of which event the probability is $\frac{B}{A}$; therefore the present value of the conditional annuity is $\frac{B}{Ar}$; in the same manner, the present value of the second year's annuity is $\frac{A}{Cr^2}$, the present value of the third year's annuity is $\frac{D}{Ar^3}$, &c. therefore the whole value required is $\frac{1}{A} \times \frac{B}{r} + \frac{C}{r^2} + \frac{D}{r^3} + \&c.$ to the end of the tables.

De Moivre supposes that out of eighty-six persons born, one dies every year, till they are all extinct. This supposition is sufficiently exact, if our calculations be made for any age above ten, as will appear from an inspection of the tables; and on this supposition the sum of the

series $\frac{1}{A} \times \frac{B}{r} + \frac{C}{r^2} + \frac{D}{r^3} + \&c.$ may be found.

Let n be the number of years which any individual wants of eighty-six; then will n be the number of persons living, of that age, out of which one dies every year;

and $\frac{n-1}{n}$, $\frac{n-2}{n}$, $\frac{n-3}{n}$, &c. will be the probabilities of his living 1, 2, 3, &c. years; hence the present value of an annuity of 1*l.* to be paid during his life is $\frac{n-1}{nr} +$

$\frac{n-2}{nr^2} + \frac{n-3}{nr^3} + \&c.$ continued to n terms. The sum of

the series $\frac{n-1 \cdot x}{n} + \frac{n-2 \cdot x^2}{n} + \frac{n-3 \cdot x^3}{n}$ to n terms is

found to be $\frac{n-1 \cdot x - nx^2 + x^{n+1}}{x \cdot 1 - x^2}$; let $x = \frac{1}{r}$, and the sum

of the series $\frac{n-1}{nr} + \frac{n-2}{nr^2} + \frac{n-3}{nr^3} + \&c.$ to n terms,

is $\frac{n-1 \cdot r - n + \frac{1}{r^{n-1}}}{n \cdot r - 1}$; the present value of the annuity.

COR. 1. This expression for the sum is the same

with $\frac{nr-n}{n \cdot r-1} - \frac{r-n}{n \cdot r-1}$, or $\frac{1}{r-1} - \frac{r}{n} \times \frac{1-r^n}{r-1}$; let P be the present value of an annuity of 1*l.* to continue certain

for n years, then $P = \frac{1-r^n}{r-1}$; and the expression be-

comes $\frac{1-r}{n} P$.

COR. 2. The present value of the annuity to continue for ever, from the death of the proposed individual, is $\frac{rP}{n \cdot r-1}$. For the whole present value of the annuity

to continue for ever, is $\frac{1}{r-1}$; and if from this, its value for the life of the individual be taken, the remainder $\frac{rP}{n \cdot r-1}$ is the present value of the annuity to

continue for ever, from the time of his death.

To find the present value of an annuity of 1*l.* to be paid as long as two specified individuals are both living. Find, by the foregoing rules, the probability that they will both be alive at the end of 1, 2, 3, &c. years, to the end of the tables; call these probabilities a, b, c , &c. and r the amount of 1*l.* in one year; then $\frac{a}{r} + \frac{b}{r^2} + \frac{c}{r^3} + \&c.$ is the present value of the annuity required.

To find the present value of an annuity of 1*l.* to be paid as long as either of two specified individuals is living. Find, as above, the probability that they will not both be extinct in 1, 2, 3, &c. years, to the end of the tables, and call these probabilities A, B, C , &c. then the present value of the annuity is $\frac{A}{r} + \frac{B}{r^2} + \frac{C}{r^3} + \&c.$

COR. If the annuity be M *l.* the present value is M times as great as in the former case, or

$$M \times \frac{A}{r} + \frac{B}{r^2} + \frac{C}{r^3} + \&c.$$

These are the mathematical principles on which the values of annuities for lives are calculated, and the reasoning may easily be applied to every proposed case. But in practice, these calculations, as they require the combination of every year of each life with the corresponding years of every other life concerned in the question, will be found extremely laborious, and other methods must be resorted to when expedition is required.

PART IV.

ON THE APPLICATION OF ALGEBRA TO GEOMETRY.

THE signs made use of in algebraical calculations being general, the conclusions obtained by their assistance are universal, and may with great ease and convenience be transferred from abstract magnitudes to every class of particular quantities; thus the relation of lines, surfaces, or solids, may generally be deduced from the principles of Algebra, and many properties of these quantities discovered which could not be derived from principles purely geometrical.

Simple algebraical quantities, their products, powers, roots, &c. may be represented by lines. Any line AB , may be taken at pleasure to represent one quantity a , but if we have a second quantity b to represent, we must take a line which has to the former the same ratio that b has to a . Instead of saying AB represents a , we may say $AB=a$, supposing AB to contain as many linear units as a contains numeral ones.

When a series of algebraical quantities is to be represented on one line, and each of them measured from the same point, the positive quantities being represented by lines taken in one direction, the negative quantities must be represented by lines taken in the opposite direction. Let a be the greatest of these quantities, then $a-x$ may, by the variation of x , become equal to each of them in succession. Let AB be the given line, and A the point from which the quantities are to be measured; take

$AB=a$; and, since $a-x$ must be measured from A , BD must be taken in the contrary direction $=x$, then $AD=a-x$; and that $a-x$ may successively coincide with each quantity in the series, beginning with the greatest positive quantity, x must increase; therefore BD , which is equal to x , must increase; and when x is greater than a , BD

is greater than AB , and AD which represents the negative quantity $a-x$ lies in the opposite direction from A .

COR. 1. If the algebraical value of a line be found to be negative, the line must be measured in a direction opposite to that which in the investigation was supposed to be positive.

COR. 2. If quantities be measured upon a line from its intersection with another, the positive quantities being taken in one direction, the negative quantities must be taken in the other.

If a fourth proportional to lines representing p , q , r , be taken, it will represent $\frac{qr}{p}$; and if $p=1$, it will represent qr ; if also q and r be equal, it will represent q^2 .

If a mean proportional between lines representing a and b be taken, it will represent $\sqrt{ab}$, which when $a=1$ becomes $\sqrt{b}$. Hence it appears that any possible algebraical quantities may be represented by lines; and conversely, lines may be expressed algebraically; and if the relations of the algebraical quantities be known the relations of the lines are known.

The relations of surfaces to each other may be expressed algebraically. Let the sides AB , AC , of the rectangle AD ,

contain the linear units a , b , respectively; then ab will be the number of superficial units contained in the area. For every unit in AB , or a , has units in the area corresponding to it; consequently there are upon the whole, ab units in the area. Thus ab is a proper representation of the rectangle AD ; and by reducing other surfaces to rectangles, their algebraical values may be found.

COR. Hence the product of the two quantities a and b is often called their *rectangle*; and, when b is equal to a , this product is called the *square* of a .

In the same manner, if a , b , c , represent the linear units in the three sides of a rectangular parallelepiped, abc will be the number of solid units contained in the figure; and consequently solids may be compared by comparing their algebraical values.

If the line PM move parallel to itself upon the indefinite line AP , and at the same time increase or decrease, the point M will trace out a straight line or a curve. AP is called the *abscissa*, and MP the *ordinate*; and the straight line or curve is said to be the locus of the point M . The nature of the curve depends upon the relation of AP to PM ; and this relation, when expressed algebraically, is called the *equation to the curve*.

Having given the nature or construction of the curve, its equation may be found. Let BM be a straight line cutting AP in a given angle at B , the relation of AP to PM is expressed by a simple equation. Suppose $AP=x$, $PM=y$, $AB=a$; and since the angles at B , P , and M , are invariable, BP bears an invariable ratio to PM , let this be the ratio of $b:c$. Then since $BP=AP-AB=x-a$, we have $x-a:y::b:c$, and $by=cx-ca$, or $by-cx+ca=0$.

COR. A simple equation belongs to a straight line; because by altering the values of b , c , and a , and taking x and a , positive or negative, as the case requires, the equation $by-cx+ca=0$ may be made to coincide with any proposed simple equation.

To find the equation to the *Parabola*. Let a point S be

taken without the right line CB , and let the indefinite line SM revolve about the point S in the plane SBC ; also let CM , which is perpendicular to CB , cut SM in M ; then, if SM be always equal to CM , the locus of the point M is a parabola. Through S draw BSP at right angles to CB , and, if SB be bisected in A , the curve will pass through A , as appears by the construction; draw MP perpendicular to BP , and let $AP=x$, $PM=y$, $AS=a$; then $SP^2+PM^2=(SM^2=CM^2)=BP^2$, or $x-a^2+y^2=x+a^2$; that is, $x^2-2ax+a^2+y^2=x^2+2ax+a^2$, or $y^2=4ax$.

To find the equation to the *Ellipse*. Let two indefinite

lines SM , HM , revolve, in a given plane, about the points S , H , and cut each other in M in such a manner that $SM+MH$ may be an invariable quantity; the locus of the point M is an ellipse. Bisect SH in C , and from M draw MP perpendicular to SH , or SH produced; let $CP=x$, $PM=y$, $CS=c$, $SM+MH=2a$. Then $\sqrt{SP^2+PM^2}=SM$, and $\sqrt{HP^2+PM^2}=HM$; therefore $\sqrt{SP^2+PM^2}+\sqrt{HP^2+PM^2}=SM+MH$, or $\sqrt{c-x^2+y^2}+\sqrt{c+x^2+y^2}=2a$; hence $\sqrt{c+x^2+y^2}=2a-\sqrt{c-x^2+y^2}$, and squaring both sides,

sides, $c^2 - 2cx + x^2 + y^2 = 4a^2 - 4a\sqrt{c+x}^2 + y^2 + c^2 + 2cx + x^2 + y^2$; that is, by transposition, $4a^2 + 4cx = 4a\sqrt{c+x}^2 + y^2$, or $a^2 + cx = a\sqrt{c+x}^2 + y^2$; and again, squaring both sides, $a^4 + 2a^2cx + c^2x^2 = a^2c^2 + 2a^2cx + a^2x^2 + a^2y^2$, or $a^2y^2 = a^4 - a^2c^2 - a^2x^2$; let $a^2 - c^2 = b^2$, then $a^2y^2 = a^2b^2 - b^2x^2$, and $y^2 = \frac{b^2}{a^2} \times a^2 - x^2$.

COR. 1. If S and H coincide, $c=0$; hence $a=b$, and $y^2 = a^2 - x^2$, the equation to a circle.

COR. 2. When $x=+a$, or $-a$, then $y=0$; therefore taking $CA=CD=a$, the curve passes through A and D .

COR. 3. If $AP=z$, then $x=a-z$; therefore, $y^2 = \frac{b^2}{a^2} \times a^2 - a^2 + 2az - z^2 = \frac{b^2}{a^2} \times 2az - z^2$; the equation which expresses the relation between AP and PM .

COR. 4. If AS be finite, and $SM+MH$ be increased without limit, the curve at all finite distances from S becomes a parabola. In this case z^2 vanishes when compared with $2az$; therefore the equation becomes $y^2 = \frac{b^2}{a^2} \times 2az$;

also $b^2 = a^2 - c^2 = a+c \times a-c$, and since the difference between a and c is finite, and a is infinite, $a+c=2a$; hence $b^2=2a \times AS$, therefore $y^2 = \frac{2a \times AS}{a^2} \times 2az = 4AS \times z$.

To find the equation to the Hyperbola.

Let two indefinite lines SM , HM , revolve, in a given plane, about the points S , H , and cut each other in M , in such a manner that $HM-SM$ may be a given quantity; the locus of the point M is an hyperbola. Bisection SH in C , and draw MP perpendicular to HS , or HS produced; let $CP=x$, $PM=y$, $SC=c$, $HM-SM=2a$. Then

$\sqrt{x+c}^2 + y^2 - \sqrt{x-c}^2 + y^2 = 2a$, and $a^2y^2 = c^2 - a^2 \cdot x^2 - a^2c^2 - a^4$; in this case $2c$ is greater than $2a$ (Euc. 20. 1.), let therefore $b^2 = c^2 - a^2$, then $a^2y^2 = b^2x^2 - a^2b^2$, or $y^2 = \frac{b^2}{a^2} \times x^2 - a^2$.

COR. 1. The equation to the ellipse $y^2 = \frac{b^2}{a^2} \times a^2 - x^2$, becomes the equation to the hyperbola if b^2 be supposed to be negative.

COR. 2. The equation $y^2 = \frac{b^2}{a^2} \times a^2 - x^2$ may be considered as the equation to any conic section: it is the equation to an ellipse when b^2 is positive, to a parabola when b^2 is infinite, and to an hyperbola when b^2 is negative.

COR. 3. If $SM-HM=2a$, a figure similar and equal to the former will be traced out, which is called the opposite hyperbola.

COR. 4. If $x=\pm a$, then $y=0$; therefore taking $CA=CD=a$, the curve passes through A and D .

COR. 5. If $AP=z$, then CP or $x=z+a$, and $x^2 - a^2 = z^2 + 2az$; hence $y^2 = \frac{b^2}{a^2} \times z^2 + 2az$, the equation which expresses the relation between AP and PM .

COR. 6. In the opposite hyperbola, $x=z-a$; therefore $x^2 - a^2 = z^2 - 2az$, and $y^2 = \frac{b^2}{a^2} \times z^2 - 2az$.

To find the equation to the Cissoïd. Let AB be the dia-

meter of a semicircle ANB , from the points R and P , taken always at equal distances from A and B , draw RN , PM , at right angles to AB , and join AN meeting PM in M ; the point M we trace out a curve called the Cissoïd of Diocles. From the nature of the circle $AR \times RB = RN^2$, and by the construction $AR \times RB = PB \times AP$; also from the similar triangles APM , ARN , $AP:PM::AR:RN$, or $AP:PM::PB:RN = \frac{PB \times PM}{AP}$; and $RN^2 = \frac{PB^2 \times PM^2}{AP^2} = PB \times AP$; therefore, $PB \times PM^2 = AP^3$. Let $AB=b$, $AP=x$, $PM=y$ then $b-x \times y^2 = x^3$, the equation required.

To find the equation to the Conchoid. Let AB be a line

given in position, and about any point C , taken without it, let the indefinite line CM revolve, and cut AB in E ; then, if EM be taken always of the same length, the point M will trace out a curve C which is called the Conchoid of Nicomedes. Draw ADC and MP at right angles to AB , and MF parallel to it; let $CA=a$, $AD=EM=b$, $AP=x$, $PM=y$. Then from the similar triangles CFM , MPE , $CF(a+y):FM(x)::MP(y):PE = \frac{xy}{a+y}$; and $EM^2 = EP^2 + PM^2$, i. e. $b^2 = \frac{x^2y^2}{(a+y)^2} + y^2$;

therefore, $(a+y)^2 \times b^2 = x^2y^2 + (a+y)^2 \times y^2$, or $(a+y)^2 \times b^2 - y^2 = x^2y^2$, the equation to the curve.

To find the equation to the Logarithmic Curve. If in the indefinite line AE , we take AB , BC , CD , &c. always equal to each other, and ordinates AF , BG , CH , DI , &c. be drawn in right angles to AE , and in geometrical progression, the curve $FGHI$, which passes through their extremities, is called the Logarithmic Curve. From the nature of logarithms, any abscissa AC is the logarithm of the corresponding ordinate CH , in a system which depends upon the magnitude of AF and BG , supposing AB given; in the same system, let 1 be the logarithm of a , also let $AC=x$, $CH=y$; then $x = \log. y$, and $1 = \log. a$, or $x = x \times \log. a$; therefore $\log. y = x \times \log. a = \log. a^x$; hence $y = a^x$, the equation to the curve.

Having given the relation between one abscissa CP , and ordinate PM , in a curve, to find the relation between the abscissa SQ , which is measured from a given point S in a given direction, and the ordinate QM , which is inclined to PM at a given angle.

Suppose PM perpendicular to CP ; produce MQ and DPC till they meet in G , draw SB , SD , SF , respectively parallel to MG , MP , DC ; and let $S. \angle KSE = p$, $S. \angle KSE$, or $MKQ = m$, $S. \angle KMQ = q$, $S. \angle MQK = n$, $S. \angle MFE$, or $MGP = s$, to rad. 1; $SB=FG=d$, $DC=f$, $CP=x$, $PM=y$, $SQ=z$, $QM=v$.

Then,

y are impossible. But if $2bc-4ae$ be also $=0$, then $y = \frac{-b+cx \pm \sqrt{b^2-4ad}}{2a}$; therefore the curve becomes a right line. 3. If c^2-4af be negative, the curve has no infinite arc, for, when $\pm x$ is infinite, the values of y are impossible; hence the curve is an ellipse. 4. If c^2-4af be negative, $2bc-4ae=0$, b^2-4ad be also 0, or negative, all the values of y are impossible; in this case the ellipse wholly vanishes.

On the Construction of Equations.

The relation between the abscissa and ordinate of a conic section is expressed by a quadratic, in which for every different value of the abscissa, there are two corresponding values of the ordinate; and if the abscissa be so drawn and the conic section so constructed, that its equation may coincide with a proposed quadratic, the two ordinates will be the roots of that quadratic, which may be determined to a tolerable degree of accuracy by actual measurement.

Let MCM be a circle, (a figure more easily described

than any other conic section,) whose centre is A , and radius AM ; take AP an abscissa, PM an ordinate, meeting

the circle in M and M' ; join AM , and draw MB at right angles to AP ; let

$AP=x$, $PM=y$, $AM=r$, and the cosine of the angle APM (to the radius r) $=c$; then $r:c::PM:PB=c \times PM=cy$, and $AM^2=AP^2+PM^2-2AP \times BP$, or $r^2=x^2+y^2-2cxy$, i. e. $y^2-2cxy+x^2-r^2=0$; which equation may be made to coincide with any proposed quadratic.

Ex. Let the roots of the equation $y^2-2cy+q=0$ be required. Here $2cx=p$, and $x^2-r^2=q$, and any one of the quantities c , x , or r , may be taken at pleasure. Suppose

$a=1$, then $x=\frac{p}{2}$, $r^2=x^2-q=\frac{p^2}{4}-q$, and $r=\sqrt{\frac{p^2}{4}-q}$; and, since the cosine of the $\angle APM$ =radius, PM coincides with PAD ; let, therefore, a circle be described with the radius $\sqrt{\frac{p^2}{4}-q}$, cutting the line DAP in D and C ; take $AP=\frac{p}{2}$, and the roots of the equation are PC and PD .

The interfections of two conic sections may be determined by a biquadratic equation, and, if the figures be so drawn that this biquadratic coincides with a proposed equation, the roots of the latter equation may be found by measuring the ordinates which determine the points of intersection.

Let MAM be a parabola whose axis is AP , $M'MM'$ a circle whose centre is C , and radius CM , cutting the parabola in the

points M, M', M'', M''' ; from these points draw the ordinates to the axis, $MP, M'P, M''P, M'''P$, and from C draw CD perpendicular to the axis, and CN parallel to it, meeting PM in N . Let $AD=a$, $DC=b$, $CM=n$, the parameter of the parabola $=p$, $AP=x$, $PM=y$; then $px=y^2$; also $CM^2=CN^2+$

NM^2 , or $n^2=x-a^2+y-b^2$, i. e. $x^2-2ax+a^2+y^2-2by+b^2=n^2$; and, by substituting x for its value $\frac{y^2}{p}$, and

arranging the terms according to the dimensions of y , we obtain $y^4-2pa-p^2 \cdot y^2-2bp^2y+p^2 \times a^2+b^2-n^2=0$, a biquadratic equation whose roots are $PM, P'M, P''M, P'''M$, and which may be made to coincide with any proposed biquadratic wanting the second term.

Ex. Let the roots of the equation $y^4-qy^2+ry-s=0$ be required. Assume $p=1$, $2a-1=q$, or $a=\frac{q+1}{2}$; $-2b=r$,

or $b=\frac{-r}{2}$; $a^2+b^2-n^2=-s$, or $n^2=a^2+b^2+s$, and consequently $n=\sqrt{a^2+b^2+s}$; describe a parabola whose pa-

rameter is 1 , and in the axis take $AD=\frac{q+1}{2}$; draw DC at

right angles to it, and $=\frac{-r}{2}$; from the centre C , with the

radius $\sqrt{a^2+b^2+s}$, describe the circle $M'MM'$, cutting the

parabola in the points M, M', M'', M''' , then the ordinates to

the axis $PM, P'M, P''M, P'''M$, are the roots sought.

When DC represents a negative quantity, the ordinates on the same side of the axis with C represent the negative roots of the equation; and the contrary.

COR. 1. If the circle touch the parabola, two roots of the equation are equal; if it cut it only in two points, or touch it in one, two roots are impossible; and, if the circle fall wholly within or without the parabola, all the roots are impossible.

COR. 2. If $a^2+b^2=n^2$, or the circle pass through the point A , the last term of the equation $p^2 \times a^2+b^2-n^2=0$; therefore $y^4-2pa-p^2 \cdot y^2-2bp^2y=0$, or $y^3-2pa-p^2 \cdot y-2bp^2=0$, a cubic equation, which may be made to coincide with any proposed cubic wanting the second term, and the ordinates $PM, P'M, P''M$, are its roots.

COR. 3. If $a^2+b^2-n^2=0$, and also $b=0$, the equation becomes $y^2-2pa-p^2=0$; by means of which any quadratic wanting the second term may be solved. In this case the circle passes through the vertex of the parabola, and its centre falls in the axis. These solutions may be obtained, and nearly in the same manner, by means of any two of the conic sections.

If the roots of a cubic equation $x^3-qx+r=0$ be possible, they may be found by means of a table of cosines.

Let DAC be an angle whose cosine, to the radius m , is x ; in AD take $AB=m$, from B as a centre, with the radius BA , describe a circle cutting AM in C , and from C , with the same radius, describe a circle cutting AD in D ; join BC, CD , and draw BK, DM , at right angles to AM , and CL at right angles to AD . Then, the triangles BAC and BCD being isosceles, the angles BAC and BCA are equal, as also CBD and CDB ; and the perpendiculars BK, CL , bisect the bases AC, BD . Also $\angle DBC=\angle BAC+\angle BCA=2\angle BAC$, and $\angle DCM=\angle CAD+\angle CDA=\angle CAD+\angle CBD=\angle CAD+2\angle CAD=3\angle CAD$. Let CM , the cosine of $\angle DCM$ to the radius m , be called c ; then, from the similar triangles

$ABK, ACL, AB:AK::AC:AL$, or $m:x::2x:\frac{2x^2}{m}=AL$,

and $AL-AB=\frac{2x^2}{m}-m=BL$; hence AD , or $AL+BL=$

$\frac{4x^2}{m}-m$; again, $AB:AK::AD:AM$, or $m:x::\frac{4x^2}{m}-m:$

4N

$\frac{4x^3}{m^2}$

$\frac{4x^3}{m^2} - x = AM$, and $AM - AC = CM = \frac{4x^3}{m^2} - 3x = c$, therefore $4x^3 - 3m^2x = m^2c$, or $4x^3 - 3m^2x - m^2c = 0$.

Let the equation $4x^3 - 3m^2x - m^2c = 0$, or $x^3 - \frac{3m^2}{4}x - \frac{m^2c}{4} = 0$, be made to coincide with the equation $x^3 - qx + r = 0$; that is, let $\frac{3m^2}{4} = q$, and $\frac{m^2c}{4} = -r$, or $m = \sqrt{\frac{4q}{3}}$, and $c = -\frac{3r}{q}$; then, from a table of cofines, find the angle whose

cofine is $-\frac{3r}{q}$, to the radius $\sqrt{\frac{4q}{3}}$, and the cofine of one third of this angle, to the same radius, is one value of x .

COR. 1. If A be the arc whose cofine is c , and P the whole circumference, c is also the cofine of $A + P$, or $A + 2P$; therefore, the cofines of $\frac{A+P}{3}$, and $\frac{A+2P}{3}$, are also values of x .

COR. 2. Since the radius is greater than the cofine, $\sqrt{\frac{4q}{3}}$ is greater than $-\frac{3r}{q}$, or $\frac{4q}{3}$ is greater than $\frac{9r^2}{q^2}$, that is, $\frac{q^2}{27}$ is greater than $\frac{r^2}{4}$; therefore this solution can only be applied when the roots of the cubic are possible.

General Properties of Curve Lines.

A curve is said to be of n dimensions when the equation belonging to it rises to n dimensions.

Let $y^n - ax + b \cdot y^{n-1} + cx^2 + dx + e \cdot y^{n-2} - \&c. \dots + gx^n + hx^{n-1} + lx^{n-2} + \&c. = 0$, a general equation of n dimensions, expresses the relation between the abscissa and ordinate of a curve, then for every different value of x , there are n values of y ; therefore the ordinate will cut the curve in n , or in $n-2, n-4, \&c.$ points, according as the equation has n , or $n-2, n-4, \&c.$ possible roots.

COR. 1. Hence, if the equation be of an odd number of dimensions, the curve will have, at least, one infinite arc; for whatever be the value of x , there is at least one possible value of y corresponding to it.

COR. 2. $ax + b$ is the sum of the ordinates, $cx^2 + dx + e$ the sum of the products of any two, $\&c.$ and $gx^n + hx^{n-1} + lx^{n-2} + \&c.$ is the product of all the ordinates.

If two parallel lines, MM', NN' , be drawn in a curve, and cut by AQ , in such a manner that in each case, the sum of the ordinates on one side of AQ is equal to the sum of the ordinates on the other; all lines drawn in the curve, parallel to these, will be cut by AQ in the same manner.

Let $y^n - ax + b \cdot y^{n-1} + cx^2 + dx + e \cdot y^{n-2} - \&c. = 0$, be the equation to the curve, reckoning the abscissa from A ; also, let $AP = q$, $AQ = r$; then the equation in the two cases be-

comes $y^n - aq + b \cdot y^{n-1} + \&c. = 0$, and $y^n - ar + b \cdot y^{n-1} + \&c. = 0$; and since, in each case, the sum of the positive ordinates is equal to the sum of the negative, $aq + b = 0$, and $ar + b = 0$, and by subtraction $a \times r - q = 0$, or $a = 0$, hence $b = 0$; therefore whatever be the value of x , $ax + b = 0$, or the sum of the ordinates on one side of AQ is equal to the sum of the ordinates on the other. The line AQ is called a *diameter* of the curve.

If the abscissa APE , and ordinate NPQ cut a curve in as many points as it has dimensions, the rectangle under the

segments of the abscissa, $PB \times PC \times PD \times PE$, will be to the rectangle under the ordinates, $PM \times PN \times PO \times PQ$, in an invariable ratio. Let $y^n - ax + b \cdot y^{n-1} + \&c. \dots + gx^n + hx^{n-1} + lx^{n-2} + \&c. = 0$ be the equation to the curve; then $gx^n + hx^{n-1} + lx^{n-2} + \&c. = PM \times PN \times PO \times PQ$; also the values of x , when $y = 0$, are AB, AC, AD, AE , that is, the roots of the equation $gx^n + hx^{n-1} + lx^{n-2} + \&c. = 0$, or $x^n + \frac{hx^{n-1}}{g} + \frac{lx^{n-2}}{g} + \&c. = 0$, are AB, AC, AD, AE , and consequently the quantity $x^n + \frac{hx^{n-1}}{g} + \frac{lx^{n-2}}{g} + \&c. = AP - AB \times AP - AC \times AP - AD \times AP - AE = PB \times PC \times PD \times PE$; and $gx^n + hx^{n-1} + lx^{n-2} + \&c. = g \times PB \times PC \times PD \times PE = PM \times PN \times PO \times PQ$; therefore, $PB \times PC \times PD \times PE : PM \times PN \times PO \times PQ :: 1 : g$.

COR. If $n=2$ the curve is a conic section; and, if the abscissa be a diameter, or the ordinates on each side of it, PM, PO , equal to each other, the rectangle under the segments of the abscissa is to the square of the ordinate in an invariable ratio.

If there be n right lines, $BM', CM', DM', \&c.$ and $PM,$

PM', PM'' , be ordinates to the abscissa AP , the relation between the abscissa and ordinates will be expressed by an equation of the form

of the form $y^n - Ax + B \cdot y^{n-1} + Cx^2 + Dx + E \cdot y^{n-2} - \&c. = 0$.

For if $AP = x$, then $PM = ax + b$, $PM' = cx + d$,

$PM'' = ex + f$, $\&c.$ where a, b, c, d, e, f , are invariable; that is, the values of y are $ax + b, cx + d, ex + f, \&c.$ therefore $y^n - a + c + e \dots \times x + b + d + f \dots \times y^{n-1} + \&c. = 0$, and if $A = a + c + e \dots$, $B = b + d + f \dots$, $\&c.$ $y^n - Ax + B \cdot y^{n-1} + \&c. = 0$.

If a curve have as many asymptotes as it has dimensions, and a line be drawn which cuts them all, the parts of the line measured from the asymptotes to the curve will together be equal to the parts measured, in the same direction, from the curve to the asymptotes.

Let $y^n - ax + b \cdot y^{n-1} + \&c. = 0$ be the equation to the curve, and $y^n - Ax + B \cdot y^{n-1} + \&c. = 0$ the equation to the asymptotes; when x is infinite, the former equation becomes $y^n - axy^{n-1} + \&c. = 0$, and the latter $y^n - Axy^{n-1} + \&c. = 0$, and these equations coincide; therefore $A = a$; also $ax + b$ is the sum of the ordinates to the curve, and $Ax + B$, or $ax + B$, is the sum of the ordinates to the asymptotes, in all cases; hence the difference of these, $b - B$, is an invariable quantity, whatever be the value of x ; and at an infinite distance this difference is nothing; therefore it is always nothing, or $b = B$; consequently, $ax + b = Ax + B$; that is, the sum of the ordinates to the curve is equal to the sum of the ordinates to the asymptotes.

Let

Let $QONM$ be the curve, AP the abscissa, PQ an ordinate, meeting the curve in the points M, N, O, Q , and the

asymptotes in a, b, c, d , then $PM+PN+PO+PQ=Pa+Pb+Pc+Pd$, and by transposition $PM-Pa+PO-Pc=Pb-PN+Pd-PQ$, or $aM+cO=Nb+Qd$.

COR. In the common hyperbola MCN whose centre is O , and asymptotes Oa, Ob , if any line $aMNb$ be drawn

cutting the curve in M, N , and the asymptotes in a, b , then aM is equal to Nb .

If a straight line DCM be made to revolve about C , and cut the curve MMM' in as many points as it has dimensions; and, if $\frac{1}{CD}$ be always taken equal to $\frac{1}{CM} + \frac{1}{CM'} - \frac{1}{CM''} - \&c.$ the locus of the point D will be a straight line EDF .

Let ABP be an abscissa, and from M and D draw MP and DB at right angles to ABP , and let $y^n = ax + b \cdot y^{n-1} + \dots + px^{n-1} + qx^{n-2} + \&c. y + Px^n + Qx^{n-1} + \&c. = 0$ be the equation which represents the relation of AP to

PM . Also, let $AC=z, CM=v, CB=w, BD=u; S. \angle MCP = s, S. \angle CMP = c$, to radius 1. Then $1:s::v:sv=y$; and $1:c::v:cv=CP$, hence $x=AP=z+cv$. If these values of x and y be substituted in the equation to the curve, the relation of AC to CM will be known; and the coefficient of the last term but one of the transformed equation, divided by the last term, will be the sum of the

reciprocals of its roots, or $\frac{1}{CM} + \frac{1}{CM'} - \frac{1}{CM''} - \&c.$

Now, since $x=z+cv$,

$$x^n = z^n + nz^{n-1}cv + n \cdot \frac{n-1}{2} z^{n-2}c^2v^2 + \&c.$$

$$x^{n-1} = z^{n-1} + n-1 \cdot z^{n-2}cv + n-1 \cdot \frac{n-2}{2} z^{n-3}c^2v^2 + \&c.$$

$$x^{n-2} = z^{n-2} + n-2 \cdot z^{n-3}cv + n-2 \cdot \frac{n-3}{2} z^{n-4}c^2v^2 + \&c.$$

&c. &c.

and, substituting these values for x and its powers, and sv for y , in the terms of the original equation, we have the two last terms of the transformed equation, $pz^{n-1} + qz^{n-2} + \&c. \times sv + nPz^{n-1} + n-1 \cdot Qz^{n-2} + \&c. \times cv$, and $Pz^n + Qz^{n-1} + \&c.$ all the other terms involving the square or some higher power of v ; hence

$$\frac{s \times pz^{n-1} + qz^{n-2} + \&c. + c \times nPz^{n-1} + n-1 \cdot Qz^{n-2} + \&c.}{Pz^n + Qz^{n-1} + \&c.}$$

$$= \frac{1}{CM} + \frac{1}{CM'} - \frac{1}{CM''} - \&c. = \frac{1}{CD} = \frac{1}{\sqrt{w^2 + u^2}}, \text{ and}$$

$$\frac{s \times pz^{n-1} + qz^{n-2} + \&c. + c \times nPz^{n-1} + n-1 \cdot Qz^{n-2} + \&c.}{\sqrt{w^2 + u^2} \times Pz^n + Qz^{n-1} + \&c.}$$

Also, from the similar triangles MCP, BCD ,

$$\sqrt{w^2 + u^2} : u :: 1 : s = \frac{u}{\sqrt{w^2 + u^2}}$$

$$\sqrt{w^2 + u^2} : w :: 1 : c = \frac{w}{\sqrt{w^2 + u^2}};$$

$$\text{Therefore } \frac{u}{\sqrt{w^2 + u^2}} \times \frac{pz^{n-1} + qz^{n-2} + \&c. + \frac{w}{\sqrt{w^2 + u^2}}}{\sqrt{w^2 + u^2}}$$

$$\times nPz^{n-1} + n-1 \cdot Qz^{n-2} + \&c. = \frac{1}{\sqrt{w^2 + u^2}} \times$$

$$\frac{Pz^n + Qz^{n-1} + \&c. \text{ or } u \times pz^{n-1} + qz^{n-2} + \&c. + w \times}{n-1 \cdot Qz^{n-2} + \&c. = Pz^n + Qz^{n-1} + \&c. \text{ and,}}$$

since the point C is fixed, AC or z is invariable; therefore the relation between w and u , or CB and BD , is expressed by a simple equation, and the locus of the point D is a straight line.

In the general equation $y^n = a + bx \cdot y^{n-1} + \&c. = 0$, if x be so assumed that two roots are impossible, two values of the ordinate belonging to this abscissa are impossible, that is, there are no lines which represent them. Hence it is evident, that in deducing the properties of the ordinates from the equation to the curve, we must suppose all the roots of this equation possible; because, though the sums, powers, products, &c. of such impossible quantities may become possible, and their relations, discovered by an algebraical process, may be expressed by possible quantities, yet the reasoning does not extend to curves, in which the original quantities cannot be represented.

On the subject of Algebraical Curves the reader may consult Dr. Waring's *Proprietates Algebraicarum Curvarum*.

ALGEBRA'IC, or **ALGEBRA'ICAL**, *adj.* [from *algebra*.] Relating to algebra; as, An *algebraical* treatise. Containing operations of algebra; as, An *algebraical* computation.

ALGEBRA'IST, *f.* A person that understands or practices the science of algebra.

ALGEDO, *f.* the running of a gonorrhœa stopping suddenly after it appears. When it thus stops, a pain reaches to the anus, or to the testicles, without their being swelled; and sometimes this pain reaches to the bladder; in which case there is an urging to discharge the urine, which is with difficulty passed, and in very small quantities at a time. The pain is continued to the bladder by the urethra; to the anus, by the acceleratory muscles of the penis; and to the testicles, by the vasa deferentia and vesiculæ feminales. In this case, calomel repeated so as to purge brings back the running, and then all difficulty from this symptom ceases.

AL'GEMA, *f.* [*αλγημα*, Gr.] A pain, a sad troublesome sensation, impressed upon the brain from a smart vexatious irritation of the nerves.

AL'GENEB, *f.* a fixed star, of the second magnitude, in Perseus's right side. Its longitude is $27^{\circ} 46' 12''$ of Taurus, and its latitude $30^{\circ} 05' 28''$ north, according to Flamsteed's catalogue.

ALGEZIRA, a town of Andalusia, in Spain, with a port on the coast of the straits of Gibraltar. By this city the Moors entered Spain in 713; and it was taken from them in 1344, after a very long siege, remarkable for being the first in which cannon were made use of. It was called Old Gibraltar, and is about four leagues from the New. Lat. $36^{\circ} 0. N.$ lon. $5. 2. W.$

ALGHIER', or **ALGE'RI**, a town in Sardinia, with a bishop's see, upon the western coast of the island, between Safferi and Bofa. Though it is not large, it is well peopled, and has a commodious port. The coral fished for on this coast is in the highest esteem of any in the Mediterranean. Lat. $36. 0. N.$ lon. $4. 2. W.$

ALGIABARII, *f.* a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God. The Algiabarii stand opposed to the ALCADARII.

AL'GID, *adj.* [*algidus*, Lat.] Cold; chill.

ALGI'DITY, or **AL'GIDNESS**, *f.* Chilliness; cold.

ALGIFIC, *adj.* [from *algor*, Lat.] That which produces cold.

ALGI'ERS, a kingdom of Africa, now one of the states of Barbary. According to Dr. Shaw who resided twelve years at Algiers, in quality of chaplain to the British factory, and has corrected many errors of ancient and modern geographers respecting the states of Barbary, this country extends 480 miles along the coast of the Mediterranean, and is from forty to 100 miles in breadth.

It lies between lon. $0. 16.$ and $9. 16. W.$ and extends from lat. $36. 55.$ to $44. 50. N.$ It is bounded on the north by the Mediterranean; on the east by the river Zaine, the ancient Tufca, which divides it from Tunis; on the west by the Mulvya, and the mountains of Trava, which separate it from Morocco; and on the south by mount Atlas and the Numidian desert.

The climate of Algiers is in most places so mild, that they enjoy a constant verdure; the leaves of the trees being neither parched up by heat in summer nor nipped by the winter's cold. They begin to bud in February; in April the fruit appears in its full bigness, and is commonly ripe in May. The soil, however, is excessively various; some places being very hot, dry, and barren, on which account they are generally suffered to lie uncultivated by the inhabitants, who are very negligent. These barren places, especially such as lie on the southern side, and are at a great distance from the sea, harbour vast numbers of wild creatures, as, lions, tigers, buffaloes, wild boars, stags, porcupines, monkeys, ostriches, &c.

The Algerine kingdom made formerly a considerable part of the Mauritania Tingitana, which was reduced to

a Roman province by Julius Cæsar, and from him also called *Mauritania Cæsariensis*. In the general account of Africa it has been noticed, that the Romans were driven out of that continent by the Vandals; these by Belisarius, the Greek emperor Justinian's general; and the Greeks in their turn by the Saracens. This last revolution happened about the middle of the seventh century; and the Arabs continued masters of the country, divided into a great number of petty kingdoms or states, under chiefs of their own choosing, till the year 1031, when Abubekeren-Omar, or, as the Spanish authors call him, *Abu Texefien*, an Arab of the Zinhagian tribe, being provoked at the tyranny of those despots, gathered a most powerful army of malcontents, in the southern provinces of Numidia and Libya. His followers were nicknamed *Marabites*, or *Morabites*; by the Spaniards *Almoravides*; probably from their being assembled principally by the faints, who were also called Morabites. The khalif of Kayem's forces were at this time taken up with quelling other revolts in Syria, Mesopotamia, &c. and the Arabs in Spain engaged in the most bloody wars; so that Texefien, having nothing to fear from them, had all the success he could wish against the Arabian cheyks or petty tyrants, whom he defeated in many battles, and at last drove them not only out of Numidia and Libya, but out of all the western parts, reducing the whole province of Tingitania under his dominion.

Texefien was succeeded by his son Yusef, or Joseph, a brave and warlike prince. In the beginning of his reign, he laid the foundation of the city of Morocco, which he designed to make the capital of his empire. While that city was building, he sent some of his marabouts ambassadors to Tremecen (now a province of Algiers), at that time inhabited by a powerful and insolent sect of Mahometans called *Zeneti*. The design of this embassy was to bring them back to what he called the *true faith*; but the Zeneti, despising his offers, assembled at Amaf, or Amfa, their capital, murdered the ambassadors, and invaded Joseph's dominions with an army of 50,000 men.

The king hearing of their infamous proceedings, speedily mustered his army, and led it by long marches into their country, destroying all with fire and sword; while the Zeneti, instead of opposing his progress, retired as fast as possible towards Fez, in hopes of receiving assistance from thence; but the Fezzans marched out against them in a hostile manner; and coming up with the unhappy Zeneti, encumbered with their families and baggage, and ready to expire with hunger and fatigue, they cut them all to pieces, except a small number who were mostly drowned in attempting to swim across a river, and some others who in their flight perished by falling from the adjacent rocks. In the mean time Joseph reduced their country to a mere desert: which was, however, soon peopled by a numerous colony of Fezzans, who settled there under the protection of the reigning kings. In this war it is computed that near a million of the Zeneti, men, women, and children, lost their lives.

The restless and ambitious temper of Joseph did not let him remain long at peace. He quickly declared war against the Fezzans, reduced them to become his tributaries, and extended his conquests all along the Mediterranean. He next attacked some Arabian cheyks who had not yet submitted to his jurisdiction; and pursued them with such fury, that neither the Libyan deserts, nor ridges of the most craggy rocks, could shelter them from his arms. He attacked them in such of their retreats, castles, and fortresses, as were till then deemed impregnable; and at last subdued them, to the great grief of the other African nations, who were greatly annoyed by the ravages committed by his numerous forces.

Thus was founded the empire of the Morabites; which, however, was of no long duration; that race being in the 12th century driven out by Mohavedin, a marabout. This race of priests was expelled by Abdulac, governor of Fez; and he, in the 13th century, stripped of his new conquests

by the Sharifs of Hafeen, the descendants of those Arabian princes whom Abu-Texefien had formerly expelled.

The better to secure their new dominions, the Sharifs divided them into several little kingdoms or provinces; and among the rest the present kingdom of Algiers was divided into four, namely, *Tremecen*, *Tenez*, *Algiers Proper*, and *Bujeya*. The four first monarchs laid so good a foundation for a lasting balance of power between their little kingdoms, that they continued for some centuries in mutual peace and amity; but at length the king of Tremecen having ventured to violate some of their articles, Abul-Farez, king of Tenez, declared war against him, and obliged him to become his tributary. This king dying soon after, and having divided his kingdom among his three sons, new discords arose; which the king of Spain taking advantage of, a powerful fleet and army were sent against Barbary, under the count of Navarre, in 1505. This commander soon made himself master of the important cities of Oran, Bujeyah, and some others; which so alarmed the Algerines, that they put themselves under the protection of Selim Eutemi, a noble and warlike Arabian prince. He came to their assistance with a great number of his bravest subjects, bringing with him his wife Saphira, and a son then about twelve years old. This, however, was not sufficient to prevent the Spaniards from landing a number of forces near Algiers that same year, and obliging that metropolis to become tributary to Spain. Nor could Selim prevent them from building a strong fort on a small island opposite to the city, which terrified their corsairs from sailing in or out of the harbour. To this galling yoke the Algerines were obliged to submit till the year 1516; when, hearing of the death of Ferdinand king of Spain, they sent an embassy to the famous corsair Barbarossa, who, with his brother, was invited thither to defend them from the Spanish yoke, for which they agreed to pay a gratuity answerable to so great a service. These two brothers, named Horuc and Hayradin, were the sons of a porter in the isle of Lesbos. The elder obtained the additional name of Barbarossa, from the red colour of his beard; and it afterwards became the common surname of both. The strong bent of their natural disposition led them, when youths, to associate with pirates, among whom they became distinguished by their undaunted courage and spirit of enterprise. After acting with these free-booters for some time, their superior talents raised them to the command of a vessel, with which they proved so successful, that Horuc Barbarossa became the admiral of a considerable fleet of corsairs, and his brother Hayradin bore the second command. With this force they enriched themselves and their followers with the spoils, which they procured on the Mediterranean Sea, and in the Levant.

On Barbarossa's approach to Algiers, he was met by prince Eutemi, attended by all the people of that metropolis, who looked for deliverance from this free-booter, whom they accounted invincible. He was conducted into the city amidst the acclamations of the people; and lodged in one of the noblest apartments of Eutemi's palace, where he was treated with the greatest marks of distinction. Elated beyond measure with this kind reception, Barbarossa formed a design of becoming king of Algiers: and fearing some opposition from the inhabitants, on account of the excesses he suffered his soldiers to commit, murdered Eutemi, and caused himself to be proclaimed king; his Turks and Moors crying out as he rode along the streets, "Long live King Horuc Barbarossa, the invincible king of Algiers, the *chosen of God* to deliver the people from the oppression of the Christians; and destruction to all that shall oppose, or refuse to own him as their lawful sovereign." These last threatening words so intimidated the inhabitants, already apprehensive of a general massacre, that he was immediately acknowledged king. The unhappy princess Saphira, it is said, poisoned herself, to avoid ravishment by this new king, whom she unsuccessfully endeavoured to stab with a dagger.

Barbarossa was no sooner seated on the throne, than he treated his subjects with such cruelty, that they used to shut up their houses and hide themselves when he appeared in public. In consequence of this, a plot was soon formed against him; but, being discovered, he caused twenty of the principal conspirators to be beheaded, their bodies to be buried in a dunghill, and laid a heavy fine on those who survived. This so terrified the Algerines, that they never afterwards durst attempt any thing against either Barbarossa or his successors.

In the mean time, the son of Eutemi having fled to Oran, and put himself under the protection of the marquis of Gomarez, laid before that nobleman a plan for putting the city of Algiers into the hands of the king of Spain. Upon this, young Selim Eutemi was sent to Spain to lay his plan before cardinal Ximenes; who, having approved of it, sent a fleet with 10,000 land forces, under the command of Don Francisco, or, as others call him, *Don Diego de Vera*, to drive out the Turks, and restore the young prince. But the fleet was no sooner come within sight of land, than it was dispersed by a storm, and the greatest part of the ships dashed against the rocks. Most of the Spaniards were drowned; and the few who escaped to shore were either killed by the Turks or made slaves.

Though Barbarossa had nothing to boast on this occasion, his pride and insolence were now swelled to such a degree, that he imagined himself invincible, and that the very elements conspired to make him so. The Arabians were so much alarmed at his success, that they implored the assistance of Hamidel Abdes, king of Tenez, to drive the Turks out of Algiers. That prince readily undertook to do what was in his power for this purpose, provided they agreed to settle the kingdom on himself and his descendants. This proposal being accepted, he immediately set out at the head of 10,000 Moors; and, upon his entering the Algerine dominions, was joined by all the Arabians in the country. Barbarossa engaged him only with 1000 Turkish musqueteers and 500 Granada Moors; totally defeated his numerous army; pursued him to the very gates of his capital, which he easily made himself master of; and, having given it up to be plundered by his Turks, obliged the inhabitants to acknowledge him as their sovereign. This victory, however, was chiefly owing to the advantage which his troops had from their fire-arms; the enemy having no other weapons than arrows and javelins.

No sooner was Barbarossa become master of the kingdom of Tenez, than he received an embassy from the inhabitants of Tremecen; inviting him to come to their assistance against their then reigning prince, with whom they were dissatisfied on account of his having dethroned his nephew, and forced him to fly to Oran; offering him even the sovereignty in case he accepted of their proposal. The king of Tremecen, not suspecting the treachery of his subjects, met the tyrant with an army of 6000 horse and 3000 foot: but Barbarossa's artillery gave him such an advantage, that the king was at length forced to retire to his capital; which he had no sooner entered, than his head was cut off by his own people, and sent to Barbarossa, with a fresh invitation to come and take possession of the kingdom. On his approach, he was met by the inhabitants, whom he received with great complaisance, and many fair promises; but, beginning to tyrannize as usual, his new subjects soon convinced him that they were not so passive as the inhabitants of Algiers. Apprehending, therefore, that his reign might prove uneasy and precarious, he entered into an alliance with the king of Fez; after which, he took care to secure the rest of the cities in his new kingdom, by garrisoning them with his own troops. Some of these, however, revolted soon after; upon which he sent one of his corsairs, named *Efcander*, a man no less cruel than himself, to reduce them. The Tremecenians now began to repent of having invited such a tyrant to their assistance; and held consultations

on the most proper means of driving them away, and bringing back their lawful prince Abuchen Men; but, their cabals being discovered, a great number of the conspirators were massacred in the most cruel manner. The prince had the good luck to escape to Oran, and was taken under the protection of the Marquis of Gomarez, who sent immediate advice of it to Charles V. then lately arrived in Spain, with a powerful fleet and army. That monarch immediately ordered the young king a succour of 10,000 men, under the command of the governor of Oran; who, under the guidance of Abuchen Men, began his march towards Tremecen; and in their way they were joined by prince Selim, with a great number of Arabs and Moors. The first thing they resolved upon was, to attack the important fortrefs of Calau, situated between Tremecen and Algiers, and commanded by the corsair Escander at the head of about 300 Turks. They invested it closely on all sides, in hopes Barbarossa would come out of Tremecen to its relief, which would give the Tremeceni-ans an opportunity of keeping him out. The tyrant, however, kept close in his capital, being embarrassed by his fears of a revolt, and the politic delays of the king of Fez, who had not sent the auxiliaries he promised. The garrison of Calau, in the mean time, made a brave defence; and, in a sally they made at night, cut off near 300 Spaniards. This encouraged them to venture a second time; but they were now repulsed with great loss, and Escander himself wounded; soon after which they surrendered; but were all massacred by the Arabians, except sixteen, who clung close to the stirrups of the king, and of the Spanish general.

Barbarossa being now informed that Abuchen Men, with his Arabs, accompanied by the Spaniards, were in full march to lay siege to Tremecen, thought proper to march out, at the head of 1500 Turks and 5000 Moorish horse, in order to break his way through the enemy; but he had not proceeded far from the city, before his council advised him to return and fortify himself in it. This advice was now too late; the inhabitants having resolved to keep him out, and open their gates to their own lawful prince as soon as he appeared. In this distress Barbarossa saw no way left but to retire to the citadel, and there defend himself till he could find an opportunity of stealing out with his men and all his treasure. Here he defended himself vigorously; but, his provisions failing him, he took advantage of a subterraneous way, which he had caused to be digged for that purpose, and, taking his immense treasure with him, stole away as secretly as he could. His flight, however, was soon discovered; and he was so closely pursued, that to amuse, as he hoped, the enemy, he caused a great deal of his money, plate, jewels, &c. to be scattered along the road, thinking they would not fail to stop their pursuit to gather it up. This stratagem, however, failed, through the vigilance of the Spanish commander, who, being himself at the head of the pursuers, obliged them to march on, till he was come up close to him on the banks of the Huexda, about eight leagues from Tremecen. Barbarossa had just crossed the river with his vanguard, when the Spaniards came up with his rear on the other side, and cut them all off; and then, crossing the water, overtook him at a small distance from it. Here a bloody engagement ensued, in which the Turks fought like lions; but, being overpowered by numbers, they were all cut to pieces, and Barbarossa slain, in the forty-fourth year of his age, and four years after he had raised himself to the royal title of *Jigel*; two years after he had acquired the sovereignty of Algiers, and scarce a twelvemonth after the reduction of Tremecen. His head was carried to Tremecen on the point of a spear; and Abuchen Men proclaimed king, to the joy of all the inhabitants.

The news of Barbarossa's death spread the utmost consternation among the Turks at Algiers; however, they caused his brother Hayradin to be immediately proclaimed king. The Spanish commander now sent back the em-

peror's forces, without making any attempt upon Algiers; by which he lost the opportunity of driving the Turks out of that country; while Hayradin, justly dreading the consequences of the tyranny of his officers, sought the protection of the Grand Signior. This was readily granted, and himself appointed bashaw or viceroy of Algiers; by which means he received such considerable reinforcements, that the unhappy Algerines durst not make the least complaint: and such numbers of Turks resorted to him, that he was not only capable of keeping the Moors and Arabs in subjection at home, but of annoying the Christians at sea. His first step was to take the Spanish fort abovementioned, which was a great nuisance to his metropolis. The Spaniards held out to the last extremity; but, being all slain or wounded, Hayradin easily became master of the place.

Hayradin now set about building a strong mole for the safety of his ships. In this he employed 30,000 Christian slaves, whom he obliged to work without intermission for three years; in which time the work was completed. He then caused the fort he had taken from the Spaniards to be repaired, and placed a strong garrison in it, to prevent foreign vessels from entering the harbour without giving an account of themselves. By these two important works, Hayradin soon became dreaded not only by the Arabs and Moors, but also by the maritime Christian powers, especially the Spaniards. The viceroy failed not to acquaint the Grand Signior with his success, and obtained from him a fresh supply of money, by which he was enabled to build a stronger fort, and to erect batteries on all places likely to be invaded by an enemy.

In the mean time the Sultan raised Hayradin to the dignity of bashaw of the empire, and appointed Hassan Aga, a Sardinian renegado, an intrepid warrior, and an experienced officer, to succeed him as bashaw of Algiers. Hassan had no sooner taken possession of his new government, than he began to pursue his ravages on the Spanish coast with greater fury than ever, extending them to the ecclesiastical state, and other parts of Italy. But pope Paul III. being alarmed at this, exhorted the emperor Charles V. to send a powerful fleet to suppress those frequent and cruel piracies; and, that nothing might be wanting to render the enterprise successful, a bull was published by his holiness, wherein a plenary absolution of sins, and the crown of martyrdom, was promised to all those who either fell in battle or were made slaves; the emperor on his part needed no spur; and therefore set sail with a powerful fleet, consisting of one hundred and twenty ships and twenty galleys, having on-board 30,000 chosen troops, an immense quantity of money, arms, ammunition, &c. In this expedition several young nobility and gentry attended as volunteers, and among these many knights of Malta so remarkable for their valour against the enemies of Christianity. Even ladies of birth and character attended Charles in his expedition, and the wives and daughters of the officers and soldiers followed them with a design to settle in Barbary after the conquest was finished.

By this prodigious armament, the Algerines were thrown into the utmost consternation. The whole garrison consisted of 800 Turks and 6000 Moors, without fire-arms, and poorly disciplined and accoutred; the rest of their forces being dispersed in the other provinces of the kingdom, to levy the usual tribute on the Arabs and Moors. The Spaniards landed without opposition, and immediately built a fort, under the cannon of which they encamped, and diverted the course of a spring which supplied the city with water. Being thus reduced to the utmost distress, Hassan received a summons to surrender at discretion, on pain of being put to the sword with all the garrison. The herald was ordered to extol the vast power of the emperor both by sea and land, and to exhort him to return to the Christian religion. But to this Hassan only replied, that he must be a madman who would pretend to advise an enemy, and that the advised must still act more madly who would

would take counsel of such an adviser. He was, however, on the point of surrendering the city, when advice was brought him that the forces belonging to the western government were in full march towards the place; upon which it was resolved to defend it to the utmost. Charles, in the mean time, resolving upon a general assault, kept a constant firing upon the town; which, from the weak defence made by the garrison, he looked upon as already in his hands. But while the *douwan*, or Algerine senate, were deliberating on the most proper means of obtaining an honourable capitulation, a mad prophet, attended by a multitude of people, entered the assembly, and foretold the speedy destruction of the Spaniards before the end of the moon, exhorting the inhabitants to hold out till that time. This prediction was soon accomplished in a very surprising and unexpected manner: for, on the 28th of October, 1541, a dreadful storm of wind, rain, and hail, arose from the north, accompanied with violent shocks of earthquakes, and a dismal and universal darkness both by sea and land; so that the sun, moon, and elements, seemed to combine together for the destruction of the Spaniards. In that one night, some say in less than half an hour, eighty-six ships and fifteen galleys were destroyed, with all their crews and military stores; by which the army on shore was deprived of all means of subsisting in these parts. Their camp also, which spread itself along the plain under the fort, was laid quite under water by the torrents which descended from the neighbouring hills. Many of the troops, by trying to remove into some better situation, were cut in pieces by the Moors and Arabs; while several galleys, and other vessels, endeavouring to gain some neighbouring creeks along the coasts, were immediately plundered, and their crews massacred by the inhabitants.

The next morning Charles beheld the sea covered with the fragments of so many ships, and the bodies of men, horses, and cattle, swimming on the waves; at which he was so disheartened, that, abandoning his tents, artillery, and all his heavy baggage, to the enemy, he marched at the head of his army, though in no small disorder, towards cape Malabux, in order to reembark in those few vessels which had outweathered the storm. But Hassan, who had caused his motions to be watched, allowed him just time to get to the shore, when he sallied out and attacked the Spaniards in the midst of their hurry and confusion to get into their ships, killing great numbers, and bringing away a still greater number of captives; after which he returned in triumph to Algiers, where he celebrated with great rejoicings his happy deliverance from such distress and danger.

The unhappy Spaniards had scarce reached their ships, when they were attacked by a fresh storm, in which several more of them perished; one ship in particular, containing 700 soldiers, besides sailors, sunk in the emperor's sight, without a possibility of saving a single man. At length, with much labour, they reached the port of Bujayah, at that time possessed by the Spaniards. Here the emperor dismissed the few remains of the Maltese knights and their forces, who embarked in three shattered galleys, and with much difficulty and danger reached their own country. Charles himself staid no longer than till the 16th of November, when he set sail for Carthage, and reached it on the 25th of the same month, severely instructed in the vanity of human greatness. In this unfortunate expedition upwards of 120 ships and galleys were lost, 300 colonels and other land and sea officers, 8000 soldiers and marines, besides those destroyed by the enemy on the reembarkation, or drowned in the last storm. The number of prisoners was so great, that the Algerines sold some of them, by way of contempt, for an onion per head.

Hassan, elated with this victory, undertook an expedition against the king of Tremecen, who, being now deprived of the assistance of the Spaniards, was forced to procure a peace by paying a vast sum of money, and becoming tributary to him. The bashaw returned to Algiers, laden

with riches; and soon after died of a fever, in the sixty-sixth year of his age.

From this time the Spaniards were never able to annoy the Algerines in any considerable degree. In 1555, they lost the city of Bujayah, which was taken by Salha Rais, Hassan's successor; who next year set out on a new expedition, which he kept a secret, but was suspected to be intended against Oran: but he was scarcely got four leagues from Algiers, when the plague, which at that time raged violently in the city, broke out in his groin, and carried him off in twenty-four hours.

Immediately after his death the Algerine soldiery chose a Corsican renegade, Hassan Corfo, in his room, till they should receive farther orders from the Porte. He did not accept of the bashawship without a good deal of difficulty; but immediately prosecuted the intended expedition against Oran, dispatching a messenger to acquaint the Porte with what had happened. They had hardly begun their hostilities against the place, when orders came from the Porte, expressly forbidding Hassan Corfo to begin the siege, or, if he had begun it, enjoining him to raise it immediately. This news was received with great grief by the whole fleet and army, as they thought themselves sure of success, the garrison being at that time very weak. Nevertheless, as they dared not disobey, the siege was immediately raised.

Corfo had hardly enjoyed his dignity four months, before news came, that eight galleys were bringing a new bashaw to succeed him; one Tekelli, a principal Turk of the Grand Signior's court: upon which the Algerines unanimously resolved not to admit him. By the treachery of the Levantine soldiers, however, he was admitted at last, and the unfortunate Corfo thrown over a wall in which a number of iron hooks were fixed; one of which catching the ribs of his right side, he hung three days in the most exquisite torture before he expired.

Tekelli was no sooner entered upon his new government, than he behaved with such cruelty and rapaciousness, that he was assassinated under the very dome of a saint, by Yusuf Calabres, the favourite renegade of Hassan Corfo; who for this service was unanimously chosen bashaw, but died of the plague six days after his election.

Yusef was succeeded by Hassan the son of Hayradin, who had been formerly recalled from his bashawship, when he was succeeded by Selha Rais; and now had the good fortune to get himself reinstated in his employment. Immediately on his arrival, he engaged in a war with the Arabs, by whom he was defeated with great loss. The next year, the Spaniards undertook an expedition against Mostagan, under the command of the count d'Alcandela; but they were utterly defeated, the commander himself killed, and 12,000 taken prisoners. This disaster was owing to the inconsiderate rashness, or rather madness, of the commander; which was so great, that, after finding it impossible to rally his scattered forces, he rushed, sword in hand, into the thickest of the enemy's ranks, at the head of a small number of men, crying out, "St. Jago! St. Jago! the victory is ours, the enemy is defeated;" soon after which he was thrown from his horse, and trampled to death.

The next enterprise in which Hassan engaged, was the siege of Marfalquiver, situated near the city Oran, which he designed to invest immediately after. The army employed in this siege consisted of 26,000 foot and 10,000 horse, besides which he had a fleet consisting of thirty-two galleys and galliots, together with three French vessels laden with biscuit, oil, and other provisions. The city was defended by Don Martin de Cordova, brother of the count d'Alcandela, who had been taken prisoner in the battle where that nobleman was killed, but had obtained his liberty from the Algerines with immense sums, and now made a most gallant defence against the Turks. The city was attacked with the utmost fury by sea and land, so that several breaches were made in the walls. The Turkish standards were several times planted on the walls,

walls, and as often dislodged; but the place must have in the end submitted, had not Hassan been obliged to raise the siege in haste, on the news that the famed Genoese admiral Doria was approaching with considerable succours from Italy. The fleet accordingly arrived soon after; but, missing the Algerine galleys, bore away for Pennon de Valez, where they were shamefully-repulsed by a handful of Turks who garrisoned that place; which, however, was taken the following year.

In 1567, Hassan was again recalled to Constantinople, where he died three years after. He was succeeded by Mahomet, who gained the love of the Algerines by several public-spirited actions. He incorporated the Janisaries and Levantine Turks together, and by that means put an end to their dissensions, which laid the foundation of the Algerine independency on the Porte. He likewise added some considerable fortifications to the city and castle, which he designed to render impregnable. But, while he was thus studying the interest of Algiers, one Gascon, a bold Spanish adventurer, formed a design of surprising the whole piratic navy in the bay, and setting them on fire in the night-time, when they lay defenceless, and in their first sleep. For this he had not only the permission of Philip II. but was furnished by him with proper vessels, mariners, and fire-works, for the execution of his plot. With these he set sail for Algiers in the most proper season, viz. the beginning of October, when most, if not all, the ships lay at anchor there; and easily sailed near enough, unsuspected, to view their manner of riding, in order to catch them napping, at a time when the greater part of their crew were dispersed in their quarters. He came accordingly, unperceived by any, to the very mole-gate, and dispersed his men with their fire-works; but, to their great surprise, they found them so ill mixed, that they could not with all their art make them take fire. In the mean time, Gascon took it into his head, by way of bravado, to go to the mole-gate, and give three loud knocks with the pommel of his dagger, and to leave it fixed in the gate by its point, that the Algerines might have cause to remember him. This he had the good fortune to do without meeting with any disturbance or opposition; but it was not so with his men; for no sooner did they find their endeavours unsuccessful, than they made such a bustle as quickly alarmed the guard posted on the adjacent bastion, from which the uproar quickly spread itself through the whole garrison. Gascon, now finding himself in the utmost danger, sailed away with all possible haste: but he was pursued, overtaken, and brought back a prisoner to Mahomet; who no sooner got him into his power, than he immediately caused a gibbet of considerable height to be erected on the spot where Gascon had landed, ordering him to be hoisted up, and hung by the feet to a hook, that he might die in exquisite torture; and, to shew his resentment and contempt of the king his master, he ordered his commission to be tied to his toes. He had not, however, hung long in that state, when the captain who took him, accompanied by a number of other corsairs, interceded so strongly in his behalf, that he was taken down and put under the care of some Christian surgeons; but two days after, some Moors reporting that it was the common talk and belief in Spain, that the Algerines durst not hurt a hair of Gascon's head, the unfortunate Spaniard was hoisted up by a pulley to the top of the execution-wall, and let down again upon the hook, which in his fall caught him by the belly, and gave him such a wound that he expired without a groan. Thus ended the expedition of John Gascon, which has procured him a place among the Spanish martyrs; while, on the other hand, the Algerines look upon his disappointment to have been miraculous, and owing to the efficacious protection of the powerful saint, whose prayers had before raised such a terrible storm against the Spanish fleet.

Mahomet, being soon after recalled, was succeeded by the famous renegade Ochali, who reduced the kingdom of Tunis; which, however, remained subject to the vice-

roy of Algiers only till the year 1586, when a bashaw of Tunis was appointed by the Porte.

The kingdom of Algiers continued to be governed, till the beginning of the seventeenth century, by viceroys or bashaws appointed by the Porte; concerning whom we find nothing very remarkable, farther than that their avarice and tyranny was intolerable both to the Algerines and the Turks themselves. At last the Turkish Janisaries and militia becoming powerful enough to suppress the tyrannical sway of these bashaws, and the people being almost exhausted by the heavy taxes laid upon them, the former resolved to depose these petty tyrants, and set up some officers of their own at the head of the realm. The better to succeed in this attempt, the militia sent a deputation to the Porte, to complain of the avarice and oppression of these bashaws, who sunk both the revenue of the state, and the money remitted to it from Constantinople, into their own coffers, which should have been employed in keeping up and paying the soldiery. They represented how much more honourable it would be for the Grand Signior to permit them to choose their own dey or governor from among themselves, whose interest it would then be to see that the revenue of the kingdom was rightly applied in keeping up its forces complete, and in supplying all other exigencies of the state, without any farther charge or trouble to the Porte than that of allowing them its protection. On their part, they engaged always to acknowledge the Grand Signiors as their sovereigns, and to pay them their usual allegiance and tribute, to respect their bashaws, and even to lodge and maintain them and their retinue, in a manner suitable to their dignity, at their own charge. The bashaws, however, were, for the future, to be excluded from assisting at any but general douwans, unless invited to it; and from having the liberty of voting in them, unless when their advice was asked, or the interest of the Porte was likely to suffer by their silence. All other concerns, which related to the government of Algiers, were to be wholly left under the direction of the dey and his douwan. These proposals having been accepted by the Porte, the deputies returned highly satisfied; and, having notified their new privileges, the great douwan immediately proceeded to the election of a dey from among themselves. They compiled a new set of laws, and made several regulations for the better support and maintenance of this new form of government, to the observation of which they obliged all their subjects to swear; and the militia, navy, commerce, &c. were all settled pretty nearly on the footing upon which they now stand; though the subsequent altercations that frequently happened between the bashaws and deys, the one endeavouring to recover their former power, and the other to curtail it, caused such frequent complaints and discontents at the Ottoman court, as made them frequently repent their compliance.

In the year 1601, the Spaniards, under the command of Doria the Genoese admiral, made another attempt upon Algiers, in which they were more fortunate than usual, their fleet being only driven back by contrary winds, so that they came off without loss. In 1609, the Moors, being expelled from Spain, flocked in great numbers to Algiers; and, as many of them were very able sailors, they undoubtedly contributed to make the Algerine fleet so formidable. In 1616, their fleet consisted of forty sail of ships between 300 and 400 tons, their admiral 500 tons. It was divided into two squadrons, one of eighteen sail, before the port of Malaga; and the other at the Cape of Santa Maria, between Lisbon and Seville; both of which fell upon all Christian ships with whom they pretended to be in friendship, as well as upon the Spaniards and Portuguese, with whom they were at war.

The Algerines were thus become very formidable to the European powers. The Spaniards, who were most in danger, and least able to cope with them, solicited the assistance of England, the pope, and other states. The French, however, were the first to shew their resentment

of the perfidious behaviour of these miscreants; and, in 1617, M. Beaulieu was sent against them with a fleet of fifty men of war, who defeated their fleet, took two of their vessels, while their admiral sunk his own ship and crew, rather than fall into his enemies' hands.

In 1623, the Algerines and other states of Barbary threw off their dependence on the Porte altogether, and set up for themselves. What gave occasion to this was the twenty-five years truce which sultan Amurath IV. was obliged to make with the emperor Ferdinand II. to prevent his being overmatched by carrying on a war against him and the sophi of Persia at the same time. As this put a stop to the piratical trade of the Algerines, they proceeded on a new plan, and resolved, that whoever desired to be at peace with them, must, distinctly and separately, apply to their government. No sooner was this resolution taken, than the Algerines began to make prizes of several merchants ships belonging to powers at peace with the Porte. Nay, having seized a Dutch ship and polacre at Scanderoon, they ventured on shore; and, finding the town abandoned by the Turkish aga and inhabitants, they plundered all the magazines and warehouses, and set them on fire.—About this time Louis XIII. undertook to build a fort on their coasts, instead of one formerly built by the Marsilians, and which they had demolished. This, after some difficulty, he accomplished; and it was called the *Bastion of France*; but the situation being afterwards found inconvenient, the French purchased the port of La Calle, and obtained liberty to trade with the Arabians and Moors. The Ottoman court, in the mean time, was so much embarrassed with the Persian war, that there was no leisure to check the Algerine piracies. This gave an opportunity to the vizir and other courtiers to compound matters with the Algerines, and to get a share of their prizes, which were very considerable. However, for form's sake, a severe reprimand, accompanied with threats, was sent them; to which they replied, that “these depredations deserved to be indulged to them, seeing they were the only bulwark against the Christian powers, especially against the Spaniards, the sworn enemies of the Moslem name;” adding, that “if they should pay a punctilious regard to all that could purchase peace, or liberty to trade with the Ottoman empire, they should have nothing to do but set fire to all their shipping, and turn camel-drivers for a livelihood.”

The Algerines, therefore, prosecuted their piracies with impunity, to the terror and disgrace of the Europeans, till the year 1652; when, a French fleet being accidentally driven to Algiers, the admiral took it into his head to demand a release of all the captives of his nation, without exception. This being refused, the Frenchman without ceremony carried off the Turkish viceroy, and his cadî or judge, who were just arrived from the Porte, with all their equipage and retinue. The Algerines, by way of reprisal, surprised the Bastion of France above-mentioned, and carried off the inhabitants to the number of 600, with all their effects; which so provoked the admiral, that he sent them word he would pay them another visit the next year with his whole fleet.

The Algerines, undismayed by these threats, fitted out a fleet of sixteen galleys and galliots, excellently manned and equipped, under the command of admiral Hali Pinchinin. The chief design of this armament was against the treasure of Loretto; which, however, they were prevented by contrary winds from obtaining. Upon this they made a descent on Puglia in the kingdom of Naples; where they ravaged the whole territory of Necotra, carrying off a vast number of captives, and among them some nuns. From thence steering towards Dalmatia, they secured the Adriatic; and, loading themselves with immense plunder, left those coasts in the utmost consternation and resentment.

At last the Venetians, alarmed at such terrible depredations, equipped a fleet of twenty-eight sail, under the command of admiral Capello, with express orders to burn, sink, or take, all the Barbary corsairs he met with, either

on the open seas, or even in the Grand Signior's harbours, pursuant to a late treaty of peace with the Porte. On the other hand, the captain-bashaw, who had been sent out with the Turkish fleet to chase the Florentine and Maltese cruisers out of the Archipelago, understanding that the Algerine squadron was so near, sent express orders to the admiral to come to his assistance. Pinchinin readily agreed; but, having first resolved on a descent upon the island of Lissa, or Lisina, belonging to the Venetians, he was overtaken by Capello, from whom he retired to Valona, a sea-port belonging to the Grand Signior, whither the Venetian admiral pursued him; but, the Turkish governor refusing to eject the pirates according to the articles of the peace between the Ottoman court and Venice, Capello was obliged to content himself with watching them for some time. Pinchinin was soon weary of restraint, and ventured out; when an engagement immediately ensued, in which the Algerines were defeated, and five of their vessels disabled; with the loss of 1500 men, Turks and Christian slaves, besides 1600 galley-slaves who regained their liberty. Pinchinin, after this defeat, returned to Valona, where he was again watched by Capello; but the latter had not lain long at his old anchorage before he received a letter from the senate, desiring him to make no farther attempt on the pirates at that time, for fear of a rupture with the Porte. This was followed by a letter from the governor of Valona, desiring him to take care lest he incurred the sultan's displeasure by such insults. The brave Venetian was forced to comply; but, resolving to take such a leave of the Algerines as should be remembered by them, he observed how they had reared their tents, and drawn their booty and equipage along the shore. He then kept firing among their tents, while some well-manned galliots and brigantines were ordered among their shipping, who attacked them with such bravery, that, without any great loss, they towed out their sixteen galleys, with all their cannon, stores, &c. In this last engagement, a ball from one of the Venetian galleys happening to hit a Turkish mosque, the whole action was considered as an insult upon the Grand Signior. To conceal this, Capello was ordered to sink all the Algerine ships he had taken, except the admiral; which was to be conducted to Venice, and laid up as a trophy. Capello came off with a severe reprimand; but the Venetians were obliged to buy, with 500,000 ducats, a peace from the Porte.

In the year 1681, Louis XIV. provoked by the grievous outrages committed by the Algerines on the coasts of Provence and Languedoc, ordered a considerable fleet to be fitted out against them, under the marquis Du Quesne, vice-admiral of France. His first expedition was against a number of Tripolitan corsairs; who had the good fortune to outrow him, and shelter themselves in the island of Scio, belonging to the Turks. This did not, however, prevent him from pursuing them thither, and making such a terrible fire upon them as quickly destroyed fourteen of their vessels, besides battering the walls of the castle. This severity seemed only to be designed as a check to the piracies of the Algerines; but, finding they still continued their outrages, he sailed to Algiers in August 1682, cannonading and bombarding it so furiously, that the whole town was in flames in a very little time. The great mosque was battered down, and most of the houses laid in ruins; inasmuch that the inhabitants were on the point of abandoning the place; when on a sudden the wind turned about, and obliged Du Quesne to return to Toulon. The Algerines immediately made reprisals, by sending a number of galleys and galliots to the coast of Provence, where they committed the most dreadful ravages, and brought away a vast number of captives: upon which a new armament was ordered to be got ready at Toulon and Marseilles against the next year; and the Algerines, having received timely notice, put themselves into as good a state of defence as possible.

In May 1683, Du Quesne with his squadron cast anchor before Algiers; where being joined by the marquis D'Af-
fraville,

franville, at the head of five stout vessels, upwards of 100 bombs were thrown into the town the first day, which did terrible execution; while the besieged made some hundred discharges of their cannon against them without doing any considerable damage. The following night the bombs were again thrown into the town in such numbers, that the dey's palace and other great edifices were almost destroyed; some of their batteries were dismounted, and several vessels sunk in the port. The dey and Turkish bashaw, as well as the whole soldiery, alarmed at this dreadful havoc, immediately sued for peace. As a preliminary, the immediate surrender was insisted on of all Christian captives who had been taken fighting under the French flag; which being granted, 142 of them were immediately delivered up, with a promise of sending him the remainder as soon as they could be got from the different parts of the country. Accordingly Du Quesne sent his commissary-general and one of his engineers into the town; but with express orders to insist upon the delivery of all the French captives without exception, together with the effects they had taken from the French; and that Mezomorto their then admiral, and Hali Rais one of their captains, should be given as hostages.

This last demand having embarrassed the dey, he assembled the douwan, and acquainted them with it: when Mezomorto, in a violent rage, told the assembly, that the cowardice of those who sat at the helm had occasioned the ruin of Algiers; but that, for his part, he would never consent to deliver up any thing that had been taken from the French. He immediately acquainted the soldiery with what had passed; which so exasperated them, that they murdered the dey, and chose Mezomorto in his place. This was no sooner done, than he cancelled all the articles of peace which had been made, and hostilities were renewed with greater fury than ever.

The French admiral now kept pouring in such volleys of bombs, that in less than three days the greatest part of the city was reduced to ashes; and the fire burnt with such vehemence, that the sea was enlightened with it for more than two leagues round. Mezomorto, unmoved at all these disasters, and the vast number of the slain, whose blood ran in rivulets along the streets; or rather, grown furious and desperate, sought only how to wreak his revenge on the enemy; and, not content with causing all the French in the city to be cruelly murdered, ordered their consul to be tied hand and foot, and fastened alive to the mouth of a mortar, from whence he was shot away against their navy. By this piece of inhumanity Du Quesne was so exasperated, that he did not leave Algiers till he had utterly destroyed all their fortifications, shipping, almost all the lower part, and above two-thirds of the upper part, of the city, by which means it became little else than a heap of ruins.

The Algerines have also at different periods received several hostile visits from the English. About the year 1620 Sir Robert Mansel was sent out from England with six men of war and twelve stout ships hired from the merchants. He arrived at Algiers, but neither negotiation nor force procured any substantial redress. Two other fleets were afterwards sent against them, one under lord Willoughby, the other under lord Denbigh, both of which did so little, that very few of our historians take any notice of them. The renowned Blake, in the year 1655, being in the Mediterranean, proceeded to Algiers, to demand satisfaction for the piracies committed on the English, and the release of all captives belonging to his nation. The dey expressed the most friendly disposition, and promised every redress in his power. It is not to be supposed, however, that the natural perfidy of these pirates would long suffer them to abide by any treaty; for, notwithstanding these promises, they lost no opportunity of making prizes of English ships, whenever they could conveniently come at them; so that, in the year 1661, the earl of Sandwich was sent to Algiers to menace the dey for his infraction of the treaty which he had entered into with

Blake. Not being able to obtain any concessions, he made an ineffectual attempt to set fire to the ships in the harbour; but, leaving Sir John Lawton with a strong squadron to cruise off the port, so many of their ships were taken, that they were at last compelled to enter again into a treaty; which, however, like the former one, was not long observed. In the year 1669, a squadron commanded by Sir Thomas Allen, in conjunction with one from the states of Holland commanded by Van Ghent, sunk and destroyed many ships belonging to these pirates, and rescued a considerable number of Christian slaves. The next year Sir Edw. Spragge was sent with a larger force on the same service, when he so effectually annoyed their shipping, that a peace was concluded to the satisfaction of the English, which they observed better than the former ones. In the year 1749, the Prince Frederic packet-boat, bound from Lisbon to Falmouth, was taken by four Algerine cruisers, carried into Algiers, and plundered of effects to the amount of 25,000 pounds; and after being detained twenty-three days was suffered to depart. This outrage occasioned commodore Keppel (late lord Keppel) to be sent out with seven ships of war. He took on-board certain presents for the dey, the forwarding of which had been neglected, and which that prince having been long accustomed to receive, laid claim to by prescription. Mr. Keppel arrived there in August, and had an audience of the dey, but could not obtain a restitution of the property.

In 1775, the king of Spain caused another formidable armament to be prepared, in order to chastise the Algerines for the depredations which their corsairs still committed on his subjects. The fleet destined for this expedition was fitted out at the ports of Carthagena, Cadiz, and Barcelona; at the former of which the whole force assembled, and thence, after being detained a month by contrary winds, sailed against Algiers, arriving in the bay the latter end of June. The fleet consisted of seven ships of the line of 74 guns each, eight ships of 40 guns, thirty-two frigates from 20 to 36 guns, and about twenty smaller armed vessels of different constructions, with 400 transports, having 19,000 seamen and marines: on-board the transports were 22,000 foot, and 4,000 horse, consisting of the best troops in Spain, an artillery of 400 pieces of cannon, with 2,000 men to work the guns. This large fleet and army were provided with vast quantities of stores and provisions. The marine was under the command of Don Pedro Castegon, and the land forces under count O'Reilly, a native of Ireland, who had been long in the service of Spain, and enjoyed the particular favour of the sovereign. Such a force seemed to menace the reduction of all the piratical states of Barbary. Eight days elapsed before the troops were landed, and the attack was then made in a desultory and injudicious manner; no regular design or plan of operations appeared to have been settled between the general and admiral, but great dissension and animosity prevailed. The deeply-rooted antipathy which subsists between the Spaniards and Moors caused each to be eager for action; but the first attack was made upon very unequal terms: whilst the Spaniards advanced thro' a close country, exposed to the full effect of the enemy's fire, the Moors lay protected behind trees and enclosures, from which no efforts could dislodge them. This destructive conflict was maintained for thirteen hours: at length the Spaniards became dispirited, and a precipitate retreat ensued. Great number of wounded were left on the field of battle to satiate the vengeance of their barbarous enemies, who put all to death without mercy that fell into their hands. As soon as it was dark, the Spanish army re-embarked in such confusion, that, had they been opposed by a skilful enemy, very few would have regained the ships, and the most entire defeat would have ensued: but the unskilfulness of the Algerines in military operations prevented them from improving the opportunity. The disgrace and loss which had befallen the Spanish arms in this attack, had effectually cooled their military ardour; and

and all thoughts of any farther attempts to retrieve the honour of the nation, and effectuate the purposes of the expedition, were laid aside. In four days after, a great part of the fleet, with all the land-forces, sailed back to Spain. The misconduct and disgrace attending this expedition was generally imputed to the count O'Reilly; and the loss sustained in it, as given by authority, amounted to twenty-seven officers killed, 191 wounded; 501 men killed, 2088 wounded; but private computations estimated the loss at about 5000.

In the year 1784 another expedition was set on foot, by the court of Madrid, against this state; the chief command of which was entrusted to admiral Don Antonio Barcelo. Eight successive attacks were made, with great spirit and bravery, on the forts which defend the entrance of the harbour; but they were repelled with equal intrepidity by the Algerines. Some parts of the city were set on fire, but the injuries which the Spanish fleet sustained were much greater than the annoyance which it gave the enemy; and the attempt to destroy Algiers was in the result given up as impracticable.

The dey is now absolute monarch; and pays no other revenue to the Porte than that of a certain number of fine boys or youths, and some other presents which are sent thither yearly. His own income probably rises and falls according to the opportunities that occur of fleecing both natives and foreigners; whence it is variously computed by different authors. Dr. Shaw computes the taxes of the whole kingdom to bring into the treasury no more than 300,000 dollars; but supposes that the eighth part of the prizes, the effects of those persons who die without children, joined to the yearly contributions raised by the government, presents from foreigners, fines, and oppressions, may bring in about as much more. Both the dey and officers under him enrich themselves by the same laudable methods of rapine and fraud; which it is no wonder to find the common people practising upon one another, and especially upon strangers, seeing they themselves are impoverished by heavy taxes, and the injustice of those who are in authority.

It has been already observed, that the first deys were elected by the militia, who were then called the *douwan* or common-council. This elective body was at first composed of 800 militia-officers, without whose consent the dey could do nothing; and upon some urgent occasions all the officers residing in Algiers, amounting to above 1500, were summoned to assist. But, since the deys have become more powerful, the *douwan* is principally composed of thirty *chiahs*-beshaws or colonels, with now and then the mufti and *cadi* upon some emergencies; and, on the election of a dey, the whole soldiery are allowed to come and give their votes. All the regulations of state ought to be determined by that assembly, before they pass into a law, or the dey hath not power to put them in execution: but, for many years back, the *douwan* is of so little account, that it is only convened out of formality, and to give assent to what the dey and his chief favourites have concerted beforehand.

In this country it is not to be expected that justice will be administered with any degree of impartiality. The Mahometan soldiery, in particular, are so much favoured, that they are seldom put to death for any crime except rebellion; in which case they are either strangled with a bow-string or hanged to an iron hook. In smaller offences, they are fined, or their pay stopped; and, if officers, they are reduced to the station of common soldiers, from whence they may gradually raise themselves to their former dignity. Women guilty of adultery, have a halter tied about their necks, with the other end fastened to a pole, by which they are held under water till they are suffocated. The bastinado is likewise inflicted for small offences; and is given either upon the belly, back, or soles of the feet, according to the pleasure of the *cadi*; who also appoints the number of strokes. These sometimes amount to 200 or 300; according to the indulgence the offender can ob-

tain either by bribery or friends; and hence he often dies under this punishment for want of money or advocates. But the most terrible punishments are those inflicted upon Jews or Christians who speak against Mahomet or his religion; in which case, they must either turn Mahometans or be impaled alive. If they afterwards apostatize, they are burned or roasted alive, or else thrown down from the top of the city walls, upon iron hooks, where they are caught by different parts of their body, according as they happen to fall, and expire in the greatest torments. This terrible punishment, however, begins to be disused.

The officer next in power to the dey is the *aga* of the janizaries, who is one of the oldest officers in the army. Next to the *aga* in dignity is the secretary of state, who registers all the public acts; and after him are the thirty *chiahs* or colonels, who sit next to the *aga* in the *douwan*, and in the same gallery with him. Out of this class are generally chosen those who go ambassadors to foreign courts, or who disperse the dey's orders throughout the realm. Next to them are 800 *bolluck*-beshaws, or eldest captains, who are promoted to that of *chiahs*-beshaws according to their seniority. The *oldack*-beshaws or lieutenants are next; who amount to 400, and are regularly raised to the rank of captains in their turn, and to other employments in the state, according to their abilities.

Other military officers of note are the *vekelards* or purveyors of the army; the *peys*, who are the four oldest soldiers, and consequently the nearest to preferment; the *foulacs*, who are next in seniority to them, and are part of the dey's body-guard, always marching before him when he takes the field, and distinguished by their carbines and gilt scymitars, with a brass gun on their caps; the *kayts* or Turkish soldiers, each band of whom have the government of one or more *adawars* or itinerant villages, and collect their taxes for the dey; and the *fagiards* or Turkish lancemen, an hundred of whom always attend the army, and watch over the water appointed for it. To these we may add the *beys*, or governors of the three great provinces of the realm. All the above-mentioned officers ought to compose the great *douwan* or council above-mentioned; but only the thirty *chiahs*-beshaws have a right to sit in the gallery next after the dey. The rest are obliged to stand on the floor of the hall or council-chamber, with their arms across, and as much as possible without motion; neither are they permitted to enter with their swords on, for fear of a tumult. As for those who have any matters to transact with the *douwan*, they must stand without, let the weather be ever so bad; and there they are commonly presented with coffee by some of the inferior officers, till they are dismissed.

The kingdom of Algiers is at present divided into three provinces or districts, viz. the eastern, western, and southern. The eastern or Levantine government, which is by far the most considerable, and is also called *Beylick*, contains the towns of Bona, Constantina, Gigeri, Bujeyah, Steffa, Tebef, Zamoura, Biscara, and Necanz, in all which the Turks have their garrisons; besides which, it includes the two ancient kingdoms of Cuco and Labez, though independent of the Algerine government, to whose forces their country is inaccessible; so that they still live under their own cheyks, chosen by each of their *adawars* or hords. The western government hath the towns of Oran, Tremecen, Mostagan, Tenez, and Secrelly, with its castle and garrison. The southern government hath neither town, village, nor even a house, the inhabitants leading a wandering life, and living in tents.

The most considerable rivers of Algiers are the Zha or Zis, which runs across the province of Tremecen and the desert of Anguid, falling into the Mediterranean near the town of Tabecrita, where it has the name of *Sirat*. 2. The Haregol, supposed the *Sign* of Ptolemy, comes down from mount Atlas, crosses the desert of Anguid, and falls into the sea about five leagues from Oran. 3. The Mina, supposed the *Chylematis* of Ptolemy, a large river, which runs through the plains of Bathala, and falls into the sea near

near the town of Arzew. This river hath lately received the name of *Cena*, who rebuilt the town of Bathalaw after it had been destroyed. 4. The Shelliff, or Zilif, descending from mount Guanexeris, runs through some great deserts, the lake Titteri, the frontiers of Tremecen and Tenez, falling into the sea a little above the city of Mostagan. 5. The Celef, supposed to be the *Carthana* of the ancients, falls into the sea about three leagues west of Algiers, after a short course of eighteen or twenty leagues. 6. The Hued-alquiver, supposed to be the *Nalabata*, or *Nasaba* of the ancients, and called by the Europeans *Zingani*, runs down with a swift course through the high mountains of Cuco, and falls into the sea near Bujeyah. 7. Suf-Gemar, or Suf-Gimmar al Rumniel, supposed to be the *Ampfaga* of Ptolemy, hath its source on mount Aurus; thence runs through the fruitful plains of Constantina, where its stream is greatly increased; and, running northward, it falls into the sea a little east of Gigeri. 8. The Ladag, or Ludeg, runs down from mount Atlas through part of Constantina, and falls into the sea a little eastward of Bona. 9. Guadi, or Guadel Barbel, springs from the head of Orbus, or Urbs, in Tripoli, runs through Bujeyah, and falls into the sea near Tabarea.

The inhabitants along the coasts are a mixture of different nations; but chiefly Moors and Morefcos driven out of Catalonia, Arragon, and other parts of Spain. Here are also great numbers of Turks, who come from the Levant to seek their fortune; as well as multitudes of Jews and Christians taken at sea, who are brought hither to be sold for slaves. The Berebers are some of the most ancient inhabitants of the country; and are supposed to be descended from the ancient Sabeans, who came hither from Arabia Felix under the conduct of one of their princes. Others believe them to be some of the Canaanites driven out of Palestine by Joshua. These are dispersed all over Barbary, and divided into a multitude of tribes under their respective chiefs: most of them inhabit the mountainous parts; some range from place to place, and live in tents, or portable huts; others in scattered villages: they have, nevertheless, kept themselves for the most part from intermixing with other nations. The Berebers are reckoned the richest of all, go better clothed, and carry on a much larger traffic of cattle, hides, wax, honey, iron, and other commodities. They have also some artificers in iron, and some manufacturers in the weaving branch. The name of *Berber* is supposed to have been originally given them on account of their being first settled in some desert place. Upon their increasing in process of time, they divided themselves into five tribes, probably on account of religious differences, called the *Zinhagians*, *Musamedins*, *Zeneti*, *Hoares*, and *Gomeres*; and these, having produced 600 families, subdivided themselves into a great number of petty tribes. To these we may add the *Zuowahs*, by European authors called *Azuagues*, or *Affagues*, who are likewise dispersed over most parts of Barbary and Numidia. Great numbers of these inhabit the mountainous parts of Cuco, Labez, &c. leading a wandering pastoral life. But the most numerous inhabitants are the Moors and Arabians. The former are very stout and warlike, and skilful horsemen; but so addicted to robbing, that one cannot safely travel along the country at a distance from the towns without a guard, or at least a marabout or saint for a safeguard. For as they look upon themselves to be the original proprietors of the country, and not only as dispossessed by the rest of the inhabitants, but reduced by them to the lowest state of poverty, they make no scruple to plunder all they meet by way of reprisal. The inhabitants in general have a pretty fair complexion; they are robust and well proportioned. People of distinction wear their beard; they have rich clothes made of silk, embroidered with flowers of gold, and turbans enriched with jewels. The Turks, who compose the military force, have great privileges, pay no taxes, are never publicly punished, and rarely in private. The lowest foldier domineers over the most distinguished

Moors at pleasure. If he finds them better mounted than himself, he exchanges horses without ceremony. The Turks alone have the privilege of carrying fire-arms. Many good qualities, however, distinguish them in spite of this excess of despotism. They never game for money; nor even for trifles; and they never profane the name of the Deity. They soon forget their private quarrels; and, after the first paroxysm of resentment is over, it is infamy for a Turk to keep in remembrance the injuries he has received. In this respect certainly they are less barbarous than other nations that boast of their civilization.

The corsairs or pirates form each a small republic, of which the rais or captain is the supreme bashaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the vessel is decided in an arbitrary way. These corsairs are chiefly instrumental in importing whatever commodities are brought into the kingdom, either by way of merchandize or prizes. These consist chiefly of gold and silver stuffs, daniaks, cloths, spices, tin, iron, plated brass, lead, quicksilver, cordage, sail-cloth, bullets, cochineal, linen, tartar, alum, rice, sugar, soap, cotton raw and spun, copperas, aloes, brazil, logwood, vermilion, &c. Very few commodities, however, are exported from this part of the world: the oil, wax, hides, pulse, and corn, produced, being but barely sufficient to supply the country; though, before the loss of Oran, the merchants have been known to ship off from Barbary several thousand tons of corn. The consumption of oil, though in great abundance, is so considerable, that it is seldom permitted to be shipped off for Europe. The other exports consist chiefly in ostriches feathers, copper, rugs, silk fishes, embroidered handkerchiefs, dates, and Christian slaves. Some manufactures in silk, cotton, wool, leather, &c. are carried on in this country, but mostly by the Spaniards settled here, especially about the metropolis. Carpets are also a manufacture of the country; which, though much inferior to those of Turkey both in beauty and fineness, are preferred by the people to lie upon, on account of their being both cheaper and softer. There are also at Algiers looms for velvet, taffaties, and other wrought silks; and a coarse sort of linen is likewise made in most parts of the kingdom. The country furnishes no materials for ship-building: they have neither ropes, tar, sails, anchors, nor even iron. When they can procure enough of new wood to form the main timbers of a ship, they supply the rest from the materials of prizes which they go out to seize; and thus find the secret of producing new and swift-sailing vessels from the ruins of the old. Of all the states on the coast of Barbary, the Algerines are the strongest at sea, and furnish the greatest number of corsairs, and of course commit the greatest depredations on the seas.

The commerce of the American states hath lately suffered very considerably from the captures made by these corsairs, particularly those ships which visit the Mediterranean. They have in general vouchsafed to be at peace with the English and Dutch; but seem to have sworn eternal war against Spain, Italy, France, &c. whom they look upon to be the greatest enemies to the Mahometan name. "It is remarkable that these pirates," says the Abbé Raynal, "have in turn reduced the greatest powers of Europe to the disgrace of making them annual presents; which, under whatever name they are disguised, are in fact a tribute. They have sometimes, indeed, been punished and humbled, but their rapines have never been totally suppressed. To what people is reserved the glory of breaking those fetters which Africa is thus insensibly preparing for us, and of removing those terrors which are so formidable to navigation? No nation can attempt it alone; perhaps, if it did, the jealousy of the rest would throw secret obstacles in its way. This must therefore be the work of a general combination. All the maritime powers ought to concur in the execution of a design in which all are equally interested. These states, which every thing invites to mutual alliance, good-will, and defence,

fence, ought to be weary of the calamities which they reciprocally bring upon each other. After having so frequently formed leagues for their mutual destruction, let them at length take up arms for their general security: war would then, for once at least, become beneficial and just; and one may venture to assert that such a war would be of no long continuance, if it were conducted with skill and unanimity. Perhaps this most noble and the greatest of enterprises would cost Europe less blood and treasure than the most trivial of those quarrels with which it is continually agitated. The jealousy of the great maritime powers, who have constantly rejected all expedients for securing the navigation of Europe from the depredations of freebooters, hath been the chief cause of its continuance. The hope of checking the industry of every weak state, hath accustomed them to wish, that these piracies should continue, and hath even induced them to abet the plunderers. This is an enormity, the ignominy of which they would never have incurred if their discernment had been equal to their rapacity. All Christendom would certainly profit by this happy change, but the greatest advantages must infallibly accrue to the maritime states, in proportion to their power. Their situation, the safety of their navigation, the greatness of their capitals, and various other advantages which they possess, would secure them such superiority. However, if the reduction and subjection of these states would not become a source of happiness to those people as well as to ourselves; if we must keep up and perpetuate slavery and poverty amongst them; if fanaticism can still renew those detestable cruades, which philosophy, too late, has consigned to the indignation of all ages; if Africa must at length become the scene of our cruelties, as Asia and America have been, and still are, may the project which humanity hath dictated be buried in perpetual oblivion! It is indifferent whether they be Christians or Mussulmans who suffer: man is the only object worthy to interest man." *Hist. Pol. liv. xi.*

ALGIERS, the capital of the above kingdom, is probably the ancient *Icosium*: by the Arabians called *Algezair*, or rather *Al-Jezier*, or *Al-Jezerah*, i. e. *the island*, because there was an island before the city, to which it hath been since joined by a mole. It is built on the declivity of a hill by the sea-side, in the form of an amphitheatre. The tops of the houses are quite flat and white; and one house rises above another in such a manner, that they do not hinder each other's prospect. The streets are so narrow, that they will scarcely admit three persons to walk abreast, and the middle part is lower than the sides. When any loaded beasts, such as camels, horses, mules, or asses, pass along, you are forced to stand up close to the wall to let them pass by. There is but one broad street, which runs through the city from east to west, in which are the shops of the principal merchants, and the market for corn and other commodities. The lower part of the walls of the city are of hewn stone, and the upper part of brick; they are thirty feet high on the land side, and forty towards the sea; the fosses or ditches are twenty feet broad and seven deep. There is no sweet water in the city; and, though there is a tank or cistern in every house, yet they often want water, because it rains but seldom: the chief supply is from a spring on a hill, the water of which is conveyed by pipes to above a hundred fountains, at which a bowl is fastened for the use of passengers. The common reservoir is at the end of the mole, where the ships take in their water. Every one takes his turn at these places, except the Turks, who are first, and the Jews last. There are five gates, which are open from sun-rising till sun-setting; and seven forts or castles without the walls, the greatest of which is on the mole without the gate, all of which are well supplied with cannon. There are 107 mosques, three colleges or public schools, and a great number of petty ones for children. The houses, of which there are about 15,000, are square, and built of stone and brick, with a square court in the middle, and galleries all round. There are said to be about 120,000 inhabitants

VOL. I. No. 21.

in the city, comprehending 5000 Jewish families, besides Christians. There are four fundics or public inns, such as are in Turkey; and, six cazernes or barracks, for the unmarried Turkish soldiers, which will hold 600 each. There are no inns for Christians to lodge at; but only a few tipping huts kept by slaves, for the accommodation of Greeks and the poorer sort of travellers, where any thing may be had for money. Here are bagnios or public baths, in the same manner as in Turkey, at a very moderate rate. The women have baths of their own, where the men dare not come. Without the city there are a great number of sepulchres, as also cells or chapels, dedicated to marabouts or reputed saints, which the women go to visit every Friday. The Turkish soldiers are great tyrants; for, they not only turn others out of the way in the streets, but will go to the farm-houses in the country for twenty days together, living on free quarters, and making use of every thing, not excepting the women. The Algerines eat, as in Turkey, sitting cross-legged round a table about four inches high, and use neither knives nor forks. Before they begin, every one says *Be isme Allah*, "In the name of God." When they have done, a slave pours water on all their hands as they sit, and then they wash their mouths. Their drink is water, sherbet, and coffee. Wine is not allowed, though drunk immoderately by some. The prospect of the country and sea from Algiers is very beautiful; but the city, though for several ages it has braved some of the greatest powers in Christendom, it is said, could make but a faint defence against a regular siege. The mole of the harbour is 500 paces in length, extending from the continent to a small island where there is a castle and large battery. Lat. 36. 40. N. lon. 3. 30. E.

AL'GOL, *f.* a fixed star of the third magnitude, called *Medusa's Head*, in the constellation Perseus; its longitude is $21^{\circ} 50' 42''$ of Taurus, and its latitude $23^{\circ} 23' 47''$ north; according to Flamsteed's catalogue.

ALGON'QUINS, a nation in North America, who formerly possessed great tracts of land along the north shore of the river St. Lawrence. For a long time they were in alliance with the Iroquois; but, in consequence of some disputes about the right of hunting, the Iroquois attacked the Algonquins with such diabolical fury, as shewed they could be satisfied with nothing less than the extermination of the whole race; which, had it not been for the interposition of the French, they would have accomplished. The few Algonquin nations that are now to be seen, seem entirely ignorant of agriculture, and subsist by fishing and hunting. They allow themselves a plurality of wives; notwithstanding which, they daily decrease in populousness, few or none of their nations containing above 6000 souls, and many of them not 2000. Their language is one of the three radical ones in North America, being understood from the river St. Lawrence to that of the Mississippi.

AL'GOR, *f.* [Lat.] with physicians, an unusual coldness in any part of the body. It is also used for extreme cold; chiliness.

ALGORAB, *f.* a fixed star of the third magnitude, in the right wing of the constellation Corvus.

AL'GORISM, or AL'GORITHM, *f.* [Arab.] is similar to LOGISTICS, signifying the art of computing in any particular way, or about some particular subject; or the common rules of computing in any art. As the *algorithm* of numbers, of algebra, of integers, of fractions, of surds, &c. meaning the common rules for performing the operations of arithmetic, or algebra, or fractions, &c.

ALGO'SE, *adj.* [from *algor*, Lat.] Extremely cold; chill.

ALGUAZIL, *f.* in the Spanish polity, an officer whose business it is to see the decrees of a judge executed.

ALHA'GI, *f.* in botany, the trivial name of a species of hedyarum. See HEDYSARUM.

ALHA'MA, a pleasant town of the kingdom of Granada, in Spain, situated in the midst of some craggy mountains,

tains, about twenty-five miles south-west of Granada, on the banks of the Rio Frio, in lat. 36. 59. N. lon. 1. 10. W. and is famous for its warm baths. It was taken from the Moors in 1481. The inhabitants, though surprised, and the town without a garrison, made a gallant defence: but, being at length forced to submit, the place was abandoned to the pillage of the Christian soldiers; who, not satisfied with an immense quantity of gold and jewels, made slaves of upwards of 3000 of the inhabitants.

ALHAMBRA, the ancient fortress and residence of the Moorish monarchs of Grenada. It derives its name from the red colour of the materials with which it was originally built, Alhambra signifying a red house. It appears to a traveller a huge heap of irregular buildings, all huddled together, seemingly without the least intention of forming one habitation. The walls are entirely unornamented, of gravel and pebbles, daubed over with plaster by a very coarse hand: yet this is the palace of the Moorish kings of Granada, indisputably the most curious place internally, that exists in Spain, perhaps in the world.

"On my first visit," says Mr. Swinburne, "I confess I was struck with amazement, as I stepped over the threshold, to find myself on a sudden transported into a species of fairy land. The first place you enter is the court called the *communa* or *del mesucar*, that is, the *common baths*; an oblong square, with a deep basin of clear water in the middle; two flights of marble steps leading down to the bottom; on each side a parterre of flowers, and a row of orange-trees. Round the court runs a peristyle paved with marble; the arches bear upon very light pillars, in proportions and style different from all the regular orders of architecture. The ceilings and walls are incrustated with fret-work in stucco, so minute and intricate, that the most patient draughtsman would find it difficult to follow it, unless he made himself master of the general plan. In every division are Arabic sentences of different lengths, most of them expressive of the following meanings: "There is no conqueror but God;" or, "Obedience and honour to our Lord Abouabdoulah." The ceilings are gilt or painted, and time has caused but little diminution in the freshness of their colours, though constantly exposed to the air. The lower part of the walls is mosaic, disposed in fantastic knots and festoons. The porches at the ends are more like grotto-work than any thing else to which they can be compared. That on the right hand opens into an octagon vault, and forms a perfect whispering gallery, meant to be a communication between the offices of the houses.

"Opposite to the door of the *communa* through which you enter, is another leading into the *quarto de los leones*, or, apartment of the lions; which is an oblong court, 100 feet in length and fifty in breadth, environed with a colonnade seven feet broad on the sides and ten at the end. Two porticos or cabinets about fifteen feet square, project into the court at the two extremities. The square is paved with coloured tiles; the colonnade with white marble. The walls are covered five feet up from the ground with blue and yellow tiles, disposed chequerwise. Above and below is a border of small escutcheons, enamelled blue and gold, with an Arabic motto on a bend, signifying, "No conqueror but God." The columns that support the roof and gallery are of white marble, very slender, and fantastically adorned. They are nine feet high, including base and capital, and eight inches and a half diameter. They are very irregularly placed; sometimes singly, at others in groups of three, but more frequently two together. The width of the horse-shoe arches above them is four feet two inches for the large ones, and three for the smaller. The ceiling of the portico is finished in a much finer and more complicated manner than that of the *communa*, and the stucco laid on the walls with inimitable delicacy; in the ceiling it is so artfully frosted and handled as to exceed belief. The capitals are of various designs, though each design is repeated several times

in the circumference of the court, but not the least attention has been paid to placing them regularly or opposite to each other. Not the smallest representation of animal life can be discovered amidst the varieties of foliage, grotesques, and strange ornaments. About each arch is a large square of arabesques, surrounded with a rim of characters, that are generally quotations from the Koran. Over the pillars is another square of delightful filligree work. Higher up is a wooden rim, or kind of cornice, as much enriched with carving as the stucco that covers the part underneath. Over this projects a roof of red tiles, the only thing that disfigures this beautiful square. This ugly covering is modern, put on by order of Mr. Wall, the late prime minister, who a few years ago gave the Alhambra a thorough repair. In Moorish times, the building was covered with large painted and glazed tiles, of which some few are still to be seen. In the centre of the court are twelve ill-made lions muzzled, their fore parts smooth, their hind parts rough, which bear upon their backs an enormous basin, out of which a lesser rises. While the pipes were kept in good order, a great volume of water was thrown up, that, falling down into the basins, passed through the basins, and issued out of their mouths into a large reservoir, where it communicated by channels with the jet d'eau in the apartments. This fountain is of white marble, embellished with many festoons and Arabic distichs, thus translated:

"Seest thou not how the water flows copiously like the Nile?"

"This resembles a sea washing over its shores, threatening shipwreck to the mariner."

"This water runs abundantly to give drink to the lions."

"Terrible as the lion is our king in the day of battle."

"The Nile gives glory to the king, and the lofty mountains proclaim it."

"This garden is fertile in delights: God takes care that no noxious animal shall approach it."

"The fair princess that walks in this garden, covered with pearls, augments its beauty so much, that thou may'st doubt whether it be a fountain that flows, or the tears of her admirers."

"Passing along the colonnade, and keeping on the south side, you come to a circular room used by the men as a place for drinking coffee and sorbets in. A fountain in the middle refreshed the apartment in summer. The form of this hall, the elegance of its cupola, the cheerful distribution of light from above, and the exquisite manner in which the stucco is designed, painted, and finished, exceed all powers of description. Every thing in it inspires the most pleasing, voluptuous, ideas; yet in this sweet retreat they pretend that Abouabdoulah assembled the Abencerrages, and caused their heads to be struck off into the fountain. Continuing your walk round, you are next brought to a couple of rooms at the head of the court, which are supposed to have been tribunals or audience-chambers.

"Opposite to the *Sala de los Abencerrages* is the entrance into the *Torre de las dos hermanas*, or the tower of the two sisters; so named from two very beautiful pieces of marble laid in the pavement. This gate exceeds all the rest in profusion of ornaments, and in beauty of prospect which it affords through a range of apartments, where a multitude of arches terminate in a large window open to the country. In a gleam of sunshine, the variety of tints and lights thrown upon this enfleade are uncommonly rich. The first hall is the concert-room, where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is equal to the finest existing, for the size of the slabs and evenness of the colour. The two sisters, which give name to the room, are slabs that measure fifteen feet by seven and a half, without flaw or stain. The walls, up to a certain height, are mosaic, and above are divided into very neat compartments of stucco, all of one design, which is also followed

lowed in many of the adjacent halls and galleries. The ceiling is a fretted cove. To preserve this vaulted roof, as well as some of the other principal cupolas, the outward walls of the towers are raised ten feet above the top of the dome, and support another roof over all, by which means no damage can ever be caused by wet weather or excessive heat and cold. From this hall you pass round the little myrtle-garden of Lindaraxa, into an additional building made to the east end by Charles V. The rooms are small and low. His dear motto, *Plus outré*, appears on every beam. This leads to a little tower, projecting from the line of the north wall, called *El tocador*, or the dressing-room of the sultana. It is a small square cabinet, in the middle of an open gallery, from which it receives light by a door and three windows. The look-out is charming. In one corner is a large marble slab, drilled full of holes, through which the smoke of perfumes ascended from furnaces below; and here, it is presumed, the Moorish queen was wont to sit to fumigate and sweeten her person. The emperor caused this pretty room to be painted with representations of his wars, and a great variety of grotesques, which appear to be copies, or at least imitations, of those in the loggie of the Vatican. From hence you go through a long passage to the hall of ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the mottoes of all the kings of Granada. This long narrow antichamber opens into the communica on the left hand, and on the right into the great audience-hall in the tower of Comares; a noble apartment, thirty-six feet square, thirty-six high up to the cornice, and eighteen from thence to the centre of the cupola. The walls on three sides are fifteen feet thick, on the other nine; the lower range of windows thirteen feet high. The whole wall is inlaid with mosaic of many colours, disposed in intricate knots, stars, and other figures. In every part various Arabic sentences are repeated.

"The most remarkable room below is the king's bed-chamber, which communicated, by means of a gallery, with the upper story. The beds were placed in two alcoves, upon a raised pavement of blue and white tiles; but as it was repaired by Philip V. who passed some time here, it cannot be said how it may have been in former times. A fountain played in the middle, to refresh the apartment in hot weather. Behind the alcoves are small doors, that conduct you to the royal baths. These consist of one small closet with marble cisterns for washing children, two rooms for grown-up persons, and vaults for boilers and furnaces that supplied the baths with water and the stoves with vapours. The troughs are formed of large slabs of white marble; the walls are beautified with party-coloured earthen-ware; light is admitted by holes in the coved-ceiling. Adjoining is a whispering gallery, and a kind of labyrinth, said to have been made for the diversion of the women and children. One of the passages of communication is fenced off with a strong iron grate, and called "the prison of the sultana;" but it seems more probable that it was put up to prevent any body from climbing into the women's apartments.

"Under the council-room is a long slip called "the king's study;" and adjoining to it are several vaults, said to be the place of burial of the royal family. In the year 1574, four sepulchres were opened; but, as they contained nothing but bones and ashes, were immediately closed again.

"This description of the Alhambra may be finished by observing how admirably every thing was planned and calculated for rendering this palace the most voluptuous of all retirements; what plentiful supplies of water were brought to refresh it in the hot months of summer; what a free circulation of air was contrived, by the judicious disposition of doors and windows; what shady gardens of aromatic trees; what noble views over the beautiful hills and fertile plains! No wonder the Moors regretted Granada; no wonder they still offer up prayers to God every Friday for the recovery of this city, which they esteem a terrestrial paradise." See GRANADA.

ALHA'ZEN, ALLA'ZEN, or ABDI'LAZUM, was a learned Arabian, who lived in Spain about the year 1100. He wrote upon Astrology; and his work upon Optics was printed, in Latin, at Basil, in 1572, under the title of *Optice Theaurus*, by Risner. Alhazen was the first who shewed the importance of refractions in astronomy, so little known to the ancients. He is also the first author who has treated on the twilight, in which he also speaks of the height of the clouds.

ALHEN'NA, *f.* in botany. See LAWSONIA.

ALI gives the denomination to a sect among the Mahometans, who adhere to the right of succession of Ali the fourth khalif or successor of Mahomet, and to the reform of Mussulmanism introduced by him. The sectaries of Ali are more particularly called *Schites*, and stand opposed to *Sunnites*, or sect of Omar, who adhere to the law as left by Mahomet, Abubeker, and Omar. Ali was cousin of Mahomet, and son-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great disputes arose about the succession. Many stood for Ali; but Abubeker was preferred, and elected the first khalif. Ali took his turn, after the death of Othman. The Persians are the chief adherents to the sect of Ali, whom they hold to have been the legitimate successor of Mahomet, and Abubeker an usurper. On the contrary, the Turks are of the sect of Omar; and hold Ali in execration, having raised a furious civil war among the Mussulmans. The distinguishing badge of the followers of Ali is a red turban, which is worn by the Persians, who are hence called in derision, by the Turks, *Kiflachi*, *q:d.* "red heads." Ali is reputed the author of several works, particularly a *Centiloquium*, in great esteem among the Arabs and Persians, part of which has been published in English by Mr. Ockley.

ALI (Hyder). See HYDER ALI.

ALI BEY was born in Natolia, in 1728, and received at his birth the name of Joseph. His father was a Greek priest, of a distinguished family, who educated him with great care. At thirteen years of age, Joseph being hunting in a neighbouring forest, he was fallen upon by robbers, and carried off to Grand Cairo: here he was sold to Ibrahim, a lieutenant of the janissaries, who had him circumcised, clothed him in the dress of the Mamalouks, and called him Ali: he gave him masters in the Turkish and Arabic languages, and in horsemanship; and, by kind treatment, made him satisfied with his new station. In a course of years, he succeeded in these languages, shewed wonderful dexterity in the use of arms, and became so dear to his master, that he raised him rapidly in his household, and created him a *cachev*, or governor, at the age of twenty-two. In this station, he manifested his equity and good administration of justice, improved the discipline of the Mamalouks, and laid the foundation of his future greatness. But, a false accusation having been made against him to the Grand Signior, he was proscribed, and his head was ordered to be sent to Constantinople. Being fortunately apprised of the design, he seized and put to death the messenger who brought the order, and was soon enabled to put himself at the head of an army. Taking advantage of the distressful and dangerous situation to which the Turkish empire was reduced, in consequence of the war with Russia, he boldly mounted the throne of the ancient sultans of Egypt. But, not content with the kingdom of Egypt, he also laid claim to Syria, Palestine, and that part of Arabia which had belonged to the ancient sultans. He marched at the head of his troops to support these pretensions, and actually subdued some of the neighbouring provinces both of Arabia and Syria. At the same time that he was engaged in these great enterprizes, he was not less attentive to the establishing of a regular form of government, and introducing order into a country that had been long the seat of anarchy and confusion. His views were equally extended to commerce; for which purpose he gave great encouragement to the Christian traders, and took off some shameful restraints and indignities

ties to which they were subjected in that barbarous country. He also wrote a letter to the republic of Venice, with the greatest assurances of his friendship, and that their merchants should meet with every degree of protection and safety. His great design was said to be, to make himself master of the Red Sea; to open the port of Suez to all nations, but particularly to the Europeans, and to render Egypt once more the great centre of commerce. The conduct and views of Ali Bey shewed an extent of thought and ability that indicated nothing of the barbarian, and bespoke a mind equal to the founding of an empire: but he was not finally successful. He was, however, for some time extremely fortunate; he assumed the titles and state of the ancient sultans of Egypt, and was ably supported by Sheick Daher, and some other Arabian princes, who warmly espoused his interests. He also succeeded in almost all his enterprises against the neighbouring Asiatic governors and bashaws, whom he repeatedly defeated; but he was afterwards deprived of the kingdom of Egypt by the base and ungrateful conduct of his brother-in-law, Mahomed Bey Aboudaah, his troops being totally defeated on the 7th of March, 1773, and himself wounded and taken prisoner. He died of his wounds, in the forty-fifth year of his age, and was buried at Grand Cairo.

ALJAMEIA, a name which the Moriscoes in Spain give to the language of the Spaniards. Among other articles agreed on by the junto, which was appointed by the emperor Charles V. in 1526, this was one, That the Moriscoes should no longer speak *Algavareia*, i. e. "Moorish or Arabic;" but should all speak *Aljameia*, i. e. "Spanish," as it was called by the Moors, and all their writings and contracts should be in that language.

A'LIAS, *adv.* A Latin word signifying *otherwise*.—In law, it is a second or further writ, after a former writ has been sued out without effect: "We command you as we formerly have commanded you," *sicut alias præcipimus*.

ALIAS DICTUS is used in the description of a defendant, where his true name is not certainly known.

A'LIBI, *adv.* [Lat.] In law, denotes the absence of the accused from the place where he is charged with having committed a crime; or his being *elsewhere*, as the word imports, at the time specified.

A'LIBLE, *adj.* [*alibilis*, Lat.] Nutritive; nourishing; or that which may be nourished.

A'LICANT, a large sea-port town in the province of Valencia and territory of Segura. It is seated between the mountains and the sea, and the port is defended by three bastions furnished with artillery. To prevent the visits of the Algerine pirates, watch-towers were built to give notice of the approach of an enemy's ship. It was taken by the English in 1706, and held out a siege of two years before it was retaken by the French and Spaniards.

It was garrisoned by only two regiments, under the command of major-general Richards. The city held out for a considerable time against a large train of heavy artillery, which was well served, but at length the garrison was compelled to retire into the castle, which had been deemed impregnable, until the bravery of English sailors mastered it in the year 1706. Here they sunk three cisterns, and then, with incredible labour, filled them with water. The French carried on the siege with vigour, but found it impossible to make any impression on a place which both art and nature had joined in securing. Still however determined not to relinquish their design, they resolved to attempt mining through the solid rock, in order at once to blow up the castle and garrison into the air. The besieged were not at all alarmed at this undertaking, which they considered as utterly impracticable. It even supplied them with fresh hopes, as they believed it would retard the operations of the siege until a British fleet should arrive to their succour. Encouraged by these prospects, they bestirred themselves in annoying the workmen, and retarding their progress. The besiegers however wrought incessantly, and in three months such a fissure was made in the rock as their most experienced en-

gineers pronounced equal to the tremendous purpose for which it had been hewn. One thousand five hundred barrels of powder were deposited therein, together with beams, iron bars, and crows, which, by stopping the expansion of the powder when fired, might render the concussion more violent. On the 20th of March, 1709, the garrison was summoned to surrender, and the most solemn assurances given them of being safely escorted to Barcelona, and their baggage and effects secured to them, if they surrendered in three days; the ruin that awaited them in case of an obstinate rejection of the terms proposed was likewise represented in all its force.

A general council of war was now called, to deliberate on the proper step to be taken at this crisis of their fate; and they unanimously resolved to commit themselves to the providence of God, and defend the place. This resolution was communicated to the French commander, who two nights after again sent a flag, and endeavoured to divert the English from their desperate purpose, offering the same honourable terms of capitulation as had been before tendered: but all in vain. The third night approached, when the French sent their third and last summons, and with it an assurance, that their mine was primed, and should be sprung by six o'clock the next morning. They remonstrated against the fatal obstinacy which caused them wilfully to seek their own destruction; still offering them the former terms of surrender: but nothing could shake the steady purpose of these determined men. At five o'clock the next morning, as a prelude to this direful stroke, all the inhabitants of that quarter were ordered to quit their habitations. The besieged during the night had kept a general guard, and employed the time in religious exercises. Major-general Richards, colonel Sibourg, and lieutenant-colonel Thornicroft of Sir Charles Hotham's regiment, sat together in the governor's usual lodging-room; other officers cantoned themselves as their tempers inclined, to pass the dreary and prefiging night.

At length, day appearing, the inhabitants were seen flying in crowds to the westernmost part of the town. The general, attended by the principal officers, went to the west battery, to gain fuller information. After he had remained there about a quarter of an hour, lieutenant-colonel Thornicroft desired him to remove from so dangerous a spot; but he and colonel Sibourg both answered, that no danger was to be apprehended there, more than in any other place; and that there they would wait the event. The lieutenant-colonel, resolving to share the fate of his superiors, continued with them, as did other officers from the same motive: but the hour of five being now considerably past, the corporal's guard cried out, that the train was fired, observing some smoke from the lighted matches, and other combustible matter near it, from whence the flame ascended to the centinels above. The general and field officers were then urged to retreat, but refused. The mine at last blew up; the rock opened and shut; the whole mountain felt the convulsion; the general and field officers with their company, ten guns, and two mortars, were buried in the abyss; the walls of the castle shook, part of the great cistern fell, another cistern almost closed, and the rock shut a man to his neck in its cleft, who lived many hours in that agonizing posture. About thirty-six centinels, and women, were swallowed up in different quarters, whose dying groans were heard, some of them four days after the melancholy catastrophe. Many houses of the town were overwhelmed in their ruins, and the castle suffered greatly; but was saved from total destruction by the vent which the explosion forced through the veins of the rock. After the loss of major-general Richards, the command devolved on lieutenant-colonel Dalbecaume, of Sibourg's regiment, who drew out a detachment of the whole garrison, and with it made a desperate sally, to shew that they were not appalled by this convulsive shock. The bombs from the castle played on the town more violently, and the shot galled every corner of their streets;

streets; this vigorous defence was maintained till the arrival of the British fleet, a month afterwards, under the command of Sir George Byng; his ships were, the *Defiance*, *Northumberland*, *Essex*, *York*, and *Dunkirk*. The last went within the line in three fathoms and a half, as drawing less water than the others; then, laying her broadside to the east part of the town, began to cannonade; but, the wind being fresh, and a great swell rolling in from the eastward, the large ships were obliged to weigh their anchors, and get out of cannon-shot. The *Dunkirk*, having much of her rigging damaged, and her small bow-er cut, lay exposed for some time to the shot, bombs, and carcasses, of the enemy; but at length got off. The weather continuing very bad, and general Stanhope, who was on-board the fleet, finding the enemy increase considerably in strength, and supposing the garrison by this time to be driven to great extremities, sent a flag of truce to chevalier d'Asfeldt, the Spanish commander, with proposals for surrendering the castle, which were agreed to, and the garrison, marching out with the honours of war, embarked on-board the fleet. No troops ever displayed a more inflexible firmness, and, although the event was fatal to the principal officers, yet the garrison in general, after enduring all these perils, instead of surrendering prisoners of war, only evacuated the place.

A great trade is carried on at *Alicant*, in wine and fruit. It is seated in the Mediterranean, on a bay of the same name, thirty-seven miles north-east of *Murcia*, and seventy-five south of *Valencia*. Lat. 38. 24. N. lon. 0. 36. W.

ALICA'TA, a mountain of Sicily, near the valleys *Mazara* and *Noto*, upon which was situated, as is generally thought, the famous *Dædalion*, where the tyrant *Phalaris* kept his brazen bull.

ALICATA, a town of Sicily, remarkable for corn and wine. It was plundered by the Turks in 1543, and is seated on a fort of peninsula near the sea, twenty-two miles S. E. of *Girgenti*. Lat. 37. 11. N. lon. 15. 20. E.

ALICATA CHLAMYS, was a sort of vest with sleeves, worn by the Roman boys till the age of thirteen, at which time they put on the *prætexta*.

AL'ICE, [*adeliza*, Lat. of *adel*, Teut. of *æthel*, Sax. noble.] A proper name of women. This name in Teutonic is *Adelheit*, which last syllable is the termination of many substantives, where the English use *ess* or *ness*; thus, *Adelheit* signifies nobleness.

AL'IDADE, *f.* an Arabic name for the label, index, or ruler, which is moveable about the centre of an astrolabe, quadrant, &c. and carrying the sights or telescope, and by which are shewn the degrees cut off the limb or arch of the instrument.

A'LIEN, *f.* [*alienus*, Lat.] In law, is one that is born out of the dominions of the crown of England. 1 *Blackst.* 366. But children of the king's ambassadors born abroad have always been held to be natural subjects. *Id.* 373. An alien born may purchase lands or other estates, but not for his own use; for the king, upon such purchase, is entitled to them. *Id.* 371.

But an alien may acquire a property in goods, money, and other personal estate, or may hire a house for his habitation.

Also aliens may trade as freely as other people; only they are subject to certain higher duties at the custom-house; which is what is now called the alien's duty; to be exempted from which, is one principal cause of the frequent applications to parliament for acts of naturalization. *Id.* 316. An alien may bring an action concerning personal property, and may make a will and dispose of his personal estate. *Id.* 372.

By several acts of parliament, all children born out of the king's allegiance, whose fathers (or grandfathers by the father's side) were natural born subjects, are now deemed to be natural born subjects themselves to all intents and purposes; unless such ancestors were attainted, or banished beyond sea for high treason; yet so as that the grand-

children of such ancestors shall not be privileged in respect of the alien's duty, except they be Protestants, and actually reside within the realm; nor shall be able to claim any interest, unless the claim be made within five years after the same shall accrue. *Id.* 373. If an Englishman living beyond sea marries a wife there, and has a child by her, and dies; this child is born a denizen, and shall be heir to him, notwithstanding that the wife was an alien. *Cro. Cha.* 601.

Aliens can have no heirs, because they have not in them any inheritable blood. 2 *Blackst.* 249. If an alien be made a denizen by the king's letters patent, and then purchases lands, his son, born before his denization, shall not inherit those lands; but a son born afterwards may, even tho' his elder brother be living; for the father, before denization, had no inheritable blood to communicate to his eldest son; but by denization it acquires an hereditary quality, which will be transmitted to his subsequent posterity. Yet, if he had been naturalized by act of parliament, such eldest son might then have inherited; for that cancels all defects, and is allowed to have a retrospective energy, which simple denization hath not. *Ibid.* The necessity of trade, however, has mollified the too rigorous rules of the old law, in the restraint and discouragement of aliens. A Jew may bring an action, though heretofore he could not; but commerce has taught the world more humanity. And therefore it is held, that an alien enemy commorant here, by licence of the king, and under his protection, may maintain an action of debt upon a bond, even though he did not come with a safe conduct. *L. Raym.* 282. 1 *Atk.* 43.

On a bill in chancery, brought for an account against the representatives of an East-India governor, who pleaded that the plaintiff was an alien born, and an alien infidel, and therefore could have no suit here; lord Hardwicke said, as the plaintiff's was a mere personal demand, it was extremely clear that he might bring a bill in this court, and over-ruled the defendant's plea, without hearing counsel of either side. 1 *Atk.* 51.

An alien enemy, who was the captain of a French privateer, took an English ship, upon the high seas, in time of open war; and ranfomed the ship and cargo; and had the mate given to him as an hostage; which hostage died in prison. The ransom bill was signed by both captains; and by the hostage; and by it the captain obliges himself and his owners to pay to the French captain the ransom money within two months. By the court: An action is maintainable by the French captain against the English captain upon this ransom bill; notwithstanding the death of the hostage, and notwithstanding the plaintiff's being an alien enemy. And the like law prevailed both in France and Holland. *Burr. Mansf.* 1741.

An alien whose sovereign is in amity with the crown of England, residing here, and receiving the protection of the law, owes a local allegiance to the crown during the time of his residence; and if, during that time, he commits an offence, he shall be liable to be punished for the same, even as a natural born subject. For his person and personal estate are as much under the protection of the law as the natural born subject's; and, if he is injured in either, he has the same remedy at law for such injury. *Foss.* 185. So also, an alien whose sovereign is at enmity with us, living here under the king's protection, committing offences, may be proceeded against in like manner; for he oweth a temporary local allegiance. *Id.*

ALIEN-DUTY, an impost laid on all goods imported by aliens, over and above the customs paid for such goods imported by British, and on British bottoms.

ALIENS-DUTY, is otherwise called *petty customs*, and *navigation-duty*. Fish dried or salted, and cod-fish or herring not caught in British vessels and cured by British, pay a double aliens-duty. See *DUTY*.

ALIEN-PRIORIES, a kind of inferior monasteries, formerly very numerous in England, and so called from their belonging to foreign abbeys.

To ALIEN, *v. a.* [*aliener*, Fr. *alieno*, Lat.] To make any thing the property of another. To estrange; to turn the mind or affection; to make averfe: with *from*.—The king was disquieted, when he found that the prince was totally aliened from all thoughts of marriage. *Clarendon*.

A'L IENABLE, *adj.* That of which the property may be transferred.—Land is *alienable*, and treasure is transitory, and both must pass from him, by his own voluntary act, or by the violence of others, or at least by fate. *Dennis*.

To A'L IENATE, *v. a.* [*aliener*, Fr. *alieno*, Lat.] To transfer the property of any thing to another.—The countries of the Turks were once Christian, and members of the church, and where the golden candlesticks did stand, though now they be utterly alienated, and no Christians left. *Bacon*.—To withdraw the heart or affections: with the particle *from*, where the first possessor is mentioned.—The manner of men's writing must not alienate our hearts from the truth. *Hooker*.

ALIENATE, *adj.* [*alienatus*, Lat.] Withdrawn from; stranger to: with the particle *from*.—The whigs are damnable wicked; impatient for the death of the queen; ready to gratify their ambition and revenge by all desperate methods; wholly alienate from truth, law, religion, mercy, conscience, or honour. *Swift*.

ALIENATION, *f.* [*alienatio*, Lat.] The state of being alienated; as, The state was wasted during its alienation. Change of affection. Applied to the mind, it means disorder of the faculties.—Some things are done by man, though not through outward force and impulsion, though not against, yet without, their wills: as in alienation of mind, or any like inevitable utter absence of wit and judgment. *Hooker*.

ALIENATION, in law, is a transferring the property of any thing from one man to another. It chiefly relates to lands and tenements; as to aliene land in fee, is to sell the fee-simple thereof; to aliene in mortmain, is to make over lands or tenements to a charitable use. All persons who have a right to lands may, generally, aliene them to others. But some alienations are prohibited; as alienation by tenant for life, tenant for years, tenant in dower: if these aliene for a greater estate than they have in the lands, it is a forfeiture of their estate. 1 *Inst.* 251. Conditions in deeds that the purchaser shall not aliene, are void. But one may grant an estate in fee, on condition that the grantee shall not aliene to a particular person. Also estates in tail, for life, or years, where the whole interest is not parted with, may be made with condition not to aliene to others, for preservation of the reversion. *Lit.* 361. By the 12th Car. II. c. 24. all fines for alienation are taken away, except fines due by the customs of particular manors.

ALIENATION-OFFICE, is an office to which all writs of covenants and entry, upon which fines are levied, and recoveries suffered, are carried, to have fines for alienation set and paid thereon.

ALIENILOQUY, *f.* [*alieniloquium*, of *alienus*, foreign, and *loquor*, Lat. to speak.] A talking wide from the purpose, or not to the matter in hand.

ALIFEROUS, *adj.* [*alifer*, Lat. of *ala*, a wing, and *fero*, to bear.] Bearing or having wings.

ALIGEROUS, *adj.* [*aliger*, Lat. of *ala*, a wing, and *gero*, to carry.] Bearing, carrying, or having, wings.

To ALIGGE, *f.* [from *a*, and *lig*, to lie down.] To lay; to allay; to throw down; to subdue. An old word even in the time of Spencer, now wholly forgotten.

To ALIGHT, *v. n.* [*alightan*, Sax. *af-lichten*, Du.] To come down, and stop. The word implies the idea of descending; as, of a bird from the wing; a traveller from his horse or carriage; and generally of resting or stopping. It is used also of any thing thrown or falling; to fall upon:

But storms of stones from the proud temple's height
Four down, and on our batter'd helms alight. *Dryden*.

ALIKE, *adv.* [from *a* and *like*.] With resemblance; without difference; in the same manner; in the same form. In some expressions it has the appearance of an adjective,

but is always an adverb.—The darkness hideth not from thee; but the night shineth as the day: the darkness and the light are both alike to thee. *Psalms*, cxxxix. 12.

Riches cannot rescue from the grave,
Which claims alike the monarch and the slave. *Dryden*.

A'L IMA, *f.* [of *a*, and *limos*, Gr. hunger.] Medicines which either prevent or assuage hunger.

A'L IMENT, *f.* [*alimentum*, Lat.] Nourishment; that which nourishes; nutriment; food.—All bodies which, by the animal faculties, can be changed into the fluids and solids of our bodies, are called *aliments*. In the largest sense, by *aliment*, I understand every thing which a human creature takes in common diet; as meat, drink; and seasoning, as salt, spice, vinegar. *Arbuthnot*.

By the process of digestion is prepared a very mild, sweet, and whitish, liquor, resembling milk, and distinguished by the name of *chyle*; which being absorbed by the lacteal veins, by them conveyed into the circulation, and there assimilated into the nature of blood, affords that supply of nutrition, which the continual waste of the body is found to require. Next to air, food is the most necessary thing for the preservation of our bodies: and, as on the choice thereof our health greatly depends, it is of great importance to understand, in general, what is the properest for our nourishment; and, in particular deviations from health, what is the best adapted to restore us. Our blood and juices naturally incline to become putrid and acrimonious: fresh chyle, duly received, prevents this destructive tendency, and preserves in them that mild state which alone consists with health. An animal diet affords the most of this bland nutritious mucilage; watery fluids dilute the too gross parts, and carry off what is become unfit for use. It is only the small portion of jelly which is separated from the farinaceous parts of vegetables, that, after being much elaborated, is converted into the animal nature; yet the use of vegetables prevents both repletion and a too great tendency to a putrescent acrimony of the blood. In hot climates, as well as against the constitutional heat of particular persons, vegetables are demanded in the largest portion; animal substances afford the highest relish while our appetite continues; but will sate the appetite before the stomach is duly filled. Vegetables may be eaten after either flesh or fish: few herbs or fruits satiate so much as that the stomach may not be filled with them, when it is already satisfied with flesh or fish; whence it may be observed, that no diet which is very nourishing can be eaten to fulness, because its nutritious parts are oily and satiating. Health depends almost wholly on a proper crisis of the blood; and, to preserve this, a mixture of vegetables in some degree is always required, for a loathing is soon the consequence of animal food alone: hot acrid habits, too, receive from milk and vegetables the needful for correcting their excesses; but in cold, pituitous, and nervous, habits, who want most nourishment from least digestion, and from the smallest quantity of food, animal diet is to be used more freely.

Thus much being obvious with respect to the matter and quality of our aliment, the valetudinarian may easily regulate his diet with some advantage to himself by an attention to the few ensuing particulars. In winter, eat freely, but drink sparingly: roast meat is to be preferred, and what is drunk should be stronger than at other seasons. In summer, let thirst determine the quantity to be drunk; cold stomachs never require much: boiled meats and vegetables, if not otherwise contradicted, may now be more freely used. Lax habits require the winter's diet to be continued all the year, and rigid ones should be confined to that of summer. Fat people should fast at times, but the lean should never do so. Those who are troubled with eruptions occasioned by their food should drink but little, and use some unaccustomed exercise. The thirsty should drink freely, but eat sparingly. In general, let moderation be observed; and, though no dinner hath been had, a light supper is at all times to be preferred. After very high-

high-seasoned meats, a glass of water acidulated with the acid elixir of vitriol, or in very weak stomachs the sweet elixir of vitriol, is far more assiduous to the work of digestion than the common method of taking brandy. See **FOOD** and **DRINK**.

ALIMENTAL, *adj.* That which has the quality of aliment; that which nourishes; that which feeds.

ALIMENTALLY, *adv.* So as to serve for nourishment.—The substance of gold is invincible by the power-fullest heat, and that not only *alimentally* in a substantial mutation, but also mendicamentally in any corporeal conversion. *Brown*.

ALIMENTARINESS, *f.* The quality of being alimentary, or of affording nourishment.

ALIMENTARY, *adj.* That which belongs or relates to aliment. That which has the quality of aliment, or the power of nourishing.—I do not think that water supplies animals, or even plants, with nourishment, but serves for a vehicle to the *alimentary* particles, to convey and distribute them to the several parts of the body. *Ray*.—Of *alimentary* roots, some are pulpy and very nutritious; as, turnips and carrots. These have a fattening quality. *Arbutnot*.

ALIMENTA'RII PUERI, &c. were certain children maintained and educated by the munificence of the emperors, in a sort of public places not unlike our hospitals.—Trajan was the first that brought up any of these alimentary boys. He was imitated by Adrian. Antonius Pius did the same for a number of maids, at the solicitation of Faustina; and hence, in some medals of that empress, we read *PELLAE FAUSTINIANAE*.—Alexander Severus did the like at the request of Mammæa; and the maids thus educated were called *Mammæanae*.

ALIMENTARY DUCT or **CANAL**, is a name given by Dr. Tyson, and some others, to that part of the body through which the food passes from its reception into the mouth to its exit at the anus; including the gula, stomach, and intestines. See **ANATOMY**.

This duct has been said to be the true characteristic of an animal, or (in the jargon of the schools) *in proprium quarto modo*: there being no animal without it, and whatever has it being properly enough ranged under the class of animals. Plants receive their nourishment by the numerous fibres of their roots, but have no common receptacle for digesting the food received, or for carrying off the recrements. But in all, even the lowest degree of animal life, we may observe a stomach and intestines, even where we cannot perceive the least formation of any organ of the senses, unless that common one of feeling, as in oysters. *Phil. Trans. No. 269, p. 776, et seq.*

Dr. Wallis brings an argument from the structure of the alimentary tube in man, to prove that he is not naturally carnivorous; to which Dr. Tyson makes some objections. *V. Phil. Trans. No. 269, p. 777.*

ALIMENTARY LAW, [*lex alimentaria*, Lat.] was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMENTATION, *f.* The power of affording aliment; the quality of nourishing. The state of being nourished by assimilation of matter received.—Plants do nourish; inanimate bodies do not: they have an accretion, but no *alimentation*. *Bacon*.

ALIMONIOUS, *adj.* That which nourishes: a word very little in use.—The plethora renders us lean, by suppressing our spirits, whereby they are incapacitated of digesting the *alimonious* humours into flesh. *Harvey*.

A'LIMONY, *f.* [*alimonia*, Lat.] in law, is that maintenance, which, after a divorce of husband and wife, *a mensa et thora*, the ecclesiastical judge allows to the woman out of her husband's estate. But in case of elopement, and living with an adulterer, the law allows her no alimony; for, as that amounts to a forfeiture of her dower after his death, it is also a sufficient reason why she should not be a partaker of his estate when living. *3 Black. 94.*

A'LINGRAHS, or **A'LINGSAHS**, an inland town of

West Gothland, in Sweden, where are silk, woollen, tobacco, and pipe, manufactories. Lat. 50. 20. N. lon. 13. 20. E.

A'LIPÉDE, [*alipes*, Lat. of *ales*, a bird, and *pes*, a foot.] Nimble, swift of foot.

ALIPILA'RIOUS, or **ALIPIL'US**, in Roman antiquity, a servant belonging to the baths, whose business it was, by means of waxen plasters, and an instrument called *vol-fella*, to take off the hairs from the arm-pits, arms, legs, &c. this being deemed a point of cleanliness.

ALIP'TERY, *f.* [*alipterium*, Lat. of *αλεπτέριον*, Gr.] A place belonging to, or an apartment in, baths, where persons were anointed.

A'LlQUANT, *adj.* [*aliquantus*, Lat.] *Aliquant Part*, is that part which will not exactly measure or divide the whole, without leaving some remainder. Or the *aliquant part* is such, as, being taken or repeated any number of times, does not make up the whole exactly, but is either greater or less than it. Thus 4 is an *aliquant part* of 10; for 4 twice taken makes 8, which is less than 10; and three times taken makes 12, which is greater than 10.

A'LlQUOT, *adj.* [*aliquot*, Lat.] *Aliquot Part*, is such a part of any whole, as will exactly measure it without any remainder. Or the *aliquot part* is such, as being taken or repeated a certain number of times, exactly makes up, or is equal to, the whole. So 1 is an *aliquot part* of 6, or of any other whole number; 2 is also an *aliquot part* of 6, being contained just 3 times in 6; and 3 is also an *aliquot part* of 6, being contained just 2 times: so that all the *aliquot parts* of 6 are 1, 2, 3. All the *aliquot parts* of any number may be thus found:—Divide the given number by its least divisor; then divide the quotient also by its least divisor; and so on, always dividing the last quotient by its least divisor, till the quotient 1 is obtained; and all the divisors, thus taken, are the prime *aliquot parts* of the given number. Then multiply continually these prime divisors, viz. every two of them, every three of them, every four of them, &c. and the products will be the other or compound *aliquot parts* of the given number. So if the *aliquot parts* of 60 be required; first divide it by 2, and the quotient is 30: then 30 divided by 2 also, gives 15, and 15 divided by 3 gives 5, and 5 divided by 5 gives 1: so that all the prime divisors or *aliquot parts* are 1, 2, 3, 5. Then the compound ones, by multiplying every two, are 4, 6, 10, 15; and every three, 10, 20, 30. So that all the *aliquot parts* of the given number 60, are 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30.—In like manner it will be found that all the *aliquot parts* of 360 are 1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, 18, 20, 24, 30, 36, 40, 45, 60, 72, 180.

ALISA'NUS, *f.* in botany. See **RHEXIA**.

A'LISH, *adj.* [from *ale*.] Refembling ale; having qualities of ale.—Stirring it and beating down the yeast, gives it the sweet *alish* taste. *Mortimer*.

ALP'SMA, *f.* [*αλς*, Gr. the sea.] In botany, a genus of the hexandria polygynia class, ranking in the natural order of tripetaloidæ. The generic characters are—Calyx: perianthium three-leaved; leaflets ovate, concave, permanent. Corolla: three-petalled; petals roundish, large, flat, very spreading. Stamina: filaments awl-shaped, shorter than the corolla; antheræ roundish. Pistillum: germs more than five: styles simple; stigmas obtuse. Pericarpium: compressed capsules. Seeds: solitary, small.—*Essential Character*. Calyx, three-leaved; petals, three; seeds, several.

Species. x. *Alisma plantago*, or great water plantain: leaves ovate, acute; capsules obtusely triangular. Great water plantain is easily known by its smooth entire leaves on very long petioles; and by its purplish flowers, growing in a kind of umbel, at the end of a long scape. Root roundish and white. Height from two to three feet. Stems and branches with three blunt corners. Petioles longer than the leaves, broader at the base. Leaves with seven or eight ribs, two of them near each edge. The flowers are fully expanded about four in the afternoon. It grows in watery places, on the banks of pools, lakes, and rivers, and flowers in July and August. There is a variety of this with narrower leaves.

2. *Alisma flava*; leaves ovate, acute, peduncles umbellate, capsules globose. It grows in Jamaica, Barbadoes, and several other places in the warm parts of America, in stagnant waters and swampy places; it would be difficult to preserve this plant in England, since it will not live in the open air, and requires a bog to make it thrive; but, as it has no great beauty, or use, it is not worth the trouble of cultivating in this country.

3. *Alisma damasonium*, or star-headed water plantain: leaves cordate-oblong, flowers six-pointed, capsules awl-shaped. It is a native of France, England, and Siberia; and is found in standing waters, which are not very deep; but is by no means so common as the first sort. If it is wanted as a medicine, it must be gathered in its natural place of growth, since it is never cultivated in gardens.

4. *Alisma cordifolia*: leaves heart-shaped, obtuse, flowers twelve-stamened, capsules hook-pointed. This species is the connecting link between this genus and that of *Sagittaria*. It is found both in South and North America.

5. *Alisma natans*, or creeping water plantain: leaves ovate, obtuse; peduncles solitary. The leaves which swim on the surface are ovate, but those which are under water are linear: this is the case with many aquatic plants, the motion of the water lengthening the leaves. It is found in ditches in France, Sweden, Germany, and Siberia; also in a lake or two in Wales: it flowers in July and August.

6. *Alisma ranunculoides*, or small water plantain: leaves linear-lanceolate, capsules globose and squarrose. In a situation where the water is nearly dried up, this plant is from two to six inches high, the stems and proliferous umbels hardly longer than the leaves, and some of the flowering branches procumbent; but on the edge of old turf-pits, where there is plenty of water, it grows with an upright naked stem, from one to two feet high, bearing umbels of numerous rays, and these again others. The root-leaves, in this state, are on very long foot-stalks, linear-lanceolate, not greatly exceeding the foot-stalk in breadth, and are extremely like the paddles of the canoes of some of the South Sea islands. The corolla is bluish white, and opens about noon. It is a native of Sweden, Holland, France, Germany, Italy, and England, in marshes and moors: as on Giggleswick-tarn, Yorkshire; between Burton and Derby; Bungay, Suffolk; and Ellingham-fen, Norfolk.

7. *Alisma subulata*: leaves awl-shaped. This is a Virginian plant.

8. *Alisma parnassifolia*: leaves heart-shaped, acute; petioles jointed. A native of Italy; found in the marshes under the Apennines.

9. *Alisma repens*: stems creeping, leaves lanceolate petioled acute. A native of Spain, on the sandy banks of the river Manzanares; flowering in August. It seems to be the same (though much smaller) with the *Alisma* which Abbé Poiret found on the northern coast of Africa, and which is described by Lamark.

Propagation and Culture. If any one be desirous of cultivating the European species, he must have a piece of water on purpose, or keep them in pots or tubs perpetually immersed in water, unless he has frames of wood with partitions filled with earth, which he can water largely at his pleasure.

ALIS'MA, *f.* in botany. See *ARNICA*, *PRIMULA*, and *SENECIO*.

ALISON'TIA, or *ALISUN'TIA*, a river of Belgic Gaul, now called *Alfitz*; which rising on the borders of Lorraine, and running through the duchy, waters the city of Luxembourg, and, swelled by other rivulets, falls into the Sur.

AL'LITES, *f.* in Roman antiquity, a designation given to such birds as afforded matter of auguries by their flight.

AL'LITURE, *f.* [*alitura*, Lat.] Nourishment, or the reparation of the body by the addition of new nutritious juices.

ALITURGESY, *f.* [*aliturgesia*, Lat. of *ἀλιουργία*, Gr.] A franchisement, or exemption from any public office or charge.

ALIVE, *adj.* [of *a* and *lyf*, Sax. life.] In the state of life; not dead. In a figurative sense, unextinguished; undestroyed; active; in full force. Cheerful; sprightly; full of alacrity. In a popular sense, it is used only to add an emphasis, like the French *du monde*; as, the *best man alive*; that is, the *best*, with an emphasis. This sense has been long in use, and was once admitted into serious writings, but is now merely ludicrous.—The earl of Northumberland, who was the proudest man *alive*, could not look upon the destruction of monarchy with any pleasure. *Clarendon*.—John was quick and understood business, but no man *alive* was more careless in looking into his accounts: *Arbuthnot*.

AL'KAHEST, *f.* in chemistry, the universal menstruum, or dissolvent. A name first used by Paracelsus, and derived from the German words *al* and *geist*, i. e. *all spirit*.—Van Helmont borrowed the word, and applied it to his invention, which he called the universal dissolvent. As it is difficult to say whether the falsity or folly of what is handed down to us with respect to this article be the greatest, the curious are referred to the writers themselves, to whom we are obliged for what is said concerning it. See Paracelsus de Viribus Membranarum, lib. ii. cap. vi. Eph. Germ. D. xi. ann. 8. app. 3. Helmont Complexorium atque Mistionum elementalium signum; sect. 27—29. Helmont Poteff. Medic. sect. 3—24. Helmont Arbor Vitæ. Boerhaave's Chemistry. Alcahest is also a name of the liquor of flints.

ALKALE'SCENT, *adj.* [from *alkali*.] That which has a tendency to the properties of an alkali.—All animal diet is *alkalescent* or anti-acid. *Arbuthnot*.

AL'KALI, *f.* [of *al* and *kali*, i. e. of or from *kali*.] Alkaline salt is called *alafi*, *alafor*, *alafort*, *alkahesi glauveri*; according to some *calcadis*. *Alkali*, because a great quantity of that kind of salt is obtained from a plant called by the Egyptians *kali*, by us *glass-wort*. The name *alkali* hath been given to the fixed salt of all plants; and that because an effervescence arises upon mixing an acid liquor with the salt; all volatile or fixed salts, and all terrestrial matters which ferment with acids, have come to be called *alkalies*.

Alkaline salts are divided into two kinds, the fixed and volatile; and the former into two species, vegetable, and mineral, or fossil. All of these possess some properties in common, and some peculiar to each. Those which they have in common are, 1. An acrid and pungent taste, which, when the salts are very pure and strong, degenerates into absolute causticity, and would entirely destroy the organ of sensation if long applied to it. 2. A tendency to dissolve animal substances, and reduce them to a gelatinous substance. 3. An attraction for acids, with a power of separating earths and metals from them. 4. They change the blue vegetable juices to green; the green to yellow; the yellow to orange; the orange to red; and the red to purple. 5. They unite with oils; and destroy or cause to fade almost all kinds of colours that can be put upon cloth; whence their use in bleaching, &c.

The properties common to both kinds of fixed alkalies are, 1. They resist the action of fire to a great degree, so that they can easily be reduced to a solid form by evaporating any liquid in which they happen to be dissolved. 2. By an intense fire, they flow into a liquid which concretes into a solid mass when cold. 3. If mixed in certain proportions with vitrifiable earths, they melt, in a heat still more intense, into glass. 5. Mixed with ammoniacal salts, with animal substances, or with foot, they extricate a volatile alkali.

The volatile alkali differs from the other two in being unable to resist the fire, and being entirely resolvable into an invisible and permanently elastic fluid, called *alkaline air*. In consequence of its volatility, it always affects the olfactory nerves, and its smell is the general criterion by which its strength may be judged of. Its attraction for acids, power of changing colours, &c. are also considerably weaker than those of the fixed alkalies.

Effervescence with acids is not, as was formerly supposed, a distinguishing property of alkalies; for this effect is merely owing to the fixed air, to which they are united during the process by which they are originally formed. The quantity of this air, however, is never so great as to saturate them entirely; on the contrary, their alkaline properties are always very perceptible, and they are commonly said to be in a *mild* state. But the truth is, they are then in a kind of intermediate state, between what may be called perfectly mild and perfectly caustic. In their perfectly mild state, they are united with such a large quantity of fixed air as entirely overpowers their alkaline properties; and therefore they are no more intitled to the name of alkalies in this state, than when combined with the marine, nitrous, or any other, acid; in which case the compounds are called *neutral salts*. But it is a much more laborious and tedious process to saturate an alkali completely with fixed air than with any other acid; nor does it very easily retain the aerial acid after it has once been combined with it. Hence the caustic taste and properties of the alkali almost always predominate, and the salt contains a portion of pure and caustic alkali, to which alone its virtues are to be ascribed.

Vegetable alkali, when pure, and containing about one-half its weight of fixed air, is of a white colour when dry; and very caustic to the taste. It runs *per deliquium* when exposed to the air; and is usually incapable of being crystallized, though it acquires this property after being employed in the rectification of ardent spirit. After this alkali has been once united with marine acid, it appears to have undergone some change; for the salt then produced, by combining it with the vitriolic acid, resembles Glauber's salt almost as much as it does vitriolated tartar.

The fossil alkali differs from the vegetable in having a smaller attraction for acids; in being more easily fusible by itself, and forming a more soluble compound with the vitriolic acid. It is also easily crystallizable, even without the addition of more fixed air than it naturally contains; and experience has determined it to be more proper for glass or soap manufactures than the vegetable alkali; for which reason the demand for it is very considerable.

The fossil alkali was anciently called *natron* or *nitre*, and is spoken of by Pliny and Tacitus as an ingredient in glass, &c. The knowledge of this salt was lost in the general obscuration of science which took place on the decline of the Roman empire; nor do we find it mentioned till the time of the Hon^{ble} Robert Boyle; and even since that time, though Mr du Hamel gave an accurate account of it in a memoir for the year 1736, little farther notice was taken of it till very lately, when the College of Physicians of London restored it to the Pharmacopœia, calling the vegetable alkali, *kali*; the fossil or mineral, *natron*; and the volatile, *ammonia*.

We are now certainly informed that the fossil alkali is found native in many parts of the world, which never is the case with the vegetable alkali. The places where it abounds most are, Egypt, the country of Tripoli in Barbary, the peak of Teneriffe, in one of the Canary islands, Hungary, several of the provinces of Russia, some parts of Asia, particularly the neighbourhood of Smyrna, &c. though it has not hitherto been found in any of the western countries of Europe, excepting in the neighbourhood of volcanoes; or in mineral waters; and in these last only in a very small quantity.

The demand in this country for fossil alkali, which is the natural basis of sea-salt, is supplied from the ashes of kali, and other sea-plants, from which it is separated in the same manner as the vegetable alkali from the ashes of other plants. The purest kind of ashes containing this salt is called *soda* or *barilla*, and is imported chiefly from foreign countries; that which is obtained from the sea-weed growing on our own coasts, is known by the name of *kelp*, but is excessively impure; a method, however, has been lately discovered, by Mr George Hodson, of Chester, by which the fossil alkali is separated from the muriatic acid

as it exists in common salt, and as it exists in kelp, for which he obtained a patent in 1792. His method is as follows. To extract the alkali from common salt, proceed thus: with a ton of salt mix to the amount of sixteen bushels of charcoal, or rather small-coal; and, in this state, throw it into a furnace for the purpose of fusion. It must be well stirred, in order to effect a proper union of the materials, and to expose, by bringing all the parts successively to the surface, the whole mass to the action of the reverberating flame. After the fusion is completed, it is to remain one hour in the furnace, and then to be drawn out. The substance thus drawn is the ash, in its impure state; to refine it, nothing farther is requisite than to form a lixivium, and evaporate it to dryness.

Modern chemistry has discovered many acids, and has succeeded in decomposing them into simpler substances, and recomposing them. But the alkalies still remain in number only three; and nothing has yet been effected to shew an unequivocal decomposition of the two fixed alkalies.

To extract the alkali from the common salt as it resides in kelp, a ton of kelp must be broken into small lumps, and mixed with ten bushels of charcoal, or small-coal, instead of sixteen. In every other respect the process corresponds with the above description. The *rationale* is as follows: The phlogiston contained in the small-coal, or charcoal, being liberated by the fire, exerts its agency on the common salt, and effects a decomposition in it. The acid of the salt, being separated from its alkaline basis, is dissipated, and the alkali, left in conjunction with the residuum of the charcoal, or small-coal, forms the ashes.

A patent hath also been granted to Mr. Anthony Boulton de Boneuil, of Liverpool, for an invention of an apparatus on a new construction, for the purpose of making fossil alkali; by which that very useful and important article is obtained of a quality equal to that extracted from the best barilla. We shall give the particulars in the inventor's own words. "Previous to specifying my apparatus, I must observe that, to extract fossil alkali from marine salt, two things are wanted: first, the materials containing the necessary principles; secondly, a proper apparatus for working them successively. As for materials, I use charcoal and iron, mixed and melted with Glauber's salt, into which marine salt is at first to be converted, and of course I claim no grant on that head. But I work those materials in a manner hitherto unpractised, and with an apparatus entirely new.

"By this improved apparatus, instead of keeping the mixture of the materials in an open reverberatory furnace, exposed to the violence of the fire, and the course of the air, I keep them in pots or crucibles made of iron, standing upon a mere flat furnace, such as are commonly used for distillation, where their necks are raised a little above the surface of the furnace, and their mouths closely shut with lids. The empty places between each crucible are shut on the surface of the furnace with breaks, to prevent the fire from catching the materials, as the lids are intended to prevent them from the contact of the exterior air; from these two improvements it happens, that the sulphur formed at first, by the mixture of the vitriolic acid lying in the Glauber's salt with the principle lying in the charcoal, meeting with iron on every side, leaves the alkali and turns to iron; by which it is thus so strongly kept, that a martial pyrite is instantly produced, and the fossil alkali remains free, and stands by itself amidst the pyrite. By former methods, the materials being worked in open reverberatory furnaces, and being so exposed both to the violence of the fire and the course of air, it happens, that the fire, acting immediately and on every side upon the materials, burns the sulphur as soon as it is engendered, and consequently before it has turned to iron; the vitriolic acid that becomes again free returns to the alkali, and re-produces Glauber's salt. To extract the fossil alkali from the martial pyrite, by my method, the matter is poured from the iron crucibles into iron pans, and afterwards spread on the ground, where it is left till the mar-

trial earth into which it turns becomes efflorescent; then the earth is elixivated several times, and the water, having thus imbibed the alkali, is boiled, evaporated, and poured into proper pans, wherein the alkali goes out and crystallizes, and becomes equal to the best barilla."

The alkalies may be rendered caustic by the addition of quick-lime. In this state they destroy the parts of a living animal in a manner similar to fire; whence they are called *potential* cauteries, as the former is called the *actual* cautery. The *kali purum*, formerly *lapis infernalis*, of the shops, is of this kind. The alkalies attract moisture from the air when in their caustic state, though neither the fossil alkali nor its combinations do so in any other case. It is only in their caustic state also that they unite with oils, or dissolve in spirit of wine; which last they have been supposed to purify.

Volatile alkali, when procured immediately by the distillation of any substance capable of yielding it, is obtained in a state similar to that in which the alkalies are usually met with, viz. half mild and half caustic. By exposing the liquid alkali to a great quantity of fixed air, we may at last have it perfectly mild and neutralised; in which state it appears as a white salt extremely volatile, though less so than the pure caustic alkali. It dissolves very readily in water; but unless some caustic spirit, or some lime or fixed alkali, be added, in order to abstract part of the fixed air, it will scarcely exhibit the characteristic of volatile alkali; viz. a pungent and urinous smell. The addition of fixed air, however, makes very little difference with regard to the chemical combinations of this salt; for, as fixed air has a very slender power of acidity, it is expelled by every other acid with the greatest ease, and the same combinations formed as though it had not been present. The only difference is, that, when a mild alkali is added to an acid, a strong effervescence is produced by the escape of the fixed air, while, with the caustic alkali, the mixture is made without any ebullition.

Besides their attraction for acids, the alkalies have also an attraction for oils, sulphur, and spirit of wine, in the moist way, when the salts are deprived of their fixed air; and in this, as well as the dry way, with several metals, and vitrifiable earths and stones, as has been already mentioned. With oil the vegetable fixed alkali forms a soap, though less perfect than that made with the caustic mineral alkali. When combined with fixed air, they scarcely unite with oils. Boiled with sulphur, or melted with it in their dry state, they unite into a very fetid compound called *hepar sulphuris*, which is soluble in water, but totally and very quickly decomposed by the contact of air. Vegetable alkali unites with iron, tin, and zinc; corrodes copper, and runs with it into a liquor of a deep blue colour, and joins with lead in fusion. It does not act upon gold in its metallic state; but, if a sufficient quantity be added to a solution of gold in aqua regia, the calx of the metal will be first precipitated and afterwards dissolved.

Vegetable alkali is a principal ingredient in the powders called *fluxes*, used for the fusion of metalline ores. It promotes the fusion of earths, and forms glafs with the crystalline kind. It is soluble in an equal weight of distilled water; and, when exposed to the air, it soon attracts moisture from it, and flows into a liquid. In its caustic state it dissolves in spirit of wine, and forms with it a red tincture called *Van Helmont's tincture of salt of tartar*, formerly used both as an internal and external remedy, but now fallen into disrepute.

Fossil alkali in its caustic state unites with oil into an harder soap than that made with vegetable alkali. With sulphur it forms an *hepar sulphuris* in the same manner as the vegetable alkali, and yields a tincture with spirit of wine, which dissolves part of the salt whilst hot, but lets it fall again in a crystalline form when cold. Gold, silver, or quicksilver, are not affected by a solution of this salt; but copper and tin are dissolved by it in the open air. It affects tin, lead, regulus of antimony, and cobalt, slightly; but acts powerfully upon zinc, and forms a kermes mine-

ral with crude antimony. Copper, iron, bismuth, zinc, antimony, and regulus of cobalt, fused with two parts of fossil alkali, are almost entirely dissolved in a very strong heat; but tin, lead, and regulus of antimony, treated in the same manner only suffer a partial solution.

All the alkalies are of considerable use in medicine, though there must be a considerable diversity in their operations on the human body, as the vegetable alkali shews itself so much more acid and powerful than the fossil. They unite immediately with acids, and change them into mild neutral salts; hence, if any of the strong mineral acids fall upon any part of the human body, and begin to corrode and give pain, the immediate application of the lixivium tartari, or of a solution of any of those alkaline salts in water, or of the salts themselves in powder, will destroy their causticity, and prevent their doing further mischief: Or if any of these acids should drop on clothes, linen, or other substances, and alkaline salts are immediately applied, they will neutralize the acid, and prevent its further corrosion: Or if a person should, through mistake, swallow any of the mineral acids, or corrosive sublimate, or any other corroding salt, which an alkali will decompose, the taking into the stomach solutions of the alkaline salts, or the salts themselves in proper doses, are the most likely means of affording immediate relief.

Fixed alkaline salt loosens the belly, and renders the effect of purgatives more lasting, and is peculiarly useful against that constipation of the bowels which is generally attendant on the studious and sedentary. It destroys acidity in the primæ viæ, converting them into a mild aperient salt, and thus removes a cause of many chronic diseases. It resolves viscid and glutinous humours, by which, and its gentle stimulus, obstructions are removed, and wherever it passes secretions are promoted. It loosens the texture of calcareous concretions, by strongly attracting their air; and, made into a ley with a small quantity of lime, this power is increased. In those flatulent disorders which arise from a destructive bile it also affords great relief.

As a principal medical effect of alkaline salt is to attenuate the blood and humours, it is obviously improper in the scurvy, and all those disorders in which the texture of the blood is already too much enfeebled; in particular disorders this medicine is hurtful, by increasing that coagulation which is always observed to attend them. It is probable, that the restrictions on the Jews with respect to their diet, was in part from the speedy putrefescence to which the prohibited subjects tend; animal food is all alkalescent, but some more so than others; all fish soon putrify, but those without scales, and the shell-fish, the soonest.

Both the vegetable and fossil alkali applied externally in a caustic state, first irritate and inflame the skin, and afterwards act as fire in mortifying and destroying it; and therefore have been much used by surgeons for opening buboes and other abscesses, and for eating away proud or fungous flesh. Various formulæ of caustic alkalies are employed in medicine for different purposes, for which see CHEMISTRY and PHARMACY.

ALKALI, or SAL KALI, *f.* in botany. See SALICORNIA.

AL'KALINE, *adj.* That which has the qualities of alkali.—Any watery liquor will keep an animal from starving very long, by diluting the fluids, and consequently keeping them from an *alkaline* state. People have lived twenty-four days upon nothing but water. *Arbutnot.*

To ALKA'LIZATE, *v. a.* To make bodies alkaline, by changing their nature, or by mixing alkalies with them.

ALKALIZATE, *adj.* That which has the qualities of alkali; that which is impregnated with alkali.—The colour of violets in their syrup, by acid liquors, turns red, and, by urinous and *alkalizable*, turns green. *Newton.*

ALKALIZA'TION, *f.* The act of alkalizing, or impregnating bodies with alkali.

ALKÆN'DA, *f.* in botany. See MYRTUS.

ALKANET,

ALKANET, *f.* in botany. See ANCHUSA.

ALKEKENGİ, *f.* in botany. See ATROPA and PHYSALIS.

ALKERMES, *f.* [of *al*, the Arabic particle, and *kermes*, certain red or scarlet insects.] A celebrated remedy, of the consistence of a confection; whereof the kermes berries are the basis. The other ingredients are pippin-cyder, rose-water, sugar, ambergrease, musk, cinnamon, aloes-wood, pearls, and leaf-gold; but the sweets are usually omitted. The *confectio alhermes* is chiefly made at Montpellier; the grain which gives it the denomination being no where found so plentifully as there.

AL-KO'RAN. See ALCORAN.

ALKMA'AR. See ALCMAER.

ALL, *adj.* [*all*, *æl*, *calle*, *alle*, Sax. *ell*, Welsh; *al*, Du. *alle*, Germ. *alles*, Gr.] Being the whole number; every one.—The great encouragement of *all*, is the assurance of a future reward. *Tillotson*.—Being the whole quantity; every part.—Political power, I take to be a right of making laws with penalties, and of employing the force of the community in the execution of such laws, and in the defence of the commonwealth; and *all* this only for the public good. *Locke*.—The whole extent of place. The whole quantity, applied to duration of time:

On those pastures cheerful spring

All the year doth sit and sing;

And, rejoicing, smiles to see

Their green backs wear his livery.

Crashaw.

ALL, *adv.* Quite; completely.—Justice may be furnished out of fire, as far as her sword goes; and courage may be *all* over a continued blaze. *Addison*.

If e'er the miser durst his farthings spare,
He thinly spreads them through the public square,
Where, *all* beside the rail, rang'd beggars lie,
And from each other catch the doleful cry.

Gay.

Altogether; wholly; without any other consideration.—I am of the temper of most kings, who love to be in debt, are *all* for present money, no matter how they pay it afterward. *Dryden*.—Only; without admission of any thing else:

Sure I shall never marry like my sister,
To love my father *all*.

Shakespeare.

Although: this sense is truly Teutonic, but now obsolete. It is sometimes a word of emphasis, nearly the same with *just*. It was anciently in English what it is now in the other Teutonic dialects, a particle of mere enforcement.

ALL, *f.* The whole; opposed to part, or nothing. Every thing:

The youth shall study, and no more engage
Their flatt'ring wishes for uncertain age;
No more with fruitless care, and cheated strife,
Chace fleeting pleasure through the maze of life;
Finding the wretched *all* they here can have,
But present food, and but a future grave.

Prior.

The phrase, *and all*, is of the same kind.—A torch, snuff and *all*, goes out in a moment, when dipped in the vapour. *Addison*.—*All* is much used in composition; but, in most instances, it is merely arbitrary; as, *all-commanding*. Sometimes the words compounded with it are fixed and classical; as, *Almighty*. When it is connected with a participle, it seems to be a noun; as, *all-surrounding*. In other cases an adverb; as, *all-accomplished*, or completely accomplished.

Proverbs. In the grave *all* are alike. Lat. *Æqua tellus pauperi regnumque pueris horat*. And therefore, as we are *all* to be reduced to the same state in so short a time, what a folly it is for us to puff ourselves up with pride and vanity, on account of any superiority in this world, either of body, mind, or estate; when we do not know but the very next moment may, and a very short time will, put us upon a level with those, who, for their inferiority, we esteem the most mean and despicable.—What *all* say is as

good as sealed; that is, as good as confirmed, and may be reasonably supposed to be true.—*All* cannot do *all*. Lat. *Nemo omnes possumus omnes*. H. Ger. *Gin jeder kan nicht alles*. We ought not therefore to despise or think meanly of those who may not be masters just of the same skill and knowledge we ourselves are, when perhaps they have some qualifications superior to our own, or at least that are of some use to mankind.

ALL-BEARING, *adj.* That which bears every thing; omniparous:

Thus while he spoke the sovereign plant he drew,
Where on th' *all-bearing* earth unmark'd it grew. *Pope*.

ALL-CHEERING, *adj.* That which gives gaiety and cheerfulness to all:

Soon as the *all-cheering* sun
Should, in the farthest east, begin to draw
The shady curtains from Aurora's bed. *Shakespeare*.

ALL-COMMANDING, *adj.* Having the sovereignty over all.—He now sets before them the high and shining idol of glory, the *all-commanding* image of bright gold. *Raleigh*.

ALL-COMPOSING, *adj.* That which quiets all men, or every thing:

Wrapt in embow'ring shades Ulysses lies,
His woes forgot! but Pallas now address,
To break the bands of *all-composing* rest. *Pope*.

ALL-CONQUERING, *adj.* That which subdues every thing:

Second of Satan sprung, *all-conquering* death!
What think'st thou of our empire now? *Milton*.

ALL-CONSUMING, *adj.* That which consumes every thing:

By age unbroke—but *all-consuming* care
Destroys perhaps the strength that time would spare. *Pope*.

ALL-DEVOURING, *adj.* That which eats up every thing:
Secure from flames, from envy's fiercer rage,
Destructive war, and *all-devouring* age. *Pope*.

ALL-FOURS, *f.* A low game at cards, played by two, so named from the four particulars by which it is reckoned, and which, joined in the hand of either of the parties, are said to make *all-fours*.

ALL-GOOD, *f.* in botany. See CHENOPodium.

ALL HAIL, *f.* [from *all*, and *hail* for *health*.] All health. This is therefore not a compound, though perhaps usually reckoned among them; a term of salutation. *Salve*, or *salute*:

All hail, ye fields, where constant peace attends!

All hail, ye sacred solitary groves!

All hail, ye brooks, my true, my real, friends,

Whose conversation pleases and improves! *Walsh*.

ALL-HALLOWS, or ALL-SAINTS, *f.* in the calendar, denotes a festival celebrated on the first of November, in commemoration of all the saints, or holy men. The number of saints being so excessively multiplied, it was found too burthensome to dedicate a feast-day to each. Hence an expedient was had recourse to, by commemorating such in a lump as had not their own days. Boniface IV. in the ninth century, introduced the feast of All-Saints in Italy, which was soon after adopted into the other churches.

ALLHALLOWTIDE, *f.* The term near All-Saints.—Cut off the bough about *Allhallowtide*, in the bare place, and set it in the ground, and it will grow to be a fair tree in one year. *Bacon*.

ALL-HEAL, *f.* in botany. See STACHYS.

ALL-JUDGING, *adj.* That which has the sovereign right of judgment:

I look with horror back,
That I detest my wretched self, and curse
My past polluted life. *All-judging* heaven,
Who knows my crimes, has seen my sorrow for them.

Rowe.

ALL.

ALL-KNOWING, *adj.* Omniscient; all-wise.—Shall we repine at a little misplaced charity, we, who could no way foresee the effect; when an *all-knowing* all-wise Being showers down every day his benefits on the unthankful and undeserving? *Atterbury*.

ALL-MAKING, *adj.* That created all; omnific.

ALL-POWERFUL, *adj.* Almighty; omnipotent; possessed of infinite power.—O *all-powerful* Being! the least motion of whose will can create or destroy a world; pity us, the mournful friends of thy distressed servant. *Swift*.

ALL-SAINTS BAY, one of the most rich and fertile captainships in Brasil, producing abundance of cotton, and vast quantities of sugar. It has several cities and towns, of which St. Salvador is the capital. Lat. 12. 3. S. lon. 40. 10. W.

ALL-SEER, *f.* He that sees or beholds every thing; he whose view comprehends all things:

That high *All-seer*, which I dallied with,
Hath turn'd my feigned prayer on my head,
And giv'n in earnest what I begg'd in jest. *Shakespeare*.

ALL-SEEING, *adj.* That beholds every thing:

The same First Mover certain bounds has plac'd,
How long those perishable forms shall last;
Nor can they last beyond the time assign'd
By that *all-seeing* and all-making mind. *Dryden*.

ALL-SOULS, in the calendar, denotes a feast-day, held on the second of November, in commemoration of all the faithful deceased. The feast of All-Souls was first introduced in the eleventh century, by Odilon abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches.

ALL-SUFFICIENT, *adj.* Sufficient to every thing.—The testimonies of God are perfect, the testimonies of God are *all-sufficient* unto that end for which they were given. *Hooker*.

ALL-WISE, *adj.* Possess of infinite wisdom.—There is an infinite, eternal, *all-wise*, mind governing the affairs of the world. *South*.

Supreme, *all-wise*, eternal, potentate!
Sole author, sole disposer, of our fate! *Prior*.

ALL'IA, or **ALLAH**, *f.* the name by which the professors of Mahometanism call the Supreme Being. The term *alla* is Arabic, derived from the verb *alah*, to adore. It is the same with the Hebrew *Eloah*, which signifies the *Adorable Being*.

ALLAHABAD, a city of Oude, in Hindostan, seated at the confluence of the Ganges and Jumna. It is 470 miles N. W. of Calcutta. Lat. 25. 45. N. lon. 82. 0. E.

ALLAMANDA, *f.* [from Mr. Frederic Allamand, a Dutch surgeon.] In botany, a genus of the pentandria monogynia class, in the natural order of contortæ. The generic characters are—Calyx: perianthium one-leafed, five parted; parts ovate, acute. Corolla: one-petalled, funnel-shaped; tube cylindric; border semiquinquesid., swelling; divisions spreading; obtuse. Stamina: filaments scarcely any; antheræ five, sagittate, converging in the throat of the tube. Pistillum: germ oval, surrounded with a ring; style filiform, the length of the tube; stigma headed, contracted in the middle. Pericarpium: an orbicular, lens-shaped, echinate, one-celled, two-valved, capsule. Seeds: very many, imbricate, orbiculate, flat, edged with a membranous wing.—*Essential Character*. Corolla, contorted; capsule lens-shaped, erect, echinate, one-celled, two-valved, many seeded.

There is but one species known, called *allamanda cathartica*. It is a milky shrub, with its stem twining, and climbing on trees: branches round, pubescent. Leaves in fours, on very short petioles, elliptic-lanceolate, shining, quite entire, with a villous rachis. Flowers terminal, in erect racemes: twin, pedunculate; corolla yellow. The leaves are cathartic, and an infusion of them is used at

Surinam in the cholic. It is found wild there, at Cayenne, in Guiana, &c. by the sea-side. Introduced in 1785, by Baron Hake.

AL'LANTOIS, or **ALLANTOIDES**, *f.* [from *αλλας*, Gr. a sausage, or hog's pudding; because in some brutes it is long and thick.] The membrane so called which forms part of the secundines; it being also named *alantoides farciminalis*, the "urinary membrane." Some assert, and others deny, the existence of this in the human species. Dr. Hale says, if you first find the hole whence the urine came forth, if the allantois is not too much torn, you may blow up this membrane with a pipe, to its full dimensions, and thus you can separate much of it from the chorion. De Graaf says, that all the membranes of the secundines will appear distinct by blowing, with a pipe, into a hole made through the chorion; and that the allantois is no where perforated by the funis umbilicalis; for the funis does not pass through any of the membranes, it only adheres to the inside of the amnios. Dr. James says, that the allantois, or urinary membrane, does not cover the whole fœtus, but only that part of it which respects the chorion, and does not lie on the placenta; for the allantois cannot be extended any farther than to the edge of the placenta, where the amnios and chorion are so closely joined by fibres, that no membrane can come between them; wherefore the allantois is not every where fastened to the chorion, and consequently is not of the same shape as the other membranes.

This membrane contains, it is said, the urine that is discharged from the bladder: what passes from the bladder into the urachus cannot, in a natural state, return by it. There have been instances of persons discharging their urine at the navel. It is also asserted by some, that the liquor may be forced from the bladder to the allantois by fitting a pipe to it, and from the allantois to the bladder. If you raise the allantois a little, and squeeze it with the hand, you force the liquor into the bladder, and thro' the penis. Neither artery nor vein can be discovered in this membrane. If any anatomists have ever demonstrated this membrane, not one of them has given a distinct figure of it; all the engravings which are designed to represent it, are too incorrect to afford us a distinct idea. Dr. Hunter, in his lectures, absolutely denies the existence of this membrane, except in brutes. See on this subject what Dr. Hales hath inserted in the *Philos. Trans. Abr.* vol. iv. and Mons. Littré in the *Mem. Acad. de Sciences*, 1701.

ALL'AS, a town on, and a strait between, the Isle of Lambock and Combava, in the East Indies. Lat. 10. 20. N. lon. 86. 14. E.

ALLATIUS (Léo), Keeper of the Vatican library, a native of Scio, and a celebrated writer of the 17th century. He was of great service to the gentlemen of Port Royal in the controversy they had with M. Claude touching the belief of the Greeks with regard to the eucharist. No Latin was ever more devoted to the see of Rome, or more inveterate against the Greek schismatics, than Allatius. He never engaged in matrimony; nor was he ever in orders; and Pope Alexander VII. having asked him why he did not enter into orders? he answered, "Because I would be free to marry." The pope rejoined, "If so, why do you not marry?" "Because (replied Allatius) I would be at liberty to take orders." Thus, as Mr. Bale observes, he passed his whole life, wavering betwixt a parish and a wife; sorry, perhaps, at his death, for having chosen neither of them; when, if he had fixed upon one, he might have repented his choice for thirty or forty years. If we believe John Patricius, Allatius had a very extraordinary pen, with which, and no other, he wrote Greek for forty years; and we need not be surprised, that, when he lost it, he was so grieved, that he could scarcely forbear crying. He published several manuscripts, several translations of Greek authors, and several pieces of his own composing. In his compositions he is thought to show more

more erudition than judgment; he used also to make frequent digressions from one subject to another. He died at Rome in 1669, aged 83.

To ALLA'Y, *v. a.* [from *alloyer*, Fr. to mix one metal with another in order to coinage; it is therefore derived by some from *à la loi*, "according to law;" the quantity of metals being mixed according to law; by others, from *allier*, to unite; perhaps from *allocare*, to put together.] To mix one metal with another, to make it fitter for coinage. In this sense, most authors preserve the original French orthography, and write *alloy*. See ALLOY.—To join any thing to another, so as to abate its predominant qualities. It is used commonly in a sense contrary to its original meaning, and is, to make something bad, less bad. To obtund; to repress; to abate. To quiet; to pacify; to repress. The word, in this sense, I think not to be derived from the French *alloyer*, but to be the English word *lay*, with a before it according to the old form. *Johnson*.

ALLAY, *f.* [*alloy*, Fr.] The metal of a baser kind mixed in coins, to harden them, that they may wear less:

For fools are stubborn in their way,
As coins are harden'd by th' alloy.

Butler.

Gold is alloyed with silver and copper, two carats to a pound Troy; silver with copper only, of which eighteen pennyweights is mixed with a pound. Cowell thinks the alloy is added to countervail the charge of coining, which might as well have been done only by making the coin less. Any thing which, being added, abates the predominant qualities of that with which it is mingled; in the same manner, as the admixture of baser metals allays the qualities of the first mass.—Dark colours easily suffer a sensible alloy, by little scattering light. *Newton*.—Alloy being taken from baser metals, commonly implies something worse than that with which it is mixed.—The joy has no alloy of jealousy, hope, and fear. *Roscommon*.

ALLAY'ER, *f.* The person or thing which has the power or quality of allaying.—Phlegm and pure blood are reputed *allayers* of acrimony: and Avicenn countermands letting blood in choleric bodies; because he esteems the blood a *frænum bilis*, or a bridle of gall, obtunding its acrimony and fierceness. *Harvey*.

ALLAY'MENT, *f.* That which has the power of allaying or abating the force of another.

ALLEGANY, or APPALA'CHIAN MOUNTAINS, a chain or range of mountains in North America, which extend north-easterly, and south-westerly, nearly parallel with the coast of the southern states, through which they run. They occupy a space of about 900 miles in length, and from sixty to 200 in breadth, to the eastward of the Mississippi and lakes. The different ridges which compose this immense range have different names in different states, as the Kittattiny, the Blue, the North, and the South, Mountains. They are not confusedly scattered and broken, rising here and there into high peaks over-topping each other, but stretch along in uniform ridges, scarcely half a mile high, spreading towards the south. Some of them terminate in high perpendicular bluffs; others gradually subside into a level country, giving rise to the rivers which run southerly into the gulph of Mexico. In the back parts of Pennsylvania, scarcely one acre in ten of this range is capable of culture; in other parts extensive tracts of fine arable and pasture land intervene between the ridges, having generally a rich black soil, and some of the mountains will admit of cultivation almost to their tops.

ALLEGANY, a river of North America, which rises in the Allegany Mountains, in lat. 42. 0. N. At Fort Venango, at the mouth of French Creek, it is 200 yards wide, and navigable for light batteaux. At Fort Pitt it joins the Monongahela; and then it is called the Ohio. See OHIO.

ALLEGA'TA, [Lat.] a word anciently subscribed at the bottom of rescripts and constitutions of the emperors; as *signata*, or *testata*, was under other instruments.

ALLEGA'TION, *f.* [from *allege*.] Affirmation; de-

claration. The thing alleged or affirmed. An excuse; a plea.—I omitted no means to be informed of my errors; and I expect not to be excused in any negligence on account of youth, want of leisure, or any other idle *allegations*. *Pope*.

To ALLE'GE, *v. a.* [*allego*, Lat.] To affirm; to declare; to maintain. To plead as an excuse, or produce as an argument.—If we forsake the ways of grace or goodness, we cannot *allege* any colour of ignorance, or want of instruction; we cannot say we have not learned them, or we could not. *Sprat*.

ALLE'GEABLE, *adj.* That which may be alleged.

ALLE'GEMENT, *f.* The same with ALLEGATION.

ALLE'GER, *f.* He that alleges.

ALLE'GIANCE, *f.* [*allegiance*, Fr.] In law, is the tie, or *ligamen*, which binds the subject to the king, in return for that protection which the king affords the subject. The thing itself, or substantial part of it, is founded in reason and the nature of government; the name and the form are derived to us from our Gothic ancestors. Under the feodal system, every owner of lands held them in subjection to some superior or lord, from whom or from whose ancestors the tenant or vassal had received them: and there was a mutual trust or confidence subsisting between the lord and vassal, that the lord should protect the vassal in the enjoyment of the territory he had granted him; and, on the other hand, that the vassal should be faithful to the lord, and defend him against all his enemies. This obligation on the part of the vassal was called his *fidelitas*, or fealty: and an oath of fealty was required by the feodal law to be taken by all tenants to their landlord, which is couched in almost the same terms as our ancient oath of allegiance; except that, in the usual oath of fealty, there was frequently a saving or exception of the faith due to a superior lord by name, under whom the landlord himself was perhaps only a tenant or vassal. But when the acknowledgement was made to the absolute superior himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any saving or exception. Land held by this exalted species of fealty, was called *feudum ligium*, a liege fee, the vassals *homines ligii*, or liege men; and the sovereign, their *dominus ligius*, or liege lord. And, when sovereign princes did homage to each other for lands held under their respective sovereignties, a distinction was always made between *simple* homage, which was only an acknowledgement of tenure; and *liege* homage, which included the fealty before mentioned, and the services consequent upon it. In Britain, when it became a settled principle of tenure, that all lands in the kingdom were holden of the king as their sovereign and lord paramount, no oath but that of fealty could be taken to inferior lords; and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy, the term allegiance was soon brought to signify all other engagements which are due from subjects to their prince, as well as those duties which were simply and merely territorial. And the oath of allegiance, as administered in England for upwards of 600 years, contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom." But, at the revolution, the terms of this oath being thought perhaps to favour too much the notion of non-resistance, the present form was introduced by the convention parliament, which is more general and indeterminate than the former; the subject only promising "that he will be faithful and bear true allegiance to the king," without mentioning "his heirs," or specifying in the least wherein that allegiance consists. The oath of supremacy is principally calculated as a renunciation of the pope's pretended authority: and the oath of abjuration, introduced in the reign of king William, very amply supplies the loose and general texture

ture of the oath of allegiance; it recognizing the right of his majesty, derived under the act of settlement; engaging to support him to the utmost of the juror's power; promising to disclose all traitorous conspiracies against him; and expressly renouncing any claim of the descendants of the late pretender, in as clear and explicit terms as the English language can furnish. This oath must be taken by all persons in any office, trust, or employment; and may be tendered by two justices of the peace to any person whom they shall suspect of disaffection. And the oath of allegiance may be tendered to all persons above the age of twelve years, whether natives, denizens, or aliens.

But, besides these express engagements, the law also holds that there is an *implied*, *original*, and *virtual*, allegiance, owing from every subject to his sovereign, antecedently to any express promise, although the subject never swore any faith or allegiance in form. Thus Sir Edward Coke very justly observes, that "all subjects are equally bounden to their allegiance as if they had taken the oath; because it is written by the finger of the law in their hearts, and the taking of the corporeal oath is but an outward declaration of the same."

Allegiance, both express and implied, is however distinguished by the law into two sorts or species, the one *natural*, the other *local*; the former being also perpetual, the latter temporary.

Natural allegiance is such as is due from all men born within the king's dominions immediately upon their birth. *Local* allegiance is that which is due from an alien, or stranger born, for so long a time as he continues within the king's dominion and protection; and it ceases, when such stranger transfers himself from this kingdom to another. *1 Blackst. 366, 370.*

By the common law, every layman, above the age of twelve years, was obliged to take the oath of allegiance at the tourn or leet; and it was a high contempt to refuse it. *1 Infl. 68.*

The *oath of allegiance*, or rather the *allegiance* itself, is held to be applicable, not only to the political capacity of the king, or regal office, but to his natural person and blood-royal: and for the misapplication of their allegiance, viz. to the regal capacity or crown, exclusive of the person of the king, were the Spencers banished in the reign of Edward II. And from hence arose that principle of personal attachment and affectionate loyalty, which induced our forefathers to hazard all that was dear to them, life, fortune, and family, in defence and support of their liege lord and sovereign. It is to be observed, however, in explanation of this allegiance, that it does not preclude resistance to the king, when his misconduct or weakness is such as to make resistance beneficial to the community. It seems fairly presumable, that the convention parliament, which introduced the oath of allegiance in its present form, did not intend to exclude all resistance: since the very authority by which the members sat together, was itself the effect of a successful opposition to an acknowledged sovereign. Again: The allegiance above described can only be understood to signify obedience to lawful commands. If, therefore, the king should issue a proclamation, levying money or imposing any service or restraint upon the subject, beyond what the law authorized, there would exist no sort of obligation to obey such a proclamation, in consequence of having taken the oath of allegiance. Neither can allegiance be supposed to extend to the king after he is actually and absolutely deposed, driven into exile, or otherwise rendered incapable of exercising the regal office. The promise of allegiance implies, that the person to whom the promise is made continues king; that is, continues to exercise the power, and afford the protection, which belong to the office of king; for it is the possession of these which makes such a particular person the object of the oath.

ALLE'GIANT, adj. Loyal; conformable to the duty of allegiance: a word not now used.

ALLEGORIC, adj. After the manner of an allegory; not real; not literal.

A kingdom they portend thee; but what kingdom, Real or *allegoric*, I discern not. *Milton.*

ALLEGORICAL, adj. In the form of an allegory; not real; not literal; mythical.—When our Saviour said, in an *allegorical* and mystical sense, Except ye eat the flesh of the Son of Man, and drink his blood, ye have no life in you; the hearers understood him literally and grossly. *Benley.*

ALLEGORICALLY, adv. After an allegorical manner.—Virgil often makes Iris the messenger of Juno, *allegorically* taken for the air. *Peacham.*

ALLEGORICALNESS, f. The quality of being allegorical.

To ALLEGORIZE, v. a. To turn into allegory; to form an allegory; to take in a sense not literal.—An alchymist shall reduce divinity to the maxims of his laboratory, explain morality by sal, sulphur, and mercury; and *allegorize* the scripture itself, and the sacred mysteries thereof, into the philosopher's stone. *Locke.*

ALLEGORY, f. [*allegoric*, Fr. *allegoria*, Sp. *allegoria*, It. and Lat. *αλληγορία*, of *αλλο*, another, and *αγορευειν*, to speak, Gr.] A figure in rhetoric, which consists in choosing a secondary subject, having all its properties and circumstances resembling those of the principal subject, and describing the former in such a manner as to represent the latter. The principal subject is thus kept out of view, and we are left to discover it by reflection. There cannot be a finer or more correct allegory than that in psalm lxxx. where a vineyard is made to represent God's chosen people, the Jews.

Nothing gives greater pleasure than an allegory, when the representative subject bears a strong analogy, in all its circumstances, to that which is represented. But some writers are unlucky in their choice, the analogy being generally so faint and obscure, as rather to puzzle than to please. Allegories, as well as metaphors and similes, are unnatural whenever they express any severe passion which totally occupies the mind. See *METAPHOR*.

ALLE'GRI (Antonio), called *Correggio* from the place of his birth, an eminent historical painter, was born in the year 1494, and died in 1534. Being descended of poor parents, and educated in an obscure village, he enjoyed none of those advantages which contributed to form the other great painters of that illustrious age. He saw none of the statues of ancient Greece or Rome; nor any of the works of the established schools of Rome and Venice. But Nature was his guide; and Correggio was one of her favourite pupils. To express the facility with which he painted, he used to say that he always had his thoughts ready at the end of his pencil. The agreeable smile, and the profusion of graces, which he gave to his madonnas, saints, and children, have been taxed with being sometimes unnatural; but still they are amiable and seducing. An easy and flowing pencil, an union and harmony of colours, and a perfect intelligence of light and shade, give an astonishing relief to all his pictures, and have been the admiration both of his contemporaries and his successors. Annibal Caracci, who flourished fifty years after him, has been particularly lavish in his commendation of this great artist.

ALLE'GRO, f. in music, an Italian word denoting one of the six distinctions of time, and shews that the part is to be played in a sprightly, brisk, lively, and gay, manner. *Piu ALLEGRO*, signifies, that the part it is joined to should be sung or played quicker; as *Poco piu ALLEGRO* intimates, that the part to which it refers ought to be played or sung a little more briskly than *allegro* alone requires.

ALLEIN (Joseph), the son of Tobias Allein, was born at Devizes, in Wiltshire, in 1633, and educated at Oxford. In 1655, he became assistant to Mr. Newton, in Taunton-Magdalen,

Magdalen, in Somersetshire; but was deprived for non-conformity. He died in 1668, aged 35. He was a man of great learning, and greater charity; preserving, though a nonconformist and a severe sufferer on that account, great respect for the church, and loyalty to his sovereign. He wrote several books of piety, which are highly esteemed; but his "Alarm to Unconverted Sinners" is more famous than the rest.

ALLELU'JAH, *f.* [This word is falsely written for *Hallelujah*, הלל and יה.] A word of spiritual exultation, used in hymns; it signifies, *Praise God*.—He will set his tongue to those pious divine strains, which may be a proper prelude to those *allelujahs* he hopes eternally to sing.

ALLEMAN'DE, *f.* [Ital.] A kind of grave solemn music, with good measure, and a slow movement. It is also a brisk kind of dance, very common in Germany and Switzerland.

ALLEMA'NNIC, *f.* in a general sense, denotes any thing belonging to the ancient Germans. Thus, we meet with Allemannic history, Allemannic language, Allemannic law, &c.

ALLEN (Thomas), a celebrated mathematician of the 16th century. He was born at Uttoxeter in Staffordshire, in 1542; was admitted a scholar of Trinity-college, Oxford, in 1561; where he took his degree of master of arts in 1567. In 1570 he quitted his college and fellowship, and retired to Gloucester-hall, where he studied very closely, and became famous for his knowledge in antiquity, philosophy, and mathematics. He received an invitation from Henry earl of Northumberland, a great friend and patron of the mathematicians, and he spent some time at the earl's house; where he became acquainted with those celebrated mathematicians Thomas Harriot, John Dee, Walter Warner, and Nathaniel Torporley. Robert earl of Leicester, too, had a great esteem for Allen, and would have conferred a bishopric upon him; but his love for solitude and retirement made him decline the offer. His great skill in the mathematics gave occasion to the ignorant and vulgar to look upon him as a magician or conjurer. Allen was indefatigable in collecting scattered manuscripts relating to history, antiquity, astronomy, philosophy, and mathematics: which collections have been quoted by several learned authors, and mentioned as in the Bibliotheca Alleniana. He published in Latin the second and third books of Ptolemy, "Concerning the Judgment of the Stars," or, as it is usually called, of the "Quadripartite Construction," with an exposition. He wrote also notes on many of Lilly's books, and some on John Bale's work, "De Scriptoribus Maj. Britanniae." He died at Gloucester-hall in 1632, being 90 years of age.

Mr. Burton, the author of his funeral oration, calls him the very soul and fun of all the mathematicians of his age. And Selden mentions him as a person of the most extensive learning and consummate judgment, the brightest ornament of the university of Oxford. Also Camden says, he was skilled in most of the best arts and sciences. A. Wood has also transcribed part of his character from a manuscript in the library of Trinity-college, in these words:—"He studied polite literature with great application; he was strictly tenacious of academic discipline, always highly esteemed by foreigners and those of the university, and by all of the highest stations in the church of England, and the university of Oxford. He was a sagacious observer, an agreeable companion, &c."

ALLEN (John), archbishop of Dublin in the reign of Henry VIII. was educated in the university of Oxford; from whence removing to Cambridge, he there took the degree of bachelor of laws. He was sent by Dr. Warham, archbishop of Canterbury, to the pope, about certain matters relating to the church. He continued at Rome nine years, and was created doctor of laws. After his return, he was appointed chaplain to cardinal Wolsey, and was commissary or judge of his court as legate *à latere*; in the execution of which office he was suspected of great dishonesty, and even perjury. He assisted the cardinal in visit-

ing, and afterwards suppressing, forty of the smaller monasteries, for the erection of his college at Oxford and that at Ipswich. The cardinal procured for him the living of Dalby in Leicestershire, though it belonged to the master and brethren of the hospital at Burton Lazars. In the year 1525 he was incorporated doctor of laws in the university of Oxford. On the 13th of March 1528 he was consecrated archbishop of Dublin; and about the same time was made chancellor of Ireland. He wrote several pieces relating to the church. His death, which happened in July 1534, was very tragical: for, being taken in a time of rebellion by Thomas Fitzgerald, eldest son to the earl of Kildare, he was by his command most cruelly murdered, being brained like an ox, at Tartaine in Ireland, in the 58th year of his age.

ALLEN (Sir Thomas), vice-admiral of the white, was a distinguished commander in the British navy, during the war between the English and Dutch, in the reign of Charles II. In the year 1665, he attacked a Dutch fleet, richly laden, from Smyrna, consisting of forty merchant ships, and four men of war. In the engagement, which happened near Cadiz, the Dutch commodore, Brackel, was killed, and four of the richest ships taken; the rest took refuge in the bay of Cadiz, where he blocked them up for a considerable time. In the celebrated action with Van Tromp, which happened in 1666, Sir Thomas Allen commanded the white squadron of the English fleet, under prince Rupert and the earl of Albemarle. He attacked the Dutch van, which he entirely routed; and it is remarkable that he killed the three admirals who commanded it. The Dutch are said to have lost twenty ships in this action, and near 4000 men. The English lost only one ship, the Resolution, which was burnt; three captains were killed, and about 300 private men.

ALLEN (isle of), in the county of Kildare, in Ireland, though apparently an English name, seems to be only a corruption of the Irish *Hy-al-lain*, i. e. the district of the great plain country. In this district stands the Hill of Allen, the Mount Croinla of the ancient bards. The bog of Allen, an immense tract of turf-bog, or peat-moist, the largest in the kingdom, runs through part of the counties of Dublin, Carlow, Kildare, Kilkenny, and Meath. A great part of it has of late years been reclaimed by burning, and the sowing of rape-seed.

ALLENBURG, a little town of Tapiau, in Prussia, commodiously situated on the river Alle. Lat. 51. 30. N. lon. 22. 10. E.

ALLENDORF, a small town in the circle of the Upper Rhine, and in the landgraviate of Hesse Cassel, remarkable for its salt-works and three stone-bridges. It is seated on the river Weser, fifteen miles east of Cassel. Lat. 51. 26. N. lon. 10. 5. E.

ALLER, a river which runs through the duchy of Lunenburg, and falls into the Weser a little below Verden.

ALLER, *good*, in our ancient writers. The word *aller* serves to make the expression of superlative signification. So, *aller-good* is the greatest good. Sometimes it is written *alder*.

ALLER'ION, or **ALE'ION**, *f.* in heraldry, a sort of eagle without beak or feet, having nothing perfect but the wings. They differ from martlets by having their wings expanded, whereas those of the martlet are close; and denote Imperialists vanquished and disarmed; for which reason they are more common in French than in German coats of arms.

AL'LESTRY (Richard, D. D.) an eminent divine, born at Uppington in Shropshire, in March 1619; was educated in the grammar-school at Coventry, and afterwards at Christ-church in Oxford. He took up arms for king Charles I. and was sometimes seen with his musket in one hand and his book in the other. He was very active in the service of Charles II. before his restoration, and was employed by the royalists in transacting business with that prince during his exile; but was at last seized at Dover by a party of soldiers, and committed prisoner to

to Lambeth-house, where he was confined six or eight weeks: but soon after the restoration he was made canon of Christ-church, created doctor of divinity, and appointed chaplain in ordinary to the king, and regius professor of divinity. In 1665 he was appointed provost of Eton college, where he raised the school, which he found in a low condition, to an uncommon pitch of reputation. The west side of the outward quadrangle of that college was built from the ground at his expence. The excellent Dr. Hammond, who was his intimate friend, left him his valuable library, which he himself afterwards bequeathed to his successors in the divinity-chair. He was eminent for his piety, benevolence, and integrity; for the sincerity of his friendship, and his disinterested temper. He wrote several books; and a collection of his sermons was printed after his decease, by Dr. Fell, bishop of Oxford. He died August 20, 1680.

AL'LESTRY (Jacob), an English poet of the last century. He was the son of James Allestry, a bookseller of London, who was ruined by the great fire in 1666. Jacob was educated at Westminster-school, entered at Christ-church, Oxford, in 1671, at the age of eighteen, and was elected student in 1672. He took the degree in arts; was music-reader, and *terræ filius*, in 1681; both which offices he executed with great applause, being esteemed a good philologist and poet. He had a chief hand in the verses and pastorals spoken in the theatre at Oxford May 21, 1681, by Mr. William Savile, second son of the marquis of Halifax, and George Cholmondeley, second son of Robert Viscount Kells (both of Christ-church), before James duke of York, his duchess, and the lady Anne; which verses and pastorals were afterwards printed in the "Examen Poeticum." He died October 15, 1686.

ALLEVEU'RE, *f.* A small brass Swedish coin, worth about a halfpenny English money.

To ALLEVIATE, *v. a.* [*allevio*, Lat.] To make light; to ease; to soften. To extenuate; as, He *alleviates* his fault by an excuse.—Most of the distempers are the effects of abused plenty and luxury, and must not be charged upon our Maker; who, notwithstanding, hath provided excellent medicines, to *alleviate* those evils which we bring upon ourselves. *Bentley.*

ALLEVIATION, *f.* The act of making light, of allying, or extenuating. That by which any pain is eased, or fault extenuated.—All apologies for, and *alleviations* of, faults, though they are the heights of humanity, yet they are not the favours but the duties of friendship. *South.*

ALLEY, *f.* [*allée*, a walk, of *aller*, Fr. to go.] A walk in a garden.

Come, my fair love, our morning's task we lose;
Some labour ev'n the easiest life would choose:
Our's is not great; the dangling boughs to crop,
Whose too luxuriant growth our *alleys* stop. *Dryden.*

A passage in towns narrower than a street.—A back friend, a shoulder clapper, one that commands the passages of *alleys*, creeks, and narrow lands. *Shakespeare.*

AL'LEY, *f.* in perspective, that which, in order to have a greater appearance of length, is made wider at the entrance than at the termination.

AL'LEY, *f.* in the new husbandry, implies the vacant space between the outmost row of corn on one bed and the nearest row to it on the next parallel bed; and it is usually about four feet in breadth, exclusive of the partitions between the rows of corn in the beds.

AL'LEY (William), bishop of Exeter in the reign of queen Elizabeth, was born at Great Wycomb, in Buckinghamshire. From Eton school, in the year 1523, he removed to king's college, Cambridge, where he took the degree of bachelor of arts. He also studied some time at Oxford; afterwards he married, was presented to a living, and became a zealous reformer. Upon queen Mary's accession, he left his cure and retired into the north of England; where he maintained his wife and himself by teaching a school, and practising physic. Queen Elizabeth af-

cending the throne, he went to London, where he acquired great reputation by reading a divinity-lecture at St. Paul's, and in July, 1560, was consecrated bishop of Exeter. He died on the 15th of April, 1570, and was buried at Exeter, in the cathedral. He wrote, 1. "The Poor Man's Library," 2 vol. fol. These volumes contain twelve lectures on the first epistle of St. Peter, read at St. Paul's. 2. "A Hebrew Grammar." Whether it was ever published, is uncertain. He translated the Pentateuch in the version of the bible which was undertaken by queen Elizabeth's command.

AL'LEYN (Edward), a celebrated English actor in the reigns of queen Elizabeth and king James, and founder of the college at Dulwich in Surry, was born at London, Sept. 1, 1566. Haywood, in his prologue to Marlowe's Jew of Malta, calls him, Proteus for shapes, and Roscius for a tongue. He usually played the capital parts, and was one of the original actors in Shakespeare's plays. It may appear surprising how one of Mr. Alleyn's profession should be enabled to erect such an edifice as Dulwich College, and liberally endow it for the maintenance of so many persons. But it must be observed, that he had some paternal fortune, which, though small, might lay a foundation for his future affluence. He was himself the first master of his college; so that, to make use of the words of Mr. Haywood, one of his contemporaries, "He was so mingled with humility and charity, that he became his own pensioner, humbly submitting himself to that proportion of diet and clothes which he had bestowed on others." We have no reason to think he ever repented of this distribution of his substance; but, on the contrary, that he was entirely satisfied, as appears from the following memorial in his own writing, found amongst his papers: "May 26, 1620—My wife and I acknowledged the fine at the common pleas bar, of all our lands to the college: blessed be God that he has given us life to do it." He died Nov. 25, 1626, in the 61st year of his age, and was buried in the chapel of his new college, where there is a tombstone over his grave, with an inscription. His original Diary is also there preserved.

AL'LIA, a river of Italy, which, running down a steep channel from the mountains of Crustumium, mixes with the Tiber, forty miles from Rome. It is famous for the great slaughter of the Romans by the Gauls, under Brennus.

ALLIANCE, *f.* [*alleanza*, It. *aliança*, Sp. *alliance*, of *allier*, Fr. of *alligo*, Lat. to tie or unite together.] The state of connection with another by confederacy; a league. In this sense, our histories of queen Anne mention *the grand alliance*. Relation by marriage. Relation by any form of kindred. The act of forming or contracting relation to another; the act of making a confederacy. The persons allied to each other.

ALLIANCE, with the ancient Romans, though a sort of servitude, was much coveted. Ariarathes, we are told by Polybius, offered a sacrifice to the gods by way of thanksgiving, for having obtained an alliance. The reason was, that thenceforwards people were sure not to receive any injuries except from them. There were different sorts of allies: some only united to them by a participation of the privileges of Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them, as Massinissa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which last, by a long alliance, became subjects, as the kings of Bithynia, Cappadocia, Egypt, and most of the cities of Greece: lastly, others by compulsive treaties, and the law of subjection, as Philip and Antiochus. For they never granted peace to an enemy without making an alliance with him; that is, they never subdued any people without using it as a means of subduing others.

The forms or ceremonies of alliances have been various in different ages and countries. Among us, signing and swearing are the chief; anciently eating and drinking together, chiefly offering sacrifices together, were the customary

tomary rite of ratifying an alliance. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs; were sacrificed on this occasion. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a sharp stone, dipping herein a piece of their garments, and therewith smearing seven stones, at the same time invoking the gods Vrotalt and Alilat, i. e. according to Herodotus, Bacchus and Urania. Among the people of Cholchis, the confirmation of alliances is said to be effected by one of the princes offering his wife's breasts to the other to suck, which he was obliged to do till there issued blood.

ALLIANCE, in a figurative sense, is applied to any kind of union or connection; thus we say, there is an alliance between church and state.

ALLIAR ZERIS. A term used in preparing the philosopher's stone, to signify philosophical copper, which is also called water of quicksilver, white copper, and many other names.

ALLIARIA, *f.* in botany. See ERYSIMUM.

ALLICIENCY, *f.* [*allicio*, Lat. to entice or draw.] The power of attracting any thing; magnetism; attraction.—The feigned central alliciency is but a word, and the manner of it full occult. *Glanville.*

ALLIENCY, *f.* [from *allidere*, Lat.] Enticingness; alluringness.

To ALLIGATE, *v. a.* [*alligo*, Lat. from *ad*, to, and *ligo*, to bind.] To tie one thing to another; to unite.

ALLIGATI, *f.* in Roman antiquity, the basest kind of slaves, who were usually kept fettered. The Romans had three degrees, or orders, of slaves or servants; the first employed in the management of their estates; the second in the menial or lower functions of the family; the third, called alligati, above-mentioned.

ALLIGATION, *f.* The act of tying together; the state of being so tied. In arithmetic, the rule that teaches to adjust the price of compounds, formed of several ingredients of different value. See ARITHMETIC.

ALLIGATOR, *f.* in zoology, a synonyme of the *lacerta crocodilis*. See LACERTA.

ALLIGATOR-PEAR, *f.* in botany. See LAURUS.

ALLIGATURE, *f.* The link, or ligature, by which two things are joined together.

ALLIONIA, *f.* [named in honour of *Charles Allioni*, professor of botany at Turin, &c.] In botany, a genus of the tetrandria monogynia class, ranking in the natural order of aggregatæ. The generic characters are—Calyx: perianthium common to three flowers, simple, oblong, five-parted; parts ovate, acute, permanent; proper obsolete, superior. Corolla: proper one-petalled, funnel-shaped, edge quinquefid, erect. Stamina: filaments fetaceous, longer than the corolla, bending to one side; antheræ roundish. Pistillum: germ inferior, oblong; style fetaceous, longer than the stamens; stigma multifid, linear. Pericarpium: none. Seeds: solitary, oblong, five-cornered, naked. Receptaculum: naked.—*Essential Character.* Calyx common, oblong, simple, three-flowered; proper obsolete, superior. Corollules irregular. Receptaculum naked.

Species. 1. *Allionia violacea*: leaves heart-shaped, calyxes quinquefid. Native of South America.

2. *Allionia incarnata*: leaves obliquely ovate, calyxes triphyllous. This is an annual glaucous plant; a native of Peru, on rocks, and in sandy soils. Introduced into the Paris garden, from seeds sent by Dombey. It flourishes there, and perfects its seeds in the middle of summer.

ALLIOTICS, *f.* in pharmacy, medicines which by fermentation and cleansing alter and purify the blood.

ALLIOTH, *f.* a star in the tail of the greater bear, much used for finding the latitude at sea.

ALLISION, *f.* [from *allisum*, sup. of *allido*, of *ad*, to, and *lido*, to hurt.] The act of striking one thing against another.—There have not been any islands of note, or considerable extent, torn and cast off from the continent by

earthquakes, or severed from it by the boisterous *allision* of the sea. *Woodward.*

ALLITERATION, *f.* [*ad* and *litera*, Lat.] An ornament of language, chiefly used in poetry, which consists in the repetition of the same letter at certain intervals. It sometimes deforms language however instead of adorning it, especially in prose compositions; and, on this account, as well as the trivial degree of excellence which attaches to it even when judiciously applied, critics in general disregard it. The poets furnish numerous instances of alliteration, most of them perhaps accidental. Dr. Johnson cites the following line from Milton, as an instance:

“Behemothi biggest born—”

But Grey's Odes abound with alliterations; almost every srophe commencing and concluding with an alliterative line:

“Ruin seize thee, ruthless king.”

“To high-born Hoel's harp, or soft Llewellyn's lay.”

“Weave the warp, and weave the woof.”

“Stamp we our vengeance deep, and ratify his doom.”

“Regardless of the sweeping whirlwind's sway.”

“That hush'd in grim repose, expects his evening prey.”

From Mr. Pope we may also draw an example:

“Eternal beauties grace the shining scene,
Fields ever fresh, and groves for ever green.”

ALLIUM, *f.* [derivation uncertain. Some deduce it from *αλλεσθαι*, *exilire*, on account of its quick growth; others from *halo*, because it exhales a strong smell; others from *αγλαδης*, a head of garlic.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of spathaceæ. The generic characters are—Calyx: spathe common, roundish, withering, many-flowered. Corolla: petals six, oblong. Stamina: filaments six, subulate, often the length of the corolla; antheræ oblong, upright. Pistillum: germ superior, short, bluntly three-cornered, the corners marked with a line; style simple; stigma sharp. Pericarpium: capsule very short, broad, three-lobed, three-celled, three-valved. Seeds: few, roundish. In some species three alternate filaments are broad and forked, with an intermediate anther.—*Essential Character.* Corolla six-parted, spreading; spathe many-flowered; umbel heaped; capsule superior.

Species. 1. Stem-leaves flat; umbel capsule-bearing.

1. *Allium ampeloprasum*, or great round-headed garlic: umbel globose, stamens three-cusped, petals with a rough keel. This species is found growing naturally in the East, in Switzerland, in a small island in the Bristol channel, &c. With us it flowers in July and August.

2. *Allium porrum*, or common leek: umbel globose, stamens three-cusped, petals with a rough keel, root coated. It is very like the former, and perhaps only a variety. It flowers in April and May.

3. *Allium lineare*, or linear-leaved garlic: umbel globose, stamens three-cusped, twice as long as the corolla. This grows naturally in Siberia. It has narrower leaves than the common leek, the stalks are smaller, and do not rise so high; the heads of flowers are also smaller, and of a purple colour.

4. *Allium rotundum*, or great round-headed garlic: umbel subglobose, stamens three-cusped, side-flowers nodding. Native of the southern parts of Europe.

5. *Allium victorialis*, or long-rooted garlic: umbel rounded, stamens lanceolate, larger than the corolla, leaves elliptic. Grows on the mountains of Switzerland, Austria, Silesia, and Savoy. The wild plant has the root-leaves half an inch broad; transplanted into a garden, the leaves grow to four inches in breadth, without becoming much longer. The stem is from a foot to eighteen inches in height.

6. *Allium sub-hirsutum*, or hairy garlic or Dioscorides's moly: stamens awl-shaped, lower leaves hirsute. Native

of Italy, Spain, Africa, and the Levant. It flowers in May, and was cultivated in 1596 by Gerard.

7. *Allium magicum*, or Homer's garlic or moly: stamens simple, branches bulb-bearing. This species is preserved by many persons in the gardens for the sake of variety, but it has a very strong scent.

8. *Allium obliquum*, or oblique-leaved garlic: stamens filiform, thrice as long as the flower, leaves oblique. Native of Siberia.

9. *Allium ramosum*, or branched garlic: umbel globose, stamens awl-shaped longer, leaves linear, subconvex. This and the former grow naturally in Siberia, whence their seeds were sent to Petersburg, and from them the botanic gardens have been supplied; but they are only preserved for the sake of variety.

10. *Allium roseum*, or rose garlic: umbel flat topped, petals emarginate, stamens very short, simple. It grows naturally about Montpellier, and in Piedmont, in the fields, olive-grounds, and vineyards.

11. *Allium Tartaricum*, or Tartarian garlic: umbel flat, stamens simple, leaves femicylindrical. Native of Siberia.

11. Stem-leaves flat; umbel bulb-bearing. 12. *Allium sativum*, or common garlic: bulb compound, stamens three-cusped. Garlic is said to be found wild in the island of Sicily. It has many bulbs, commonly called cloves, invested with a white skin; the leaves are linear, long, and narrow, like those of grass. Cultivated in 1551; and probably much earlier.

13. *Allium scorodoprasum*, or rochambole: stamens three-cusped, leaves crenulate, sheaths two-edged. Rochambole is found wild in Sweden, Denmark, and Hungary. This has compound bulbs, but the cloves are smaller than those of garlic.

14. *Allium arenarium*, or sand garlic: stamens three-cusped, sheaths columnar, spathe awnless. It grows wild in Thuringia, Scania, Denmark, Switzerland, Italy, and Westmoreland.

15. *Allium carinatum*, or mountain garlic: stamens awl-shaped, spathe very long. It is found wild in Scania, Germany, Italy, and Switzerland; also in Westmoreland; about Ramsgate, in the isle of Thanet; and between Sandwich and Deal.

III. Stem-leaves columnar; umbel capsule-bearing. 16. *Allium sphaerocephalon*, or small round-headed garlic: stamens three-cusped, longer than the corolla, leaves femicolumnar. Native of Italy, Germany, Switzerland, and Siberia. Haller thinks that the eighteenth is not specifically distinct from this.

17. *Allium parviflorum*, or small-flowered garlic: umbel globose, stamens simple, longer than the corolla, spathe awl-shaped. Like the former, except in having simple filaments. It is a native of the south of Europe.

18. *Allium descendens*, or purple-headed garlic: stamens three-cusped, outer peduncles shorter. Native of Italy and Switzerland.

19. *Allium moschatum*, or musk-smelling garlic: umbel flat-topped, mostly six-flowered, petals acute, stamens simple, leaves fetaceous. It grows wild in Provence, Narbonne, and Spain. Casp. Bauhin relates, that Saltzman brought him the plant from the hills about Montpellier in 1598, and that he cultivated it in his garden.

20. *Allium flavum*, or sulphur-coloured garlic: flowers pendulous, petals ovate, stamens longer than the corolla. Gouan and Gerard think this to be a variety of the last. It is a native of the south of France, Italy, and Austria.

21. *Allium pallens*, or pale-flowered garlic: flowers pendulous, truncated; stamens simple, equalling the corolla. Native of Italy, Spain, Montpellier, and Hungary. Introduced in 1779, by Abbé Poirét.

22. *Allium paniculatum*, or panicle garlic: peduncles capillary, spread out; stamens awl-shaped, spathe very long. The leaves are awl-shaped and channelled; and it is a native of Italy, Austria, Switzerland, Carniola, Sibe-

ria, and the Levant. Gerard joins this with the foregoing.

23. *Allium vineale*, or crow garlic: stamens three-cusped. This is a native of Germany, Switzerland, Italy, &c. With us it is frequent in pastures, and communicates its rank taste to the milk and butter. In other countries it grows also among the corn, and in vineyards.

24. *Allium oleraceum*, or purple-striped garlic: stamens simple; leaves rough, femicolumnar; furrowed underneath. Native of Sweden, Germany, Switzerland, Italy; and with us in Westmoreland, and Yorkshire; near, Bristol; and in Essex, near Notley, among corn.

25. *Allium Pallasii*, or Pallas's garlic: umbel difform, stamens simple, equalling the corolla; style very short. The leaves are shorter than the stem, and alternate.

IV. Leaves radical, stem naked. 26. *Allium nutans*, or flat-stalked garlic: scape two-edged, leaves linear flat, stamens three-cusped. It varies so much in different ages and soils as scarcely to be known. The cusps of the stamens are obliterated in old plants. A native of Siberia.

27. *Allium ascalonicum*, or shallot or eschallote: scape columnar, leaves awl-shaped, umbel globose, stamens three-cusped. Hasselquist found the eschallotte native in Palestine, and it was cultivated here in 1633.

28. *Allium senescens*, or narcissus-leaved onion or garlic: scape two-edged, leaves linear, convex beneath, smooth, umbel roundish, stamens awl-shaped. This species is a native of Siberia, the Alps, Silesia, and the island of Sicily.

29. *Allium odorum*, or sweet-smelling garlic: scape nearly columnar, leaves linear, channelled, angular beneath, umbel flat-topped. Is a native of the south of Europe, China, Japan, &c.

30. *Allium inodorum*, or Carolina garlic: scape naked subtriquetrous, leaves linear flat keeled beneath, umbel fastigate floriferous, stamens simple. Native of Carolina. It was introduced in 1776, by the duchess dowager of Portland, and it flowers in March and April.

31. *Allium angulosum*, or angular-scaped garlic: scape two-edged, leaves linear-channelled, somewhat angular beneath, umbel flat-topped. Allioni can scarcely find any certain difference between the twenty-eighth and this, which is found in meadows, whereas that grows on rocks; the flowers also are larger, the plant is higher, and the leaves are not flexuose. Native of Siberia, Italy, Austria, Switzerland, and Germany, in moist places.

32. *Allium nigrum*, or black garlic: scape columnar, leaves linear, umbel hemispherical, petals erect, spathe pointed, bifid. Resembles No. 28, but is twice the size; has the leaves of narcissus. It is a native of Provence, Italy, Austria, and the neighbourhood of Algiers.

33. *Allium Canadense*, or Canada tree-onion: scape columnar, leaves linear, head bulb-bearing. Native of North America.

34. *Allium ursinum*, or ramsons: scape three-sided, leaves lanceolate, petiolate, umbel flat-topped. Native of Sweden, Denmark, Germany, Switzerland, Italy, in woods and moist shady places; and in England is not uncommon.

35. *Allium triquetrum*, or three-cornered moly: scape and leaves three-sided, stamens simple. A native of Italy and Spain.

36. *Allium cepa*, or common onion: scape swelling out below, and longer than the columnar leaves. The common onion is too well known, by its fistular leaves and swelling stalks, to need a particular description. The Latin name *cepa* is derived from *caput*, a head, on account of the form of its bulb; for the same reason, the Greeks called it *κρομμύον*. Our English and French names are from the Latin *unio*; because the bulb never throws out any offsets. The varieties of the common onion are—the Strasburgh, or common oval; the Spanish, silver-skinned, and red-skinned; the Portugal great oval onion; and the Tripoli. All these vary from seeds, and there are several intermediate differences which are not worth enumerating. The virtues of this genus are considerable. The common onion

onion has been considered as of an alexipharmic quality, and has been prescribed in malignant and epidemical distempers. They are very diuretic and powerful in cleansing and breaking away any obstructions in the urinary passages. They are likewise very efficacious in all infarctions of the lungs, greatly promoting expectoration, and relieving asthma and difficulty of breathing. Externally they are employed in cataplasms for suppurating hard tumors. Garlic is still more powerful than onions. As it is very heating and penetrating, it should not be used too freely, being apt to cause head-achs and other inconveniences. A clove or two of garlic pounded with honey, and taken two or three nights together, is good in rheumatic cafes. A quart of water poured boiling hot upon a pound of the fresh root, cut into slices, and suffered to stand upon it in a close vessel, for twelve hours, becomes strongly impregnated with the taste and smell of the garlic. This infusion, with a proper quantity of sugar, makes the syrup of garlic of the shops. Vinegar and honey excellently coincide with and improve this medicine, as a detergent and deobstruent, in disorders of the breast: a composition of this kind is prepared by infusing an ounce and a half of the fresh root in half a pint of vinegar, and dissolving in the strained liquor, by the heat of a water-bath, ten ounces of clarified honey: to cover in some degree the ill smell of the garlic, a little carraway and sweet-fennel seed, bruised, two drachms of each, are boiled for a short time in the vinegar, before the garlic is put in. The garlic itself is never to be boiled; its essential oil (in which its virtue consists) exhaling during that process.

37. *Allium moly*, or yellow moly: scape subcylindric, leaves lanceolate, sessile; umbel level-topped. This was formerly preserved in gardens for the sake of its yellow flowers, but, having a very strong garlic scent, most people have rooted it out. A native of Hungary, on Monte Baldo, about Montpellier, and on the Pyrenees.

38. *Allium tricoccum*, or three-seeded garlic: scape naked, semicolumnar; leaves lanceolate-oblong, flat, smooth; umbel globular, seeds solitary. Native of North America.

39. *Allium fistulosum*, or Welsh onion or ciboule: scape equalling the columnar swelling leaves. Ciboule or Welsh onion is perennial, and does not form bulbs like the common onion; it was cultivated in 1629.

40. *Allium schœnoprassum*, or cives or chives: scape equalling the columnar awl-siliform leaves. These smell very strong, and there is a variety of them found in Siberia, &c. figured by Gmelin and Buxbaum, described by Murray in the new Gottingen Comment. In the common cives the leaves are straight; in this they are reflected at the ends; in that the form of the umbel can scarcely be called pyramidal, as it is in this. The scape however of both is clothed with the sheath of the leaves, so that it cannot be said that it is truly naked. A native of Italy, Switzerland, Sweden, and Siberia.

41. *Allium Sibiricum*, or Siberian garlic: scape columnar, leaves semicylindric, stamens awl-shaped. This and the next are natives of Siberia. Introduced in 1777 by chevalier Murray.

42. *Allium tenuissimum*, or slender-leaved garlic: scape columnar, empty; leaves awl-siliform; heads loose, few-flowered. It is much eaten by the field-mice, and they lay up the roots for their winter food.

43. *Allium chamæ-moly*, or bastard garlic: scape scarcely any, naked; capsules drooping, leaves flat ciliate. Native of Italy; flowering in January.

44. *Allium gracile*, or Jamaica garlic: scape naked, columnar, very long; leaves linear, channelled; stamens subulate, connate at the base. This is a native of Jamaica, was introduced in 1787 by Hinton East, Esq. and it flowers in February.

45. *Allium Neapolitanum*, or Naples garlic: scape naked ancipital, leaves lanceolate channelled, umbel scattered. It is cultivated in the gardens near Naples, and begins to grow spontaneously about the city, flowering in March.

Propagation and Culture. Garlic is easily propagated by planting the cloves or small bulbs of the root in the spring, with a dibber or in drills, in beds four feet wide, in rows six inches from each other, and four or five inches distant in the rows; keeping them clean from weeds. About the beginning of June, the leaves should be tied in knots, to prevent their spindling or running to seed, which will greatly enlarge the bulb. Towards the end of July the leaves will begin to wither and decay, when the roots should be taken up, cleaned and dried in the sun, tied in bunches and hung up in a dry room, to prevent their rotting, and thus preserved for winter use.

Rocambole may be propagated either by the roots, or the bulbs produced on the stalks: they should be planted in autumn, especially on dry ground, otherwise their bulbs will not be large. They are to be planted and prepared for use in the same manner as garlic.

All the flowering sorts are very hardy, and will thrive in almost any soil and situation; they are easily propagated either by their roots, or seeds; if from the roots, the best time is in autumn, that they may take good root in the ground before the spring, which is necessary, in order to have them flower strong the following summer. If by seeds, they may be sown in a border of common earth, either in autumn, soon after the seeds are ripe, or in the spring following; and will require no farther care, but to keep them clear from weeds: in the following autumn, they may be transplanted into the borders where they are to remain. They flower in May, June, and July.

Species the fifth, sixth, seventh, tenth, sixteenth, eighteenth, twentieth, twenty-eighth, thirty-first, and thirty-seventh, are the best known in the gardens, but lately have been little cultivated; most of them are from twelve to eighteen inches in height, and continue a month in flower: the fifth and seventh are from two feet to a yard high, and produce large specious umbels. The yellow moly (No. 37.) has some beauty in the flowers, and deserves a place in borders where few better things will thrive: it increases plentifully both by roots and seeds.

Of the leek there has been generally supposed two sorts, but I have made trial of them both, by sowing their seeds several times, and find they are the same; the difference which has risen between them, has been occasioned by some persons having saved the seeds from old roots, and not from the seedling leeks, whereby they have degenerated them, and rendered them smaller and narrower leaved; but by care this may be recovered again, as I have experienced. Leeks are cultivated by sowing their seeds in the spring, in the same manner as is directed below for onions, with which these are commonly sown, the two sorts of seeds being mixed according to the proportion which is desired of either sort; though the most common method is, to mix an equal quantity of both, for the onions will greatly out-grow the leeks in the spring; but, these being drawn off early in August, the leeks will have time to grow large afterwards, so that there may be a moderate crop of both sorts. The management of leeks being exactly the same with onions, we shall not repeat it; but shall only add, that many persons sow their leeks very thick in beds in the spring; and, in June, after some of their early crops are taken off, they dig up the ground, and plant their leeks out thereon, in rows a foot apart, and six inches asunder in the rows, observing to water them until they have taken root; after which they will require no farther culture, but to clear the ground from weeds. The leeks thus planted will grow to a large size, provided the ground be good. If you would save the seeds of this plant, you should make choice of some of the largest and best leeks you have, which must remain in the place where they grew until February, when they should be transplanted in a row against a warm hedge, paling, or wall, at about eight inches asunder; and, when their stems advance, which will be in May or June, they should be supported by a string, to prevent their being broken down, to which they are very liable, especially when

when in head; and the closer they are drawn to the fence in autumn, the better the seeds will ripen; for it sometimes happens in cold summers or autumns, that those which grow in the open garden do not perfect their seeds in this country, especially if there should be sharp frosts early in autumn, which will entirely spoil the seed. When it is ripe (which may be known by the heads changing brown) you should cut off their heads with about a foot or more of the stalk to each, and tie them in bundles, three or four heads in each, and hang them up in a dry place, where they may remain until Christmas or after, when you may thresh out the seeds for use. The husk is very tough, which renders it very difficult to get out the seeds; therefore some persons who have but a small quantity rub it hard against a rough tile, which will break the husks, and get out the seeds better than most other methods I have known used.

The onion is propagated by seeds, which should be sown at the latter end of February or the beginning of March, on good, rich, light ground, which should be well dug and levelled, and cleared from the roots of all bad weeds; then the seeds should be sown in a dry time, when the surface of the ground is not moist; and, where they are intended for a winter crop, they must not be sown too thick. In cold wet land it is better to defer sowing till the middle of March; and in very moist rich soils it may be done any time before the middle of April. But the early-sown crops bulb or apple best, and grow to the largest size. The common allowance of seed is six pounds to an acre of land; or an ounce to a rod or pole. But the generality of gardeners sow more, because many of them allow for a crop to draw out, which they call cullings; these are thinned out when young, and tied in bunches for the market; but those who have regard to their principal crop never practise this, but sow no more seed than is sufficient, for, when the plants come up too close, they draw each other weak; and, when this happens, their roots never grow so large as those which are thin sowed: besides there is a great trouble in hoeing them; and, when they are thinned for the market, the ground is trodden over, and the onions which are to stand have their leaves bruised, whereby they are greatly injured; so that, where young onions are wanted, it is a much better way to sow some separate beds for this purpose, than to injure the future crop. It is a common practice to mix other crops with the onion; but this is an obstruction to the main crop, without any great advantage; it is better therefore not to sow any thing with it, unless perhaps a little cos lettuce. In about six or seven weeks after sowing, the onions will be up forward enough to hoe; at which time (choosing dry weather) you should, with a small hoe about two inches and a half broad, cut up lightly all the weeds; and also cut out the onions where they grow too close in bunches, leaving them at this first hoeing at least two inches apart. This, if well performed, and in a dry season, will preserve the ground clear of weeds at least a month or five weeks; when you must hoe them over a second time, cutting up all the weeds as before, and also cut out the onions to a larger distance, leaving them this time three or four inches asunder. This also, if well performed, will preserve the ground clean a month or six weeks longer, when you must hoe them over the third and last time. Now you must carefully cut up all weeds, and single out the onions to near six inches square; by which means they will grow much larger than if left too close. This time of hoeing, if the weather proves dry, and it is well performed, will keep the ground clear until the onions are fit to pull up; but, if the weather should prove moist, and any of the weeds should take root again, you should, about a fortnight or three weeks after, go over the ground and draw out all the large weeds with your hands; for, the onions having now begun to bulb, they should not be disturbed with a hoe. Toward the middle of August your onions will have arrived at their full growth, which may be known by their blades falling to the ground and shrink-

ing; you should therefore, before their necks or blades are withered off, draw them out of the ground, cropping off the extreme part of the blade, and lay them abroad upon a dry spot of ground, observing to turn them every other day at least, to prevent their striking fresh root; which they will suddenly do, especially in moist weather. In about a fortnight's time your onions will be dry enough to house, which must be performed in perfectly dry weather; in doing of this, you must carefully rub off all the earth from the roots, and be sure to mix no faulty ones amongst them, which will in a short time decay, and spoil all those that lie near them; nor should you lay them too thick in the house, which would occasion their sweating, and thereby rot them; nor should they be put in a lower room, or ground floor, but in a loft or garret; and, the closer they are kept from the air, the better they will keep. You should, at least once a month, look over them to see if any of them are decayed; these must be immediately taken away, otherwise they will infect all that lie near them. But, notwithstanding all the care you can possibly take in the drying and housing your onions, many of them will grow in the loft, especially in mild winters, which are generally moist; therefore those who would preserve them late in the season, should select a parcel of the firmest and most likely to keep, from the others, and with a hot iron slightly singe their beards, or roots, which will effectually prevent their sprouting; but in doing this there must be great caution used not to scorch the pulp of the onions, for that will cause them to perish soon after. The best onions for keeping are the Strasburgh kind, which is an oval-shaped bulb; but this seldom grows so large as the Spanish, which is flatter; the white sort is esteemed the sweetest; but these varieties are not lasting; for, if you save the seeds of the white onions only, you will have a mixture of the red ones amongst them: nor will the Strasburgh onion keep long to its kind, but will by degrees grow flatter, as do the large Portugal and Tripoli onions, when planted in our climate, which in a year or two will be so far degenerated, as not to be known they were from that race. It is of great importance to have fresh seed, for, if it is above a year old, not one plant in fifty will grow. - This is an objection against foreign seed, which cannot be depended upon: it is necessary, however, to import it sometimes, for it degenerates in our climate. The goodness of the seed may easily be tried, by forcing it in the hot-house, or in warm water. In order to save seeds at home, you must in the spring make choice of some of the firmest, largest, and best-shaped, onions, (in quantity proportionable to the seed you intend to save;) and, having prepared some good ground, (which should be well dug, and laid out in beds about three feet wide,) in the beginning or middle of March you must plant your onions in the following manner: Having strained a line about four inches within the side of the bed, you must, with a spade, throw out an opening about six inches deep, the length of the bed, into which you should put the onions, at about nine inches distance from each other; with a rake draw the earth into the opening again to cover the bulbs; then proceed to remove the line again about a foot farther back, where you must make an opening as before, and so again till the whole is finished; so that you will have four rows in each bed, between which you must allow a space of two feet for an alley, to go among them to clear them from weeds, &c. In a month's time their leaves will appear above ground, and many of the roots will produce three or four stalks each; you must therefore keep them diligently cleared from weeds, and about the beginning of June, when the heads of the flowers begin to appear, you must provide a parcel of stakes about four feet long, which should be driven into the ground, in the rows of onions, at about six or eight feet apart; to which you should fasten some packthread, rope-yarn, or small cord, which should be run on each side the stems of the onions, a little below their heads, to support them from breaking down with the wind and rain; for, when

the feeds are formed, the heads will be heavy, and are very often broken down by their own weight, where they are not well secured; and, if the stalks are broken before the feeds have arrived to maturity, they will not be near so good, nor keep so long as those which are perfectly ripened. About the end of August the onion feed will be ripe, which may be known by its changing brown, and the cells in which the feeds are contained opening; so that, if it be not cut in a short time, the feeds will fall to the ground: when you cut off the heads, they should be spread abroad upon coarse cloths in the sun, observing to keep them under shelter in the night, as also in wet weather; and, when the heads are quite dry, you must beat out the feeds, which are very easily discharged from their cells: then having cleared them from all the husks, &c. after having exposed them one day to the sun to dry, you must put them up in bags to preserve them for use. The directions here given are for the general crop of winter onions; but there are two other crops of this common sort of onion, cultivated in the gardens about London to supply the market, one of which is commonly called the Michaelmas onion. These are sown in beds pretty close, in the middle of August, and must be well weeded when they come up. In the spring of the year, after the winter onions are over, they are tied up in bunches; but from the thinning of these, they carry to market young green onions in March, for fallads, &c. In the spring they sow more beds in the same manner, to draw up young onions for fallads, after the Michaelmas onions are grown too large for that purpose; and, where a supply of these is required, there may be three different sowings, at about three weeks distance from each other, which will be sufficient for the season. To have onions for pickling, some feed should be sown late in light poor land: the middle of April is the proper time. Sow it pretty thick, and do not thin it, unless when it rises in clusters. The bulbs will be fit to take up in August.

The scallion, or efallion, is a sort of onion which never forms any bulbs at the roots, and is chiefly used in the spring for green onions, before the other sorts, sown in July, are big enough; but this sort of onion, how much soever in use formerly, is now so scarce as to be known to few people, and is rarely to be met with, except in curious botanic gardens: the gardeners near London substitute for this, those onions which decay and sprout in the house: these they plant in a bed early in the spring, which in a short time will grow large enough for use; when they draw them up, and, after pulling off all the outer coat of the root, they tie them up in bunches, and sell them in the market for scallions. The true scallion is easily propagated by parting the roots, either in spring or autumn; but the latter season is preferable, because of their being rendered more fit for use in the spring: these roots should be planted three or four in a hole, at about six inches distance every way, in beds or borders three feet wide, which in a short time will multiply exceedingly, and will grow upon almost any soil and in any situation; and their being so hardy as to resist the severest of our winters, and being green, and fit for use so early in the spring, renders them worthy of a place in all good kitchen-gardens.

The cives are a very small sort of onion, which never produce any bulbs, and seldom grow above six inches high in the blade, which is also very small and slender, and in round bunches; this was formerly in great request for fallads in the spring, as being milder than those onions which had stood through the winter; these are propagated by parting their roots, are also very hardy, and will be fit for use early in the spring.

The ciboule, or Welsh onions, are also propagated for spring use only; these never make any bulb, therefore are only fit to be used green for fallads, &c. They are sown about the end of July, in beds of about three feet and a half wide, leaving alleys of two feet broad, to go between the beds to clean them, and in a fortnight's time they will appear above ground, when they must be carefully cleared

from weeds; towards the middle of October their blades will die away, so that the whole spot will seem to be naked, which has led many people to dig up the ground again, supposing the crop totally lost; whereas, if they stand undisturbed, they will come up again very strong in January, and from that time grow very vigorously, resisting all weathers; and by March will be fit to draw for young onions, and are, in the markets, more valued than any other sort at that season; for they are extremely green and fine, though they are much stronger than the common onion in taste, approaching nearer to garlic, which has occasioned their being less esteemed for the table: but as no winter, however hard, will hurt them, it is proper to have a few of them to supply the table, in case the common sort should be destroyed by frosts.

The roots of these onions, if planted out at six or eight inches distance, in March, will produce ripe feeds in autumn, but it will be in small quantities the first year; therefore the same roots should remain unremoved, which the second and third year will produce many stems, and afford a good supply of feeds; these roots will abide many years good, but should be transplanted and parted every second or third year, which will cause them to produce strong feeds.

The eschalotte, chalott, or shallot, is propagated by the smaller roots or off-sets, planted in November or February, on beds four feet wide, six inches from each other, and two or three deep. They want no culture but to keep them clean from weeds. The end of July or beginning of August, the roots will have attained their full growth; but the time of taking them up is best determined by the withering of the leaves: this should be done in a dry day. Spread them in the sun, and, when dry, clean and tie them in bunches for use.

AL'L'IUM, *f.* in botany. See HYACINTHUS, HYPOXIS, and TRADESCANTIA.

AL'LIX (Dr. Peter), a learned French protestant divine, born at Alençon, in 1641. He became minister of the reformed church at Rouen, where he published many learned and curious pieces; the credit of which induced the reformed to call him to Charenton, about a league from Paris, being the principal church they had in France. On the revocation of the edict of Nantz, he retired to England; where he studied the language with so much success, as to publish a work, intitled, "Reflections on the Books in the Holy Scriptures, to establish the Truth of the Christian Religion," two vols. which he dedicated to James II. acknowledging his obligations to that prince, and his kind behaviour to the distressed refugees in general. He wrote several other treatises relating to ecclesiastical history; which rendered him as famous in England as in France, for his ingenious and solid defences of the reformed religion. He was complimented with the degree of D. D. and in 1690 was made treasurer of the church of Salisbury. He died in 1717.

ALLO'A, or AL'LOWAY, a sea-port town in Scotland, seated on the Forth, about twenty miles higher up the river than Leith, and five miles east of Stirling. It is a populous place; has two market days in the week; and is remarkable for its fine castle, the seat of the earl of Mar, and for the coal-mines near it. The harbour is extremely commodious, with great depth of water; and vessels are expeditiously loaded with coals from the pits by an uncommon waggon-way, on which one horse draws with ease three waggons at once, each containing a ton and a half. An excellent dry-dock has also lately been erected here, capable of receiving ships of the greatest burthen. There is likewise a large glass-house for blowing bottles, of which vessels are supplied with any quantity upon the shortest notice.

ALLOBROGES, *f.* [from *Allobrox*.] A people of Gallia Narbonensis, situated between the rivers Iara and Rhodanus, and the Lacus Lemanus: commended by Cicero for their fidelity; discommended by Horace, on account of their fondness for novelty.

ALLOCA'TION, *f.* [*alloco*, Lat.] The act of putting one

one thing to another. The admission of an article in reckoning, and addition of it to the account.

ALLOCATIO'NE FACIENDA, *f.* is a writ directed to the lord-treasurer, or barons of the exchequer, commanding them to allow an accountant such sums as he has lawfully expended in the execution of his office.

ALLOCUTION, *f.* [*allocutio*, Lat. of *ad*, to, and *loquor*, to speak.] The act of speaking to. An oration or speech made by a general to his soldiers, to encourage them to fight, and to dehort them from sedition.

ALLO'DIAL, *adj.* [from *allodium*.] Held without any acknowledgment of superiority; not feudal; independent.

ALLO'DIUM, *f.* [A word of very uncertain derivation, but most probably of German original.] A possession held in absolute independence, without any acknowledgment of a lord paramount. It is opposed to *fee*, or *feudum*, which intimates some kind of dependence. See **FEOBAL SYSTEM**.

ALLO'NGE, *f.* [*allonge*, Fr.] A pass or thrust with a rapier, so called from the lengthening of the space taken up by the fencer. It is likewise taken for a long rein, when the horse is trotted in the hand.

To **ALLO'O**, *v. a.* [This word is generally spoke *halloo*, and is used to dogs, when they are incited to the chase or battle; it is commonly imagined to come from the French *allons*; perhaps from *all lo*, look all; shewing the object.] To set on; to incite a dog, by crying *alloo*.

Alloo thy furious mastiff; bid him vex
The noxious herd, and print upon their ears
A sad memorial of their past offence.

Philips.

ALLO'PHYLIUS, *f.* [*αλλοφυλος*, of *αλλος*, another, and *φυλη*, a tribe, Gr.] One of another tribe, nation, or kindred; a stranger, or alien.

ALLO'PHYLUS, *f.* [*αλλοφυλος*, Gr. *alienigenus*, Lat. foreign.] In botany, of the octandria monogynia class, ranking in the natural order of guttiferæ. The generic characters are—Calyx: perianthium four-leaved; leaflets orbiculate; two exterior, opposite, smaller by half. Corolla: of four petals, less than the calyx, orbiculate, equal: claws broad, length of the two smaller leaves of the calyx. Stamina: filaments filiform, the length of the corolla; antheræ roundish. Pistillum: germ superior, roundish, twin; style filiform, longer than the stamens; stigma bifid, with the divisions rolled back.—*Essential Character*. Calyx, four-leaved; leaflets orbiculate, two opposite smaller. Petals, four; less than the calyx: germ twin: stigma quadrifid.

Species. 1. *Allophylus zeylanicus*: leaves oval acuminate quite entire; racemes axillary very short. This is a tree having the appearance of *Persea*; it is a native of the island of Ceylon.

2. *Allophylus rigidus*: leaves simple, toothletted and spiny; flowers in racemes. 3. *Allophylus racemosus*: leaves ternate, flowers in racemes. Natives of Hispaniola.

4. *Allophylus cominia*: leaves ternate, flowers in panicles. It grows plentifully in Jamaica.

5. *Allophylus ternatus*: leaves ternate serrate, racemes long terminating. This is only a shrub five feet in height, with spreading branches. It is a native of CochinChina, by the banks of rivers. The inhabitants use the leaves as a cataplasm in contusions.

AL'LOQUY, *f.* [*alloquium*, Lat. of *ad*, to, and *loquor*, to speak.] The act of speaking to another; address; conversation.

To **ALLOT**, *v. a.* [from *lot*.] To distribute by lot. To grant:

I shall deserve my fate, if I refuse
That happy hour which heaven allots to peace. *Dryden.*

To distribute; to parcel out; to give each his share.—Since fame was the only end of all their studies, a man cannot be too scrupulous in allotting them their due portion of it. *Tatler.*

ALLO'TMENT, *f.* That which is allotted to any one;

the part, the share, the portion granted.—There can be no thought of security or quiet in this world, but in a re-signation to the allotments of God and nature. *L'Estrange*. Part appropriated.—It is laid out into a grove for fruits and shade, a vineyard, and an allotment for olives and herbs. *Broomer*.

ALLOT'TERY, *f.* That which is granted to any particular person in a distribution.—Allow me such exercises as may become a gentleman, or give me the poor allottery my father left me by testament. *Shakespeare*.

To **ALLO'W**, *v. a.* [*allower*, Fr. *alyfan* or *allefan*, Sax. of *allaudo*, Lat. of *ad*, to, and *laudo*, to commend.] To admit; as, to allow a position; not to contradict; not to oppose.—The principles which all mankind allow for true, are innate; those, that men of right reason admit, are the principles allowed by all mankind. *Locke*. To justify; to maintain as right. To grant; to yield; to own any one's title to.—We will not, in civility, allow too much sincerity to the profession of most men: but think their actions to be interpreters of their thoughts. *Locke*.—To grant license to; to permit.—But, as we are allowed of God to be put in trust with the gospel, even so we speak, not as pleasing men, but God, which trieth our hearts. 1 *Theff.* ii. 4.—To give a sanction to; to authorize. To give to; to pay to:

Ungrateful then! if we no tears allow
To him that gave us peace and empire too. *Waller.*

To appoint for; to set out to a certain use; as, He allowed his son the third part of his income. To make abatement, or provision; or to settle any thing, with some concessions or cautions regarding something else.—If we consider the different occasions of ancient and modern medals, we shall find they both agree in recording the great actions and successes in war; allowing fill for the different ways of making it, and the circumstances attending it. *Addison*.

ALLO'WABLE, *adj.* That which may be admitted without contradiction. That which is permitted or licensed; lawful; not forbidden.—Reputation becomes a signal and a very peculiar blessing to magistrates; and their pursuit of it is not only allowable but laudable. *Atterbury*.

ALLO'WABLENESS, *f.* The quality of being allowable; lawfulness; exemption from prohibition.

ALLO'WANCE, *f.* Admission without contradiction.—Without the notion and allowance of spirits, our philosophy will be lame and defective in one main part of it. *Locke*. Sanction; license; authority. Permission; freedom from restraint.—They should be accustomed betimes to consult and make use of their reason, before they give allowance to their inclinations. *Locke*.—A settled rate, or appointment for any use.—And his allowance was a continual allowance given him of the king; a daily rate for every day all his life. 2 *Kings*.—Abatement from the strict rigour of a law, or demand.—Parents never give allowances for an innocent passion. *Swift*.—Established character; reputation:

His bark is stoutly timber'd, and his pilot
Of very expert and approv'd allowance. *Shakespeare.*

ALLO'Y, *f.* A word used for the tempering and mixture of other metals with silver or gold. In the mint, a pound weight of gold is coined into forty-four guineas and a half, which is equal to 46l. 14s. 6d. An ounce therefore of such gold coin is worth 3l. 17s. 10½d. in silver. A pound weight of standard silver bullion is coined into sixty-two shillings: therefore an ounce of silver bullion is worth 5s. 2d.—That precise weight and fineness, by law appropriated to the pieces of each denomination, is called the standard. Fine silver is silver without the mixture of any baser metal. Alloy is baser metal mixed with it. Let another piece be coined of the same weight, wherein half the silver is taken out, and copper, or other alloy, put into the place, it will be worth but half as much; for the value of the alloy is so inconsiderable as not to be reckoned. *Locke*. Abatement; diminution.—The pleasures of sense are probably

bably relished by beasts in a more exquisite degree than they are by men; for they taste them sincere and pure, without mixture or alloy. *Atterbury.*

ALL'-SEED, *f.* in botany. See LINUM and CHENOPodium.

ALL'-SPICE, *f.* in botany. See MYRTUS.

ALLUBE'SCENCY, *f.* [*allubescencia*, Lat.] Willingness; content.

To ALLU'DE, *v. n.* [*alludir*, Sp. and It. of *alludo*, Lat. of *ad*, to, and *ludo*, to play.] To have some reference to a thing, without the direct mention of it; to hint at; to insinuate. It is used of persons; as, He *alludes* to an old story: or of things; as, The lampoon *alludes* to his mother's faults.

ALL'UM. See A'LUM.

ALLU'MINOR, *f.* [*allumer*, Fr. to light.] One who colours or paints upon paper or parchment; because he gives graces, light, and ornament, to the letters or figures coloured.

To ALLU'RE, *v. a.* [*lurer*, Fr. *looren*, Dut. *beloeren*, Sax.] To entice to any thing, whether good or bad; to draw towards any thing by enticement.—Unto laws that men make for the benefit of men, it hath seemed always needful to add rewards, which may more *allure* unto good, than any hardness deterreth from it; and punishments, which may more deter from evil, than any sweetness there-to *allureth*. *Hooker.*

The golden sun, in splendour likest heav'n,
Allur'd his eye.

Milton.

ALLU'RE, *f.* Something set up to entice birds, or other things, to it. We now write *lure*.

ALLU'REMENT, *f.* [from *allure*.] That which allures, or has the force of alluring; enticement; temptation of pleasure:

To shun th' *allurement* is not hard
To minds resolv'd, forewarn'd, and well prepar'd;
But wond'rous difficult, when once beset,
To struggle thro' the straits, and break th' involving net.
Dryden.

ALLU'RER, *f.* The person that allures; enticer; inveigler.

ALLU'RINGLY, *adv.* In an alluring manner; enticingly.

ALLU'RINGNESS, *f.* The quality of alluring or enticing; invitation; temptation by proposing pleasure.

ALLU'SION, *f.* [*allusion*, Fr. *allusione*, It. *allusion*, Sp. of *allusio*, Lat. of *allusum*, sup. of *alludo*, *ad*, to, and *ludo*, to play.] That which is spoken with reference to something supposed to be already known, and therefore not expressed; a hint; an implication. It has the particle *to*.—Expressions now out of use, *allusions* to customs lost to us, and various particularities, must needs continue several passages in the dark. *Locke.*

ALLU'SIVE, *adj.* [*alludo*, *allusum*, Lat.] Hinting at something not fully expressed.—Where the expression in one place is plain, and the sense affixed to it agreeable to the proper force of the words, and no negative objection requires us to depart from it; and the expression, in the other, is figurative or *allusive*, and the doctrine, deduced from it, liable to great objections; it is reasonable, in this latter place, to restrain the extent of the figure and allusion to a consistency with the former. *Rogers.*

ALLU'SIVELY, *adv.* In an allusive manner; by implication; by insinuation.—The Jewish nation, that rejected and crucified our Saviour, within the compass of one generation, were, according to his prediction, destroyed by the Romans, and preyed upon by those eagles (*Mace. xxiv. 28.*) by which, *allusively*, are noted the Roman armies, whose ensign was the eagle. *Hammond.*

ALLU'SIVENESS, *f.* The quality of being allusive.

ALLU'VION, *f.* [*alluvio*, Lat. of *ad*, to, and *luo*, to wash.] The carrying of any thing to something else by the motion of the water. The thing carried by water to something else.

ALLUVION, in law, is the washing of the sea or of a river; in which case the law is, that if land be gained of the sea by washing up of sand and earth, by small and imperceptible degrees, so as in time to make it *terra firma*, it shall go to the owner of the land adjoining; but, if the alluvion be sudden and considerable, it belongs to the king by his prerogative: so that the quantity of the ground gained, and the time during which it is gaining, are what make it either the king's or the subject's property. In the same manner, if a river, running between two lordships, by degrees gaineth upon one of them, and leaves the other dry; the owner who loseth his ground thus imperceptibly has no remedy: but if the course of the river be changed by a sudden and violent flood, or other hasty means, and thereby a man loseth his ground, he shall have what the river has left in another place, as a recompense for this sudden loss. 2 *Black. 262.*

ALLU'VIOUS, *adj.* That which is carried by water to another place; and lodged upon something else.

To ALLY, *v. a.* [*allier*, Fr.] To unite by kindred; friendship, or confederacy. To make a relation between two things, by similitude, resemblance, or any other means.

ALLY, *f.* [*allie*, Fr.] One united by some means of connexion; as marriage, friendship, confederacy.—We could hinder the accession of Holland to France, either as subjects, with great immunities for the encouragement of trade, or as an inferior and dependent *ally* under their protection. *Temple.*

ALMACAR'RON, a sea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalquivir. It is about twenty miles west of Carthage, and is remarkable for the prodigious quantity of alum found in its territory. Lat. 37. 40. N. lon. 1. 15. W.

ALMA'DE, a town of Spain, in the province of La Mancha, in the kingdom of Castile, situated upon the top of a mountain, where are the most ancient as well as the richest silver mines in Europe.

AL'MADIE, *f.* a kind of canoe, or small vessel, about four fathoms long, commonly made of bark, and used by the negroes of Africa.

AL'MADIE, *f.* is also the name of a kind of long-boats, fitted out at Calicut, which are eighty feet in length, and six or seven in breadth. They are exceedingly swift, and are otherwise called *cathuri*.

AL'MAGEST, *f.* the name of a celebrated book composed by Ptolemy; being a collection of a great number of the observations and problems of the ancients, relating to geometry and astronomy, but especially the latter. And being the first work of this kind which has come down to us, and containing a catalogue of the fixed stars, with their places, besides numerous records and observations of eclipses, the motions of the planets, &c. this work will ever be held dear and valuable to the cultivators of astronomy.

In the original Greek it is called *συναξίς μεγίστη*, the great composition or collection. And to the word *μεγίστη*, *megiste*, the Arabians joined the particle *al*, and thence called it *Almaghesti*, or, as we call it, from them, the *Almagest*. Ptolemy wrote this book at Alexandria in Egypt, where the Arabians found it on the capture of that kingdom. It was by them translated out of Greek into Arabic, by order of the caliph Almainon, about the year 827; and first into Latin about 1230, by favour of the emperor Frederic II. The Greek text was not known in Europe till the beginning of the 15th century, when it was brought from Constantinople by George, a monk of Trabezond, who translated it into Latin, which translation has several times been published. Riccioli, an Italian jesuit, also published, in 1651, a body of astronomy; which, in imitation of Ptolemy, he called "*Almagestum Novum*," the New *Almagest*; being a large collection of ancient and modern observations and discoveries in the science of astronomy.

ALMA'GRA, *f.* a fine deep red ochre, with some admixture of purple, very heavy, and of a dense yet friable structure, and rough dusty surface. It adheres very firmly to the tongue, melts freely and easily in the mouth, is of

an austere and strongly astringent taste, and stains the skin in touching. It is the *Sil Atticum* of the ancients: it ferments very violently with acid menstrua; by which single quality it is sufficiently distinguished from the *Sil Syriacum*, to which it has in many respects a great affinity. It is found in immense quantities in many parts of Spain; and in Andalusia there are in a manner whole mountains of it. It is used in painting, and in medicine as an astringent.

ALMA'GRO, a fortress of Spain, the capital of one of the districts of La Mancha. It was built by the archbishop Roderic, of Toledo, who finished it in 1214, and put a considerable garrison into it to restrain the incursions of the Moors.

AL'MAIN, *f.* [*allemain*, Fr. q. d. all man; but Cluverius derives it of *allmanni*, because they were a mixture of men of all nations and countries.] A German.

ALMAIN, in music, a certain kind of air that moves in common time.

ALMAIN RIVETS, a certain light kind of armour, with plates of iron, for defence of the arms, used by Germans.

ALMA'MON, caliph of Bagdat, a philosopher and astronomer in the beginning of the 9th century, ascended the throne in the year 814. He was son of Harun Al-Rashid, and grand-son of Almanzor. His name is otherwise written *Mamon*, *Almaon*, *Almamun*, *Alamoun*, or *Al-Maimon*. Having been educated with a love for the liberal sciences, he applied himself to cultivate and encourage them in his own country. For this purpose he requested the Greek emperors to supply him with such books on philosophy as they had among them; and he collected skilful interpreters to translate them into the Arabic language. He also encouraged his subjects to study them; frequenting the meetings of the learned, and assisting at their exercises and deliberations. He caused Ptolemy's *Almagest* to be translated in 827, by Isaac Ben-honain, and Thabet Ben-korah, according to Herbelot; but, according to others, by Sergius, and Alhazen, the son of Joseph. In his reign, and doubtless by his encouragement, an astronomer of Bagdat, named Habash, composed three sets of astronomical tables. Almamon himself made many astronomical observations, and determined the obliquity of the ecliptic to be then $23^{\circ} 35'$ (or $23^{\circ} 33'$ in some manuscripts); but Vossius says $23^{\circ} 51'$ or $23^{\circ} 34'$. He also caused skilful observers to procure proper instruments to be made, and to exercise themselves in astronomical observations; by which he revived the sciences in the East to such a degree, that many learned men were found, not only in his own time, but after him, in a country where the study of the sciences had been long forgotten. This learned king died near Tarsus in Cilicia, by having eaten too freely of some dates, on his return from a military expedition, in the year 833.

AL'MANACK, *f.* [Derived, by some, from the Arabic *al*, and *manah*, Heb. to count, or compute; by others, from *al*, Arabic, and *man*, a month, or *μανηος*, the course of the months; by others, from a Teutonic original, *al*, and *maan*, the moon, an account of every moon, or month: all of them are probable.] A calendar; a book in which the revolutions of the seasons, with the return of feasts and fasts, are noted for the ensuing year.

Almanacks are of various kinds and composition, some books, others sheets, &c. some annual, others perpetual. The essential part is the calendar of months, weeks, and days; the motions, changes, and phases, of the moon; with the rising and setting of the sun and moon. To these are commonly added various matters, astronomical, astrological, chronological, meteorological, and even political, rural, medical, &c. as also eclipses, solar ingresses, aspects and configurations of the heavenly bodies, lunations, heliocentric and geocentric motions of the planets, prognostications of the weather, and predictions of other events, the tides, twilight, equation of time, &c. Till about the 4th century, almanacks bore the marks of heathenism only; from thence to the 7th century, they were a mixture of heathenism and christianity; and ever since they have been

altogether christian: but at all times, astrological and other predictions have been considered as an essential part, and still are so to this day with several of them, notwithstanding that most people affect to disbelieve in such predictions.

NAUTICAL ALMANACK, and *Astronomical Ephemeris*, is a national almanack, chiefly for nautical purposes, which was begun in the year 1767, under the direction of the Board of Longitude. It is still published by anticipation for several years beforehand, for the convenience of ships going out upon long voyages, for which it is highly useful, and was found eminently so in the course of the late voyages round the world for making discoveries. Besides most things essential to general use, that are to be found in other almanacks, it contains many new and important particulars; more especially, the distances of the moon from the sun and fixed stars, which are computed for the meridian of the Royal Observatory of Greenwich, and set down to every three hours of time, expressly designed for computing the longitude at sea, by comparing these with the like distances observed there.

Construction of ALMANACKS. The first thing to be done is, to compute the sun's and moon's place for each day of the year, or it may be taken from some ephemerides, and entered into the almanack; next, find the dominical letter, and, by means thereof, distribute the calendar into weeks; then, having computed the time of Easter, by it fix the other moveable feasts; adding the immoveable ones, with the names of the martyrs, the rising and setting of each luminary, the length of day and night, the aspects of the planets, the phases of the moon, and the sun's entrance into the cardinal points of the ecliptic, i. e. the two equinoxes and solstices. By the help of good astronomical tables or ephemerides, the construction of almanacks is extremely easy.

Almanacks for one year pay a duty of four-pence; those for more years, pay for three years one penny; but perpetual almanacks are to pay only for three years, at two-pence. Out of the duties by this act there shall be paid to each university 500l. per ann. half-yearly, at Midsummer and Christmas, and the surplus shall be paid into the exchequer to go to the sinking fund. Selling unstamped almanacks incurs the same penalty as for selling unstamped newspapers. Almanacks in bibles and common prayer-books are exempted.

ALMANACK, among antiquaries, is also the name given to a kind of instrument, usually of wood, inscribed with various figures and Runic characters, and representing the order of the feasts, dominical letters, days of the week, and golden number, with other matters necessary to be known throughout the year; used by the ancient northern nations, in their computations of time, both civil and ecclesiastical. Almanacks of this kind are known by various names, among the different nations wherein they have been used; as rimstocks, primstaries, runstocks, runstafis, *Scipiones Runici*, *Bacculi Annales*, clogs, &c. They appear to have been used only by the Swedes, Danes, and Norwegians. From the second of these people, their use was introduced into England, whence divers remains of them in the counties. Dr. Plot has given the description and figure of one of these clogs, found in Staffordshire, under the title of "The perpetual Staffordshire Almanack."

ALMA'NAR, *f.* in astrology, denotes the pre-eminence, or prevalency, of one planet over another.

ALMA'ND, or AMAN, a river of Athol, a branch of the Tay. It has a cascade near thirty yards high, close by which two rocks so meet over the river as to make a natural bridge.

AL'MANDINE, *f.* [Fr. of *almandina*, Ital.] A ruby, coarser and lighter than the oriental, and nearer the colour of the granate.

ALMAN'ZA, a town of New-Castile, on the frontiers of the kingdom of Valencia, in Spain, situated in N. lat. 38. 54. W. lon. 1. 19. It is remarkable for the defeat of the allies in 1707, under the marquis de las Minas and the earl of Galway. In the beginning of this action, the English troops

troops penetrated through the centre of the Spanish army; but the Portuguese cavalry being broken by the Spanish, and the French infantry making a dreadful fire on their flanks, the allied army was at last broken, and began their retreat when it was almost dark. Colonel Hill carried off the remains of thirteen battalions towards the river Xucar, which if they could have passed, they might have been safe: but, being very much fatigued, they were obliged to halt; by which means they were surrounded, and forced to surrender prisoners of war. In this battle, the allies lost 120 standards, together with all their artillery and baggage; a great number were killed, and several thousands taken prisoners. The Marquis de las Minas was dangerously wounded; and his mistress in the garb of an amazon was killed by his side. The earl of Galway had two cuts across the face, which, though not dangerous, had prevented him from seeing or giving orders properly.

ALMA'RIA, in old records, the archives of a church; a library.

AL/MARIC HERESY, a tenet broached in France by one Almaric, in the year 1209. It consisted in affirming, that every Christian was actually a member of Christ; and that without this faith no one could be saved. His followers went farther, and affirmed, that the power of the Father lasted only during the continuance of the Mosaic law; that the coming of Christ introduced a new law; that at the end of this began the reign of the Holy Ghost; and that now confession and the sacraments were at an end, and that every one is to be saved by the internal operations of the Holy Spirit alone, without any external act of religion.—Their morals were as infamous as their doctrine was absurd. Their tenets were condemned by a public decree, of the council of Sens, in the year 1209.

AL/ME, or ALMA, singing and dancing girls in Egypt, who, like the Italian *Improvvisatori*, can occasionally pour forth "unpremeditated verse." They are called *Almé*, from having received a better education than other women. They form a celebrated society in this country. To be received into it, according to Mr. Savary, it is necessary to have a good voice, to understand the language well, to know the rules of poetry, and be able to compose and sing couplets on the spot, adapted to the circumstances. The *Almé* know by heart all the new songs. Their memory is furnished with the most beautiful tales. There is no festival without them; no entertainment of which they do not constitute the ornament. They are placed in a rostrum, from whence they sing during the repast. They then descend into the saloon, and form dances which have no resemblance to ours. They are pantomime ballets, in which they represent the usual occurrences of life. The mysteries of love, too, generally furnish them with scenes. The suppleness of their bodies is inconceivable. One is astonished at the mobility of their features, to which they give at pleasure the impression suited to the characters they play. The indecency of their attitudes is often carried to excess. Their looks, their gestures, every thing, speaks, but in so expressive a manner, that it is impossible to mistake them. At the beginning of the dance, they lay aside with their veils the modesty of their sex. A long robe of very thin silk goes down to their heels, which is slightly fastened with a rich girdle. Long black hair, plaited and perfumed, is flowing on their shoulders. A shift, transparent as gauze, scarcely hides their bosom. As they put themselves in motion, the shapes, the contours, of their bodies, seem to develop themselves successively. Their steps are regulated by the sound of the flute, of castanets, the tambour de basque, and cymbals, which accelerates or retards the measure. They are still further animated by words adapted to such scenes. They appear in a state of intoxication. They are the Bacchants in a delirium. It is when they are at this point, that, throwing off all reserve, they abandon themselves totally to the disorder of their senses; it is then that a people far from delicate, and who like nothing hidden, redouble their applauses. These *Almé* are sent for into all the harems. They teach the

women the new airs; they amuse them with amorous tales, and recite in their presence poems, which are so much the more interesting, as they furnish a lively picture of their manners. They initiate them into the mysteries of their art, and teach them to contrive lascivious dances. These girls, who have a cultivated understanding, are very agreeable in conversation. They speak their language with purity. The habit of dedicating themselves to poetry renders the softest and most sonorous expressions familiar to them. They repeat with a great deal of grace. In singing, nature is their only guide. Sometimes two of them sing together, but always with the same voice. It is the same with an orchestra, where all the instruments playing in unison execute the same part.

The *Almé* assist at the marriage-ceremonies, and march before the bride, playing on instruments. They make a figure likewise at funerals, and accompany the procession, singing sorrowful airs. They break forth into groans and lamentations, and give every sign of grief and despair. These women are paid very high, and seldom appear but amongst the grandes and rich men.

The common people in Egypt have also their *Almé*. They are girls of the second class, who try to imitate the former; but they have neither their elegance, their graces, nor their knowledge. They are every where to be met with. The public places and the walks about Grand Cairo are full of them. As the populace require allusions still more strongly marked, decency will not permit the relation to what a pitch they carry the licentiousness of their gestures and attitudes.

ALME, or dancing-girls, are also employed all over the east, as affording the principal diversion at all public entertainments. They are mostly prostitutes; and, by the laws of their society, are bound to refuse no one for their price, which is rated according to their beauty and other accomplishments. There are even particular sets of them appropriated to the service of the Gentoo temples, and the use of the bramin priests who attend them. These poor creatures say that they were first debauched by their god, and afterwards by him consigned over to the use of the priests who belong to his temples.

These dancing-girls, whether in a settled or unsettled condition, live in a band or community under the direction of some superannuated female of the same profession, under whom they receive a regular education, and are trained up in all the arts of love and pleasing, like scholars in an academy. Thus they acquire the art of captivating the affections of the other sex to such a degree, that nothing is more common than for one of the princes or chief people of the country to take a liking to one of these girls, and waste immense sums on her, though at the same time their own harem is stocked with beauties far superior, and who are besides possessed of the natural modesty of the sex, to which the others have not the smallest pretensions. Thus some of these girls acquire immense wealth. In the neighbourhood of Goa, for instance, on a part of the continent bordering on the district of that island, the dancing girls founded a village, after being driven from Goa by the zeal of the archbishop. Here they reside in a body corporate, and attend the parties of pleasure of the noblemen and principal inhabitants, for it is not every one's purse that can afford them. Here many of them acquire considerable fortunes by this scandalous traffic, and throw it into a common stock for the sake of carrying on merchandise; being concerned in shipping and the most profitable voyages, for which they have regular factors and brokers.

The dress of these women varies according to the country they live in; but in all it is the most gorgeous imaginable. They are loaded with jewels, literally from top to toe, since even on their toes they wear rings. Their necks are adorned with carcanets, their arms with bracelets, and their ancles with chains of gold and silver, often enriched with precious stones. They also wear nose-jewels, which at first have an odd appearance, but to which the eye is soon reconciled. In Hindostan these dancing girls,

as well as the other women of the country, have a peculiar method of preserving and managing their breasts, which at the same time makes no inconsiderable part of their finery. They inclose them in a pair of hollow cases, exactly fitted to them, made of very light wood, linked together and buckled at the back. These at once confine their breasts so that they cannot grow to any disgustfully exuberant size; though, from their smoothness and pliancy, they play so freely with every motion of the body, that they do not crush the tender texture of the flesh in that part, like the stiff whale-bone stays in use among the Europeans. The outside of them is spread over with a thin plate of gold or silver, or set with gems, if they can afford it. Another occasional ornament the dancing-girls put on, particularly when they resort to their gallants, viz. a necklace of many loose turns, composed of flowers strung together, which they call *mogrees*, somewhat resembling Spanish double jessamy, but of a much stronger and more agreeable fragrant odour, and far preferable to any perfumes. "They have nothing (says Mr. Grose) of that nauseous boldness which characterises the European prostitutes, their style of seduction being all softness and gentleness."

With regard to the performances of these women as dancers, we have various accounts. The author of *Memoirs of the War in Asia*, acquaints us, "that their attitudes as well as movements are not ungraceful. Their persons are delicately formed, gaudily attired, and highly perfumed. By the continuation of wanton attitudes, they acquire, as they grow warm in the dance, a frantic lasciviousness themselves, and communicate, by a natural contagion, the most voluptuous desires to the beholders." Mr. Ives seems to have been very cool on this subject. "I could not," says he, "observe any thing in their performance worthy of notice." Their movements are more like tumbling or shewing postures than dancing. Their dress is thin and light; and their hair, neck, ears, arms, wrists, fingers, legs, feet, and even their toes, are covered with rings of gold and silver, made after a clumsy manner. They wear two rings in their noses; and, by their staring looks and odd gesticulations, you would rather suspect them to be mad women than morris-dancers. The band of music that attends them is not less singular in its way: it is chiefly composed of three or four men, who hold two pieces of bell-metal in their hands, with which they make an incessant noise; another man beats what he is pleased to call a drum; and, that they may not want vocal music to complete the band, there are always two others appointed to sing. These last generally lay in their mouths a good loading of beetle-nut before they begin; which, after having been well chewed, tinges the saliva with such a redness, that a stranger would judge them to bleed at the mouth by too violent an exertion of their voice. These gentry are called *ticky-taw* boys, from the two words *ticky-taw*, which they continually repeat, and chant with great vehemence. The dancing-girls are sometimes made use of in their religious ceremonies, as, when the priests bring forth the images of their gods into the open fields on a car ornamented with lascivious figures, these girls dance before the images amidst a great croud of people; and, having been selected for their superior beauty, are very profitable to their masters the priests, who are said to prostitute them to all comers."

Mr. Grose informs us, that "these dances would hardly at first relish with Europeans, especially as they are accompanied with a music far from delightful, consisting of little drums called *gumgums*, cymbals, and a sort of fife, which makes a hideous din, and are played on by men, whose effeminacy, grimaces, and uncouth shrivelled features, all together shock the eye and torture the ear. However by use we become reconciled to the noise, and may observe some not unpleasing airs, with which the dancers keep time: the words often express the matter of a pantomime dance, such as a lover courting his mistress; a procureur bringing a letter, and endeavouring to

seduce a woman from one gallant in favour of another; a girl, timorous and afraid of being caught in an intrigue. All these love-scenes the girls execute in character dances, and with no despicable expression, if they are proficient in their art; for then their gestures, air, and steps, are marking and well adapted. In some of their dances, even in public, modesty is not much respected by the lascivious attitudes into which they throw themselves, without exposing any nudity; being richly clad and bedecked with jewels after their manner. But in private parties to which they are called, as in gardens, they give themselves a great loose, and have dances in reserve, in which, though still without any grossness in discovering their bodies, they are mistresses of such motions and lewdness of looks and gestures as are perhaps more provoking.

ALME'DIA, a frontier town of Portugal, in the province of Tra los Montes, on the confines of Leon, where a very severe action was fought between the French and Portuguese in 1663; 17 miles N. W. of Ciudad Rodrigo. N. lat. 40. 41. W. lon. 7. 10.

AL'MEHRAB, in the Mahometan customs, a niche in their mosques, pointing towards the kebla or temple of Mecca, to which they are obliged to bow in prayer.

ALMEI'SAR, a celebrated game among the ancient Arabs, performed by casting of lots with arrows, strictly forbidden by the laws of Mahomet, on account of the frequent quarrels occasioned by it. The manner of the game was thus: A young camel, being brought and killed, was divided into a number of parts. The adventurers, to the number of seven, being met, eleven arrows were provided without heads or feathers; seven of which were marked, the first with one notch, the second with two, the third with three, &c. the other four had no marks. These arrows were put promiscuously into a bag, and drawn by an indifferent person. Those to whom the marked arrows fell, won shares in proportion to their lot; the rest, to whom the blanks fell, were intitled to no part of the camel, but obliged to pay the whole price of it. Even the winners tasted not of the flesh themselves more than the losers, but the whole was distributed to the poor.

ALMENE, in commerce, a weight of two pounds used to weigh saffron in several parts of the continent of the East Indies.

ALME'RIA, a sea-port town in the kingdom of Granada in Spain, pleasantly situated in a fine bay at the mouth of the river Almeria, on the Mediterranean: N. lat. 36. 51. W. lon. 3. 20. This town is by some thought to have risen upon the ruins of the ancient Abdera, and was formerly a place of great consequence. It was taken from the Moors in 1147, by the emperor Conrad III. in conjunction with the French, Genoese, and Pisans. It was at that time the strongest place in Spain held by the infidels; from which their privateers, which were exceedingly numerous, not only infested the sea-coasts inhabited by the Christians, but gave equal disturbance to the maritime provinces of France, Italy, and the adjacent islands. The city being well fortified, having a strong castle, a numerous garrison, and being excellently provided with every thing necessary, made a vigorous resistance; but was at last taken by storm, when the victor put to the sword all the inhabitants who were found in arms, distributing the best part of the plunder among his allies, whom he sent away thoroughly satisfied. The Genoese, particularly, acquired here that emerald vessel which still remains in their treasury, and is deemed invaluable.

Upon its reduction by the Christians, Almeria became a bishopric; but is at present very little better than a village, indifferently inhabited, and has nothing to testify so much as the probability of its former greatness, except certain circumstances which cannot be effaced even by the indolence of the Spaniards themselves. What these are, Udal ap Rhys, a Welshman, thus describes in his *Tour through Spain and Portugal*. "Its climate (says he) is so peculiarly blessed, that words are insufficient to express its charms and excellencies. Its fields and meads are covered

ed with flowers all the year round; they are adorned also with palms, myrtles, plane-trees, oranges, and olives; and the mountains and promontories near it are noted for producing a great variety of precious stones, inasmuch that the next promontory to it is called the *Cape of Gates*, which is a corruption from the word *agates*, the hills thereabouts abounding in that sort of precious stones, as well as in emeralds and amethysts, granites or coarse rubies, and extreme curious alabaster in the mountains of Filaures."

ALMIGHTINESS, *f.* Unlimited power; omnipotence; one of the attributes of God.—In the wilderness, the bittern and the stork, the unicorn and the elk, live upon his provisions, and revere his power, and feel the force of his *almightiness*. *Taylor*.

ALMIGHTY, *adj.* [from *all* and *mighty*.] Of unlimited power; omnipotent. The Lord appeared unto Abraham, and said unto him, I am the *almighty* God; walk before me, and be thou perfect. *Genesis*, xvii. 1.

ALMESFEO'H, or **ALMSFEOH**, alms-money, Peterpence; a tribute formerly annually paid in England to the pope on the eighth of August; called also *hearth-penny*.

ALMIS'SA, a small town in Venetian Dalmatia, at the mouth of the Cetina. It stands between two high mountains on a steep rock, 10 miles E. of Spalatro. Lat. 44. 4. N. lon. 17. 45. E.

AL'MOND, *f.* [*amand*, Fr. derived by Menage from *amandala*, a word in low Latin; by others, from *Allemand*, a German; supposing that almonds come to France from Germany.] The nut of the almond-tree, either sweet or bitter.

ALMOND, *f.* in botany. See **AMYGDALUS** and **BRABEIUM**.

ALMOND, in commerce, a measure by which the Portuguese sell their oil; twenty-six almonds make a pipe.

ALMONDS of the **THROAT**, or **TONSILS**, called improperly *Almonds of the ears*, are two round glands placed on the sides of the basis of the tongue, under the common membrane of the fauces; each of them has a large oval sinus, which opens into the fauces, and in it are a great number of smaller ones, which discharge themselves thro' the great sinus of a mucous and slippery matter into the fauces, larynx, and œsophagus, for the moistening and lubricating those parts. When the œsophagus muscle acts, it compresses the *almonds*, and they frequently are the occasion of a sore throat.—The tonsils, or *almonds of the ears*, are also frequently swelled in the king's evil; which tumour may be very well reckoned a species of it. *Wifeman*.

ALMONDS, among lapidaries, signify pieces of rock-crystal, used in adorning branch-candlesticks, &c. on account of the resemblance they bear to the fruit of that name.

ALMOND-FURNACE, or **ALMAN-FURNACE**, called also the *Sweep*; is a peculiar kind of furnace used in refining, to separate metals from cinders and other foreign substances.

AL'MONDBURY, or **ALBANEURY**, i. e. the town or grove of St. Alban, in Yorkshire, where Paulinus the Apostle (so called because he converted many of them from heathenism) built a cathedral, and dedicated it to St. Alban, the first English martyr. It is six miles from Halifax.

AL'MONDSBURY is in Gloucestershire, about six miles and a half north from Bristol, and in the road to Gloucester. This village is said to derive its name from Alemond, a West Saxon prince, the father of Egbert, the first sole monarch of England, (who is supposed to be buried in the church,) and from a fortification of a rampier, and a double-ditch, at Knoie, in this parish, for such our ancestors called bergs, and we by frequent use have softened the word into borough or bury. On the brow of the hill, surrounded by the fortification, stands Knoie, an ancient seat belonging to the family of Chester.

AL'MONER, or **ALMNER**, *f.* [*elemosynarius*, Lat.] The officer of a prince, or other person, employed in the distribution of charity.

Almoners were employed in religious houses, to whom belonged the management and distribution of the alms of

the house. By the ancient canons, all monasteries were to spend at least a tenth part of their incomes in alms to the poor. The almoner of St. Paul's is to dispose of the monies left for charity, according to the appointment of the donors, to bury the poor who die in the neighbourhood, and to breed up eight boys to singing, for the use of the choir. By an ancient canon, all bishops are required to keep almoners.

Lord ALMONER, or **Lord High ALMONER** of **ENGLAND**, is an ecclesiastical officer, generally a bishop, who has the forfeiture of all deadlands, and the goods of *felos de se*, which he is to distribute among the poor. He has also, by virtue of an ancient custom, the power of giving the first dish from the king's table to whatever poor person he pleases, or, instead of it, an alms in money.

Great ALMONER, (*grand aumônier*,) in France, was reckoned before the revolution the highest ecclesiastical dignity in that kingdom. To him belonged the superintendency of all hospitals and houses of lepers. The king received the sacrament from his hands; and he said mass before the king in all grand ceremonies and solemnities.

ALMONER is also a more fashionable title given by some writers to chaplains. In this sense we meet with almoner of a ship, almoner of a regiment.

AL'MONRY, *f.* The place where the almoner resides, or where the alms are distributed.

ALMO'ST, *adv.* [from *all* and *most*; that is, Most part of all.] Nearly; well nigh; in the next degree to the whole, or to universality.—There can be no such thing or notion, as an *almost* infinite; there can be nothing next or second to an omnipotent God. *Bentley*.

ALMS, *f.* [in Saxon *elmes*, from *elemosyna*, Lat.] What is given gratuitously in relief of the poor. It has no singular.—The poor beggar hath a just demand of an *alms* from the rich man; who is guilty of fraud, injustice, and oppression, if he does not afford relief according to his abilities. *Swift*.

Giving *alms* never lessens the stock. Sp. *El dar limosna nunca mengua la bolsa*. The blessings of heaven, so positively promised in Scripture to the charitable and compassionate man, and the visible effect of them so often experienced, leave us no room to call the truth of this aphorism in question. And indeed, were it but the advantage this character gives a man in the eye of the world, (though that ought to be the last motive to charity,) it meets with a more than sufficient reward.

In the early ages of Christianity, the alms of the charitable were divided into four parts; one of which was allotted to the bishop, another to the priests, and a third to the deacons and sub-deacons, which made their whole subsistence; the fourth part was employed in relieving the poor, and in repairing the churches.

No religious system is more frequent or warm in its exhortations to alms-giving than the Mahometan. The Alcoran represents alms as a necessary means to make prayer be heard. Hence that saying of one of their khalifs: "Prayer carries us half-way to God, fasting brings us to the door of his palace, and alms introduces us into the presence-chamber." Hence many illustrious examples of this virtue among the Mahometans. Hasan, the son of Ali, and grandson of Mohammed, in particular, is related to have thrice in his life divided his substance equally between himself and the poor, and twice to have given away all he had. And the generality are so addicted to the doing of good, that they extend their charity even to brutes.

ALMS, also denotes lands or other effects left to churches or religious houses, on condition of praying for the soul of the donor. Hence, *Free ALMS* was that which is liable to no rent or service; and *Reasonable ALMS* was a certain portion of the estates of intestate persons, allotted to the poor.

ALMS-BOX, or **CHEST**, a small chest or coffer, called by the Greeks *κίστη*, wherein anciently the alms were collected, both at church and at private houses. The alms-chest in English churches, is a strong box, with a hole

in the upper part, having three keys, one to be kept by the parson or curate, the other two by the church-wardens. The erecting of such alms-chest in every church is enjoined by the book of canons, as also the manner of distributing what is thus collected among the poor.

ALMS-DEED, f. An act of charity; a charitable gift.—This woman was full of good works, and *alms-deeds* which she did. *Acts*, ix. 36.

ALMS-GIVER, f. He that gives alms; he that supports others by his charity.—He endowed many religious foundations, and yet was he a great *alms-giver* in secret, which shewed that his works in public were dedicated rather to God's glory than his own. *Bacon*.

ALMS-HOUSE, f. A house devoted to the reception and support of the poor; an hospital for the poor:

Behold you *alms-house*, neat, but void of state,
Where age and want sit smiling at the gate.

Pepe.

ALMS-MAN, f. A man who lives upon alms; who is supported by charity.

ALMS (James), was born at Gosport, in Hampshire. In the fourteenth year of his age he acted as aid-de-camp to captain Watton, of the Dragon, in the engagement of Matthews and Lestock, and received from his commander many marks of approbation. From the Dragon he went to the *Namur*, of 74 guns, which ship bore a part in the memorable capture of the French Squadron, and their East-India convoy, by lord Anson, May 3, 1747. In October following, in the same ship, he accompanied admiral Boscawen to the East Indies; and this ship, with three others, was wrecked on the Coromandel coast, in April 1749; but our young hero, reserved by Providence for more brilliant services, was one out of twenty-three saved from the crew of the *Namur*. Immediately after this disaster, he was promoted to be lieutenant of the *Syren*, in which ship he came home. In 1754 he sailed again for the East Indies, as commander of the *Hardwicke* Indiaman, in which he was present at the attack of the *Geriah*, under Sir Cha. Watton. But war breaking out between France and Great Britain, in 1758, he accompanied Mr. Ives, who published the history of the voyage over land, to offer his service in the line of his profession. November 20, 1759, he was first lieutenant of the *Mars*, in the victory obtained by Sir E. Hawke over the *Confians*. In June 1761, he was promoted to the rank of master and commander; and, in February 1762, he sailed, as acting captain of the *Alarm* frigate, to the West Indies, and was at the taking of Martinico. Shortly after this, he took an armed sloop of 18 guns, and another of 12 guns. June 3, on his passage with the British fleet, destined for Havannah, by the superior failing of the *Alarm*, he came up with, and, after an hour's engagement, took two Spanish ships of war, one of 22 guns (nine-pounders) and 180 men, the other of 18 guns and 80 men; in the action several balls passed through his hat, and he was wounded in the knee: there were fourteen men killed in the *Alarm*, and twenty-six wounded. During the arduous service at the reduction of the Havannah, Capt. Alms was entrusted, by the commander in chief, on many important occasions; but it remains one of those unaccountable neglects in the fortune of many deserving officers, that he was not appointed a post-captain till 1765; from which time, till September 1780, Capt. Alms enjoyed, with his family at Chichester, every pleasure from domestic attachment, till he was appointed to the *Monmouth*, of 64 guns, in which ship he sailed under commodore Johnstone for the East Indies. The spirited manner in which he fought the *Monmouth*, in Port Praya Bay, was an introduction to what M. Suffrein afterwards experienced from him in the obstinate engagements between the two fleets in India. The ships which were destined for Madras proceeded, under his command, to join Sir Edward Hughes; and, after braving uncommon hardships from the unfavourable season, it was accomplished on the 15th of February. The active and resolute spirit of the French admiral is yet recent in the mind of every one.

The most conspicuous share which Capt. Alms had in any action was on the memorable 12th of April. He was this day second to Sir Edward Hughes. Suffrein bore down with an intention, it was thought, to board the British admiral; which Capt. Alms perceiving, luffed up the *Monmouth*, raked his enemy, and frustrated his manœuvre; though he had now to sustain a terrible fire from Suffrein and his two seconds, which continued until the *Monmouth's* main and mizen masts fell overboard. Suffrein, whose ship had sustained prodigious damage, observing the situation of his antagonist, sheered off, while the shattered *Monmouth* continued her fire as long as her shot could reach him. On the smoke clearing away as the firing ceased, Capt. Alms found himself far to windward, set his fore-fail, which was all he had, and boldly fired at the French line as he passed to join the British fleet. In this dreadful conflict with the enemy, the *Monmouth's* colours, being twice shot away, were nailed to the stump of the mizen-mast, never to be struck; the ship having seven guns dismounted, forty-five men killed, and 102 wounded. The captain himself had two wounds in the face from splinters, two musket-balls went through his hat, his hair was set on fire, his coat torn between the shoulders, and one of the skirts shot away; the *Monmouth's* wheel was twice cleared, and only two, with himself remained on the quarter-deck. Capt. Alms died at Chichester, June 8, 1791, in his sixty-fourth year.

ALMUCAN'TARS, ALMACAN'TARS, or ALMICAN'TARS, f. [from *almocantharat*, Arab.] Circles parallel to the horizon, conceived to pass through every degree of the meridian; serving to shew the height of the sun, moon, or stars, &c. and are the same as the parallels of altitude.

ALMUCANTAR-STAFF, f. was an instrument formerly used at sea to observe the sun's amplitude at rising or setting, and thence to determine the variation of the compass, &c. The instrument had an arch of fifteen degrees, made of smooth wood.

ALMUDHE'BIS, f. in the Arabian astrology, a kind of dignity or pre-eminence accruing to a planet in some place, either from its disposition or benign aspect.

ALMUGEA, f. in astrology, denotes a certain configuration of the five planets, in respect of the sun and moon, correspondent to that which is between the hours of those planets and the sun's and moon's hours. Thus, Saturn will be in the almugea of the sun when distant from him the space of five signs in succession, or in the almugea of the moon when he is at the same distance, only contrary to the succession of the sign.

ALMU'THEN, f. in the Arabian astrology, the planet which has the disposal of a place, that is, surpasses the rest in the number and efficacy of dignities, regard being had to the essential points, viz. exaltation, terms, trigon, and phases. This is otherwise called **ALMUSTEULI**.

ALMU'CIUM, f. a kind of cover for the head, worn chiefly by monks and ecclesiastics. It was of a square form, and seems to have given rise to the bonnets of the same shape still retained in universities and cathedrals.

ALMUG-TREE, f. A tree mentioned in Scripture. Of its wood were made musical instruments, and it was used also in rails, or in a stair-case. The rabbins generally render it *coral*, others *ebony*, *brazil*, or *pine*. In the Septuagint it is translated *wrought wood*, and in the Vulgate *ligna thyria*. But coral could never answer the purposes of the almugium; the pine-tree is too common in Judea to be imported from Ophir; and the thyrium, or citron-tree, much esteemed by the ancients for its fragrance and beauty, came from Mauritania. By the wood *almugim*, or *algunim*, or simply *gummim*, taking *al* for a kind of article, may be understood oily and gummy sorts of wood, and particularly the trees which produce gum ammoniac, or gum arabic; and is, perhaps the same with the shittim-wood mentioned by Moses.—And the navy also of Hiram, that brought gold from Ophir, brought in from Ophir great plenty of *almug-trees* and precious trees. 1 *Kings*, x. 11.

ALMUNE'CAR, f. a sea-port town in the kingdom of Granada,

Granada, seated on the Mediterranean, with a good harbour, defended by a strong castle, thirty miles south of Alhama. Lat. 36.30. N. lon. 3.45. W.

AL'NAGE, or AULNAGE, *f.* [from *aune*, or *alne*, Fr. an ell.] The measuring of woollen manufactures with an ell. As a proof of the goodness of that commodity, a seal was invented and affixed as a mark that the commodity was made according to the statute; but, it being now possible to purchase these seals, they are affixed, whenever the vender pleases, to all cloths indiscriminately, to the great prejudice of our woollen manufactures.

AL'NAGER, AL'NEGER, or AUL'NEGER, *f.* q. d. "measurer by the ell," signified a sworn public officer, who, by himself or deputy, was to look to the allize of woollen-cloth made throughout the land, i. e. the length, width, and work, thereof; and to the seals for that purpose ordained. The office of king's aulnager seems to have been derived from the statute of Richard I. A. D. 1197; but this office was abolished by the statute 11 and 12 Wm. III. cap. 20.

ALNE, a river in Cumberland, which runs into the Tyne below Kirk-Haugh; another in Northumberland, which runs into the German ocean at Aylmouth; and another in Warwickshire, which runs into the Arrow at Round-Alne.

AL'NEY, a little island near the city of Gloucester, famous for the single combat fought on it, between Edmund Ironside and Canute the Dane, for the whole kingdom, in fight of both their armies, in which the latter being wounded, he proposed an agreement; accordingly the kingdom was divided between them; the south part falling to Edmund, the north to Canute.

AL'NI EFFIGIE, *f.* in botany. See CRATÆGUS and MESPILUS.

ALNIFO'LIA, *f.* in botany. See CLETHRA.

ALNI FRUC'TU, *f.* in botany. See CONOCARPUS and THEOBROMA.

AL'NIGHT, *f.* [from *all* and *night*.] A service which they call *alnight*, is a great cake of wax, with the wick in the midst; whereby it cometh to pass, that the wick fetcheth the nourishment farther off. *Bacon*.

AL'NUS, *f.* in botany. See BETULA, CONOCARPUS, and RHAMNUS.

ALNUS, in the ancient theatres, that part which was most distant from the stage.

ALN'WICK, is the county-town of Northumberland, situated on the north side of a hill, near the river Alne, over which is a stone bridge, at the distance of about thirty-four miles north from Newcastle. The bridge, though belonging to the public, was re-built by the late duke of Northumberland, in a handsome Gothic stile; he also built another beautiful bridge, of one arch, a little lower down. These two bridges serve as boundaries to the fine lawns that surround the castle, which is one of the principal seats of the great ancient family of Percy, earls of Northumberland.

The town of Alnwick, being a great thoroughfare to Berwick, is populous, and in general well built. It has a large town-house, where the quarter-sessions and county-courts are held, and members of parliament are elected. It has also a spacious square for the market, which is held every Saturday; and for the fairs, which are five in a year, viz. Palm Sunday eve, May 12, last Monday in July, first Tuesday in October, and the Saturday before Christmas.

Alnwick appears to have been formerly a fortified town, by the vestiges of a wall still visible in many parts, and three gates, which remain almost entire. Handsome shamblers, with piazzas in the front and at one end, have been built by his grace, ornamented with the different crests and badges of the Percy family. The town-hall has a tower, like that of a church, with a clock. It is governed by four chamberlains, who are chosen once in two years out of a common-council consisting of twenty-four.

The castle is situated on the south side of the river Alne, opposite the town, on an elevation that gives great dignity

to its appearance, and in ancient times rendered it a most impregnable fortress. From some Roman mouldings found under the present walks, it is believed to have been founded in the time of the Romans, although no part of the original structure is now remaining. The dungeon, or keep of the present castle, was evidently founded in the Saxon times, as it appears to have been a very strong fortress immediately after the Norman conquest: for, in the reign of king William Rufus, it underwent a remarkable siege from Malcolm III. king of Scotland, who lost his life before it, as did also prince Edward his eldest son. The most authentic account of this event, seems to be that given in the ancient chronicle of Alnwick-abbey; of which a copy is preserved in the British Museum. This informs us that the castle, although too strong to be taken by assault, being cut off from all hopes of succour, was on the point of surrendering, when one of the garrison undertook its rescue by the following stratagem: He rode forth completely armed, with the keys of the castle tied to the end of his spear, and presented himself in a suppliant manner before the king's pavilion, as being come to surrender up the possession: Malcolm too hastily came forth to receive him, and suddenly received a mortal wound. The assailant escaped by the fleetness of his horse through the river, which was then swollen with rains. Prince Edward, Malcolm's eldest son, too incautiously advancing to revenge his father, received a mortal wound, of which he died three days after. The spot where Malcolm was slain, was distinguished by a cross, which has been restored by the late dukes of Northumberland, who was lineally descended from this unfortunate king, by his daughter queen Maud, wife of king Henry I. of England. In the following century, another king of Scotland was taken prisoner besieging this castle. This was William III. commonly called the Lion; who, having formed a blockade for some days, was surprised by a party of English, and taken prisoner early in the morning of July 12, 1174. This castle, like many others in the north, was anciently ornamented with figures of warriors, distributed round the battlements, and the present proprietors have allowed them to be continued, and have supplied some that had been destroyed, to shew what they once were. From length of time, and the shocks it had sustained in ancient wars, this castle was become quite a ruin, when, by the death of Algernon duke of Somerset, in 1750, it devolved, together with all the estates of this great barony, &c. to the late duke of Northumberland; who immediately set to repair the same, and with the most consummate taste and judgment restored and embellished it, as much as possible, in the true Gothic style; so that it may deservedly be considered as one of the noblest and most magnificent models of a great baronial castle. Nothing can be more striking than the effect at first entrance within the walls from the town, when, through a dark gloomy gateway of considerable length and depth, the eye suddenly emerges into one of the most splendid scenes that can be imagined; and is presented at once with the great body of the inner castle, surrounded with fair semi-circular towers, finely swelling to the eye, and gaily adorned with pinacles, figures, battlements, &c. The impression is still farther strengthened by the successive entrance into the second and third courts, through great massy towers, till the stranger is landed in the inner court, in the very centre of this great citadel. Here he enters to a most beautiful stair-case, of a very singular yet pleasing form, expanding like a fan: the cornice of the ceiling is enriched with a series of 120 escutcheons, displaying the principal quarterings and inter-marriages of the Percy family. The chapel fills all the upper space of the middle ward; and here the highest display of Gothic ornaments, in the greatest beauty, has been very properly exhibited; and the several parts of the chapel have been designed after the most perfect models of Gothic excellence. The great east window is taken from one of the finest in York-minster. The ceiling is borrowed from one of King's college, in Cambridge; and

the walls are painted after the great church in Milan. Alnwick is 306 miles north-by-west of London, thirty north of Newcastle, and twenty-six south of Berwick. Lat. 55. 24. lon. 1. 10.

ALO'A, in Grecian antiquity, a festival kept in honour of Ceres by the husbandmen, and supposed to resemble our harvest home.

ALO'E, *f.* [from *αλος*, Gr. the sea.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of lilia, or liliaceæ. The generic characters are—Corolla: one-petalled, erect, sexfid, oblong; tube gibbous; border spreading, small; nectareous at bottom. Stamina: filaments awl-shaped, as long as the corolla or longer, inserted into the receptacle; antheræ oblong, incumbent. Pistillum: germ ovate; style simple, the length of the stamens; stigma obtuse, trifid. Pericarpium: an oblong capsule, three-furrowed, three-celled, and three-valved. Seeds: several, angular.—*Essential Character.* Corolla erect, with an expanded mouth, and a nectareous base; filaments inserted into the receptacle.

Species. 1. Aloe dichotoma, or smooth-stem'd tree aloe: branches dichotomous, leaves sword-shaped, serrate. Native of the Cape of Good Hope.

2. Aloe perfoliata, or perfoliate aloe: stem-leaves toothed embracing sheathing, flowers in corymbs drooping peduncled subcylindrical. Of this species there are sixteen varieties noticed by different authors. The leaves are about four inches broad at their base, where they are near two inches thick; they have a few indentures on their edges; are of a beautiful green colour, and when young are spotted with white. The flower-stem rises near three feet high, and the flowers stand in a slender loose spike, with very short peduncles, and hang downwards; they are of a bright yellow colour, and the stamens stand out beyond the tube. This, though generally known in the shops by the name of Barbadoes aloe, is very common in the other islands of America, where the plants are propagated on the poorest land, to obtain the hepatic aloes, which are brought to England, and used chiefly for horses.

Preparation of Aloes in the Island of Barbadoes. In the month of March, when the plants are a year old, the labourers carry a parcel of tubs and jars into the field, and each takes a slip or breadth of it, and begins by laying hold of a bunch of the blades, as much as he can conveniently grasp with one hand, while with the other he cuts it just above the surface of the earth, as quickly as possible, (that the juice may not be wasted,) and then places the blades in the tub, bunch by bunch, or handful by handful. When the first tub is thus packed quite full, a second is begun (each labourer having two); and, by the time the second is filled, all the juice is generally drained out of the blades in the first tub. The blades are then lightly taken out, and thrown over the land by way of manure, and the juice is poured out into a jar. The tub is then filled again with blades, and so, alternately, till the labourer has produced his jar full, or about four gallons and a half of juice, which is often done in six or seven hours, and he has then the remainder of the day to himself, it being his employer's interest to get each day's operation as quickly done as possible. Although aloes are often cut in nine, ten, or twelve, months, after being planted, they are not in perfection till the second or third year: and they will be productive for a length of time, as ten or twelve years, or even for a much longer time, if good dung, or manure of any kind, is strewed over the field once in three or four years, or oftener if convenient. The aloe-juice will keep for several weeks without injury. It is therefore not boiled, till a sufficient quantity is provided, to make it an object for the boiling-house. In the large way, three boilers, either of iron or copper, are placed to one fire, though some have but two, and the small planters only one. The boilers are filled with the juice; and as it ripens, or becomes more inspissated, by a constant but regular fire, it is ladled forward from boiler to boiler, and fresh juice is added to that farthest from the

fire, till the juice in that nearest the fire (by much the smallest of the three, and commonly called by the name of tatch as in the manufactory of sugar) becomes of a proper consistency to be skipped, or ladled out into gourds, or other small vessels used for its final reception. The proper time to skip, or ladle, it out of the tatch, is when it is arrived at what is termed a refin height, or when it cuts freely or in thin flakes, from the edges of a small wooden slice, that is dipped from time to time into the tatch for that purpose. A little lime-water is used by some aloe-boilers, during the process, when the ebullition is too great. As to the sun-dried aloes, (which are most approved for medicinal purposes,) very little is made in Barbadoes. The process is however very simple, though extremely tedious. The raw juice is either put into bladders, left quite open at top, and suspended in the sun, or in broad shallow trays of wood, pewter, or tin, exposed also to the sun, every dry day, until all the fluid parts are exhaled, and a perfect refin formed, which is then packed up for use, or for exportation.

The Succotrine aloe, from whence the best sort of aloe for use in medicine is produced, has long, narrow, succulent, leaves, which come out without any order, and form large heads. The stalks grow three or four feet high, and have two, three, or four, of these heads, branching out from it: the lower leaves spread out on every side, but the upper leaves turn inward toward the centre; the flowers grow in long spikes, upon stalks about two feet high, each standing upon a pretty long footstalk; they are of a bright red colour tipped with green, appearing generally in the winter season.

3. Aloe arachnoides, or cobweb aloe: stemless, leaves three-cornered, cusped, ciliate; flowers in a sort of spike, upright cylindrical.

4. Aloe margaritifera, or pearl aloe: stemless, leaves three-cornered cusped papillose, flowers in racemes drooping cylindrical. The pearl aloe is of humble growth, and the leaves come out on every side (without order) near the ground; they are thick, triangular at their ends, and closely studded with white protuberances, whence the name. There is a smaller sort which has been long preserved in the English gardens. These flower in several seasons of the year.

5. Aloe verrucosa, or warted or pearl-tongue aloe: stemless, leaves sword-shaped sharp papillose distich, flowers in racemes reflex club-shaped. The flowers of this kind grow on pretty tall stalks, and form loose spikes, each hanging downward: they are of a beautiful red colour, tipped with green. This sort produces off-sets in plenty, and flowers at different seasons of the year.

6. Aloe carinata, or keel-leaved aloe: stemless, leaves acinaciform papillose, flowers in racemes drooping curved.

7. Aloe maculata, or spotted aloe. Native of the Cape of Good Hope; flowers in August.

8. Aloe lingua, or tongue aloe. Tongue aloe grows with its leaves near the ground, which are about six inches in length. The flowers are in slender loose spikes, each hanging downwards, of a red colour at bottom, and green at the top. There is a variety of this, with leaves much more spotted.

9. Aloe plicatilis, or fan aloe: almost stemless, leaves tongue-shaped even distich, flowers in racemes pendulous cylindrical. Fan aloe grows to the height of six or seven feet, with a strong stem, toward the upper part of which are produced two, three, or four, heads, composed of long, compressed, pliable, leaves, of a sea-green colour, entire, and ending obtusely; these are placed in a double row, lying over each other with their edges the same way. The flowers are produced in short loose spikes, are of a red colour, and appear at different times of the year.

10. Aloe variegata, or partridge-breast aloe: almost stemless, leaves in three ranks painted channelled, angles cartilaginous, flowers in racemes, cylindrical. This is a low plant, seldom rising above eight inches high. The leaves are triangular, and turn back at their extremity: they

ALOE.

The Barbadoes Aloe.

London Published as the Act directs 5th Nov^r 1796 by J. Wilkes

J. Pyle sculp.

they are fleshy and entire, their edges being very slightly serrated: they are curiously veined and spotted, somewhat like the feathers on a partridge's breast. The flowers grow in very loose spikes, upon stalks about one foot high; they are of a fine red colour, tipped with green.

11. Aloe viscosa, or upright triangular aloe: subcaulescent, leaves imbricate in three ranks ovate, flowers in racemes drooping cylindrical. Grows near a foot high, and is furnished with triangular leaves, from the ground upward; these are of a dark green colour, and are placed in form of a triangle; the flowers grow thinly on very slender peduncles, they are of a herbaceous colour, and their upper part turns backward.

12. Aloe spiralis, or spiral aloe: subcaulescent, leaves imbricate in eight ranks ovate, flowers in racemes curved back. Grows somewhat like the eleventh, being beset with leaves from the bottom, but they are rounder, and end in sharp points; the flowers also grow upon taller stems, which branch out, and produce long close spikes. A variety of this has been raised from seeds, which is much larger, the leaves thicker, and the stem taller.

13. Aloe retusa, or cushion aloe: stemless, leaves in five ranks deltoid. Cushion aloe has very short, thick, succulent, leaves, which are compressed on their upper side like a cushion, from whence it had the name. This grows very close to the ground, and puts out suckers on every side: the flowers grow on slender stalks, and are of a herbaceous colour.

14. Aloe spicata, or spiked aloe: flowers in spikes horizontal bell-shaped, stem-leaves flat embracing toothed. It much resembles the second species, but is very different in the spike and figure of the flowers. The flower is full of a purple honey juice, and the best and purest hepatic aloe is obtained from this species.

Medical Qualities and other Uses. The inspissated juice of the various species of aloe is a hot irritating purgative. Three sorts of it are used in the shops, viz. the *aloe fœcotrina* as it is called in the materia medica, which is the *aloe vera* of Miller. It is gentler and purer than the others, and is generally the only kind used in medicine. It is distinguished from the other kinds by having little or no smell: it is the basis of most of the empirical pills, as Anderson's, &c. &c. Succotrine aloes may be given in considerable doses, as a scruple or half a dram at a time; and is a very good purge. It is particularly useful in phlegmatic habits, as it is a good aperient and deobstruent. The tincture called *tinctura sacra*, or *hiera picra*, is a solution of it in wine. It may be given as a purgative from one to two ounces or more, or may be taken as an alterant in smaller doses, and continued till it has induced a lax habit, or soluble state of the bowels. It is an excellent medicine in languid phlegmatic habits; warming the solids, cleansing the primæ viæ, and attenuating viscid juices in the remoter parts. The hepatic aloes is said by some to be preferable (as the basis of a common purge) to the succotrine, as not stimulating so much. The London college however use only the succotrine. The pills called *pil. rufi*, and the *pil. rudii*, are both aloetics, and are extremely serviceable medicines. Spanish liquorice is said to be the most efficacious ingredient of all others, in covering the ill taste of aloes. Equal parts of aloes and Spanish liquorice, dissolved in water, is said to be one of the most pleasant and useful aloetic purges of all others. The medicine called *elixir aloes* is a liquid pil. rufi: and it may be taken in doses of from twenty drops to a tea-spoonful. *Elixir proprietatis* is the same medicine, with the ingredients in a somewhat different proportion; a dose of which is from twenty drops to a tea-spoonful, twice a day. As the droffy resinous part of aloe is not soluble in water, it has been found, when combined with other mixtures, an excellent preservative to ship's bottoms against the worm, to which ships trading to the East or West Indies are particularly subject. One ounce of aloes is sufficient for two superficial feet of plank; about twelve pounds for a vessel of fifty tons burthen, and three hundred pounds

for a first-rate man of war. It may be incorporated with six pounds of pitch, one pound of Spanish brown or whiting, and a quart of oil; or with the same proportion of turpentine, Spanish brown, and tallow. Such a coat will preserve a ship's bottom eight months, and the expence of a first-rate ship will be about 18l. The same composition may be used in the hot countries for preserving rafters, &c. from the wood-ant.—The Hottentots hollow out the trunk of the first species to make quivers for their arrows. And several of them are used for hedges.

Propagation and Culture. The soil in which these plants thrive best, is one half fresh light earth from a common (and, if the turf be taken from it and rotted, it is much better); the rest should be white sea-sand or road-sand and sifted lime-rubbish, of each of these two a fourth part; mix them together six or eight months at least before the compost be used, observing to turn it over often in the time. The middle of July is a very proper season to shift these plants; at which time you may take them out of the pots, and with your fingers open the roots, and shake out as much of the earth as possible, taking off all dead or mouldy roots, but do not break or wound the young fresh ones: then fill the pot about three parts full of the above-mentioned earth, putting a few stones in the bottom of the pot, to drain off the moisture; and, after placing the roots of the plant in such a manner as to prevent their interfering too much with each other, put in as much of the same earth as to fill the pot almost to the rim, and observe to shake the plant, so as to let the earth in between the roots; and then with your hand settle it close to the roots of the plant, to keep it steady in the pot; then water them gently, and set them abroad in a shady place, where they may remain for three weeks, giving them gentle waterings, if the weather should prove hot and dry. Toward the end of September, in a dry day, remove them into the house again, observing to give them as much free open air as possible while the weather is warm; but, if the nights are cool, you must shut up the glasses, and give them air only in the day; and, as the cold increases, you must not open the glasses, but observe to give them gentle waterings often, till the middle of October, when you must abate watering according to the heat of the house in which they are kept. For those plants which are placed in a stove will require to be watered at least once a week, most part of the winter; whereas those which are kept in a green-house, without artificial heat, should not be watered oftener in winter than once a month. When these hardier sorts of aloes are placed abroad in summer, they should have but little water given them; and, if much rain should fall during the time they are abroad, they should be screened from it: for, when they imbibe much wet in summer, they frequently rot the following winter, especially if they are not kept in a moderate warm air. Therefore, those who choose to treat these plants hardly, should be cautious of their receiving too much moisture. The tender sorts, as the viscosa, ferox, and cobweb, aloes, should constantly remain in the stove, or be removed in summer to an airy glass-case, where they may have free air in warm weather, but be protected from rain and cold. With this management the plants will thrive and increase, and such of them as usually flower may be expected to produce them in beauty at their seasons. The hardier sorts thrive much better when they are exposed in summer, and secured from the cold and rain in winter, than if they are treated more tenderly. For, when they are placed in a stove, they are kept growing all the winter, whereby they are drawn up weak; and, although they will flower oftener when they have a moderate share of heat, yet in two or three years the plants will not appear so slightly as those which are more hardily treated. Most of these aloes are increased by offsets, which should be taken from the mother plant at the time when they are shifted, and must be planted in very small pots, filled with the same earth as was directed for the old plants; but if, in taking the suckers off, you observe that part which joined to the mother

root to be moist; you must let them lie out of the ground in a shady dry place six or eight days to dry before they are planted, otherwise they are very subject to rot. After planting, let them remain in a shady place (as was before directed in shifting the old plants) for a fortnight, when you should remove the tender kinds to a very moderate hot-bed, plunging the pots therein, which will greatly facilitate their taking new root; but observe to shade the glasses in the middle of the day, and to give them a great share of air. Toward the middle of August, begin to harden these young plants, by taking off the glasses in good weather, and by raising them at other times with props, that the air may freely enter the bed, which is absolutely necessary for their growth, and to prepare them to be removed into the house, which must be done toward the end of September, and they must then be managed as was before directed for the old plants. The African aloes, for the most part, afford plenty of suckers, by which they are increased; but those few that do not, may be, most of them, propagated by taking off some of the under leaves, laying them to dry for ten days or a fortnight, as was directed for the offsets; then plant them in the same soil as was directed for them, putting that part of the leaf which adhered to the old plant, about an inch, or an inch and a half, (according to the size of the leaf,) into the earth, giving them a little water to settle the earth about them; then plunge the pots into a moderate hot-bed, observing to screen them from the violence of the sun, and give them gentle refreshings with water once a week: the best season for this is in June, that they may push out heads before winter.

Cultivation of the Aloe in the Island of Barbadoes. The lands within two or three miles of the sea, which are subject to drought, and are so stony and shallow as not to admit of the planting sugar-canes with any prospect of success, are generally found to answer best for the aloe-plant. The stones, at least the larger ones, are first picked up, and either packed in heaps upon the most shallow barren spots, or laid round the field as a dry fence. The land is then lightly ploughed, and very carefully cleared of all noxious weeds, lined at one foot distance from row to row, and the young plants set, like cabbages, at about five or six inches from each other. This regular mode of lining and setting the plants, is practised only by the most exact planters, in order to facilitate the weeding of them, by hand, very frequently: because, if they are not kept perfectly clean, and free from weeds, the produce will be very small. They will bear being planted in any season of the year, even the driest, as they will live on the surface of the earth, for many weeks, without a drop of rain.

ALOE, *f.* [אַלֹּה, Heb. as it is supposed.] A precious wood used, in the East, for perfumes, of which the best sort is of higher price than gold, and was the most valuable present given by the king of Siam, in 1686, to the king of France. It is called *tambac*, and is the heart or innermost part of the aloe-tree; the next part to which is called *calembac*, which is sometimes imported into Europe, and, though of inferior value to the *tambac*, is much esteemed. The part next the bark is termed, by the Portuguese, *pao d'aquila*, or eagle-wood; but some account the eagle-wood not the outer part of the *tambac*, but another species. Our knowledge of this wood is yet very imperfect.

ALOE AFRICANA, *f.* in botany. See **CRASSULA**.

ALOE AMERICANA, *f.* in botany. See **AGAVE**.

ALOE PURPUREA, *f.* in botany. See **DRACÆNA**.

ALOE UVARIA, *f.* in botany. See **ALETRIS**.

ALOE YUCCÆ FOLIIS, *f.* in botany. See **YUCCA**.

ALOE'TICAL, *adj.* Consisting chiefly of aloes.

ALOE'TIC, *f.* Any medicine which chiefly consists of aloes.

ALOE'US, in fabulous history, a giant, son of Titan and Terra, whose wife Iphimedia was ravished by Neptune, and had two sons by him, Othus and Ephialtes. Aloeus educated them as his own, and hence they have been called Alouides.

ALO'FT, *adv.* [*lofter*, Dan. to lift up; *loft*, air, Icelandic; so that *aloft* is, into the air.] On high; above; in the air. A word used chiefly in poetry:

For I have read in stories oft,
That love has wings, and soars aloft.

Suckling.

ALOFT, *prep.* Above:

The great luminary
Aloft the vulgar constellations thick,
That from his lordly eye keep distance due,
Dispenses light from far.

Milton.

ALO'GIANS, *f.* in church-history, a sect of ancient heretics, who denied that Jesus Christ was the Logos, and consequently rejected the gospel of St. John. The word is compounded of the privative α and $\logos$, q. d. *without logos or word*. Some ascribe the origin of the name, as well as of the sect, of Alogians, to Theodore of Byzantium, by trade a currier; who having apostatized under the persecution of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek $\alpha\lambda\omicron\gamma\omicron\iota$, because they rejected the word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach. They made their appearance toward the close of the second century.

A'LOGOS, a name given by the Egyptians to Typhon.

ALOGO'TROPHY, *f.* [of $\alpha\lambda\omicron\gamma\omicron\varsigma$, unreasonable, and $\tau\rho\phi\eta$, food, Gr.] A disproportionate nutriment, when one part of the body is nourished more or less than the other.

ALO'IDES, two formidable giants in Homer, who were the largest and handfomest men that were ever seen. At nine years of age they were thirty-six cubits high, and nine thick; and they grew every year a cubit in thickness, and an ell in height. Their prodigious bulk rendered them so proud, that they undertook to dethrone Jupiter; but they were taken prisoners by Mars, who bound them in chains. They were afterwards delivered by Mercury; but at length were thrown into Tartarus by Jupiter. See **ALOEUS**.

A'LOGY, *f.* [$\alpha\lambda\omicron\gamma\omicron\varsigma$, Gr.] Unreasonableness; absurdity.

ALO'NE, *adj.* [*alleen*, Du. from *al* and *een*, or one; that is, *single*.] Without another.—God, by whose *alone* power and conservation we all live, and move, and have our being. *Bentley*.—Without company; solitary.—Eagles we see fly *alone*, and they are but sheep which always herd together. *Sidney*.

Better be *alone*, than in ill company. This proverb contains very wholesome advice; for ill company is not only very tedious and troublesome while we partake of it, but often fatal in the consequences, whereas a good man is *nunquam minus solus quam cum solus*.

ALONE, *adv.* This word is seldom used but with the word *let*, if even then it be an adverb. It implies sometimes an ironical prohibition, forbidding to help a man who is able to manage the affair himself:

Let us *alone* to guard Corioli,
If they set down before 's; 'fore they remove,
Bring up your army.

Shakespeare.

To forbear; to leave undone.—His client stole it, but he had better have *let it alone*; for he lost his cause by his jest. *Addison*.

ALONG, *adv.* [*au longue*, Fr.] At length.—Through any space measured lengthwise.—A firebrand carried *along* leaveth a train of light behind it. *Bacon*.—Throughout; in the whole: with *all* prefixed.—Solomon, *all along* in his Proverbs, gives the title of fool to a wicked man. *Tillotson*.—Joined with the particle *with*; in company; joined with.—Religious zeal is subject to an excess, and to a defect, when something is mingled with it which it should not have; or when it wants something that ought to go *along with* it. *Sprat*.—Sometimes *with* is understood:

Command

Command thy slaves: my free-born soul disdains
A tyrant's curb, and reſtve breaks the reins.
Take this *along*; and no diſpute ſhall riſe
(Though mine the woman) for my raviſh'd prize. *Dryden.*

Forward; onward. In this ſenſe it is derived from *allons*,
French:

Come then, my friend, my genius, come *along*,
Thou maſter of the poet and the ſong. *Pope.*

ALOO'F, *adv.* [*all off*, that is, *quite off*.] At a diſtance;
with the particle *from*. It generally implies a ſmall diſtance,
ſuch as is within view or obſervation. Applied to
perſons, it often inſinuates caution or circumſpection. In
a figurative ſenſe, it is uſed to import art or cunning in
converſation, by which a man holds a principal queſtion
at a diſtance. It is uſed metaphorically of perſons that
will not be ſeen in a deſign; and it is applied to things not
properly belonging to each other:

Love's not love,
When it is mingled with regards that ſtand
Aloof from th' entire point. *Shakeſpeare.*

A'LOPE, the daughter of Cercyon, who had a child
by Neptune, called Hippothoon. It is alſo the name of
one of the Harpies.

ALOPE'CE, **ALOPE'CIA**, an iſland placed by Ptolemy
at the mouth of the Tanais, and called the iſland Tanais:
now, l'île des Renards. Alſo an iſland of the Boſphorus
Cimmerius; and another in the Ægean Sea, over-againſt
Smyrna.

ALOPE'CIA, *f.* [*from αλωπεξ*, a fox, becauſe a fox
is ſubject to a diſtemper which reſembles it.] Baldneſs,
the falling off of the hair; called alſo *capillorum deſluvium*.
Athrix, *Depilis*, *Phalacroſis*; when particularly on the ſci-
puit, *Calvities* and *Calvitium*: which Galen ſays, is owing to
a defect of moiſture. When the bald part is ſmooth and
winding, like the track of a ſerpent, it is called *ophiasis*;
but the general name of all the different appearances of
bald places is *area*, which name is taken from the area in
a garden, a ſpot on which not any thing grows; though
Blanchard ſays, that the hair falls off areatim, by ſhed-
ding; whence, in general, this diſeaſe is called *area*.

Theſe diſorders ſeem to have been more common among
the ancients than they are in our days. Celfus ſays, that
the alopecia comes at any age, but the ophiasis only affects
infants; and Sennertus obſerves, that they both are com-
mon to all ages, though they are moſt frequently met with
in childhood, and often ſucceed the tinea, achores, and ſavi.
The cauſe is a faulty humour that deſtroys the roots
of the hair, and that ſometimes only perverts the humour
that nourishes them, in which caſe the hair turns white,
yellow, &c. according to the different quality of the mor-
bid humour. Galen ſays, that eating muſhrooms may
cauſe that bad quality in the humours which produce theſe
diſorders; and alſo that malignant and contagious diſeaſes
of various kinds may produce the ſame effect.

The alopecia ſpreads itſelf on the beard, as well as on
the hairy ſcalp, and is irregularly formed. The ophiasis
uſually begins at the back part of the head, and creeps
about the breadth of two fingers, till it hath extended its
two heads to both the ears, and ſometimes to the forehead,
till both heads meet in one. The ophiasis ſeems to be
more malignant than the alopecia, ſince that in it not only
the roots of the hair, but alſo the cuticle is corroded as far
as the roots reach; the ſkin alſo changes its colour, and
is ſometimes pale; at others, darker coloured; and, if
pricked, a ſerous blood iſſues out. Theſe diſorders differ
from the tinea: in the latter the excoriations and ex-
ulcerations are deeper, and often the hair does not grow
again. In infants theſe diſorders commonly go off as age
advances; but in adults, the cure, eſpecially of the ophiasis,
is very difficult. If the part does not grow red by friction,
a cure is vainly attempted; but, in proportion as a redneſs

appears readily on rubbing the part, the cure may be ex-
pected to be eaſy and ſoon effected. If a leproſy is the
cauſe, the caſe is incurable. The beſt prognosſtic is when
hairs begin to puſh out on the edges of the areas.

As to the cure, if any other diſeaſe attends, begin by
removing it; which done, it often falls out that the alo-
pecia, &c. depending thereon, is removed alſo. Before
the hair falls off, if ſigns of the approaching diſeaſe at-
tend, gentle repellents and corroborants may be uſed; but
if the diſeaſe is formed, repellents muſt be omitted; the
head muſt be ſhaved, then waſhed with ley in which is in-
fuſed the abrotanum and ſuch-like herbs, after which let
the part be rubbed with a flannel or other coarſe cloth
until the ſkin grows red; this done, applications of muſ-
tard, white lily roots, nitre, tar, the aſhes of ſouthern-
wood, may be directed; or, waſh the head every night at
going to bed with a ley prepared by boiling the aſhes of
vine-branches in red wine. A powder made by reducing
hermodactyls to fine flour, is alſo recommended for the
ſame purpoſe. In caſes where the baldneſs is total, a
quantity of the ſineſt burdock-roots are to be bruised in a
marble mortar, and then boiled in white wine until there
remains only as much as will cover them. This liquor,
carefully ſtrained off, is ſaid to cure baldneſs, by waſhing
the head every night with ſome of it warm. A ley made
by boiling aſhes of vine-branches in common water is alſo
recommended with this intention. A freſh-cut onion,
rubbed on the part until it be red and itch, is likewiſe
ſaid to cure baldneſs. A multitude of ſuch remedies are
every where to be found in the works of Valeſcus de Ta-
ranta, Rondeletius, Holcricus, Trincavellius, Celfus, Se-
nertay, and other practical phyſicians.

ALOPECU'RO-VERONICA, *f.* in botany. See **MEN-
THA**.

ALOPECU'ROS, *f.* in botany. See **BETONICA**.

ALOPECU'RUS, *f.* [*αλωπεκος ουρα*, fox-tail.] In bo-
tany, a genus of the triandria digynia claſs, ranking in the
natural order of gramina or graſſes. The generic charac-
ters are—Calyx: glume one-flowered, two-valved; valves
ovate-lanceolate, concave, compressed, equal, connate at
the baſe. Corolla: one-valved; valve ovate-lanceolate,
concave, the edges united at the baſe, a little ſhorter than
the calyx; awn twice as long, with a bent joint, inſerted
into the back of the valve near the baſe. Stamina: fila-
ments three, capillary, flatliſh at the baſe, longer than the
calyx: antheræ forked at each end. Piſtillum: germ
roundiſh; ſtyles two, capillary, united at the baſe, longer
than the calyx; ſtigmas villous. Pericarpium: none. Co-
rolla inveſting the feed. Seed ovate, covered.—*Eſſential
Character*. Calyx: two-valved. Corolla: one-valved.

Species. 1. *Alopecurus Indicus*, or Indian fox-tail
grafs: ſpike cylindrical; involucre ſetaceous, ſuſciculate,
two-flowered; peduncles villous. Native of the Eaſt Indies.

2. *Alopecurus bulbosus*, or bulbous fox-tail grafs:
culm erect, ſpike cylindrical, root bulbous. Mr. Hudſon
affirms, that this, planted in watery places, becomes the
ſame with ſtote fox-tail, No. 5. According to him, there-
fore, it is only a variety, ariſing from the difference of ſoil.

3. *Alopecurus pratensis*, or meadow fox-tail grafs:
culm ſpiked, erect; glumes villous, corollas awnleſs. The
meadow fox-tail grafs is a native of moſt parts of Europe,
from Italy, through France, Germany, Holland, Great
Britain, to Denmark, Norway, Sweden, and Ruſſia: alſo
in Siberia. It is moſt abundant in moiſt meadows, where
the ſoil is good; neither very wet nor dry grounds agree
with it. Ray affirms, that it is extremely common all over
England: in many counties it is by no means the predo-
minant grafs; and in ſome places it is even ſcarce. About
London, in the beſt paſtures, it is certainly very common.
It is one of the earlieſt of the graſſes, producing the ſpike
in April or May, with the vernal grafs and the ladies'
ſmock. It frequently flowers twice in one ſeaſon, and
therefore ſhould ſeem to be proper for ſuch lands as will
admit of a ſecond crop being taken. It undoubtedly poſ-
ſeſſes

lesses the three great requisites of quantity, quality, and earliness, in a superior degree to any other: and therefore is highly deserving of cultivation on lands that are proper for it. The seed of this valuable grass may be collected without much difficulty, for it does not quit the chaff, and the spikes are very prolific.

4. *Alopecurus agrestis*, or field fox-tail grass: culm spiked, erect; glume smooth, calyx surrounded at bottom by a ring. This is readily distinguished from the meadow fox-tail grass, to which it bears most resemblance, by the great length and slenderness of its spikes, tapering to a point, and usually of a purple colour. It is marked as pereunial by Linnæus, Hudson, and in the Kew catalogue; by Leers, Curtis, and others, as annual. The flowering stalk is a foot or eighteen inches high, upright, except that it is crooked at bottom; it has three or four joints, which are smooth, and purple. The leaves are about three inches long, and from a sixth to a quarter of an inch broad, roughish on the upper surface only, with a blunt membrane (ligula) at the base. This grass is a weed in cultivated ground; it is also frequent by way-sides, on banks and the borders of fields, but rarely in pastures. It varies in the size both of the plant and spike, as well as in the colour of the latter, which is sometimes of a pale green or whitish, without any purple; when in full flower it bends a little. It has acquired the name of mouse-tail grass in English, and *mysuroides* in Latin, from the great length and slenderness of the spike, resembling the tail of a mouse. Its inferiority in every respect to fox-tail grass is so manifest, that it would answer no purpose to make experiments, with any hopes of bringing it into cultivation. It flowers early, continues flowering till autumn, and comes into bloom remarkably quick after being sown.

5. *Alopecurus geniculatus*, or flote fox-tail grass: culm spiked, infracted, corollas awnless; (awns concealed within the calyx.) This species is easily known in its common state, by pools and in the wet parts of meadows, by the frequent joints of the culm or stem, changing their direction at an angle, and thus appearing as if it were broken. It frequently puts out roots under water from the joints, and thus spreads itself; the leaves floating on the surface. From the deep purple colour of the spikes, it is called in some places black-grass. It sometimes occurs in dry pastures, and then, according to Mr. Curtis, it grows more upright, the spike becomes much slenderer, and the base of the stalk swells out into a kind of bulb. It flowers in June. Cattle eat it readily, but it is not a profitable grass.

6. *Alopecurus hordeiformis*, or barley-like fox-tail grass: raceme simple, flowers intrinched with awns. This is an Indian grass. It has the appearance of *hordeum murinum*, or barley-grass. The height is about a foot; the leaves are flat and channelled.

7. *Alopecurus monspeliensis*, or bearded fox-tail grass: panicle subspiked, calyxes rugged, corollas awned. It grows wild in marshes and wet pastures. Annual, flowering in June and July.

8. *Alopecurus panicus*, or hairy fox-tail grass: panicle subspiked, glumes villous, corollas awned. The whole plant is soft, and only five or six inches high. It grows on dry soils. Annual, flowering in July. Mr. Hudson joins the two last under the name of *alopecurus aristatus*, or bearded fox-tail grass. He thinks that the difference of size may arise only from situation.

Propagation and Culture. See GRASS.

A'LOPEX, *f.* in zoology, a species of the canis, with a straight tail and black tip. It is commonly called the *field fox*.

ALO'SA, *f.* The shad, or mother of herrings, a species of the clupea. See CLUPEA.

ALOS'T, a town in Flanders, seated on the river Dender, in the midway between Brussels and Ghent. Lat. 49. 55. N. lon. 4. 10. E.

ALO'UD, *adv.* Loudly; with a strong voice; with a great noise:

Strangled he lies! yet seems to cry aloud,
To warn the mighty and instruct the proud;
That of the great, neglecting to be just,
Heav'n in a moment makes an heap of dust. *Waller.*

ALOW, *adv.* In a low place; not aloft:

And now *alow*, and now aloft they fly,
As borne through air, and seem to touch the sky. *Dryden.*

AL'PHA, *f.* The first letter of the Greek alphabet, answering to our *a*. As a numeral it stands for one, or the first of any thing. It is particularly used, among ancient writers, to denote the chief or first man of his class or rank. In this sense the word stands contradistinguished from *beta*, which denotes the second person. Plato was called the *Alpha* of the wits: Eratosthenes, keeper of the Alexandrian library, whom some called a *Second Plato*, is frequently named *Beta*.

ALPHA is also used to denote the beginning of any thing. In which sense it stands opposed to *omega*, which denotes the end. And these two letters were made the symbol of Christianity; and accordingly were engraven on the tombs of the ancient Christians, to distinguish them from those of idolaters.—I am *alpha* and *omega*, the beginning and the ending, saith the Lord, which is, and which was, and which is to come, the Almighty. *Revelations.*

AL'PHABET, *f.* [*Fr. alfabeto*, Ital. *alfabeto*, Sp. of *alphabetum*, Lat. q. d. alpha, αλφα, beta, βετα, Gr. of אָלֶף, Heb. he taught, whence אָלֶף, a leader or first of a company.] The order of the letters, or elements of speech. The number of letters is different in the alphabets of different languages. The English alphabet contains 24 letters; to which if we add *j* and *v* consonant, the sum will be 26: the French contains 23; the Hebrew, Chaldee, Syriac, and Samaritan, 22 each; the Arabic, 28; the Persian, 31; the Turkish, 33; the Georgian, 36; the Coptic, 32; the present Russian, 41; the Greek, 24; the Latin, 22; the Slavonic, 27; the Dutch, 26; the Spanish, 27; the Italian, 20; the Ethiopic and Tartarian, each 202; the Shanfcrit, 50; the Indians of Bengal, 21; the Barmese, 19. The Chinese have, properly speaking, no alphabet, except we call their whole language by that name; their letters are words, or rather hieroglyphics, amounting to about 80,000. The Americans had no letters when that country was discovered by the Spaniards. The Acaanibas engrave a representation of their memorable events and epochs on stones and metals; their songs supply the rest. In Peru, and Chili, to keep an account of their goods and chattels, and to preserve the memory of their particular affairs, the Indians have recourse to certain knots of wool, which, by the variety of their colours and ties, serve instead of characters and writing. The knowledge of these knots, which they call *quipos*, is one of their great sciences; but which is always kept as a secret, and never revealed to the children till the fathers think themselves at the end of their days.

It has been a matter of considerable dispute whether the method of expressing our ideas by *letters*, be really a human invention; or whether we ought to attribute an art so exceedingly useful to an immediate revelation from the Deity; an enquiry which we shall fully investigate under the article LANGUAGE, to which it properly belongs.

In effect, alphabets were not contrived with design, according to the just rules of reason and analogy; but have been successively framed, altered, &c. as occasion offered. And hence many grievous complaints as to their deficiencies, and divers attempts to establish new and more adequate ones in their places. Bishop Wilkins charges all the alphabets extant with great irregularities, with respect both to the order, number, figure, power, &c. As to the order, it appears inartificial, precarious, and confused; because the vowels and consonants are not reduced into classes, with such orders of precedence and subsequence as their natures will bear. Even the Hebrew order is not free from this imperfection. As to number, they are both redundant and deficient. Redundant either by allotting several

several letters to the same power and sound, as in the Hebrew *u* and *v*, and the ordinary Latin *e* and *k*, *f* and *ph*; or by reckoning double letters among the simple elements of speech, as in the Hebrew *y*, the Greek *z* and *ψ*, the Latin *q* (*cu*), *x* (*cs*), and the *j* consonant, or *jod*. Deficient in divers respects, especially in regard of vowels, of which there are seven or eight kinds commonly used, tho' the Latin alphabet only takes notice of five, whereof *i* and *u*, according to our English pronunciation, are not properly vowels, but diphthongs. Add to this, that the difference among vowels, in respect of long and short, is not sufficiently provided for. The ancients, we know, used to express a long vowel by doubling its character, as *amaabam*, *naata*, *ree*, *seedes*, *sanctissimis*; though the vowel *i*, instead of being doubled, was frequently lengthened, as *Ædilis*, *pliso*, *vivus*. The ways used in English for lengthening and abbreviating vowels, viz. by adding *e* mute to the end of a syllable in order to prolong it, and doubling the following consonants for the shortening of a vowel, as *wane wann*, *ware warr*, &c. or else by inserting some other vowel for the lengthening of it, as *meat met*, *read red*, &c. are all improper, because the sign ought ever to be where the sound is. As to their powers, again, these are not always fixed to the same signification: the vowels, for instance, are generally acknowledged to have each of them several sounds. Thus the power of the vowel *e* is expressed in writing no less than six different ways, viz. by *e*, as in *he*, *me*, *she*; by *ee*, in *three*, *free*; by *ie*, in *field*, *yield*, *chief*; by *ea*, in *near*, *dear*, *hear*; by *eo*, in *people*; by *i*, in *privilege*. So is the power of the vowel *a*; as in *all*, *aul*, *aw*, *fault*, *caught*, which are only various ways of writing the same long vowel; besides the other distinct ways of expressing the same vowel when used short. The power of *o* is written five ways: *o*, as in *to*, *who*, *move*; *oe*, as in *doe*; *oo*, in *moon*, *noon*; *ou*, in *could*, *would*; *wo*, in *two*; and *fo* of the rest. Nor are the consonants of more determinate powers; witness the different pronunciation of the same letter *c* in the same word *circo*, and of *g* in *negligence*. To say no more, the letters *c*, *f*, and *t*, are used alike to denote the same power; and the letter *f* is commonly used for *z*; and, which is yet worse, some letters of the same name and shape are used at one time for vowels, and at another for consonants, as *j*, *v*, *w*, *y*. From this confusion in the power of letters there arise divers irregularities; as, that some words are distinguished in writing which are the same in pronunciation, as *cesso* and *fesso*, &c. and others are distinguished in pronunciation which are the same in writing. Hence also the Latin *male* is a dissyllable, and the English *male* a monosyllable. The names also in most alphabets are very improperly expressed by words of divers syllables, *alpha*, *beta*, &c. in which respect the Roman and English alphabets, which only name the letters by their powers, have greatly the advantage over the rest. Lastly, their figures are not well concerted; there being nothing in the characters of the vowels answerable to the different degrees of apertion; nor in the consonants analogous to the agreements or disagreements thereof.

The learned author of *Hermes* informs us, that to about twenty plain elementary sounds we owe that variety of articulate voices which have been sufficient to explain the sentiments of such an innumerable multitude as all the past and present generations of men. Mr. Sheridan says, that the number of simple sounds in our tongue are twenty-eight; while Dr. Kenrick insists, that we have only eleven distinct species of articulate sounds, which even by contraction, prolongation, and composition, are increased only to the number of sixteen; every syllable or articulate sound in our language being one of the number. Bishop Wilkins and Dr. William Holder speak of thirty-three distinct sounds.

After the decomposition of language into the elementary sounds, the next step towards the notation of it by alphabetical characters, would be the delineation of a separate mark or letter to represent each sound; which marks, though few in number, would admit of such a variety of arrange-

ments and combinations, as might be capable of producing that infinity of articulate sounds which compose language. The ingenious Wachter, in his *Natura et Scriptura Concordia*, p. 64, endeavours to shew, that ten marks or characters are sufficient for this purpose. His scheme is as follows:

Genus.	Figura.	Potestas.
Vocal	○	a. e. i. o. u.
Guttural	○ 	k. e. ch. q. g. h.
Lingual	∠	l.
Lingual	∟	d. t.
Lingual	⌒	r.
Dental	□	f.
Labial	3	b. p.
Labial	⌢	m.
Labial	≡	s. ph. v. w.
Nasal	∧	n.

If this be the case, then the most simple alphabet, which consisted only of thirteen letters, must have been abundantly sufficient to answer all the purposes of mankind, and much of our twenty-four letter alphabet may appear superfluous. That able mathematician Tacquet has calculated the various combinations of the twenty-four letters, even without any repetition, to amount to no fewer than 620,448,401,733,239,439,360,000; while Clavius makes them only 5,852,616,738,497,664,000. Either of these numbers, however, is infinite to the human conceptions, and much more than sufficient to express all the sounds that ever were articulated by man. As there are more sounds in some languages than in others, it follows of course, that the number of elementary characters or letters must vary in the alphabets of different languages. The following is the scheme of the English alphabet, as given by Mr. Sheridan in his *Rhetorical Grammar*, p. 9.

Number of simple sounds in our tongue, 28.

³ a	¹ a	² e	³ e	² o	³ o	¹ i	¹ i	² u
hall	hat	hate	beer	note	noose	bet	fit	but
w short oo				y short ee				

- 19 Consonants, { eb ed ef eg ek el em en ep er es
et ev ez eth eth ezh ing.
- 2 Superfluous, c, which has the power of *ch*, or *cs*;
q, that of *ek* before *u*.
- 2 Compound, j, which stands for *edzh*;
x, for *ks* or *gz*.
- 1 No letter, h, merely a mark of aspiration.

Consonants divided into Mutes and Semivowels.

- 6 Mutes, eb ed eg ek ep et.
3 Pure Mutes, ek ep et.
3 Impure, eb ed eg.
- 13 Semivowels, { ef el em en er es ev ez eth eth
or Liquids. } eth ezh ing.
- 9 Vocal, el em en er ev ez eth ezh ing.
- 4 Aspirated, ef es eth eth.

Divided again into

4 Labial,	eb ep ev ef.
Dental,	ed et eth etj ez efs ezh esh.
4 Palatine,	eg ek el er.
3 Nasal,	em en ing.

Mr. Sheridan observes, that our alphabet is ill calculated for the notation of the English tongue, as there are many sounds for which we have no letters or marks: and there ought to be nine more characters or letters to make a complete alphabet, in which every simple sound ought to have a mark peculiar to itself. The reason of the deficiency is, that the Roman alphabet was formerly adopted for the notation of the English language, though by no means suited to the purpose.

Many authors are of opinion, that letters derive their forms from the positions of the organs of speech in their pronunciation. Van Helmont has taken great pains to prove, that the Chaldaic characters are the genuine alphabet of nature; because, according to him, no letter can be rightly sounded without disposing the organs of speech into an uniform position with the figure of each letter; and, in support of this system, he has anatomised the organs of articulation.

The learned bishop Warburton, however, ascribes the origin of alphabetical writing to hieroglyphics, or to a series of objects or figures so delineated as to represent the ideas of the human mind. And that, when philosophy advanced, and learned men wrote, the exact delineation of hieroglyphic figures becoming too tedious and too voluminous, they then, by degrees, perfected another character, which he calls the cunning hand of hieroglyphics; these, being at first formed only by the outlines of each figure, became at length a kind of marks, which led to the construction of letters, and consequently to the formation of an alphabet.

Mr. Nelme, on the contrary, has endeavoured to shew, that all elementary characters or letters derive their form from the line and the circle. His alphabet consists of 13 radical letters, four diminished, and four augmented. The radicals are L, O, S, A, B, C, D, N, U, I, E, M, R. H, according to him, is derived from A; P from B; T from D; and F from U; these are called diminished letters. The augmented ones are, Z from S; G from C; W from U; and Y from I. He proves that his characters are very similar to those of the ancient Etruscans: but all characters are composed either of lines and circles of the former, and of parts of the latter. Mr. Gebelin again, deduces them from hieroglyphic representations; and has given several delineations of human figures, trees, &c. in confirmation of this hypothesis.

One of the most simple alphabets has been formed by making two perpendicular and two horizontal lines:

a	b	c
d	e	f
g	h	i

Thus, From which may be deduced

nine different characters or letters. Thus,

a	b	c	d	e	f	g	h	i

Nine more may be made by adding a point to each, and as

k	l	m

many more as

n	o	p

q	r	s

tion of any language, by adding two or more points to each character. Though these square characters are not calculated for dispatch; yet they may be made as expeditiously, or more so, than the Tartar, the Bramin, the Cashmirian, or many others. Writing composed of these characters, is at first sight somewhat like the Hebrew. Mr. Dow, author of the History of Hindostan, lately formed a new language and alphabet. This language, and the characters formed for its notation, were so easy, that a female of his acquaintance acquired the knowledge of

them in three weeks, and corresponded with him therein during their intimacy.

TO ALPHABET, *v. a.* To range in the order of the alphabet.

ALPHABETICAL, or ALPHABETIC, *adj.* [*alphabetique*, Fr.] In the order of the alphabet; according to the series of letters.

ALPHABETICALLY, *adv.* In an alphabetical manner; according to the order of the letters.

ALPHÆNIX, white barley-sugar, to which is given an extraordinary name, to render it more valuable. This sugar, which is thought good for colds, is made of common sugar, which is boiled until it becomes easy to crack, when they pour it upon a marble table, greased with oil of sweet almonds, and mould it into various figures with a brass crotchet. It is easily falsified with starch.

ALPHE'A, a name of Diana in Elis, given her when the river Alpheus endeavoured to ravish her without success.

ALPHEG, [of *alle*, all, and *segan*, Sax. to enjoin *q. d.* a man fit for all things; one that can do any thing; Jack of all trades.] a Christian name of a man.

ALPHERY (Mikipher), born in Russia, and of the imperial line. When that country was torn to pieces by intestine quarrels, in the latter end of the 16th century, and the royal house particularly was so severely persecuted with impostors, this gentleman and his two brothers were sent over to England, and recommended to the care of Mr. Joseph Bidell, a Russian merchant. Mr. Bidell, when they were of age fit for the university, sent them all three to Oxford, where, the small pox unhappily prevailing, two of them died. The surviving brother entered into holy orders; and in 1618 had the rectory of Wooley in Huntingdonshire. Here he did his duty with great cheerfulness and alacrity; and, although he was twice invited back to his native country by some who would have ventured their utmost to have set him on the throne of his ancestors, he chose rather to remain with his flock, and to serve God in the humble station of a parish-priest. Yet in 1643, he underwent the severest trials from the rage of the fanatics; who, not satisfied with depriving him of his living, insulted him in the most barbarous manner; for having procured a file of musqueteers to pull him out of his pulpit, as he was preaching on a Sunday, they turned his wife and small children into the street, into which also they threw his goods. The poor man in this distress raised him a tent under some trees in the churchyard, over against his house, and lived in great distress until the restoration put him in possession of his living again. He returned on this occasion to Huntingdonshire, where he did not stay long; for being upwards of 80, and withal very infirm, he could not perform the duties of his function. Having, therefore, settled a curate, he retired to Hammersmith, where shortly after he died.

ALPHESIBOE'A, the daughter of Phlegius, a priest of Bacchus. She married Alcmeon, and received the famous necklace of Eriphyle for a nuptial present; but, being divorced some time after, she prevailed on her brothers to revenge the affront, who murdered her husband.

ALPHE'US, or ALPHEIUS, a noted and large river of the Peleponnesus; which, rising in Arcadia, and running in a south-west course, pours into the Sinus Chelonica, about ten miles to the south of Olympia. The poets fable strange things of this river; particularly, that, out of love to the nymph *Arethusa*, it runs under the sea to Sicily, and bursts out at the fountain of that name in Syracuse. Its waters were reckoned good in the leprosy, which is called *Alphos* by the Greeks; and hence the name *Alpheus*.—Pausanias adds, that the Eleans had a law, which condemned any woman to death that should either appear at the Olympic games, or even cross this river during that solemnity: and the Eleans add, that the only woman who transgressed it, had disguised herself in the habit of a master or keeper of these games, and conducted her son thither; but, when she saw him come off victorious, her joy made

made her forget her disguise, so that her sex was discovered. She was pardoned; but from that time a law was made that the keepers should appear there naked. Hercules made use of this river to cleanse the stables of Augeas.

AL'PHING, is a very considerable village and church-town, situate about a mile from Exeter on the Plymouth road; this place is of late years greatly augmented and improved in buildings; and a genteel resort, being in every respect esteemed a healthy and pleasant retreat.

ALPHI'TOMANCY [of *αλφίτον*, Gr. bran or meal, and *μαντεία*, divination.] A sort of divination by barley meal.

ALPHI'TON, a hasty-pudding. Thus the Greeks call it, but the Roman name is *polenta*; it is made of barley meal moistened with water, wine, mum, or any other liquor. The soldiers had it in common use.

ALPHON'SIN, in surgery, an instrument for extracting bullets out of gun-shot wounds. This instrument derives its name from the inventor Alphonfus Ferrier, a physician of Naples. It consists of three branches, which are closed by a ring. When closed and introduced into the wound, the operator draws back the ring towards the handle, upon which the branches opening take hold of the ball; and then the ring is pushed from the haft, by which means the branches grasp the ball so firmly as to extract it from the wound.

ALPHON'SINE TABLES, are astronomical tables compiled by order of Alphonfus king of Castile. In the compiling of these it is thought that prince himself assisted.

ALPHON'SUS the Tenth, king of Leon and Castile, was surnamed The Wise, on account of his attachment to literature; and is now more celebrated for having been an astronomer than a king. He was born in 1203; succeeded his father Ferdinand the Third in 1252; and died in 1284, consequently at the age of 81.—The affairs of the reign of Alphonfus were very extraordinary and unfortunate. He understood astronomy, philosophy, and history, as if he had been only a man of letters. "What can be more surprising," says Mariana, "than that a prince, educated in a camp, and handling arms from his childhood, should have such a knowledge of the stars, of philosophy, and the transactions of the world, as men of leisure can scarcely acquire in their retirements? There are extant some books of Alphonfus on the motions of the stars, and the history of Spain, written with great skill and incredible care." In his astronomical pursuits he discovered that the tables of Ptolemy were full of errors; and thence he conceived the first of any the resolution of correcting them. For this purpose, about the year 1240, and during the life of his father, he assembled at Toledo the most skilful astronomers of his time, Christians, Moors, or Jews, when a plan was formed for constructing new tables. This task was accomplished about 1252, the first year of his reign. They were printed in 1483, at Venice, by Radolt, an edition extremely rare: there are others of the dates of 1492, 1521, 1545, &c.

We must not omit a memorable saying of Alphonfus, which has been recorded for its boldness and pretended impiety; namely, "that, if he had been of God's privy council when he made the world, he could have advised him better." Mariana however says only in general, that Alphonfus was so bold as to blame the works of Providence, and the construction of our bodies. The Jesuit's words are curious: "Emanuel, the uncle of Sanchez (the son of Alphonfus), in his own name, and in the name of other nobles, deprived Alphonfus of his kingdom by a public sentence: which that prince merited, for daring severely and boldly to censure the works of divine Providence, and the construction of the human-body, as tradition says he did. Heaven most justly punished the folly of his tongue."

AL'PHUS, *f.* [*αλφός*, from *αφαινω*, an old word for *to change*, because it changes the colour of the skin.] A disorder of the same species of that sort of white leprosy called *vitiligo*, and which is divided into the *alpus*, *melas*, and

leuce, called also *albara*; in the *alpus* the skin is white and roughish, not all over, but in spots, sometimes the patches are broad; it has the same origin as the lepra, and bears the same analogy to the leuce as the scabies to the lepra: the first is superficial, chiefly affecting the skin: the second sinks deeper into the flesh: but these are all disorders that only differ in their degrees of inveteracy. See MEDICINE, LEPROSY.

AL'PINE, [*alpino*, It. of *alpinus*, Lat.] Pertaining to the mountains called the Alps.

ALPI'NI (Prospero), a famous physician and botanist, born in the Venetian territory, in 1553. He travelled in Egypt to acquire a knowledge of exotic plants, and was the first who explained the fructification and generation of plants by the sexual system. Upon his return to Venice, in 1586, Andrea Doria, prince of Melfi, appointed him his physician: and he distinguished himself so much in this capacity, that he was esteemed the first physician of his age. The republic of Venice, in 1593, appointed him to the professorship of botany at Padua; and he had a salary of 750 florins. He discharged this office with great reputation; but his health became very precarious, and he died the 5th of February 1617, in the 64th year of his age; and was buried, without any funeral pomp, in the church of St. Anthony.—Alpini wrote the following works in Latin: The physic of the Egyptians, in four books, printed at Venice, 1591. A treatise concerning the plants of Egypt, 1592. A dialogue concerning balsams, 1592. Seven books concerning the method of forming a judgment of the life or death of patients, 1691. Thirteen books concerning methodical physic, Padua, 1611; Leyden, 1719. A disputation held in the school at Padua, concerning the Raphaniticum, Padua, 1612, and 1629. Of exotic plants, in two books, Venice, 1699. He left several other works, which have never been printed; particularly, The fifth book concerning the physic of the Egyptians, and five books concerning the natural history of things observed in Egypt, adorned with a variety of draughts of plants, stones, and animals.

ALPINIA, *f.* [so called after Prosper Alpinus, a famous physician and botanist, who travelled into Egypt between 1580 and 1584, and practised medicine at Cairo.] In botany, a genus of monandria monogynia class, in the natural order of scitamineæ. The generic characters are—Calyx: perianth one-leaved, tubulose, three-toothed: leaflets equal, erect, acute. Corolla: monopetalous, tubulose: tube cylindraceous, short: border three-parted; parts nearly equal, oblong. Nectary connate with the tube of the corolla, two-parted: the lower part, forming the lower lip, is larger and longer than the parts of the corolla, broadish, spreading, often divided. Stamina: filament proper, none; but along the upper division of the nectary, forming the upper lip, which is flattish, and the length of the corolla, grows a large anther, either deeply bifid, or entire. Pistillum: germ inferior, oblong. Style filiform, often inserted into the fissure of the anther. Stigma incrassate, obtuse. Pericarpium: capsule oval, three-celled, three-valved, crowned with the permanent calyx. Seeds: some, ovate, angular, covered with a sort of berried aril. *Essential Character*.—Calyx, three-toothed, equal, tubulose. Corolla, three-parted, equal. Nectary, two-lipped; the lower lip spreading.

Species. 1. *Alpinia racemosa*: raceme terminating spiked, flowers alternate, lip of the nectary trifid, leaves oblong acuminate. 2. *Alpinia occidentalis*: raceme radical compound erect, nectary emarginate, capsules three-celled, leaves lanceolate-ovate very smooth. They are both natives of the West-Indies.

Propagation and Culture. Being a native of hot climates, it must be preserved in a stove, and the pot plunged into a tub of water. The leaves decay every winter, and are pushed out from the roots every spring, like the *maranta*. It may be increased by parting the roots, when the leaves decay.

ALPINIA SPICATA. See COSTUS.

ALPIS'TE, or ALPIA, a sort of seed used to feed birds with, especially when they are to be nourished for breeding. The alpis'te seed is of an oval figure, of a pale yellow, inclining to an isabel colour, bright and glossy.

ALPS, *f.* an extensive range of exceeding high mountains, which separate Italy from Gaul and Germany. The word is also used as an appellative, to denote any mountains of considerable altitude or extent. Thus, the mountains of the moon, those of Sierra Leona, the peak of Teneriffe, and mount Atlas, are called the *African Alps*. The Altaic chain, and Werturian mountains, are styled the *Asiatic Alps*. The Andes, and the Allegany or Appalachian mountains, are the *Alps* of north and south *America*. The Pyrenean mountains are called the *Spanish Alps*; and the mountains of Wales, the cliffs of Albion, and the Highlands of Scotland, are frequently dignified with the title of *British Alps*, *Scottish Alps*, &c.

The Alps, properly so called, are the most stupendous, and form the principal belt or chain of primitive mountains, in Europe. They begin at the Mediterranean, and, stretching northward, separate Piedmont and Savoy from the adjacent countries; whence directing their course to the east, they form the boundary between Switzerland and Italy, and terminate near the extremity of the Adriatic Sea, to the north-east of Venice. These venerable mountains extend themselves in the form of a crescent; and, as they branch different ways, they are distinguished by different names. From Savona, to the springs of the Varus, they are called the *Maritime Alps*, the highest peak of which is named the Col de Tende. These extend from south to north, between Gaul to the west and Genoa to the east, beginning at Monaco on the Mediterranean; then running out through the east of the county of Nice, and between that and the marquisate of Saluzzo, terminate at mount Viso, between Dauphine and Piedmont. Hence to Suva run the *Alpes Cottiae*, or *Cottian Alps*; mountains extremely high, separating Dauphine from Piedmont, and extending from mount Viso to mount Cenis, between the *Maritime Alps* to the south, and the *Graia* to the north. The *Alpes Graia*, or *Grecian Alps*, so called from the passage of Hercules, begin from mount Cenis, where the *Cottian* terminate; and run out between Savoy and the Tarentese to the west, and Piedmont and the Duché d'Aouste to the east, quite to the Great St. Bernard, where the *Pennine Alps* begin. They are also called by some *Graius Mons*; which extend from west to east, between St. Bernard and the Adula, or St. Gothard; and thus they run out between the Vales to the north, and the Milanese to the south. From these are continued the *Rhetian Alps*, to the head of the river Piave; a part of which are the *Alps Tridentinae*, to the north of Trent. They consist of that chain from which flows the river Adige, or Athesis, and whose inhabitants were anciently called Rhæti. To these join the *Morician Alps*, reaching to Doblach in Tyrol, to the north of the river Tajamento: thence begin the *Alpes Carnica* or *Carnician Alps*, extending to the springs of the Save: and the last, called *Alpes Pannonica*, and *Julia*, extend to the springs of the Kulpe. Over these rugged and inhospitable mountains Hannibal forced his way from Carthage, when he invaded the Roman empire. He ascended the hills to the south of Martigny, through a narrow defile of near six miles, to the top of the first ledging of the mountains; which was then the only channel of communication between Gaul and Italy. His army was composed of infantry, cavalry, and elephants; and he was attended by a train of draught-horses and wheel-carriages, for drawing stores. Mr. Whitaker, who has lately published the course of Hannibal's passage over the Alps, says, these carriages were assuredly the same with the cars of Ireland, and the Highlands at this day, then used by the Gauls and Spaniards, and peculiarly calculated for mountainous roads. This author, in detailing Hannibal's perilous expedition, very ingeniously investigates the famous disputed point, of that undaunted commander's overcoming, by the joint agency of fire and vinegar, the prodigious obsta-

cle to his farther progress, from the sudden and perpendicular termination of the rocky road, in consequence of a recent earthquake, of which his guides had no information. The means by which Hannibal is said to have surmounted this formidable obstruction, namely, by pouring vinegar on the rocks, heated by burning large piles of wood on them, by which they mouldered away, has been much ridiculed; but, as Mr. W. observes, ridiculed only by folly and ignorance. He fully credits the account left us by the ancients, and supports it not only by arguments drawn from historical evidence, but from the effects of chemistry; and thus, with great probability, at least, he appears to have established this hitherto much controverted fact. M. Beaumont, principal engineer to his Sardinian majesty, having lately published his Travels over the Alps, we have, from his elegant and ingenious work, collected the following brief descriptions of the most sublime and striking scenes those romantic regions afford.

The *Maritime Alps* are a ridge of mountains about six hundred miles in extent. The highest peak, as we before observed, is the Col de Tende, over which is one of the three grand passages to Italy; but which can never be crossed without much difficulty, and at times not without imminent danger. The roads, however, which have been lately constructed for miles together upon arches, through narrow defiles, on the brink of vast precipices, and impending over frightful and impetuous torrents, reflect the highest credit on the king of Sardinia; by whose order, and at whose expence, these vast works have been undertaken and executed, for the accommodation of his subjects. But the attention of the curious traveller is most particularly directed to that part of the road over the Col de Brans, near the village of Tuet; it being, as it were, wonderfully supported for about two miles on arcades thrown here and there on the projecting peaks of the lateral rocks, hanging over a tremendous precipice at least fifteen hundred feet deep.

The cold of the Col de Tende is more intense than it is on mount Cenis, though the latter is more elevated above the level of the sea; for which M. Beaumont accounts, by shewing that the degree of cold, experienced on the tops of mountains, is less in proportion to their absolute elevation than to their height above the surrounding valleys. Owing to this extreme height of the Col de Tende, an intensity of cold is produced, occasioning vast accumulations of snow, which sometimes, detaching themselves from the side of the mountain, sweep all before them.

The prospect from the whole of this enormous range of mountains is extremely romantic, but more especially towards the north-west. One of the most celebrated is the Grande Chartreuse, where is a monastery founded by St. Bruno about the year 1084. From Echelles, a little village in the mountains of Savoy, to the top of the Chartreuse, the distance is six miles. Along this course, the road runs winding up, for the most part not six feet broad. On one hand is a stupendous rock, with woods of pine-trees hanging over head; on the other a prodigious precipice almost perpendicular; at the bottom rolls a torrent, that, sometimes tumbling among the fragments of stone which have fallen from on high, and sometimes precipitating itself down vast descents with a noise like thunder, rendered yet more tremendous by the echo from the mountains on each side, concurs to form one of the most solemn, the most romantic, and most astonishing, scenes in nature. To this description may be added the strange views made by the crags and cliffs, and the numerous cascades which throw themselves from the very summit down into the vale. On the top of the mountain is the convent of St. Bruno, which is the superior of the whole order. The inhabitants consist of 100 fathers, with 300 servants, who grind their corn, press their wine, and perform every domestic office, even to the making of their clothes. In the Album of the fathers is an admired alcaic ode, written by the late ingenious Mr. Gray when he visited the Chartreuse, and which has since been published among his works.

The *Pennine Alps*, and glaciers of Savoy, are also justly reckoned among the most stupendous works of Nature. Here immense masses of ice, lodged upon the gentler declivities of the Alps, exhibit representations beyond conception fantastic and picturesque. In the journey to the valley of Chamouni, we have a magnificent prospect of a chain of mountains, equally inaccessible, and covered with ice; and above the rest that of Mount Blanc, whose top appears to reach, and even pierce, the highest region of the clouds. The chain upon which this mountain looks down like a giant, is composed of masses of rocks, which terminate in spikes or spires, called the *Needles*, and which are ranged like tents in a camp. Their sides appear lighter and more airy, from the ornament of several hollow breaks and furrows fretted in the rock itself, as well as from the different streaks and panes of ice and snow, which, without changing the general character of their form, or the majesty of their appearance, give them a picturesque variety. Lower down, the eye surveys with ravishment the gills of ice, and the several glaciers, extending almost into the plain, whilst this appears like an artificial garden, embellished with the mixture of a variety of colours. We have a picturesque opposition to this chain, which is formed by innumerable mountains at the distance of near 50 leagues, between whose tops we have a glimpse of those several plains which they environ.

Near Chamouni is the Glacier de Bois, or Valley or Sea of Ice; to attain which it is necessary to ascend the Montanverd, or Green Mountain, so called from its verdure. It is impossible to describe the beauty of this enormous glacier, or the sensations excited on a view of it. No better idea can be conveyed to the mind than by imagining a stormy sea suddenly surprized by a frost. The mountains which surround this frozen valley are, 1st, Mount Charmos on the right; 2d, Mount Mallet in the back ground 3d, Periadès; 4th, the Great Jorra of an extraordinary height; 5th, l'Aiguille du Moine; 6th, that of Dru, which is opposite to a little hermitage, where people commonly stop to dine on the provisions they carry with them. This Montanverd is also very curious, being half covered with ice and snow, and, in intermediate spaces, with excellent pastures, where cattle feed.

Although it be difficult to ascertain the length and breadth of the sea of ice, as objects appear nearer on high mountains than in valleys, where the air is more dense, yet it may fairly be conjectured to be three quarters of a league broad and five leagues long; that is to say, the space which the eye comprehends from Montanverd: for the sea of ice may extend about twelve leagues. A more curious and at the same time a more dreadful scene than this cannot be conceived, at once presenting the image of the frozen sea and the verdure of the temperate zone. It is possible to descend from the Montanverd on the sea of ice, and even to cross it, but the dangers are many on account of the large crevices which it is necessary to step over, that are more than a hundred feet deep; however, M. Beaumont passed safely over them. It is a matter of much surprize, on coming to this place, to find the waves, which at some distance appear inconsiderable, to be more than eighty or an hundred feet in height.

From hence there is a very steep and narrow path, through a forest of firs and larches, which takes about an hour to descend, in order to return to a place where there is a little wooden bridge to cross over the Arveron; when another most astonishing object presents itself, an entire mountain of ice, formed by the fall of the glacier, seen from the Montanverd, which descends into the valley. High mountains of granite surround these glaciers, and form, by their irregular strata, superb cascades, mixing their waters with the Arveron, which issues from a most beautiful grotto above an hundred feet high, composed entirely of ice.—The wonderful effects of masses of ice contrasted with the impending woods and rich pastures that crown this grand and uncommon scene, added to the frightful noise so frequently heard of enormous bodies of

it breaking off from the mountain and dashing themselves to pieces in the Arveron, must create an admiration and surprize more readily felt than expressed; and raises in our minds an anxious wish, that, before our mortal journey be brought to an end, we could explore the wonders of the *Pennine Alps*, and participate in that awful and philosophic pleasure which must be excited amid such august and romantic scenes.

ALPS, LOWER, a department of France, including part of the late province of Provence, is so called from its vicinity to the mountains of the same name.

ALPS, UPPER, a department of France, including part of the late province of Dauphiny.

ALPUXAR'RAS, or ALPAXARES, mountains of Spain, in the province of Granada, on the coast of the Mediterranean sea. They are about seventeen leagues in length and eleven in breadth, reaching from the city of Velez to Almeria. They are inhabited by Moors, who are the remains of the dispersion and ruin of their empire. They embraced the Christian religion; but preserve their own manner of living, and their language, though much corrupted. Here is a rivulet between Pitros and Portugos, which dyes linen that is dipped in it black in an instant. Near this rivulet is a cavern, from which proceeds so malignant a steam, that it destroys such animals as come near it. The Moriscos cultivate the soil extremely well, and plant fruit-trees; some of which grow to a prodigious height and thickness, and give the mountains a very agreeable aspect.

ALQUIE'R, a liquid measure, used in Portugal to measure oil, two of which make an almond. See ALMOND.

ALQUIFOU', or ARQUIFOU', is a sort of lead-ore, which, when broken, looks like antimony. It is used by the potters to give a green varnish to their works, and thence is called *potter's ore*. It is met with in Cornwall, &c. The potters mix a small portion of manganese with the alquifou, and then the varnish or glazing on their ware is of a blackish hue.

ALRE'ADY, *adv.* At this present time, or at some time past; opposed to futurity; as, *Will he come soon? He is here already. Will it be done? It has been done already.*

Methinks, *already* I your tears survey,
Already hear the horrid things they say,
Already see you a degraded toast,
And all your honour in a whisper lost!

Pope.

ALRE'DUS, ALURED, or ALUREDUS, of Beverley, one of the most ancient and best English historians. He wrote in the reign of Henry I. It is generally believed that he was educated at Cambridge, and that he afterwards became one of the canons and treasurer of St. John's at Beverley. And we learn in a note of Bishop Tanner's, that, for the sake of improvement, he travelled through France and Italy; and that at Rome he became domestic chaplain to Cardinal Othobonie. He died in the year 1129; leaving behind him the following works: 1. The *Annals of Alured of Beverley*, Oxford, 1726. It contains an abridgement of our history from Brutus to Henry I. written in good Latin; and with great accuracy. 2. *Libertates ecclesie S. Johannis de Beverlac*, &c. a manuscript in the Cotton library. It is a collection of records relative to the church of Beverley, translated from the Saxon language.

ALRES'FORD, Hants, i. e. the Ford of Alre, so called from the river of that name, now generally called the river Itchen, which rises not far from this place, and unites four considerable streams within the liberty of Alresford. It is situate 20 miles from Southampton, and seven and a half from Winchester, and lies in the great road from those two places to London, from which it is distant 57 miles and a quarter. It stands exactly in the center of the capital towns of the four adjoining counties of Wilts, Berks, Surry, and Sussex, being 31 miles from Salisbury on the west, same distance from Reading on the N. E. and from Guildford on the east, and Chichester on the

the S. E. It is divided into two parishes, viz. Old and New Alresford; but these are united in one rectory, which also comprehends the parish of Meidstead. The church of Old Alresford is the mother church; those of New Alresford and Meidstead being only chapelries annexed. The church of Old Alresford was taken down in the year 1753, and has since been re-built: it is now a very neat structure, with a beautiful tower, in which are six musical bells.—Alresford is governed by a bailiff and eight burgeses, and formerly sent one member to parliament; but the charter of this town is now said to be lost. It has been twice nearly all consumed by fire. Its market is held on Thursdays for corn; it has three fairs, viz. Holy Thursday; July 5; and the first Thursday after the 10th of October, at which time a large market for sheep commences, and continues every Thursday till Christmas. Here is a good free grammar school, founded in the year 1698, by Henry Perryn, Esq. of Old Alresford, and well endowed.

ALS, *adv.* [*als*, Dutch.] Also; likewise: a word now out of use.

ALSA, a river of Carniola, now the Aupa; running by Aquileia, with a short course from north to south, into the Adriatic; where Constantine, the son of Constantine the Great, fighting against Constans his brother, lost his life.

ALSA'CE UPPER, and LOWER, late provinces of France, now included in the department of the Upper and Lower Rhine, are bounded on the east by the Rhine, on the south by Switzerland, on the west by Lorraine, and on the north by the palatinate of the Rhine. It was formerly a part of Germany, but was given to France by the treaty of Munster. It is one of the most fruitful and plentiful provinces of Europe, abounding in corn, wine, wood, flax, tobacco, pulse, fruits, &c. The mountains which divide it from Lorraine are very high; and generally covered with fir, beech, oak, and horn-beam. Those on the side of Switzerland are less high; and furnished with all sorts of wood, as well for fuel as building. The country itself is diversified with rising hills and fertile vales, besides large forests; but that between the rivers Ill, Hart, and the Rhine, as far as Straßburgh, is inferior to the rest. In High Alsace there are mines of silver, copper, and lead. They however work none but those of Giromany, from which are annually drawn 1600 marks of silver, each mark being eight ounces; and 24,000 pounds of copper. There are iron-works in several parts of Alsace, and particularly at Betford. There is a mineral spring at Sultzbach, near Munster, in High Alsace; which is in great reputation for the palsy, weakness of the nerves, and the gravel.—The inhabitants of Alsace are honest and good-natured, but wedded to their own manners and customs. The fruitfulness of their country renders them indolent and inactive; for the Swiss make their hay and reap their corn, as well as manage the vintage of High Alsace, which sends a great deal of money out of the province. The common language of the country is the German; but the better sort of people speak French.

AL'SEN, an island of Denmark in the lesser Belt, or entrance into the Baltic sea, between Sleswick and Funen. It is remarkable for producing large crops of aniseeds, a carminative much used in seasoning the food and mixing with the bread all over the Danish dominions. Lat. 55. 12. N. lon. 10. 12. E.

ALS'FIELD, a town of Germany, in the landgraviate of Hesse Cassel, ten miles north-west of Marburg, and 35 south of Hesse Cassel. It is an ancient town, and well built; and the inhabitants were the first of this country who embraced the Reformation. Lat. 50. 40. N. lon. 9. 5. E.

ALS'HASH, a beautiful city in Buckharia, supposed to be the same with that which is now called *Taschant*, the capital of the eastern part of Turkestan, possessed by the Kassats. It is situated on the river *Sihân*, now *Sir*, and had a well-watered garden for every house; but was ruined by Jenghiz Khan, who took the city, and caused a great number of its inhabitants to be massacred.

ALS'HEDA, a parish of Sweden, in the province of Smaland, where a gold mine was discovered in 1738.

AL'SINA, *f.* in botany. See THELIGONUM.

ALSINAN'THEMUM, *f.* in botany. See ARENARIA.

ALSINAS'TRUM, *f.* in botany. See COSTUS and ELATINE.

ALS'INE, *f.* [*αλος*, *lucus*, a grove.] In botany, a genus of the pentandria trigynia class, ranking in the natural order of caryophylleae. The generic characters are—Calyx: perianth five-leaved; leaflets concave, oblong, acuminate. Corolla: of five equal petals, longer than the calyx. Stamina: filaments capillary; antherae roundish. Pistillum: germ subovate; styles filiform; stigmas obtuse. Pericarpium: an ovate, one-celled, three-valved capsule, covered with the calyx. Seeds: very many, roundish.—*Essential Character.* Calyx, five-leaved; petals, five, equal; capsule, one-celled, three-valved.

Species. 1. *Aline media*, or common chickweed: petals bipartite, leaves ovate-cordate. Common chickweed is so generally known, that it seems scarcely necessary to describe it; we may observe, however, that the number of filaments in the flower is very uncertain from three to ten. In gardens or on dunghills it quickly sheds abundance of seeds, and becomes a troublesome weed; but, being annual, it may be destroyed with little trouble, if it is never suffered to feed. The diversity of soils in which it grows causes it to put on different appearances, which may mislead the unwary botanist. It is distinct however from the cerastiums, which it most resembles, in having the petals shorter than the leaves of the calyx: and from all the plants related to it, in having the stalk alternately hairy on one side only. When the flowers first open, the peduncles are upright; as the flowers go off they hang down; and when the seeds ripen they again become erect. It is commonly given as food to chickens and small birds; boiled, it exactly resembles spinach. Swine are very fond of it; and it is eaten by many insects. As a medicine, it contains no active principle, but is frequently applied to swellings either alone or in poultices. Flowers upright, and open from nine to noon; but if it rains they do not open. After rain they become pendent, but in a few days rise again. Chickweed is a remarkable instance of the sleep of plants; at night the leaves approach in pairs, so as to inclose between their upper surfaces the tender buds; and the two upper leaves but one, at the end of the stalk, are furnished with longer petioles than the others, so that they can close upon the terminating pair, and protect the end of the branch. It is found wild in most parts of the world.

2. *Aline fegetalis*: petals entire, leaves awl-shaped.

3. *Aline mucronata*: petals entire, short; leaves setaceous; calyxes awned. These two are natives of France, and Switzerland.

ALSINE. See ANDROSACE, ARENARIA, BUFONIA, CALLITRICHE, CAMPANULA, CENTUNCULUS, CERASTIUM, CORRIGIOLA, CUCUBALUS, DRABA, FRANKENIA, GLAUX, GLINUS, GYPSOPHILA, HOLOSTEUM, ISNARDIA, LINUM, LEMOSELLA, LYCHNIS, MOHRINGIA, MOLLUGO, MONTIA, NAMA, OLDENLANDIA, PEPLIS, PHARNACEUM, SAGINA, SAMOLUS, SIBTHORPIA, SILENE, SPERGULA, STELLARIA, TRIENTALIS, VERONICA.

ALSINEFOR'MIS. See MONTIA.

ALSINEL'LA. See SAGINA.

ALSINOIDES. See BUFONIA and MONTIA.

ALSIRAT, *f.* in the Mahometan theology, denotes a bridge laid over the middle of hell, finer than a hair, and sharper than the edge of a sword, over which people are to pass, after their trial, on the day of judgment. To add to the difficulty of the passage, Mahomet assures, that the alsi-rat, narrow as it is, is beset with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind; Mahomet and his muskulu-men lead the way; whereas the wicked, by the narrowness

narrowness of the path, the entangling of the thorns, and extinction of the light which directed the former to paradise, will soon mislead their footing, and tumble headlong into the great abyss which is gaping beneath to receive them.

AL'SIUM, a city of ancient Etruria, occupying, according to Cluverius, the spot on which *Pala* now stands. We are told by Dionysius Halicarnassensis, that Alsiuni was built by the Aborigines, long before the Tyrrhenians invaded Italy. In this case it must have been founded not long after the dispersion in the days of Peleg. Its founder is said to have been one *Alafus*, *Alefus*, or *Alifu*; whom some conjecture to have been Alifan, or Elisha, the son of Javan, mentioned in scripture.

AL'SO, *adv.* In the same manner; likewise. *Also* is sometimes nearly the same with *and*, and only conjoins the members of the sentence.—God do so to me, and more *also*. 1 *Samuel*, xiv. 44.

AL'SOP (Anthony), a divine and poet, was educated at Westminster-school, and thence elected to Christ-church, Oxford, where he took the degree of M. A. in March, 1696, and of B. D. in December, 1706. On his coming to the university, he was very soon distinguished by dean Aldrich, and published "Fabularum Ætopicarum Dilectus," Oxon. 1698, 8vo, with a poetical dedication to lord viscount Scudamore, and a preface, in which he took part against Dr. Bentley, in the famous dispute with Mr. Boyle. He passed through the usual offices in his college to that of censor, with considerable reputation; and for some years had the principal noblemen and gentlemen belonging to the society committed to his care. In this employment he continued till his merit recommended him to Sir Jonathan Trelawney, bishop of Winchester, who appointed him his chaplain, and soon after gave him a prebend in his own cathedral, together with the rectory of Brightwell, in the county of Berks, which afforded him ample provision for a learned retirement, from which he could not be drawn by the repeated solicitations of those who thought him qualified for a more public character and a higher station. In 1717, an action was brought against him by Mrs. Elizabeth Astrey, of Oxford, for a breach of a marriage-contract; and a verdict obtained against him for 2000*l.* which probably occasioned him to leave the kingdom for some time. His death, which happened June 10, 1726, was occasioned by his falling into a ditch that led to his garden-door. A quarto volume was published in 1752, under the title of "Antourii Alsopi, Ædis Christi olim Alunni Odarum libri duo." Four English poems of his are in Doddsley's collection, one in Peart's, several in the early volumes of the Gentleman's Magazine, and some in "The Student."

AL'SOP (Vincent), an eminent divine, was educated in St. John's college, in Cambridge, where he took the degree of master of arts. He received deacon's orders from a bishop; after which he went down into Rutlandshire, and settled at Oakham, where he became a dissenter, and received ordination in the presbyterian way. He afterwards settled at Wilbee, in the county of Northampton, whence he was ejected in 1662, for nonconformity. After this, he ventured to preach sometimes at Oakham, and at Wellingborough, where he lived, and was once six months in prison for praying by a sick person. A book he wrote against Dr. Sherlock made him well known to the world, and induced Mr. Cawton, a very eminent nonconformist in Westminster, to recommend him to his congregation for his successor. On this he quitted Northamptonshire and came to London, where he preached constantly, and wrote several pieces, which were extremely well received by the public. His living in the neighbourhood of the court exposed him to many inconveniences; but these ended with the reign of Charles II. when Mr. Alsop's son, who had engaged in treasonable practices, was freely pardoned by king James. After this our divine went frequently to court, and is supposed to be the person who drew the presbyterian's address to that prince for his general indulgence. After the revolution, Mr. Alsop gave

VOL. I. No. 24.

many public testimonies of his affection for the government. The remainder of his life he spent in the exercise of his ministry, and was one of the lecturers at Pinner's hall. He lived to be a very old man, and his memory will be always preserved by his own learned and elegant writings. Of these the most remarkable, besides his sermons, are, 1. *Antifozzo*; in vindication of some great Truths opposed by Dr. William Sherlock, 8vo, 1675. 2. *Melius Inquirendum*; in answer to Dr. Goodman's Compensate Inquiry, 8vo, 1679. 3. The Mischief of Impositions; in answer to Dr. Stillingfleet's Mischief of Separation, 1680. 4. A Faithful Reproof to a False Report, with reference to the Differences among the United Ministers in London, 8vo.

AL'STON-MOOR, Cumberland, is seated on a hill, upon the borders of Northumberland, at the bottom of which runs the river Tyne, with a stone bridge over it. The country round is extremely mountainous, but romantic and pleasant. The parish is but of small extent; but, by reason of the lead mines, is uncommonly populous. It is a market town, 320 miles distant from London. The leases of the land were originally let by indentures from Henry Hilton, of Hilton, in the county palatine of Durham, Esq. then lord of the manor; they bear date in the year 1611; but did not commence or hold till 1621, and from thence for a thousand years then to come. They are held under a yearly rent stipulated in each respective lease, and at the end of every twenty-one years pay a grassam or fine. The lands are now held under the commissioners and governors of Greenwich hospital: the royalty being a forfeited estate from the earl of Derwentwater, who was lord of the manor. The rents and fines are paid according to the old leases, at St. Martin's annually, at the capital messuage called Lowbycon, where the commissioners by their steward hold a court twice a year to call over the tenants, which is done by the bailiff; and the steward at such times enrolls new tenants, fixes constables, market-viewers, &c. &c. The lead mines are let by the commissioners on leases for twenty-one years, at 1-5th duty, by which, upon an average each year, one with another, they receive not less than 10,000*l.* net profit, which is paid to the receivers by their agent disposing or generally smelting the ore; the receivers have twelve-pence per pound for collecting the money. The governor and company at London, generally called the quaker's company, for smelting down lead with pit-coal and sea-coal, are the chief mine-adventurers. The town has a plentiful market on Saturday; and fairs the first Thursday in May and first Thursday in October.

ALSTONIA, *f.* [from Charles Alston, M. D. Professor of Materia Medica and Botany, at Edinburgh.] In botany, a genus of the polyandria monogynia class. The generic characters of which are—Calyx: perianthium inferior, imbricate; scales ovate, very obtuse, concave; the inner ones gradually larger, forming as it were a quadripartite or quinque-partite calyx. Corolla: one-petalled, shorter than the calyx; tube short; border spreading, divided into eight or ten parts: divisions equal, in a double row, alternately interior and exterior: obovate, obtuse, quite entire. Stamina: filaments very many, inserted into the tube very short, imbricate, very smooth; the outer ones longer, linear, attenuated at the tip: antheræ orbiculate, furrowed. Pistillum: germ superior, ovate, small; style simple, length of the corolla, filiform, erect; stigma capitate-obovate.—*Essential Character*. Corolla, one-petalled, eight or ten-cleft; clefts alternated.

There is only one species, which is called *Alstonia theaeformis*. This shrub was found by Mutis, in South America. It is very smooth, and has the air of the bohea tea, in the leaves, flowers, &c. The dried leaves chewed give a greenish colour to the saliva, and have the taste of the Chinese tea.

ALSTROEMERIA, *f.* [from Baron Alstroemer, of Sweden; who, in his travels through Europe, sent many plants to Linnaeus.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of lilia or

g C

lilia &c.

liliacæ. The generic characters are—Corolla: six-petalled, sub-bilabiate; the three outer petals wedge-shaped, retuse, mucronate; the inner which are alternate with the others, lanceolate; the two lower ones tubulous at the base. Stamina: filaments awl-shaped, bending down, unequal; antheræ oblong. Pistillum: germ inferior, hexangular, truncate; style bending down, filiform, the length of the stamens; stigmas three, oblong, bifid. Pericarpium: a roundish, six-ribbed, mucronate, capsule, three-celled and three-valved, valves concave, contrary to the dissepiment. Seeds: very many, globose, covered with raised points, subumbilicate at the tip.—*Essential Character*. Corolla, of six petals, subbilabiate; the two lower petals tubulose at the base. Stamina, bending down.

Species. 1. *Alstroemeria pelegrina*, or spotted-flowered *Alstroemeria*: stem erect, corollas bell-shaped, straight, leaves linear-lanceolate, sessile. The flowers are whitish, most beautifully stained and veined with purple and red. It flowers from June to October.

2. *Alstroemeria pulchella*: stem erect, corollas reflex-spreading, acute; leaves sessile; pedicles shorter than the involucre. In appearance and structure very like the former; but the leaves narrower, and the stem terminated by an irregular involucre, of larger petiolate leaves.

3. *Alstroemeria ligta*, or striped-flowered *alstroemeria*: stem erect, leaves spatulate-oblong, peduncles of the umbel longer than the involucre, corolla two-lipped. This species is remarkable for the largeness of the flowers, and for their fragrantcy, in which they are scarcely inferior to mignonette. It flowers in February and March.

4. *Alstroemeria salilla*: stem twining, leaves petiolate, lanceolate, acuminate, umbel branching, peduncles longer than the involucre, bracted and loose. 5. *Alstroemeria multiflora*: stem twining, leaves petiolate, lanceolate, acuminate, umbel simple; peduncles shorter than the bractes; petals alternate, truncate. 6. *Alstroemeria ovata*: stem twining, leaves lanceolate, lanuginose on the upper surface, lucid on the lower; corollas tubular. These species are all found in South America.

Propagation and Culture. These are stove plants, and, where they can be obtained, may be propagated by parting the roots in autumn. The first is found to be much more hardy than the third, and may be treated as a greenhouse plant; it will however flower and ripen its seeds better under the glass of a hot-bed frame, where air is freely admitted. This is more usually raised from seeds, sown in the spring, in a pot of light earth, on a gentle hot-bed, either of dung or tan.

ALD'WOLD, [of *alle*, all, and *wealdan*, Sax. to govern, q. d. to govern all; or of *alle*, all, and *Weald*, his territories, consisting mostly of woods and forests.] A king of the Northumbrians.

ALT, *f*. in music, a term applied to the high notes in the scale.

ALTA'IC CHAIN, a range of mountains which bounds Asia on the south. It begins at the vast mountain Bogdo, passes above the head of the Irtsch, and then takes a course rugged, precipitous, clothed with snow, and rich in minerals, between the Irtsch and Ob; then proceeds by the lake Telezkoi, the rise of the Ob; after which it retires, in order to comprehend the great rivers which form the Jenesei, and are locked up in these high mountains; finally, under the name of the Sainnes, is uninterruptedly continued to the lake of Baikal. A branch insinuates itself between the sources of the rivers Onon and Ingoda, and those of Ichikoi, accompanied with very high mountains, running without interruption to the north-east, and dividing the river of Amur, which discharges itself into the east, in the Chinese dominions, from the river Lena and lake Baikal. Another branch stretches along the Olecma, crosses the Lena below Jakoutsk, and is continued between the two rivers Tongouska to the Jenesei, where it is lost in woody and morassy plains. The principal chain, rugged with sharp-pointed rocks, approaches and keeps near the shores of the sea of Ockhozt, and, passing by the four-

ces of the rivers Outh, Aldan, and Maia, is distributed in small branches, which range between the eastern rivers which fall into the Icy Sea; besides two principal branches, one of which, turning south, runs through all Kamtschatka, and is broken, from the cape Lopatka, into the numerous Kurile isles, and to the east forms another marine chain, in the islands which range from Kamtschatka to America; most of them, as well as Kamtschatka itself, distinguished by fierce volcanoes, or the traces of volcanic fires. The last chain forms chiefly the great cape Tschut-iki, with its promontories and rocky broken shores.

ALTAMONT, a very handsome town of Italy, in the kingdom of Naples, and in Calabria Citerior, fifteen miles north-west of Basiliano. Lat. 39.40. N. lon. 16.22. E.

ALTAMURA, a town of Naples, in the territory of Bari, with the title of a principality, seated on the foot of the Apennine mountains. Lat. 41.0. N. lon. 16.54. E.

ALTAR, *f*. [*alta ara*; *Fest*, or from *al*, God, and *tar*, described, q. d. a place by God's appointment. It is observed by Junius, that the word *altar* is received, with Christianity, in all the European languages; and that *altare* is used by one of the fathers, as appropriated to the Christian worship, in opposition to the *ara* of gentilism.] The place where religious offerings are laid. The table in Christian churches where the communion is administered.

Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, ensign, or character, of the deity to whom they were consecrated. In the great temples of ancient Rome there were ordinarily three altars: the first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt, and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

Besides these uses of altars, the ancients swore upon them, and swore by them, in making alliances, confirming treaties of peace and other solemn occasions. Altars also served as places of refuge to all those who fled to them, whatever crime they had committed.

Altars are doubtless as ancient as sacrifices themselves; consequently their origin is not much later than that of the world; Gen. chap. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some carry them as far back as Adam, whose altar is much spoken of by Jewish, and even Christian, writers. Others are contented to make the patriarch Enoch the first who consecrated a public altar. Be this as it will, the earliest altars we find any express testimony of are those erected by Abraham.

Altars, in the patriarchal times, were very rude. The altar which Jacob set up at Beth-el was nothing but a stone, which served him instead of a bolster; that of Gideon, a stone before his house: and the first which God commanded Moses to erect was probably of earth or unpolished stones, without any iron; for, if any use was made of that metal, the altar was declared impure. The principal altars of the Jews were, *The altar of incense*; that of *burnt offering*; and the *altar, or table, for the shew-bread*. The altar of incense was a small table of shittim-wood, covered with plates of gold, of one cubit in length, another in width, and two in height. At the four corners, were four kinds of horns, and all round a little border or crown over it. This was the altar hidden by Jeremiah before the captivity; and upon it the officiating priest offered, every morning and evening, incense of a particular composition. The altar of burnt-offerings was made of shittim-wood, and carried upon the shoulders of the priests by staves of the same wood overlaid with brass. In the time of Moses, this altar was five cubits square and three high; but in Solomon's temple it was much larger, being twenty cubits square and ten in height. It was covered with brass; and at each corner was a horn or spire, wrought out of the same

same wood with the altar, to which the sacrifices were tied. Within the hollow was a grate of brass, on which the fire was made; through it fell the ashes, and were received in a pan below. At the four corners of the grate were four rings and four chains, which kept it up at the horns. This altar was placed in the open air, that the smoke of the burnt-offerings might not fully the inside of the tabernacle. The altar, or table, for the shew-bread, was likewise of shittim-wood, covered with plates of gold, having a little border round it, adorned with sculpture. It was two cubits long, one wide, and one and a half in height. Upon this table, which stood in the holy of holies, were put, every Sabbath day, twelve loaves, with salt and incense. The Jewish altars, after their return from the captivity, and the building of the second temple, were in some respects different from those described above. That of burnt-offering was a large pile, built of unhewn stone, thirty-two cubits square at the bottom, and twenty-four square at the top. The ascent was by a gentle rising, thirty-two cubits in length, and sixteen in breadth.

In the primitive Christian church, the altars were only of wood; as being frequently to be removed from place to place. But the council of Paris, in 509, decreed that no altar should be built but of stone. At first there was but one altar in each church; but the number soon increased; and, from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church twelve or thirteen. In the cathedral of Magdeburg, there are forty-nine altars.

The altar is sometimes sustained on a single column, as in the subterraneous chapels of St. Cecilia, at Rome, &c. and sometimes by four columns, as the altar of St. Sebastian of Crypta Arcuaria; but the customary form is, to be of a massive stone-work, sustaining the altar-table. These altars bear a resemblance to tombs: to this purpose, we read in church-history, that the primitive Christians chiefly held their meeting at the tombs of the martyrs, and celebrated the mysteries of religion upon them; for which reason, it is a standing rule to this day in the church of Rome, never to build an altar, without inclosing the relics of some saint in it.

ALTAR-CLOTH, f. The cloth thrown over the altar in churches.

ALTAR-THANE, or ALTARIST, f. in old law books, an appellation given to the priest or parson of a parish, to whom the altarge belonged.

ALTARGE, f. [*altaragium*, Lat.] In law, comprehends not only the offerings made upon the altar, but also all the profit which accrues to the priest by reason of the altar, *obventio altaris*. Out of these, the religious assigned a portion to the vicar; and sometimes the whole altarge was given to him by the endowment. In some places, the word altarge hath been adjudged to extend to small tithes of divers kinds; but this can only be, where there is a special custom to support it. *Burb. 79.*

AL TA'YEFF, a town of Hejaz, a district of Arabia Felix. It is situated about 60 miles east of Mecca, behind mount Gazwan, where the cold is more intense than in any other part of the district, but the air is very wholesome. Its territory abounds in fountains, and produces excellent raisins. The town is surrounded with a wall, but is not very large.

ALTDORF, a large handsome town in Switzerland, and the chief of the canton of Uri. It is situated below the lake of the four cantons, in a plain, at the foot of a mountain, whose passages are difficult, and serve instead of fortifications. It has four churches and two convents; St. Martin's church and that of the Holy Cross are the finest. The town-house and the arsenal are also worth seeing. Lat. 46.50. N. lon. 8.30. E.

ALTE'A, a sea-port town of Valencia, in Spain. It is seated on the Mediterranean, forty-two miles south-east of Valencia, and 112 south-by-east of Madrid. Lat. 38.34. N. lon. 0.15. E.

ALTE'NA, a sea-port of Germany, in the duchy of

Holfstein in Lower Saxony. It is a modern town, built by the king of Denmark, and was burnt by the Swedes in 1712; but has since been beautifully re-built. It is commodiously situated on the Elbe, in the neighbourhood of Hamburg; and being a free port, and the staple of the Danish East-India company, it enjoys a very lucrative trade, and an extensive commerce. Lat. 53.51. N. lon. 10.0. E.

ALTENBERG, an ancient town of Germany, situated on the river Pleiss, with a good castle placed on a rock, in Misnia, in the circle of Upper Saxony. It was formerly an Imperial city, but at present belongs to the house of Saxony. Here is a college which has always been in a flourishing condition. In 1705, there was a nunnery founded for women of a high rank, who are Protestants. Lat. 50.59. N. lon. 15.8. E.

ALTENBURG, a small fortified town of Hungary, in the territory of Moson, near the Danube, about fifty-five miles from Vienna. Lat. 48.15. N. lon. 35.30. E.

ALTENBURG, or OWAR, a small but strong town of Hungary, seated in a marsh, near the Danube, and surrounded with deep ditches. It is fifteen miles south of Presburgh, forty south-east of Vienna, and sixty-five south-west of Buda. Lat. 44.0. N. lon. 17.56. E.

To ALTER, v. a. [*alterer*, Fr. from *alter*, another, Lat.] To change; to make otherwise than it is. *To alter*, seems more properly to imply a change made only in some part of a thing; as, *To alter* a writing, may be, to blot or interpolate it; to *change* it, may be, to substitute another in its place. With *from* and *to*; as, Her face is *altered from* pale *to* red.—Acts appropriated to the worship of God, by his own appointment, must continue so, till himself hath otherwise declared: for who dares *alter* what God hath appointed? *Stillingsfleet*.—To take off from a persuasion, practice, or sect.—For the way of writing plays in verse, I find it troublesome and slow; but I am no way *altered* from my opinion of it, at least with any reasons which have opposed it. *Dryden*.

To ALTER, v. n. To become otherwise than it was; as, The weather *alters* from bright to cloudy.

ALTERABLE, adj. [*alterable*, Fr.] That which may be altered or changed by something else; distinct from changeable, or that which changes; or may change itself.—Our condition in this world is mutable and uncertain, *alterable* by a thousand accidents, which we can neither foresee nor prevent. *Rogers*.

ALTERABLENESS, f. The quality of being alterable, or admitting change from external causes.

ALTERABLY, adv. In such a manner as may be altered.

ALTERAGE, f. [*from alo*.] The breeding, nourishing, or fostering, of a child.—In Ireland they put their children to fosterers: the rich sell, the meaner fort buying, the *alterage* of their children; and the reason is, because, in the opinion of the people, fostering has always been a stronger alliance than blood. *Sir John Davies*.

ALTERANT, adj. [*alterant*, Fr.] That which has the power of producing changes in any thing.

ALTERATION, f. [*from alter*; *alteration*, Fr.] The act of altering or changing.—*Alteration*, though it be from worse to better, hath in it inconveniences, and those weighty. *Hooker*.—The change made:

So he, with difficulty and labour hard,

Mov'd on:

But he once past, soon after, when man fell,

Strange *alteration*! Sin, and Death, again

Following his track, (such was the will of heav'n!)

Pav'd after him a broad and beaten way.

Milton.

ALTERATIVES, f. Medicines that are supposed to make a change in the blood, particularly from a morbid to a sound state, without any manifest operation or evacuation; and the term is also employed for medicines suited to clear the blood from certain impurities supposed to remain in it. Whatever other general operations may be proper

proper to any medicines, all of them may be used as alteratives, and the most powerful alteratives are evacuates, given in diminished doses, if repeated at proper intervals; by administering them thus, or mixed with such alteratives as the case may indicate; though the discharge they promote, when given in full doses, is not increased, they pass into the blood, and the secretions are promoted whereby the faulty natural excretions are regulated.

ALTERCA'TION, *f.* [*altercation*, Fr. *altercor*, Lat.] Debate; controversy; wrangle.—Our whole life is little else than a perpetual wrangling and *altercation*; and that, many times, rather for victory and ostentation of wit, than a sober and serious search of truth. *Hakewill*.

ALTE'RN, *adj.* [*alternus*, Lat.] Acting by turns, in succession each to the other:

And God made two great lights, great for their use
To man; the greater to have rule by day,
The less by night, *altern*. *Milton*.

ALTE'RNACY, *f.* Action performed by turns.

ALTE'RN-BASE, *f.* in trigonometry, a term used in contradistinction to the true base. Thus in oblique triangles, the true base is either the sum of the sides, and then the *difference* of the sides is called the *altern-base*; or the true base is the difference of the sides, and then the *sum* of the sides is called the *altern-base*.

ALTE'RNATE, *adj.* [*alternus*, Lat.] Being by turns; one after another; reciprocal.—Friendship consists properly in mutual offices, and a generous strife in *alternate* acts of kindness. *South*.

Hear how Timotheus' various lays surprise,
And bid *alternate* passions fall and rise!
While, at each change, the son of Lybian Jove
Now burns with glory, and then melts with love. *Pope*.

ALTE'RNATE, *f.* That which happens alternately; vicissitude:

And rais'd in pleasure, or repos'd in ease,
Grateful *alternates* of substantial peace,
They bless the long nocturnal influence shed
On the crown'd goblet, and the genial bed. *Prior*.

ALTE'RNATE, in heraldry, is said in respect of the situation of the quarters. Thus, the first and fourth quarters, and the second and third, are usually of the same nature, and are called *alternate quarters*.

ALTE'RNATE, in botany, when the leaves or branches of plants arise higher on opposite sides alternately.

ALTE'RNATE ANGLES, in geometry, are the internal angles made by a line cutting two parallels, and lying on the opposite sides of the cutting line; the one below the first parallel, and the other above the second.

TO ALTE'RNATE, *v. a.* [*alternare*, Lat.] To perform alternately. To change one thing for another reciprocally.—The most high God, in all things appertaining unto this life, for sundry wise ends, *alternates* the disposition of good and evil. *Grew*.

ALTE'RNATELY, *adv.* In reciprocal succession, so that each shall be succeeded by that which it succeeds, as light follows darkness and darkness follows light.—The rays of light are, by some cause or other, *alternately* disposed to be reflected or refracted for many vicissitudes. *Newton*.

Unhappy man! whom sorrow thus and rage
To different ills *alternately* engage. *Prior*.

ALTE'RNATENESS, *f.* The quality of being alternate, or of happening in reciprocal succession.

ALTE'RNATION, *f.* The reciprocal succession of things.—The one would be oppressed with constant heat, the other with insufferable cold; and so the defect of *alternation* would utterly impugn the generation of all things. *Brown*.

ALTE'RNATION is also used to express the different changes or alterations of orders in any number of things proposed. This is also called *permutation*, &c. and is easily found by a continual multiplication of all the numbers,

beginning at unity. As suppose two things *a* and *b*; these may be placed either thus *ab* or *ba*, that is, two ways, or 1×2 . If there be three things, *a*, *b*, *c*, then the third thing *c*, may be placed three different ways with respect to each of the two positions (*ab* and *ba*) of the other two things, it may stand either before them, or between them, or after them both, that is, it may stand either first, second, or third; and therefore with three things there will be three times as many changes as with two, that is, $1 \times 2 \times 3$, or six changes with three things. Again, if there be four things, *a*, *b*, *c*, *d*, then the fourth thing *d*, may be placed in four different ways with respect to each of the six positions of the other three; for it may be set either first, or second, or third, or fourth, in the order of each position; consequently, from four things there will be four times as many alternations as there are from three things; and therefore $1 \times 2 \times 3 \times 4 = 24$, is the number of changes with four things. And so on, always multiplying the last-found number of alternations by the next number of things; or to find the number of changes for any number of things, as *n*, multiply the series of natural numbers 1, 2, 3, 4, 5, &c. to *n*, continually together, and the last product will be the number of alternations sought; so $1 \times 2 \times 3 \times 4 \times 5 \dots n$, is the number of changes in *n* things. So if, for example, it were required to find how many changes may be rung on 12 bells; it would be $1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9 \times 10 \times 11 \times 12 = 479001600$, the number of changes. Now supposing there might be rung 10 changes in one minute, that is, 10×12 or 120 strokes in a minute, or two strokes in each second of time; then, according to this rate, it would take upwards of 91 years to ring over all these changes on the 12 bells only. Also, if but two more bells were added, making 14 bells; then, at the same rate of ringing, it would require about 16575 years to ring all the changes on 14 bells but once over. And, if the number of bells were 24, it would require more than 1170000000000000 years to ring all the different changes upon them!

ALTE'RNATIVE, *f.* [*alternatif*, Fr.] The choice given of two things; so that, if one be rejected, the other must be taken:

A strange *alternative*——
Must ladies have a doctor, or a dance? *Young*.

ALTE'RNATIVELY, *adv.* In alternate manner; by turns; reciprocally.—An appeal *alternatively* made may be tolerated by the civil law as valid. *Ayliffe*.

ALTE'RNATIVENESS, *f.* The quality or state of being alternative; reciprocation.

ALTE'RNITY, *f.* [from *altern*.] Reciprocal succession; vicissitude; turn; mutual change of one thing for another; reciprocation.—They imagine that an animal of the vastest dimensions, and longest duration, should live in a continual motion, without the *alternity* and vicissitude of rest, whereby all other animals continue. *Brown*.

ALTHÆ'A, *f.* [*αλθαία*, from *αλθαειν*, Gr. to heal.] In botany, a genus of the monadelphia polyandria class, ranking in the natural order of columniferae. The generic characters are—Calyx: perianthium double; outer smaller, one-leafed, unequally novemfid; divisions very narrow; inner semiquinquefid, divisions broader, sharper. Corolla: five-petalled, united at the base, obcordate, præmorse, flat. Stamina: filaments many, inserted into the corolla; antheræ subreniform. Pistillum: germ orbiculate; style cylindrical, short; stigmas many (twenty), fetaceous, the length of the style. Pericarpium: consists of arils not jointed, forming a flat ring about a columnar receptacle; they are deciduous, and open on the inside. Seed: one, flat-kidney-shaped in each aril.—*Essential Character*. Calyx double; outer nine-cleft. Arils many, one-seeded.

Species. 1. *Althæa officinalis*, or common marsh-mallow: leaves simple, downy. Common or officinal marsh-mallow grows naturally in salt marshes, and on the banks of rivers and ditches in Cambridgeshire, Norfolk, and Suffolk;

Suffolk; on the sea-shores of Cornwall; in Holland, France, Italy, Siberia, &c. It has a perennial root, and an annual stalk, growing erect, to the height of four or five feet, and putting out a few lateral branches. The leaves are soft, angular, and alternate. The flowers are axillary, shaped like those of the mallow, but smaller and of a pale colour. These appear in June or July, and the seeds ripen in September. The outer calyx is frequently cleft into seven parts. Capsules about twenty, rounded-kidney-shaped, triangular-flattened, closed on every side, tomentose on the back, coriaceous, not gaping. Common receptacle central, in the middle, swelling globularly, and grooved, but ending at top in a long conical point. Seeds smooth and brown. The whole plant, particularly the root, abounds with a mild mucilage, which is emollient in a much greater degree than common mallow. The root boiled is much used as an emollient cataplasm, and an infusion of it is very generally prescribed in all cases wherein mild mucilaginous substances are useful, as a pectoral, and in complaints of a gravelly nature. The infusion is much superior to the syrup which is kept in the shops.

2. *Althæa cannabina*, or hemp-leaved marsh-mallow: lower leaves palmate, upper digitate. This species has a woody stem, which rises to the height of four or five feet, and puts out many side branches. The leaves are alternate. The flowers are axillary, not so large as those of the common marsh-mallow, but of a deeper red colour, and the calyx much larger. This sort seldom flowers the first year, unless the summer prove warm; but, when the plants live through the winter, they will flower early the following summer, and produce good seeds. It grows naturally in Hungary, Istria, Austria, Carniola, Italy, the south of France, &c. by wood sides.

3. *Althæa hirsuta*, or hairy marsh-mallow: leaves trifid, hairy-hispid, smooth above; peduncles solitary, one-flowered. A low plant, the branches trailing on the ground. The leaves and stalks are beset with strong hairs; the flowers are axillary, smaller than those of the common sort, and have purplish bottoms. The leaves are deeply cut into three parts, and have long petioles. The stalks are woody, but seldom last more than two years. It grows wild in Spain and Portugal, Italy, Austria, Carniola, Germany, Switzerland, and France.

4. *Althæa Ludwigii*, or Ludwig's marsh-mallow: leaves lobed, naked on both sides, peduncles collected, one-flowered.

5. *Althæa Narbonensis*, or Narbonne marsh-mallow: leaves tomentose on both sides; the lower five-lobed; the upper three-lobed; peduncles solitary, one-flowered. It was first discovered by the abbé Pourret, near Narbonne; is also found in Spain; and it flowers in August and September.

6. *Althæa corymbosa*: leaves simple, cordate or angular, smooth, peduncles and calyxes hairy, flowers in corymbs. 7. *Althæa racemosa*: leaves simple, cordate, ovate, serrate, scabrous on the upper surface, raceme terminating, erect. Natives of Jamaica.

Propagation and Culture. The marsh-mallow may be propagated fast enough, either by seeds, or parting the roots. The seeds should be sown in the spring; but the best time for parting the roots is in autumn, when the stalks decay. It will thrive in any soil or situation, but in moist places will grow larger than in dry land. The plants should not be nearer together than two feet; for the roots spread wide.

ALTHÆA, *f.* in botany. See *HERMANNIA*, *HIBISCUS*, *LAVATERA*, *MALVA*, *MELOCHIA*, *NAPÆA*, *SIDA*, and *WALTHERIA*.

ALTHÆA FRUTEX, *f.* in botany. See *HIBISCUS*.

ALTHÆA, in profane history, the daughter of Thestius and Eurythemis, who married Oeneus, king of Calydonia, and was mother of Meleager. This young prince being obliged to go to war with her two brothers, and having slain them, Althæa, out of despair for their death, burnt a log of wood, on the preservation of which the life

of her son depended; but she afterwards died of grief, See *MELEAGER*.

ALTHÆMENES, a son of Crateus, who exiled himself to avoid becoming a patricide; yet at length killed his father unknowingly, for which, on his entreating the gods, the earth opened and swallowed him up. See *CRATEUS*.

ALTHOUGH, *conj.* [from *all* and *though*.] Notwithstanding; however it may be granted; however it may be that.—We all know, that many things are believed, *although* they be intricate, obscure, and dark: *although* they exceed the reach and capacity of our wits; yea, *although* in this world they be no way possible to be understood. *Hooker*.

ALTIGRADE, *adj.* [from *altus* and *gradior*, Lat.] Rising on high.

ALTILOQUENCE, *f.* [from *altus* and *loquor*, Lat.] High speech; pompous language.

ALTIMETRY, *f.* [from *alta*, high things, and *metior*, Lat. to measure.] The art of taking or measuring altitudes or heights, whether accessible or inaccessible, generally performed by a quadrant. See *GEOMETRY*.

ALTIN, *f.* a money of account in Muscovy, worth three *copecks*; one hundred of which make a ruble, worth about 4s. 6d. sterling.

ALTIN, a lake in Siberia, from whence issues the river Ob, or Oby, in N. lat. 52. 0. E. lon. 85. 55. This lake is called by the Russians *Teloſkoi Oſero*, from the Teleſi, a Tartarian nation, who inhabit the borders of it, and who give it the name of *Altin-Kul*. By the Calmucs it is called *Altinmor*. It is near ninety miles long and fifty broad, with a rocky bottom. The north part of it is sometimes frozen so hard as to be passable on foot, but the southern part is never covered with ice. The water in Altin lake, as well as in the rivers which run through the adjacent places, only rises in the middle of summer, when the snows on the mountains are melted by the heat of the sun.

ALTINCAR, *f.* among mineralists, a species of factitious salt used in the fusion and purification of metals. The altincar is a sort of flux powder. Divers ways of preparing it are given by Libavius.

ALTING (Henry), professor of divinity at Heidelberg and Groningen, was born at Embden in 1583, of a family which had been long conspicuous in Friseland. His father, Menſo Alting, was the first, who, with two others, preached the reformation in the territory of Groningen, about the year 1566, under the tyrannical government of the duke of Alva; and the first that preached in the great church of Groningen, after the reduction of that town by the States General in 1594. Henry was chosen, in 1605, preceptor to the three young counts of Nassau, Solms, and Izenberg. After various difficulties, he settled at Groningen, where he continued till his death, August 25, 1644. Most of his works were never published; those which have been are the following: *Notæ in decadem Problematum J. Behm*, 1618. *Loci communes Explicatio Catechesos Palatinæ*, 1646, in 3 vols. *Exegetis Augustanæ confes.* 1647. *Methodus Theologiæ*, 1650. It appears from the catalogue of his works annexed to his life, that the *Medulla Hist. Prophanæ*, published by Dr. Pareus, was composed by Alting. The most remarkable piece among Alting's MSS. is, the ecclesiastical History of the Palatinate, from the reformation to the administration of John Casimir.

ALTING (James), son of the former, was born at Heidelberg in 1618. He travelled into England in 1640, where he was ordained by the learned Dr. Prideaux, bishop of Worcester. He afterwards accepted of the professorship of Groningen, vacant by the death of Gomarus; but his situation was rendered very disagreeable by the continual disputes which he had with his colleague Sam. des Maets, who favoured the school-divinity. He died in 1697. He recommended the edition of his works to Menſo Alting (author of *Notitia German. Infer Antiquæ*, fol. Amst. 1679); but they were published in 5 vols. folio, with his life, by Mr. Bekker of Amsterdam. They contain vari-

ous analytical, exegetical, practical, problematical, and philosophical tracts, which shew his industry and knowledge.

ALTISONANT, or **ALTISONOUS**, *adj.* [*altisonus*, Lat.] High sounding; pompous or lofty in sound.

ALTITUDE, *f.* [*altitudo*, Lat.] Height of place; space measured upward. The elevation of any of the heavenly bodies above the horizon. Situation with regard to lower things. Height of excellence; superiority. Height of degree; highest point.

ALTITUDE, in geometry, is the third dimension of body, considered with respect to its elevation above the ground; and is otherwise called its height when measured from bottom to top, or its depth when measured from top to bottom. See **GEOMETRY**.

ALTIVOLANT, *adj.* [*altivolans*, Lat. from *altus* and *volo*.] High flying.

ALT'KIRCH, a town in the department of the Upper Rhine, on the river Ille, forty-five miles south-west of Strasbourg. Lat. 47. 40. N. lon. 7. 20. E.

ALT'MORE, a town of Ireland, in the county of Tyrone, and province of Ulster, situated in lat. 54. 34. N. lon. 7. 2. W.

ALT'MULL, a river of Germany, which has its source in Franconia, and falls into the Danube at Kelheim, twelve miles above Ratisbon.

ALT'ON, Hants, is a pleasant healthy town, on the great western road from London, through Farnham, to Southampton and the Isle of Wight. It consists of three streets, the principal of which is wide and modern built. It has a small, but neat, church; and the river Wye runs through the town. Here is a charity-school for twenty boys, who are classically educated. The new navigation from Basingstoke, to Weybridge in Surrey, where it unites with the Thames, is within eight miles of this town. An increasing manufacture is carried on here by Mr. Waring, of barratrees, valentia, tabinets, satin-denims, and a variety of other worsted articles, dyed in the wool and esteemed for their superior quality. The white yarn trade is likewise carried on to a considerable extent. Alton has also, within these few years, made considerable advances in the growth of hops, which is still increasing, much to the advantage of its inhabitants. It has a market on Saturdays, and two annual fairs; one on the Saturday preceding the first of May, the other on the twenty-ninth of September. The country round this town is remarkably fertile and populous, having an excellent neighbourhood.

ALTON, or **AVELTON**, a village in Staffordshire, five miles north of Uttoxeter, famous for the ruins of a castle, formerly a seat of the Bertram de Verdun family, for many generations, which some would have to be built before the Norman conquest; but Dr. Plott is pretty certain that it was erected by Theobald de Verdun, in the beginning of the reign of Edward II. A great part of the walls are still standing, but they are in a very ruinous condition. It appears from its advantageous situation to have been a place of great strength; and was destroyed, as it is said, by Oliver Cromwell.

AL'TO ET BASSO, *f.* in law, signifies the entire submission (for high and low) of all differences to arbitration.

ALTO-RELIEVO. See **RELIEVO**.

ALTO-REPIENO, in music, the tenor of the great chorus, which sings and plays only now and then in some particular places.

AL'TOGETHER, *adv.* [from *all* and *together*.] Completely; without restriction; without exception.—If death and danger are things that really cannot be endured, no man could ever be obliged to suffer for his conscience, or to die for his religion; it being *altogether* as absurd to imagine a man obliged to suffer as to do impossibilities. *South*.—Conjunctly; in company. This is rather *all together*:

Cousin of Somerset, join you with me,
And *altogether* with the duke of Suffolk,
We'll quickly hoist duke Humphry from his seat.

Shakespeare.

ALT'TORF, a town of the circle of Franconia, in Germany. It has a physic-garden, with upwards of 2000 different plants; a theatre for dissections, which has many curiosities in the anatomical way; and a handsome library. It is subject to the house of Brandenburg; and is seated on the confines of Bavaria, fifteen miles from Nuremberg. Lat. 47. 46. N. lon. 9. 35. E.

ALT-RANS'TADT, a town in Saxony, famous for the treaty between Charles XII. king of Sweden and Augustus elector of Saxony, in 1706, wherein the latter regained the kingdom of Poland.

ALT'TRINCHAM, Cheshire, (by many called Altringham,) is an inland town in the parish of Bowden, eight miles from Manchester, nine from Stockport, seven from Knutsford, twelve from Northwich, and twelve from Warrington. There is a market held on Tuesday weekly, and three fairs in the year, held on the 29th of April, 5th of August, and 22d of November. The earl of Stamford, whose seat of Dunham Massey is about two miles from the town, is lord of the manor, and holds a court-leet twice a year. In the earl of Stamford's park are many stately trees, in which the herons yearly build their nests; and there are on the estate about 100,000 timber-trees. The principal manufactory in the town is worsted yarn, and worsted and hair shags; the cotton manufactory being at present in its infancy here. There are two large pieces of building here for picking and spinning cotton. There is a turnpike-road through Altringham from Manchester to Knutsford, Northwich, and Warrington. The duke of Bridgewater's navigable canal from Manchester to Runcorn passes through one part of the town; and the inhabitants are well supplied with coal at reasonable rates from his grace's mines at Worsley, about ten miles from hence.

ALT'ZEG, a town of Germany in the Lower Palatinate, the capital of a territory of the same name, with an old castle. Lat. 49. 44. N. lon. 7. 25. W.

ALVA DE TORMES, a considerable town in Spain, in the kingdom of Leon, and territory of Salamanca, with a very handsome castle. It is seated on the north bank of the river Tormes. Lat. 41. 0. N. lon. 6. 1. W.

AL'VAH, *f.* the wood wherewith Moses sweetened the waters of Marah, Exod. xv. 25. The name of this wood is not found in Scripture; but the Mahometans give it that of *alvah*, and pretend to trace its history from the patriarchs before the flood. Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVA'RES DE LUNA, or, as some call him, **ALVARO**, the favourite of John II. king of Castile, was famous for the prodigious ascendancy he gained over this prince, and for the punishment which at length overtook him. He was natural son of Don Alvaro de Luna, lord of Canete in Arragon, and of a woman infamous for unbounded lust. He was born in 1388, and named Peter; but antipope Benedict XIII. who was charmed with his wit, tho' yet a child, changed Peter to Alvares. He was introduced to court in 1408, and made a gentleman of the bed-chamber to king John, with whom he grew into the highest favour. In 1427 he was obliged to retire: the courtiers exerted all their endeavours to ruin him: they complained, that a man of no military skill, of no virtues whatever, should, by mere artifice and dissimulation, be advanced to the highest authority; and they could not bear, that, by the assistance of a few upstart men, whom he had raised and fixed to his interest, he should reign as absolutely as if he were king.

They prevailed against him, and Alvares was banished from court a year and an half: but this was the greatest affliction imaginable to the king; who shewed all marks of distress the moment he was removed from his presence, and now thought and spoke of nothing but Alvares. He was therefore recalled; and, being invested with his usual authority, revenged himself severely upon his enemies, by persuading the king to banish them. Of the forty-five years he spent at court, he enjoyed for thirty of them so

entire

entire an ascendancy over the king, that nothing could be done without his express orders; nay, it is related by Mariana, that the king could not change an officer or servant, or even his clothes or diet, without the approbation of Alvares. In short, he wanted nothing to complete his grandeur but the name of king: he had all the places in the kingdom at his disposal; he was master of the treasury, and by bounties had gained the hearts of the subjects, that the king, though his eyes now were opened, and his affections sufficiently turned against him, durst not complain. But the day of reckoning was approaching, and at length he was seized; yet not directly, openly, and violently, but with some of that management which upon a similar occasion was formerly employed by Tiberius against Sejanus. During his confinement, he made several attempts to speak to the king in person; but, not being able to effect this, he sent the following letter, from which, as well as from the rest of Alvares' history, all court-favourites may draw abundant matter for edification and instruction. "Sir, It is five-and-forty years since I was admitted into your service. I do not complain of the rewards I have received: they were greater than my merits or expectation, as I shall not deny. There was but one thing wanting to complete my happiness; and that was, to have fixed proper limits in time to this great fortune of mine. While, instead of choosing retirement, after the example of the greatest men, I still continued in the employment, which I thought not only my duty, but necessary for your interest, I fell into this misfortune. It is very hard that I should be deprived of liberty, when I have risked life and fortune more than once to restore it to you. Grief prevents me from saying more. I know that the Deity is provoked against me by my sins; but it will be sufficient for me, if his anger is appeased by the calamities I now suffer. I can no longer bear that prodigious mass of riches, which it was wrong in me to have heaped together. I should willingly resign them, but that every thing I have is in your power; and I am denied the opportunity of shewing mankind, that you have raised a person to the height of greatness, who can condemn wealth as well as procure it, and give it back to him from whom he received it. But I desire you in the strongest terms, that, as I was obliged, by the lowness of the treasury, to raise 10,000 or 12,000 crowns by methods I ought not to have taken, you will restore them to the persons from whom they were extorted. If you will not grant this on account of the services I have done, yet I think it necessary to be done from the reason of the thing."

This letter, however, produced no effect in his favour: Alvares was tried, and condemned to lose his head. After condemnation, he was removed to Valladolid; and carried upon a mule to the market-place, in the middle of which a large scaffold was erected. Mounting the scaffold, he gave his hat and signet to his page, saying, "These are the last gifts you will ever receive from me." He then submitted himself to the axe with the utmost intrepidity. Dr. Geddes relates, that he was executed on the 4th of June, others the 5th of July, 1453.

ALUDEL, *f.* [from *a* and *lutum*; that is, without lute.] Aludels are subliming pots used in chemistry, without bottoms, and fitted into one another, as many as there is occasion for, without luting. At the bottom of the furnace is a pot that holds the matter to be sublimed; and at the top is a head, to retain the flowers that rise up.

The process of sublimation differs from distillation in the nature of its product, which instead of becoming condensed in the fluid assumes the solid state, and the form of the receivers may of course be very different. The receivers for sublimates are of the nature of chimneys, in which the elastic products are condensed and adhere to their internal surface. It is evident that the head of an alembic will serve very well to receive and condense such sublimates as are not very volatile. The earlier chemists, whose notions of simplicity were not always the most perfect, thought proper to use a number of similar heads, one above the

other, communicating in succession by means of a perforation in the superior part of each, which received the neck of the capital immediately above it. These heads differing in no respect from the usual heads of alembics, excepting in their having no nose or beak, and in the other circumstances here mentioned, were called aludels. They are seldom now to be seen in chemical laboratories, because the operations of this art may be performed with greater simplicity of instruments, provided attention be paid to the heat and other circumstances.

ALVEA'RIMUM, *f.* in anatomy, the bottom of the *concha*, or hollow of the outer ear.

ALVEARIUM also signifies a bee-hive. The word is formed of *alveus*, "a channel or cavity;" in allusion to the *alveoli* or cells in bee-hives. Some ancients use also the word *alvearium* for a bee-house, more usually called among us *apiary*.

ALVEARIUM is sometimes also used figuratively, to denote a collection; in which sense *alvearium* amounts to much the same with what we otherwise call *thesaurus*, *cornucopia*, or the like. Vinc. Boreus has published an *alvearium* of law.

ALVE'OLUS, *f.* in natural history, the name of the waxen cells in bee-hives. Also the name of a sea-fossil of a conic figure, composed of a number of cells like bee-hives, joined into each other with a pipe of communication.

ALVEOLUS, in anatomy, the sockets in the jaws wherein the teeth are fixed. Some writers speak of teeth growing without alveoli. Pliny mentions a person who had a tooth in his palate. Eustachius relates, that he saw a man who at sixty had a tooth growing out of the middle of his fauces. Haller gives an instance of a person whose teeth were of a piece with his jaws, without any insertion into alveoli.

ALVE'US, *f.* Medicinally, is applied to many tubes or canals, through which some fluid flows, particularly to ducts which convey the chyle from the receptacle thereof to the subclavian vein.

ALVIDU'CA, *f.* [of *alvus*, the paunch, and *duco*, Lat. to lead.] Loosening medicines.

A'LUM, *f.* [*alumen*, Lat.] A crystallizable salt composed of vitriolic acid united with argillaceous-earth. It has an austere, sweetish, and strongly-astringent taste, which seems to proceed chiefly from a portion of the vitriolic acid which is necessary to its solubility in water and crystalline form, though it be more than requisite to produce neutralization, as judged by the test of turnsole and blue paper, which it reddens. A considerable number of instances may be exhibited in chemistry where a superabundance of one of the two principles in compound salts is necessary to produce the finest crystals, and the most permanent combination. If the excess of acid in alum be taken away, all the taste, the solubility, and the original properties, of the salt, are lost.

One hundred parts of crystallized alum require, in a mean heat, about fourteen times its weight of water to dissolve it; but boiling water dissolves one third more than its own weight of this salt, most of which consequently separates by cooling. If crystallized alum be exposed to a gradual heat, it first becomes fluid by a kind of aqueous fusion, in which its own water of crystallization is the principal agent; the remaining mass, after most of the water has been expelled, grows opaque, swells, foams, and at length remains quiet, spongy, and friable. Ignition drives off some of its superabundant acid. The quantity of earthy basis in alum may be determined by precipitation with fixed or volatile alkali. In this way, however, there is a source of inaccuracy arising from the insolubility of the alum, which takes place as soon as its superabundant acid has combined with the alkali. At this period, a portion of the neutral combination of clay and vitriolic acid falls down without further decomposition. Long-continued digestion in an alkaline lixivium is necessary to separate the whole of the acid. The volatile alkali is preferable in clearing the base of alum, because it would unite to fixed alkalies. The most commodious method of obtaining

taining pure argillaceous earth consists in precipitating it in this manner from alum. In this way Bergman found one hundred parts of crystallized alum to contain forty-four of water, eighteen of clay, and consequently thirty-eight of vitriolic acid, and probably water, which could not be made to quit the acid.

Alum is produced, but in very small quantity, in the native state; and this is mixed with heterogeneous matters. It effloresces in various forms, upon ores during calcination, but it seldom occurs crystallized. The greater part of this salt is factitious, being extracted from various minerals called alum ores, such as, 1. Sulphurated clay, which constitutes the purest of all aluminous ores, namely, that of la Tolfa, near Civita Vecchia, in Italy. It is white, compact, and as hard as indurated clay; from whence it is called *petra aluminaris*. It is tasteless and mealy: one hundred parts of this ore contain above forty of sulphur and fifty of clay, a small quantity of fixed vegetable alkali, and a little iron. Bergman says it contains forty-three of sulphur in one hundred, thirty-five of clay, and twenty-two of siliceous earth. This ore is first torrefied to decompose the sulphur, whose vitriolic acid re-acts on the clay, and forms the alum.

2. The pyritaceous clay, which is found at Schwemsal, in Saxony, at the depth of ten or twelve feet, is a black and hard, but brittle, substance, consisting of clay, pyrites, and bitumen. It is exposed to the air for two years, by which means the pyrites are decomposed, and the alum is formed. The alum ores of Hesse and Liege are of this kind; but they are first torrefied, which is said to be a disadvantageous method.

3. The *sluists aluminaris* contains a variable proportion of petroleum and pyrites intimately mixed with it. When these last are in a very large quantity, this ore is rejected as containing too much iron. Professor Bergman very properly suggests, that by adding a proportion of clay this ore may turn out advantageously for producing alum; but if the petrol is considerable it must be torrefied. The mine of Becket in Normandy, and those of Whitby in Yorkshire, are of this species.

4. Volcanic aluminous ore: such is that of Solfaterra, near Naples. It is in the form of a white saline earth, after it has effloresced in the air; or else it is in a stony form.

5. Bituminous alum ore is called shale, and is in the form of a *sluist*, impregnated with so much oily matter of bitumen as to be inflammable. It is found in Sweden, and also in the coal-mines at Whitehaven, and elsewhere.

6. Alum might also be extracted from many species of pyrites; but is in general so contaminated with iron, as scarcely to pay the expences of the operation.

The preparation of alum consists in rendering the ores aluminous in the first place, and next in dissolving and purifying the salt. Most of the alum ores contain clay and sulphur, which last requires to be converted into vitriolic acid before it can form the aluminous combination. For this purpose exposure to the air and occasional watering is effectual, and is in many places used: but it is less expeditious than the conversion of the sulphur into vitriolic acid by actual combustion. The chief difficulty of the process is, that the sulphur must be gradually and sufficiently burned without expelling it by too great a heat, which would be likewise attended with a fusion of the earthy parts that would render them capable of resisting the subsequent action of the water. After the ore has been, partly by calcination, and partly by spontaneous efflorescence, reduced to such a state as that it can be made into a paste by the hand, it is fit for boiling, which is usually performed in large leaden caldrons. In many manufactories a cold elixation is performed, until the saline solution is saturated; after which it is boiled until it be sufficiently strong for crystallization. This should not be too much loaded, because otherwise it would begin to deposit crystals by cooling before its earthy impurities had subsided. Some take the floating of a newly-laid egg as a token of the boiling being finished; a rough method in-

deed, as well because the part above the liquor may be very different, and likewise because the specific gravity of eggs soon changes. The specific gravity of a fluid which just prevents a new-laid egg from sinking is about 1.081.

The *lixivium*, sufficiently concentrated by evaporation, is conveyed through channels into coolers, where, in about an hour, it is freed, by deposition, from the grosser heterogeneous particles; it is then put into either stone or wooden receptacles. In eight or ten days the *lixivium*, commonly called *magistral water*, flows into another vessel, leaving behind a number of crystals, generally small and impure, which inerust the bottom and sides of the vessel. These are collected, and washed from the impurities which adhere externally with cold water: the impurities remaining in the reservoir after washing are kept by themselves. The washed crystals are then put into the boiler used for purifying them, and are dissolved in a quantity of water so small as barely to suspend the salt when boiling hot. The alum liquor is then poured into large strong wooden casks, whose staves and hoops are all numbered that they may be more readily put together. In these the alum gradually shoots into large crystals about the sides; the liquor in the middle is then let off by a cock in the bottom, and the vessel turned upside down for the more effectual draining of the remaining fluid. Lastly, the crystals are dried in a stove, and packed up in casks for sale.

In order to obtain the alum more pure at the second crystallization, some additions are employed in many of the manufactories, such as alkalies, lime, or urine. It is even asserted that good crystals of this salt cannot be obtained without such additions. We have not any clear account what it is that these additions perform. Urine is thought to be useful only by virtue of the volatile alkali it contains. It is thought that these additions engage with a superabundant acid, which from the decomposition of alum by alkaline substances does not seem to be the only use. As this proceeding is attended with advantage in the treatment of many kinds of aluminous ley, it seems not unlikely but that it may decompose vitriols and other metallic salts which might interrupt the crystallization of the alum, and at the same time render it impure. Thus martial vitriol, a salt frequently abounding in the alum ores after efflorescence, would be converted into calx of iron and selenite by the addition of lime; both which substances would fall down, on account of their very sparing solubility in that quantity of water which is sufficient to suspend the alum. So likewise the addition of pot-ash, or the vegetable alkali, would produce calx of iron and vitriolated tartar, the latter of which requires a very considerable quantity of water to dissolve it. It is scarcely necessary to pursue these observations, as they would require to be varied according to the nature of the impurities in the ley, and other circumstances, among which the disposition to form triple combinations, which exhibits itself where a variety of principles are suspended in the same solvent, is not one of the least considerable.

In such cases (as it is ascertained that the alum is rendered more soluble, and consequently less crystallizable, by a superabundance of vitriolic acid) the most obvious and profitable remedy seems to be that of Bergman, who advises the addition of clay, which, at the same time that it prevents the noxious superabundance, increases the quantity of alum. This should be added at the very first, when the *lixivium* is put into the boiler. All the *lixivium* may then be reduced to a tenacious mass, and formed into cakes, which may be exposed to the open air under a shed.

In this situation the iron of the vitriol becomes more perfectly calcined by the action of the air, so as to retain its acid much less forcibly; which likewise, by its stronger attraction, is disposed to unite with the clay. Calcination accelerates this effect; but it must be cautiously employed for fear of expelling the acid. In all these manipulations, it is evident that much may be gained or lost in the treatment of alum ores, according as the skill and intelligence

gence of the manufacturer may lead him to employ such processes as are best suited to their contents.

Alum is used in large quantities in many manufactories. It is extensively useful in the art of dyeing. When added to tallow, it renders it harder. Printers' cushions, and the blocks used in the calico manufactory, are rubbed with burnt alum to remove any greasiness which might prevent the ink or colour from sticking. Wood sufficiently soaked in alum does not easily take fire; and the same is true of paper impregnated with it, which is fitter to keep gunpowder, as it also excludes moisture. Paper impregnated with alum is useful in whitening silver, and silvering brass without heat. Alum mixed in milk helps the separation of its butter. If added in a very small quantity to turbid water, in a few minutes it renders it perfectly limpid, without any bad taste or quality; whilst the vitriolic acid does not precipitate so soon, nor so well, the opaque earthy mixture that renders it turbid, and gives to it a very sensible acidity. It is used in making the pyrophorus, in tanning, and many other manufactories; particularly in the art of dyeing, in which it is of the greatest and most important use, by cleansing and opening the pores on the surface of the substance to be dyed, rendering it fit for receiving the colouring particles (by which the alum is generally decomposed), and at the same time making the colour fixed. Alum constitutes the basis of crayons, which generally consist of the earth of alum finely powdered, and tinged for the purpose.

Alum is prepared in England, and many other parts of the world, and was formerly distinguished by various names. The rock alum is supposed to derive its name from an ancient city in Syria, called Roccho, at present Edeffa, where one of the earliest manufactories was carried on. The Roman alum has been considered as the best sort. It has a rosy-coloured tinge, which arises from about $\frac{1}{10}$ of its weight of a rose-coloured earth, the nature of which was not ascertained by Bergman, though he found that the goodness of the alum does not depend upon it. This alum is not preferred to other good alum by our manufacturers. Plumé alum is a name given to two very different substances. The one appears to be true alum produced by the desiccation of aluminous waters, which transude through grottos and caverns, and leave this salt behind in feathery crystals; but this is seldom met with. The other substance to which this name has been given, is the fibrous asbestos, which contains no alum; but from half to three-fourths of its weight of siliceous earth, from one-eighth to one-third of mild magnesia, and the rest calcareous earth, with a minute proportion of clay, and sometimes iron.

Medicinally, alum is used as a powerful astringent; as such it is prescribed to preserve the gums, also to restrain uterine hæmorrhages, and check the fluor albus; but, though in these sort of fluxes it is highly commended, it is rarely and with great caution to be admitted in dysenteries, particularly in the beginning. Though celebrated as an astringent in some cases, it is no less extolled in the cholick and other painful disorders of the bowels, attended with obstinate constipation. See Percival's *Essays Med. and Exp.* vol. ii. The doses in these cases are from five to twenty grains, and may be repeated every four, eight, or twelve hours; and, when duly persisted in, proves gently laxative, mitigates the pain, abates flatulence, mends the appetite, and strengthens the organs of digestion. Alum is powerfully tonic, and it is reasonably supposed to contribute to the relief of pain in the intestines, by blunting the morbid sensibility of their nerves. As the mineral acids do, it coagulates the blood and juices. In robust habits, after due bleeding and purging, it cures agues; either of the following usual forms may be given in a morning fasting, until the desired relief is obtained. Dr. Cullen thinks it ought to be employed with other astringents in diarrhœas. In active hæmorrhages it is not useful, though a powerful medicine in those which are passive. It should be given in small doses, and gradually increased.

VOL. I. No. 24.

It has been recommended in the diabetes, but tried without success; though joined with nutmeg it has been more successful in intermittents, given in a large dose an hour, or a little longer, before the approach of the paroxysm. In gargles, in relaxations of the uvula, and other swelling of the mucous membrane of the fauces, divested of acute inflammation, it has been used, and advantageously; also in every state of the cynanche tonsillaris. It is also preferable to white vitriol, or acetated ceruss, in the ophthalmia membranarum, from two to five grains dissolved in an ounce of water. Cullen's *Mat. Med.*

R Nuc. mosch. major. alum. rup. ana gr. 45. f. pulv. in tres partes divid. cujus cap. i. oman. mane jejuno. Vel.

The Roman alum is counterfeited with common alum coloured; but break it, and the counterfeit will be found pale within, while the true is of a deeper red.

ALUM-MINES are said to have been first found in Italy, in the year 1460; and in 1506 king Henry VII. made a monopolising grant of this commodity to Augustine Chigi, a merchant of Sienna. In the year 1608, the manufacture of alum was first invented, and successively practised in England, meeting with great encouragement in Yorkshire, where it was first made, from Lord Sheffield, and other gentlemen of that county. King James I. by advice of his ministry, assumed the monopoly of it to himself, and therefore prohibited the importation of foreign alum; and in 1625 the importation of it was further prohibited by the proclamation of Charles I.

ALUM-WORKS, places where alum is prepared, and manufactured in quantities for sale. They differ from alum-mines, as in the former an artificial alum, and in the latter natural alum, is produced.

ALUMINOUS, *adj.* Relating to alum, or consisting of alum.—The tumour may have other mixture with it, to make it of a vitriolic or aluminous nature. *Wifeman.*

ALUMINOUS WATERS, are those that are impregnated with the particles of that salt; and they make a species of these called mineral or medicinal waters. What gives efficacy to these waters, is said to be an acid aluminous mineral salt, preying on and dissolving a slight mixture of iron, and being mixed with other materials; hence become they deobstruent, and so beneficial to hypochondriac and cachectic patients; and not astringent, or incrassating, as the idea of their being solely impregnated with alum would induce us to conclude.

ALUN'TIUM, or ALONTIUM, anciently a town in the north of Sicily, situated on a steep eminence, at the mouth of the Chydus; said to be as old as the war of Troy. Now in ruins; from which arose the hamlet of St. Philadelphia, in the Val di Demona. The inhabitants were called *Haluntini*.

ALU'TA MONTANA, *f.* This is one of the names of the coriaceous asbestos, or mountain cork. It is easily distinguished by its elasticity and lightness, for it floats a long time on water. Its colour is either white, yellow, brown, green, or black; and its texture resembles those substances from which it has received its names: 100 parts of it contain from 56 to 62 of silex; from 22 to 26 of mild magnesia; from 10 to 12 of mild calcareous earth; from 2 to 2.8 of argil; and about 3 of iron.

ALUTATION, *f.* Tanning of leather.

ALVUS, *f.* in anatomy, a term used for the belly in general, but more frequently applied to the bowels.

ALWA'DII, a sect of Mahometans who believe all great crimes to be unpardonable. The Alwadii stand in opposition to the Morgii. They attribute less efficacy to the true belief in the salvation of men than the rest of the Mussulmans.

ALWAYS, *adv.* [It is sometimes written *alway*, compounded of *all* and *way*; *eallewaga*; Sax. *tuttavia*, Ital.] Perpetually; throughout all time: opposed to *sometime*, or to *never*.—That, which sometime is expedient, doth not *always* to continue. *Hooker.*

Man never is, but *always* to be, blest.

Pope.

Constantly; without variation: opposed to *sometimes*, or to *now and then*.—He is *always* great, when some great occasion is presented to him. *Dryden*.

AL'WYN, [of *alle*, all, and *win*, Sax. a victor, q. d. one who won all at disputing.] An eminent English Saxon, tutor to Charles the Great.

ALY'PUM, *f.* in botany. See GLOBULARIA.

ALYS'MOS, *f.* [*alyce*, from *αλυσω*, to be uneasy or anxious.] Hippocrates uses it to express that uneasiness that is attendant on acute diseases, which makes the patients toss about, so that they cannot rest long in the same posture. *Durctus* distinguishes between the *αλυσμος ανεμετος* and the *αλυσμος ναυτιδης*. The first is caused by an oppression of the vital powers, the latter by sickness in the stomach; but of this alysmos there are reckoned four sorts. It is also called *diaporema*—*aporia*.

The first and second of which are without, the third and fourth with, fever; and thus accounted for: 1. By something uneasy in the stomach; hence an irregular contraction of the heart, a difficult passage of the blood through the lungs; and consequently this anxiety. Uneasiness of the stomach by sympathy, as from a stone in the kidneys, &c. produces this disorder.

2. By vapours or spasms in the stomach, or other viscera of the belly, as in the cholera morbus, hysteria, &c.

3. From a difficulty in the passage of the blood through the lungs, which may be from a spasmodic stricture in the smaller vessels, in which case the blood is thrown by gluts into the larger. In inflammatory fevers, this symptom is attended with a low pulse, oppression in the breast, and difficult breathing.

4. It happens when a stricture of the vena porta prevents a free circulation of the blood in the lower belly. In this case there is great weight and oppression of the hypochondria. This often ends in a polypus; and so, by consequence, death, or a gangrene in the liver; whence a fatal putrid diarrhoea.

ALYSSOIDES, *f.* in botany. See ALYSSUM.

ALYSSON, *f.* in botany. See ALYSSUM, CLYPEOLA, DRABA, MARRUBIUM, MYAGRUM, and VERONICA.

ALYSSUM, *f.* [*αλυσσω*, Gr. to be mad.] In botany, a genus of the tetradynamia filiculosa class, of the natural order of filiquosae. The generic characters are—Calyx: perianthium four-leaved, oblong; leaflets ovate-oblong, obtuse, convergent, deciduous. Corolla: four-petalled, cruciform; petals flat, shorter than the calyx, very spreading; claws the length of the calyx. Stamina: filaments six, the length of the calyx; two opposite a little shorter, marked with a toothlet; antherae from erect, spreading. Pistillum: germ subovate; style simple, the length of the filaments, longer than the germ; stigma obtuse. Pericarpium: a subglobose emarginate silicle, with a style the length of the silicle, two-celled; partitions elliptic, valves elliptic hemispherical. Seeds: fixed to filiform receptacles, issuing forth at the end of the silicle, few orbicular. The petals in some species are emarginate, in others entire. The silicle in some is belying, in others compressed. The essential character consists in the shorter filaments having a toothlet inserted at the base within.

Species. 1. Undershrubs. 1. *Alyssum spinosum*, or thorny madwort: the old racemes thorny, naked. This species has woody branches, which rise about two feet high, and are armed with small spines. The leaves are hoary, lanceolate, and thinly placed on the stalks without any order. The flowers grow in small clusters at the extremities of the branches. It grows naturally in Italy, Spain, and the south of France.

2. *Alyssum halimifolium*, or sweet madwort: stems procumbent, perennial, leaves lance-linear, acute, quite entire. Spreads itself upon the ground, and never rises to any height. At the extremities of its branches it produces very pretty tufts of small white flowers, of which the plant is seldom destitute for six or seven months succe-

sively. It is a native of the southern countries of Europe; and was cultivated in 1722 in Chelsea garden.

3. *Alyssum faxatile*, or yellow madwort: stems shrubby panicled, leaves lanceolate, very soft, repand; petals entire. This is a low plant, with a fleshy stalk, which seldom rises more than one foot high, but divides into many smaller branches, which grow near the ground, so that a single plant will spread to a considerable distance. The flowers are produced in loose panicles at the extremity of every branch, and are of a bright yellow colour. They appear at the end of April, or beginning of May, and, if the season be moderate, will continue three weeks in beauty. This is a small, showy, hardy, plant, and not disposed to over-run others; it is very suitable to embellish rock-work, grows in Candia and Austria, and frequently flowers a second time in autumn.

4. *Alyssum alpestre*, or Italian madwort: stems under-shrubby, diffused, leaves roundish, hoary, calyxes coloured. This species is found on the mountains of Provence, towards Italy; also on Mont Cenis, &c.

II. Herbaceous. 5. *Alyssum hyperboreum*, or northern madwort: leaves hoary, toothed, stamens four-forked. It is found in North America.

6. *Alyssum incanum*, or hoary madwort: stem erect, leaves lanceolate, hoary, quite entire, flowers in corymbs, petals bifid. Grows to the height of two feet, having woody stalks, which divide into several branches toward the top. At the extremity of every shoot the flowers are produced in round bunches; they are small and white. It grows naturally in the south of France, Spain, and Italy, Germany, Austria, Sweden, &c. chiefly on rocky or gravelly soils, and is perennial.

7. *Alyssum minimum*, or least madwort: stems diffused, leaves linear, downy, filicles compressed. An annual plant, and grows wild in Spain.

8. *Alyssum calycinum*, or calycine madwort: stamens all toothed, calyxes permanent. This is also annual, and found wild in Austria, Carniola, France, Germany, and Switzerland.

9. *Alyssum montanum*, or mountain madwort: stems diffused, leaves sub lanceolate, dotted, and echinate. This grows naturally upon rocks in Burgundy and some other parts of France, about Basil, in Germany, Austria, Carniola, &c. and is perennial.

10. *Alyssum campestre*, or field madwort: stamens guarded with a pair of bristles, calyxes deciduous. Is very like the eighth in stem, leaves, and petals, but is more decumbent and has lance-ovate leaves. It is annual, and grows in France, Germany, and Switzerland.

11. *Alyssum clypeatum*, or buckler-podded madwort: stem erect, filicles sessile, oval, compressed-flat, petals pointed, linear. This species grows naturally in Spain and Portugal. Tournefort gathered it on mount Libanus.

III. Silicles inflated, or calyxes oblong, closed. 12. *Alyssum sinuatum*, or sinuate-leaved madwort: stem herbaceous, leaves lance-deltoid, filicles inflated. It is annual or biennial, and grows wild in Spain, by way-sides; also in the islands of the Archipelago, but is hardy enough to live in the open air in England, in a dry soil, and a warm situation.

13. *Alyssum Creticum*, or Cretan madwort: stem shrubby, leaves lanceolate, a little toothed, downy, filicles inflated, globular. The flowers grow in small clusters at the extremities of the branches. It seldom continues longer than two years in England; and, in a warm dry situation, will live in the open air. It is found in Spain and Candia.

14. *Alyssum Gemonense*, or Gemonia madwort: stem herbaceous, branches divaricated, root-leaves obovate, rather downy, filicles inflated. This species was first discovered by Pietro Arduini, in September 1759, on the mountain della Fontana, near Gemonia, in the district of Forlì, in Italy, in the clefts of rocks. It flowers in May and June.

15. *Alyssum utriculatum*, or bottle madwort: stem herbaceous,

baceous, erect, leaves smooth, lanceolate, quite entire, filicles inflated. This was found by Tournefort in the Levant: it also grows in the vineyards of Savoy. It is a hardy and beautiful perennial, flowering from April to June, at which time it begins to form its curiously-inflated pods. Like the seventeenth, it is well adapted to the decorating of walls or rock-work. Cultivated in 1739 by Mr. Miller.

16. *Alyssum vesicaria*, or bladder madwort: leaves linear toothed, filicles inflated, angular, acute. 17. *Alyssum deltoideum*, or deltoid-leaved madwort: stems undershrubby, prostrate, leaves lance-deltoid, filicles shaggy. Both these were found by Tournefort in the Levant.

Propagation and Culture. All the species may be propagated by seed, and most of them by slips and cuttings. The seeds should be sown in a border of light earth in April. Cuttings or slips should be planted in April or May; shaded in the heat of the day, and gently refreshed with water. In rich ground they seldom live through the winter in England; but in a dry, poor, rubbishy, soil, or on old walls, they will abide the cold, and last much longer. See *CARDAMINE*, *CLYPEOLA*, *DRABA*, *MYAGRUM*, *PELTARIA*, *STACHYS*, *SUBULARIA*, *SISYMBRIUM*.

ALYTAR'CA, *f.* [*αλυτάρχη*, Gr.] A priest of Antioch, in Syria, who, in the games instituted in honour of the gods, presided over the officers who carried rods to clear away the crowd and keep order. In the Olympic games, the alytarches had the same command, and obliged every person to preserve order and decency.

ALYXA'THOE, a nymph, and mother of Æscus by Priam, by whom she was greatly beloved.

ALZY'RA, or *ALCYRA*, a city of Valencia, in Spain, which carries on a considerable trade in silk. It is seated on the river Xacar, seventeen miles from the town of Valencia. Lat. 39.6. N. lon. 0.10. E.

AM. The first person of the verb *To be*.—And God said unto Moses, *I am* that *I am*: and he said, Thus shalt thou say unto the children of Israel, *I am* hath sent me unto you. *Exodus*, iii. 14.

Come then, my soul: I call thee by that name, Thou busy thing, from whence I know *I am*: For, knowing that *I am*, I know thou art; Since that must needs exist, which can impart. *Prior*.

A'MA, *f.* in ecclesiastical writers, denotes a vessel wherein wine, water, or the like, were held, for the service of the eucharist. In this sense the word is also written *amula*; sometimes also *hama*, and *hamula*. *AMA* is sometimes also used for a wine-measure, as a cask, pipe, or the like.

AMAA'SA, *f.* Such pieces of glass as are used in enamelling.

AMABILITY, *f.* [*amabilità*, It. *amabilitas*, Lat. of *amo*, to love.] Loveliness; the power of pleasing.—No rules can make *amability*, our minds and apprehensions make that; and so is our felicity. *Taylor*.

AMABY'R, *f.* a barbarous custom which formerly prevailed in several parts of England and Wales, being a sum of money paid to the lord when a maid was married within his lordship. The word is old British, and signifies "the price of virginity."

AMADABAT', [a corruption from *Ahmed abad*, or Ahmed's city, so called from a king of that name.] A large and populous city of Hindostan, and the capital of the province of Guzerat. It is situated in E. lon. 72. 10. N. lat. 23. 22. Amadabat was formerly called Guzerat; and by Shah Jehân nicknamed *Gherd-abâd*, or the "habitation of dust," because it was much incommoded therewith. It was the seat of the Guzerat kings, as it is now of the Mogul governor. The city stands in a beautiful plain; and is watered by the river Sabremetti. The walls are built with stone and brick, flanked at certain distances with great round towers and battlements. It has twelve gates; and, including the suburbs, is about four miles and a half long. The streets are wide. The *mejdân shâh*, or king's square, is 700 paces long, and 400 broad; planted

round with trees. On the west side is the castle, well walled with free-stone. The caravanfera is on the south of the square, and its chief ornament. Near the meydân also is the king's palace, whose apartments are richly ornamented: and in the midst of the city is the English factory, where they purchase fine chintz, calicoes, and other Indian merchandize. The place is so full of gardens stored with fruit-trees, that from an eminence it looks like a wood. The Hindoos have here an hospital for sick beasts, and another for sick birds, which they take great care of. According to some late accounts, this city is little inferior to the best in Europe, and is thought to yield ten times as much revenue as Surat.

AMADAN', or *HAMADAN*, a town of Persia, between Taurus and Ispahan; lat. 35. 15. N. lon. 47. 4. E. It is seated at the foot of a mountain, where there are a great many springs which water the adjacent country. The houses are built of brick hardened in the sun, and have but a very indifferent aspect. There is but one tolerable street, and that is where stuffs, garments, and the like, are exposed to sale: it is strait, long, and wide; and the shops are very well furnished. The adjacent parts are fruitful in corn and rice, inasmuch that the neighbouring provinces are supplied from hence. It is said to enjoy a very salubrious air; but the cold in winter is intense. The Armenians have a church in this town; and the Jews have a synagogue near a tomb where they pretend Esther and Mordecai lie interred: to this place they come in pilgrimage from several parts of the Levant. About a league from Amadan there is a mountain, called Nalbana, which abounds with all sorts of curious herbs: in the spring, people flock to this mountain from all parts to recover their health by inhaling the salutary effluvia of these aromatic plants. Amadan is a very ancient city: it is said to have been destroyed by Nebuchadnezzar, and rebuilt by Darius, who brought hither all his riches. The kings of Persia frequently retired to this place on account of its delightful situation; for which reason it obtained the name of the Royal City. It was conquered by the khalif Othman, and narrowly escaped being destroyed by Jenghiz Khan in 1220. It had then strong walls and a good castle, which are now in ruins. Its present beauty consists in its gardens and springs.

AMADANA'GER, a town in the hither peninsula of India, in the province of Decan; lat. 18. 10. N. lon. 74. 15. E. It was taken by the Moguls in 1593, after a siege of six months: it was at that time defended by a strong castle seated on an eminence, and surrounded with deep ditches into which several springs discharged their waters.

AMA'DIA, a trading town of Asia, in Curdistan, belonging to the Turks; seated on a high mountain. Lat. 36. 25. N. lon. 43. 1. E.

AMADOW', *f.* a kind of black match, tinder, or touch-wood, which comes from Germany. It is made of a sort of large mushrooms, or spongy excrescences, which commonly grow on old trees. This substance, being boiled in common water, and afterwards dried and well beaten, is then put into a strong ley prepared with saltpetre, after which it is again put to dry in an oven. The druggists sell this match wholesale in France, and several hawkers retail it. Some give to the amadow the name of *pyrotechnical sponge*, because of its aptness to take fire.

AMADOW'RY, *f.* A kind of cotton which comes from Alexandria by the way of Marseilles.

AMA'IN, *adv.* [from *a* and *mazen*, Sax. might, or *à-main*, Fr.] With vehemence; with vigour; fiercely; violently. It is used of any action performed with precipitation, whether of fear or courage, or of any violent effort:

From hence the boar was rous'd, and sprung *amain*,
Like light'ning sudden, on the warrior train;
Beats down the trees before him, shakes the ground;
The forest echoes to the crackling sound,
Shout the fierce youth, and clamours ring around. *Dryden*.

AMAIN, in the sea-language, a term importing to lower something at once. Thus, *to strike amain*, is to lower or let fall the top-sails; *to wave amain*, is to make a signal, by waving a drawn sword, or the like, as a demand that the enemy strike their top-sails.

AMAK', a small island in the Baltic sea, near Copenhagen, from which it is separated by a canal, over which there is a draw-bridge. Amak is about four miles long and two broad; and is chiefly peopled by the descendants of a colony from East Friesland, to whom the island was assigned by Christian II. at the request of his wife Elizabeth, sister of Charles V. for the purpose of supplying her with vegetables, cheese, and butter. From the intermarriages of these colonies with the Danes, the present inhabitants are chiefly descended; but, as they wear their own dress, and enjoy peculiar privileges, they appear a distinct race from the natives. The island contains about six villages, and between 3000 and 4000 souls. It has two churches, in which the ministers preach occasionally in Dutch and Danish. The inhabitants have their own inferior tribunals; but in capital offences are amenable to the king's court of justice at Copenhagen. The island is laid out in gardens and pastures; and still, according to the original design, supplies Copenhagen with milk, butter, and vegetables. Lat. 55. 20. N. lon. 12. 10. E.

AMAL', a town of Sweden, in the province of Daland, seated on the river Wefer. It has a good harbour, and carries on a great trade, especially in timber, deals, and tar. Lat. 58. 50. N. lon. 12. 40. E.

AMALA'GO, *f.* in botany. See PIPER.

AMALASEN'TA, daughter of Theodoric king of the Ostrogoths, and mother of Athalaric, whom she caused to be educated after the manner of the Romans, which gave great offence to the Goths. This woman, who was qualified to have reigned over a polished people, had every quality necessary to form a great princess. Possessed of genius and courage, she maintained her country in peace, caused the arts and sciences to flourish, and drew learned men about her, and preserved the Romans from the barbarity of the Goths. She was acquainted with the languages of the various nations who gained possession of the empire, and treated with them without an interpreter. After the death of her son, in 534, she placed her cousin Theodatus on the throne, who had the barbarity to cause her to be strangled in a bath, under pretence of adultery. It is said that Theodatus put her to death at the instigation of the empress Theodora, who was stung with jealousy, on account of the attachment Justinian had for her. That emperor, being informed of this cruel perfidy, declared war against the murderer, and chastised him by his general, the great Belisarius.

AM'ALEK, [אַמֶּלֶק, Heb. i. e. is a licking or suckling people, of אָמ, a people, and לָקַק, licking as a dog with his tongue.] The son of Eliphaz, by Timna his concubine, and the grandson of Esau. Gen. xxxvi. 12. and 1 Chr. i. 36. Amalek succeeded Gatam in the government of Edom. He was the father of the Amalekites; a powerful people who dwelt in Arabia Petraea, between the Dead Sea and the Red Sea, or between Havila and Shur. 1 Sam. xv. 7. It does not appear that they had cities; for there is no mention of any but one in the Scriptures; they lived generally in hamlets, caves, or tents.

The Israelites had scarcely passed the Red Sea on their way to the wilderness, before the Amalekites came to attack them in the deserts of Rephidim, Ex. xvii. 8, &c. and put those cruelly to the sword who were obliged, either through fatigue or weakness, to remain behind. Moses, by divine command, directed Joshua to fall upon this people; to record the act of inhumanity which they had committed in a book, in order to have it always before his eyes; and to revenge it in the most remarkable manner. Joshua therefore fell upon the Amalekites and defeated them while Moses was upon the mountain, with Aaron and Hur in company. Moses, during the time of the engagement, held up his hands, to which the success of the

battle was owing; for, as often as he let them down, Amalek prevailed. But, Moses's hands being tired, Aaron and Hur supported his arms, and held them extended, while the battle lasted, which was from morning till the approach of night, when the Amalekites were cut in pieces. This happened in the year of the world 2513, before Christ 1491.

The ground of the enmity of the Amalekites against the Israelites is generally supposed to have been an innate hatred from the remembrance of Jacob's depriving their progenitor both of his birth-right and blessing. Their falling upon them, however, and that without any provocation, when they saw them reduced to so low a condition by the fatigue of their march, and the excessive drought they laboured under, was an inhuman action, and justly deserved the defeat which Joshua gave them. Under the Judges, v. 3. we see the Amalekites united with the Midianites and Moabites, in a design to oppress Israel; but Elrud delivered the Israelites from Eglon king of the Moabites, Judges iii. and Gideon, chap. viii. delivered them from the Midianites and Amalekites. About the year of the world 2930, Saul marched against the Amalekites, advanced as far as their capital, and put all the people of the country to the sword; but spared the best of all the cattle and moveables, contrary to a divine command; which act of disobedience was the cause of Saul's future misfortunes.

After this war, the Amalekites scarcely appear any more in history. However, about the year of the world 2949, a troop of Amalekites came and pillaged Ziklag, which belonged to David, 1 Sam. xxx. where he had left his two wives, Ahinoam and Abigail; but he, returning from an expedition which he had made in the company of Achish into the valley of Jezreel, pursued them, overtook and dispersed them, and recovered all the booty which they had carried off from Ziklag.

The Arabians maintain Amalek to have been the son of Ham, and grandson of Noah; that he was the father of Ad, and grandfather of Schedad. Calmet think that this opinion is by no means to be rejected; as it is not very probable that Amalek, the son of Eliphaz, and grandson of Esau, should be the father of a people so powerful and numerous as the Amalekites were when the Israelites departed out of Egypt. Moses, Gen. xiv. 7. relates, that in Abraham's time, long before the birth of Amalek the son of Eliphaz, the five confederate kings carried the war into Amalek's country, about Kadesh; and into that of the Amorites, about Hazezontamar. Moses also relates, Numb. xxiv. 20. that the diviner Balaam, observing at a distance the land of Amalek, said, in his prophetic style, "Amalek is the first, the head, the original of the nations; but his latter end shall be, that he perish for ever." Calmet observes, that this epithet of the first of nations cannot certainly agree with the Amalekites descended from the son of Eliphaz, because the generation then living was but the third from Amalek. Besides, Moses never reproaches the Amalekites with attacking their brethren the Israelites; an aggravating circumstance, which he would not have omitted were the Amalekites descended from Esau; in which case they had been the brethren of the Israelites. Lastly, we see the Amalekites almost always joined in the Scripture with the Canaanites and Philistines, and never with the Edomites; and when Saul made war upon the Amalekites, and almost utterly destroyed them, we do not find that the Edomites made the least motion towards their assistance, nor to revenge them afterwards. Thence it is thought probable, that the Amalekites who are so often mentioned in Scripture were a free people, descended from Canaan, and devoted to the curse as well as the other Amorites, and very different from the descendants of Amalek, the grandson of Esau.

AMAL'FI, an ancient city of Italy, situated in lat. 40. 35. N. lon. 15. 20. E. It is said to have derived its origin from a number of Roman families, who, about the middle of the fourth century, had left Rome, and embarked

barked for Constantinople; but, meeting with orms on their passage, were cast away on the shores of Salerno, and deprived of the means of pursuing their voyage. In this state of perplexity they long remained; but at last came to the resolution of settling on the present site of Amalfi, where they expected to enjoy security, and sufficient plenty of the necessaries of life. The earliest notice of them in this settlement dates no higher than the latter end of the sixth century. Impervious mountains and inaccessible coasts preserved their infant state from the first fury of the Lombards, who seldom attempted the conquest of a maritime people.

In the year 825, when this little republic had attained a degree of wealth and reputation sufficient to excite the ambition of its neighbours, Sico, prince of Salerno, marched a body of troops by night, surprised Amalfi, and, carrying off the greatest part of the inhabitants, compelled them to fix at Salerno, which had lately suffered a great loss of people by an epidemical disorder. But, before the fourth year of their captivity was expired, the Amalfitans took advantage of the absence of the Salernitan chiefs, who were then carrying on a war with the Beneventans; armed themselves; and, after burning and plundering Salerno, marched in triumph back to their own country. Here they framed a better system of government, and reformed many abuses in their former legislation; adopting various measures that were likely to promote internal concord, and defeat the evil intentions of foreign enemies. Their first plan was to vest the supreme authority in a temporary præfect; but the experience of a few years caused them to prefer lodging that power in the hands of a duke elected for the term of his natural life. Under these governors Amalfi attained the summit of her military and commercial glory. It extended its territory, which reached eastward from Vico Vecchio, and westward to the promontory of Minerva, including likewise the island of Caprea, and the two islands of the Galli. Towards the north, it comprehended the cities of Lettere, Gragnans, Pimontio, and Capule di Franchi; towards the south, those of Scala, Ravelli, Minori, Majuri, Atrani, Tramonti, Agerula, Citara, Prajano, and Rosilano.

Leo IV. found the Amalfitans an useful ally in his wars with the infidels, and honoured the commonwealth with the title of *Defender of the Faith*. The Neapolitans, with whom, as Greek vassals, they were united in strict bonds of friendship, experienced many signal favours at their hands; and the Mussulmen themselves found it expedient to court their alliance, and to enter into treaty with them. Their situation had from the beginning given them a turn to commerce, and their attention to naval affairs so much consequence in the eyes of their protector, the emperor of Constantinople, that by his orders a court was established at Amalfi, for the decision of all controversies arising in maritime transactions. Its code and reports became the general rule in those cases throughout this part of Europe; its precedents and decrees were allowed to be good authority to found judgment upon even in foreign tribunals. To crown the mercantile and naval glory of the republic, it was reserved to the lot of an Amalfitan to make, or at least to perfect, the most important discovery ever made for the improvement of navigation. Pasitano, a village which stands on the shore a few miles west of Amalfi, boasts of having given birth to Flavio Gioia, the inventor of the mariner's compass.

The merchants of this town engrossed the trade of the Levant, and transacted the commercial business of the world in a lucrative and exclusive manner. The Pisans, Venetians, and Genoese, rose upon their ruin; and, after monopolizing the emoluments of trade for some ages, made way for the more comprehensive and daring spirit of the present maritime powers.

At present Amalfi is subject to Naples, and is the see of an archbishop. It is but a shadow of what it was in its original state, when it extended over the stupendous rocks that hang on each side, still crowned with battlemented

walls and ruined towers. Its buildings, Mr. Swinburne says, are not remarkable for elegance or size; and contain at most 4000 inhabitants, who seem to be in a poor line of life. The cathedral is an uncouth building. Under the choir is the chapel and tomb of the apostle St. Andrew; in whose honour the edifice was dedicated, when cardinal Capuano, in 1208, brought his body from Constantinople.

AMALGAM, or **AMALGAMA**, *f.* [αμα and γαμειν.] This name is applied to the combinations or mixtures of mercury with other metallic substances. As mercury is so exceedingly fusible as to be always in the fluid state in climates of a moderate temperature, it unites with many of the metals without any greater heat than that which it usually possesses. For this purpose, therefore, nothing more is necessary than to triturate thin leaves, or plates, or filings of the metallic substance with mercury. In other instances, where the disposition to combine is less powerful, it is found necessary either to fuse or ignite the metal intended to be amalgamated. When a small quantity of mercury is combined with any metal, it renders it brittle, or rather friable; a greater quantity of mercury produces a kind of imperfect fluidity resembling that of butter. This is commonly called the consistence of an amalgam. A still greater quantity of mercury renders the mass more fluid, but not uniformly so; for a portion of the amalgam either floats at the top, or sinks to the bottom, instead of intimately combining with the whole of the mercury. This fact is of the same kind as that wherein salts are soluble in water in limited quantities, beyond which they cease to be taken up. Mercury very readily combines with gold, silver, lead, tin, bismuth, and zinc. In making an amalgam of gold or silver, the clippings of the leaves from the gold-beaters may be used, or thin plates of the metals may be ignited, and plunged in mercury previously heated, so as to smoke. When the quantity of mercury is so large as to be fluid when cold, the superfluous mercury may be strained off by pressure through a leathern bag. The remaining amalgam of gold contains about one-third of its weight of mercury, but is perfectly white. The amalgam of silver sinks in mercury, and consequently is heavier than either mercury or silver.

Mercury unites with difficulty into an amalgam with copper and arsenic; and scarcely at all with platina, or with iron. This latter metal, however, does not absolutely refuse to combine with mercury, for it adheres to and coats the end of iron pestles used for the trituration of amalgams: and Dr. Lewis has observed, that a plate of tough iron is rendered brittle by keeping it immersed in mercury for some days; a fact which has been experienced in another way by Mr. de Luc, who found that springs immersed under mercury, in the construction of a barometer, were rendered brittle and useless by its action. Iron ignited to a white heat, and thrown into a large mass of mercury, becomes completely covered with a ferruginous bright amalgam. Regulus of antimony unites with mercury, though with great difficulty. Nickel and cobalt are said not to unite with mercury; and its action on manganese, wolfram, and molybdena, is not known.

Amalgams are applied to a considerable number of useful purposes. The amalgam of gold is used in the process called water-gilding, in which the mercury first serves as the medium of adhesion between the gold and copper, and is afterwards driven off by heat. See **GILDING**. Looking-glasses are silvered by an amalgam of tin. See **SILVERING**. The amalgam of zinc, triturated with talow, is found to assist the excitation or production of electricity, by the friction of a cushion against glass, in a wonderful degree; inasmuch that the quantity of electricity is twenty or thirty times as great as without it. When mercury is contaminated with any imperfect metal, it is found that by agitation, in contact with vital air, or the air of the atmosphere, the imperfect metal becomes converted into a black powdery calx, which separates from the mercury.

TO AMALGAMATE, *v. a.* To unite metals with quicksilver.

AMALGAMATION, *f.* The act or practice of amalgamating metals. For the new process, see **ORE**.

AMALTHÆA, the name of the Cumæan Sibyl, who offered to Tarquinius Superbus nine books, containing the Roman destinies, and demanded 300 pieces of gold for them. He derided her; whereupon she threw three of them into the fire; and, returning, asked the same price for the other six; which being denied, she burnt three more; and returned, still demanding the same price. Upon which Tarquin, consulting the pontiffs, was advised to buy them. These books were in such esteem, that two magistrates were created to consult them upon extraordinary occasions.

AMALTHÆA, in pagan mythology, the daughter of Melissus, king of Crete, and the nurse of Jupiter, whom she fed with goat's milk and honey. According to others, Amalthæa was a goat, which Jupiter translated into the sky, with her two kids, and gave one of her horns to the daughters of Melissus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furnishing them with whatever they wished for; and was thence called the *cornucopia*, or horn of plenty.

AMALTHÆUS (Jerôme, John Baptista, and Cornelle), three celebrated Latin poets of Italy, who flourished in the sixteenth century. Their compositions were printed at Amsterdam in 1685. One of the prettiest pieces in that collection is an epigram on two children, whose beauty was very extraordinary, though each of them was deprived of an eye:

‘Lumine Acon dextro, capta est Leonilla sinistro:

‘Et poterat forma vincere uterque Deos.

‘Parve puer, lumen quod habes concede forori;

‘Sic tu cæcus Amor, sic erit illa Venus.’

AMA'MA (Sixtinus), professor of the Hebrew tongue in the university of Franeker, a man of great learning, was born in Friesland, and studied under Drusus. He published a criticism upon the translation of the Pentateuch; collated the Dutch translation of the Bible with the original; and wrote a censure of the Vulgate translation of the historical books of the Old Testament, Job, the Psalms, and Canticles. It is impossible to answer the reasons whereby he shows the necessity of consulting the originals. This he recommended so earnestly, that some synods, being influenced by his reasons, decreed, that none should be admitted into the ministry but such as had a competent knowledge of the Hebrew and Greek text of the Scripture. He died in 1629.

AMA'NA, a mountain of Cilicia, and one of the Bahama islands.

AMA'NCE, a town in the duchy of Lorraine, upon a rivulet of the same name. Lat. 48. 45. N. lon. 6. 10. E.

AMA'ND (Mark-Anthony-Gerard, sieur de St.), a French poet, was born at Roan, in Normandy, in 1594. In the epistle-dedictory to the third part of his works, he tells us, that his father commanded a squadron of ships in the service of Elizabeth queen of England for twenty-two years, and that he was for three years prisoner in the Black Tower at Constantinople. He mentions also, that two brothers of his had been killed in an engagement against the Turks. His own life was spent in a continual succession of travels, which was of no advantage to his fortune. There are miscellaneous poems of this author, the greater part of which are of the comic or burlesque, and the amorous, kind. In 1650, he published “*Stances sur la grosseffe de la reine de Pologne et de Suede*.” In 1653, he printed his “*Moïse sauvé, idyle heroïque*.” This poem had at first many admirers: Monsr. Chapelain called it a *speaking picture*; but it has since fallen into contempt. Amand was admitted a member of the French academy, when it was first founded by cardinal Richelieu, in the year 1633: and Mr. Pelisson informs us, that in 1637, at his own desire, he was excused from the obligation of making a speech in his turn, on condition that he would compile the comic part of the dictionary which the aca-

demy had undertaken, and collect the burlesque terms. This was a task well suited to him; for it appears by his writings, that he was extremely conversant in these terms, of which he seems to have made a complete collection from the markets, and other places where the lower people resort. He died in 1661, being sixty-seven years of age.

AMAND (St.), a town of France, in the department of Cher, and late territory of Bourbonnois. It is situated on the river Cher, twenty miles south of Bourges. Lat. 46. 32. N. lon. 3. 30. E.

AMAND (St.), a town of France, in the department of the North, and in the late French Flanders. It is seated on the river Scarpe, seven miles north of Valenciennes. Lat. 50. 27. N. lon. 2. 35. E.

AMANDA'TION, *f.* [from *amando*, Lat.] The act of sending on a message or employment.

AMAN'DOLA, *f.* is a green marble, having the appearance of a honey-comb, and containing white spots: one hundred parts of it contain seventy-six of mild calcareous earth; twenty of shistus; two of iron, partly calcined. The cellular appearance proceeds from the shistus. *Kirwan*.

AMANICÆ PYLÆ, (Ptolemy;) **AMANIDES PYLÆ**, (Strabo;) **AMANI PORTÆ**, (Pliny;) straits or defiles in mount Amanus, through which Darius entered Cilicia; at a greater distance from the sea than the Pylæ Ciliciæ, or Syria, through which Alexander passed.

AMAN'NIA, *f.* in botany. See **AMMANNIA** and **PEPLIS**.

AMANTE'A, a sea-port town and bishop's see of the kingdom of Naples, situated near the bay of Euphemia, in the province of Calabria, in lat. 39. 15. N. lon. 16. 20. E.

AMANUE'NSIS, *f.* [Lat.] A person who writes what another dictates.

AMA'NUS, or **OMANUS**, a god of the ancient Persians, supposed to be the sun, or the everlasting fire which they worshipped.

AMANUS, a mountain of Syria, separating it from Cilicia; a branch of mount Taurus, extending chiefly eastward, from the sea of Cilicia to the Euphrates; now called *Monte Negro*, or rather *Montagna Neres*, by the inhabitants; that is, the watery mountain, as abounding in springs and rivulets.

AMAPAL'LA, a city and port-town of North America, in the province of Guatimala, seated on the gulph of the same name, in the Pacific ocean. Lat. 12. 30. N. lon. 63. 20. W.

AMARA'CUS, *f.* in botany. See **ORIGANUM**.

AMARA INDICA, *f.* in botany. See **MOMORDICA**.

AMARANTE, *f.* An order of knighthood, instituted in Sweden by queen Christina, in 1653, at an annual feast, celebrated in that country, called *Wirtschafft*. This feast was solemnized with entertainments, balls, masquerades, and the like diversions, and continued from evening till the next morning. That princess, thinking the name too vulgar, changed it into that of *the feast of the gods*, in regard each person here represented some deity, as it fell to his lot. The queen assumed the name of *Amarante*; that is, unfading, or immortal. The young nobility, dressed in the habit of nymphs and shepherds, served the gods at the table. At the end of the feast, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the masques; and, in memory of so gallant a feast, founded a military order, called in Sweden *Ceschsiffschafft*, into which all that had been present at the feast were admitted, including sixteen lords, and as many ladies, besides the queen. Their device was the cypher of *Amarante*, composed of two A's, the one erect, the other inverted, and interwoven together; the whole inclosed by a laurel crown, with this motto, *Dolce nella memoria*. Bullstrode Whitlock, the English ambassador from Cromwell to the court of Sweden, was made a knight of the order of *Amarante*, on which account it seems to be, that we sometimes find him styled *Sir Bullstrode Whitlock*.

AMARANTE, a town of Entre-Douro-e-Minho, Portugal. Here is a linen manufactory of considerable extent.

A'MARANTE,

AMARANTH, J. [from α , priv. and $\mu\alpha\rho\alpha\nu\alpha$, to fall or wither: because the flower being cropped does not soon wither.] In botany, a genus of the monœcia pentandria class. The generic characters are—I. Male flowers on the same plants with the females. Calyx: perianthium five or three-leaved, upright, coloured, permanent; leaflets lanceolate, acute. Corolla: none, unless you take the calyx for such. Stamina: filaments five or three capillary, from upright patulous, the length of the calyx. Antheræ oblong, versatile. II. Female flowers in the same raceme with the males. Calyx: perianthium as in the male. Pistillum: germ ovate; styles three, short, subulate. Stigmas simple permanent. Pericarpium: capsule ovate, somewhat compressed, as is the calyx on which it is placed, coloured and of the same size, three-beaked, one-celled, cut open transversely. Seed: single, globular, compressed, large.—*Essential Character.* Male. Calyx: three or five leaved. Corolla: none. Stamina: three or five. Female. Calyx: three or five leaved. Corolla: none. Styles, three. Capsule one-celled, opening horizontally. Seed, one.

The amarantus are annual, herbaceous plants. The leaves simple, alternate, ending in a little bristle. Stipules none. Flowers loosely disposed either in glomerules or in spikes. Almost all the species are natives of America, especially North America; some however are found in the tropical countries of Asia and Africa, and two only in Europe. The old English names of the few sorts formerly known, were flower-gentle, florumour, and velvet-flower, or flower-velure; but all these have given place to amaranth. Most of the species are used as culinary plants in hot countries; and the seeds of several have been sent to England, with advice to cultivate them for the same purpose here. Where esculent plants are scarce, these may be esteemed; but spinach being cultivated with us with greater ease, and being also much preferable, these are not worthy of being propagated as cuculents.

Species. I. With three stamens. 1. *Amaranthus græcizans*, or pellitory-leaved amaranth: glomerules axillary; leaves lanceolate repand obtuse. Native of North America. It flowers from July to September.

2. *Amaranthus albus*, or white amaranth: glomerules axillary; leaves roundish-ovate emarginate, stem four-cornered simple. This species is nearly related to the first, from which however it may be distinguished by its stem, and by the petioles of the leaves which are not so stout as in the other. Native of Pennsylvania, on the coast, from whence it has migrated into Italy. It flowers in July and August.

3. *Amaranthus deflexus*: spike very short with few flowers, leaves rhomb-lanceolate, capsules not gaping. It is distinguished from the rest, by the capsule not opening transversely, but being entire. Native place unknown.

4. *Amaranthus polygonoides*, or spotted-leaved amaranth: glomerules three-leaved; female flowers funnel-shaped; leaves rhomb-ovate emarginate. This species varies in different situations. In a hot-bed the stems were a foot high, and the whole plant was green except the calyxes. In the open air the stem was red, the length of the middle finger, almost upright; and the leaves were much smaller. It differs from the other species, particularly from the second, which it most resembles, in having the stem round, and the calyx of the female flowers one-leaved and funnel-shaped. Found wild by way-sides and among rubbish in the tropical countries of Asia, Africa, and America; as in Jamaica, Guiana, Senegal, Guinea, Ceylon, &c. It flowers in August.

5. *Amaranthus polygamus*, or hermaphrodite amaranth: glomerules two-stamened, subspiked, ovate; flowers hermaphrodite and female; leaves lanceolate. A native of Guiana, China, Cochin, and Amboina. The inhabitants eat the leaves and stalks of this sort, boiled, with oil and pepper, and prefer it to any of the others. It was introduced among us in 1780, by Sir Joseph Banks, baronet; and flowers in July and August.

6. *Amaranthus mangostanus*: glomerules subspiked, axillary, solitary; leaves rhomb-roundish. Native of the East Indies.

7. *Amaranthus inamæus*: glomerules subspiked, three-leaved, axillary, geminate, leaves rhomb-lanceolate. This resembles the foregoing species very much; but differs in having a three-leaved calyx; the glomerules axillary and in pairs; the spike terminating, erect, and more slender; the leaves rhomb-lanceolate; and the petiole shorter than the leaves. It is supposed to be a native of Japan.

8. *Amaranthus melancholicus*, or two-coloured amaranth: glomerules axillary peduncled roundish, leaves ovate-lanceolate coloured. This species varies in the colour of the leaves. In the open air, they are of a dirty purple on their upper surface, and the younger ones are green; in a stove the whole plant is of a fine purple colour. It is however easily distinguished in all states by its colour, its leaves, and the lateness of its flowering, after all the others are past.

9. *Amaranthus gangeticus*, or oval-spiked amaranth: glomerules in very short spikes, ovate; leaves ovate-lanceolate, emarginate. It varies with leaves entirely green. Perhaps it may be a variety of the foregoing species; but it differs from it, in having a terminating spike; axillary, sessile glomerules; leaves not so much waved or wrinkled; and also in its colour. Native of Bengal, and the Society Isles. It flowers from July to September.

10. *Amaranthus oleraceus*, or eatable amaranth: glomerules axillary branching, leaves wrinkled oblong very obtuse emarginate. Native of Guiana, the East Indies, and Egypt. It is not entitled to a place in gardens on account of its beauty. This and the next sort are esteemed in some parts of India as esculent herbs; they gather them when young, and dress them as we do spinach; but, being much inferior to it, they are seldom used where spinach will thrive. It flowers in July.

11. *Amaranthus viridis*, or green amaranth: glomerules axillary geminate, male flowers trifid, leaves ovate emarginate, stem erect. This sort is distinct from all the rest, in having the bractes not surrounding the flowers, but scattered along the rachis of the glomerule. Native of Jamaica and Brasil. It flowers in August and September.

12. *Amaranthus tricolor*, or three-coloured amaranth: glomerules sessile roundish stem-clasping, leaves lanceolate-ovate coloured. It varies in the colour of the leaves, which are less painted in the open air than in the stove. It was in Gerard's garden, in 1596, and flowers from June to September. It has been long cultivated for the beauty of its variegated leaves, in which the colours are elegantly mixed. When the plants are in full vigour, these are large, and closely set from the bottom to the top of the stalks; the branches also form a sort of pyramid: so that there is not a more handsome plant than this, when it is in full lustre. Native of Guiana, Persia, Ceylon, China, Japan, the Society Isles, &c.

13. *Amaranthus lividus*, or livid amaranth: glomerules subspiked rounded, leaves elliptic retuse, stem upright. Native of Virginia and Guiana. It flowers from July to September.

14. *Amaranthus tristis*, or round-headed amaranth: glomerules in loose spikes, leaves subcordate-ovate emarginate, shorter than the petioles. Native of China, Cochin, Amboina, and Brasil. The young plants of this sort are much used, as we do spinach, in these countries. Linneus says, that the leaves have a livid spot underneath, but this is not always observable. The colour of the leaves, although it be remarkable in this genus, is yet changed by culture. It flowers from June to August.

15. *Amaranthus blitum*, or least amaranth or blite: glomerules subspiked, flowers three-leaved, leaves ovate retuse, stem diffusid. Native of all Europe, except the very cold parts, Japan, &c. in cultivated grounds, on dunghills, banks, among rubbish, &c.

16. *Amaranthus scandens*, or climbing amaranth: spikes interrupted

interrupted compound, spikelets bent in, leaves ovate, stem weak. It resembles the foregoing species. Native of America.

II. With five stamens. 17. *Amaranthus hystericus*: flowers in simple spikes, axillary, glomerate; leaves ovate, acute. It is doubtful whether this be a distinct sort, or merely hybridous; as perhaps several others are. It is the connecting link, in point of outward form, between the three-stamened and five-stamened amaranths. It varies much; for from the same seed arise individuals wholly green, red, and rufous liver-coloured; with spikes both green and red, sometimes very thin and slender, sometimes condensed, blunt, and thick, sometimes again long and interrupted: their stature however is always low, and the spike simple. The native place is not known.

18. *Amaranthus hybridus*, or clustered amaranth: racemes decompound, heaped, erect; leaves ovate-lanceolate. It is found wild in Virginia and Arabia Felix. It flowers from June to September.

19. *Amaranthus strictus*: racemes compound, erect, strict; leaves ovate, concave. It differs from all the five-stamened species, in its upright racemes pressed close to the stalk; and the stiffness of the whole habit. Its native place of growth is unknown.

20. *Amaranthus latus*: racemes compound, erect; leaves ovate, obtuse, mucronate. It varies with a reddish stalk and leaves. The edge of the leaves has almost always a tendency to red, but the other parts are green.

21. *Amaranthus cruentus*, or various-leaved amaranth: racemes decompound, naked, patulous; leaves lanceolate-ovate. As first cultivated in England in 1728, the stem was wholly red and smooth; the petioles, ribs, and nerves of the leaves underneath, purple; the spikes purple, much spreading, and a little nodding. They were very beautiful, and made a gay appearance for the first two years; but afterwards the seeds degenerated, and the plants had little beauty; which is the same with some others of this genus. It is a native of the East Indies and of China; and flowers from June to August.

22. *Amaranthus hypochoeriacus*, or prince's-feather amaranth: racemes compound, crowded, erect; leaves oblong-lanceolate, mucronate. It is a native of Virginia, and flowers from July to September. Mr. Miller cultivated it in 1739: but it is now become a common weed, frequently growing upon dung-hills: the plants abound with seeds, so that, where they are permitted to scatter, they will come up abundantly the following summer; and will remain in the ground several years.

23. *Amaranthus sanguineus*, or spreading or bloody amaranth: racemes compound, erect; branches spreading, smooth; leaves oblong, acute. The seeds of this species were sent to Mr. Miller from the Bahama islands before 1735, as an esculent plant, bearing fine flowers. He describes it as growing three feet high, with purple stalks and leaves; the spikes short and swelling out in the middle, frequently produced from the axils; but at the extremity of the stalk arises a large cluster of spikes placed crosswise, with one upright stalk in the middle: these are of a bright purple colour at first, but afterwards become darker, as the seeds ripen. It flowers from the middle of June to September.

24. *Amaranthus paniculatus*: racemes compound; branches spreading, pubescent; leaves ovate-lanceolate. Native of America.

25. *Amaranthus retroflexus*, or hairy amaranth: racemes superdecompound, erect; branches pubescent; leaves ovate, waved. It differs very much from all the other species, in its pubescent stem, flouter stature, green colour of the whole, and peculiar habit. Native of Pennsylvania. It flowers from July to September; and was cultivated by Mr. Miller in 1739. Being now become a common weed in many gardens near London, it is seldom allowed a place except in botanic gardens.

26. *Amaranthus chlorostachys*: racemes compound, nodding; leaves lanceolate. Native place not known.

27. *Amaranthus flavus*, or pale amaranth: racemes compound, nodding; leaves ovate-lanceolate. Although it has the name of *flavus*, the flowers are always green; only turning yellow as the seed ripens. It is a native of the East Indies. Mr. Miller, who cultivated it in 1768, mentions, that he received the seeds from Portugal, by the title of *Bredos*, recommending it to be cultivated as a culinary herb: but the Portuguese call all the green amaranths by this name.

28. *Amaranthus caudatus*, or pendulous amaranth, or love-lies-bleeding. It flowers in August and September; and was cultivated in 1683, by Mr. James Sutherland. Native of Persia, Ceylon, Guiana, Peru, &c.

29. *Amaranthus spinosus*, or prickly amaranth: racemes terminating compound, axils thorny. Native of the East and West Indies, Guiana, Guinea, &c. In the former they eat it as a green boiled. It flowers from July to September. This species makes no great figure, and therefore is rarely allowed a place except in botanic gardens.

Propagation and Culture. The sorts which are worthy of a place in the pleasure garden, are particularly the eighth and the twelfth: these are tender, and require some art and care to bring them to perfection in England, therefore their management will be hereafter more particularly inserted. They are generally disposed in pots with cockscombs and other showy plants, to adorn court-yards, and other immediate environs of the house.

The twenty-first sort is also tender; whoever therefore is inclinable to cultivate that plant should treat it in the same manner as is directed for the twenty-third and twenty-eighth. Next to these are the twenty-third and twenty-eighth sorts, for the ornament of principal borders in the pleasure-garden or parterre: the seeds of these should be sown upon a moderate hot-bed towards the end of the month; and, when the plants come up, they should have a large share of air admitted to them in mild weather, to prevent their drawing up weak. When they are large enough to transplant, there should be another moderate hot-bed provided, to which they should be removed, placing them at six inches distance every way, observing to water them, as also to shade them from the sun until they have taken new root; after which, the air should be freely admitted to them at all times when the weather is favourable; their waterings should be frequent, but not given in great quantities. As the plants advance, and the warmth of the season increases, they should have a greater share of air, that by degrees they may be hardened to bear the open air. In the beginning of June they may be taken up, with large balls of earth to their roots, and planted, some into pots and others into the borders of the pleasure-garden, observing to shade them until they have taken good root; after which they must be frequently watered in dry weather, especially those in the pots, which will require watering every evening in warm dry weather. The tree amaranth will not thrive in pots, but should be planted in a rich light soil, where, if it be allowed room, and plentifully watered in dry weather, the plants will grow to a very large size, and make a fine appearance. The twenty-third and twenty-eighth sorts must be sown on a good hot-bed in February, or the beginning of March at farthest; and in about a fortnight's time, if the bed is in good temper, the plants will rise; soon after which you must prepare another hot-bed, covered with good, rich, light earth, about four inches thick; then raise up the young plants with your finger, so as not to break off the tender roots, and prick them into your new hot-bed about four inches distance every way, giving them a gentle watering to settle the earth to their roots; but in doing this, be very cautious not to bear the young plants down to the ground by hasty watering, which rarely rise again, or at least so as to recover their former strength in a long time, but very often rot in the stems, and die. In the middle of the day keep them screened with mats from the heat of the sun, and give them air by raising up the glasses; and, if the glasses are wet, it will be proper to turn

turn them every day in good weather, that they may dry; for the moisture which is occasioned by the fermentation of the dung, and the perspiration of the plants, is of a noxious quality, and very unkindly to plants; so that if the weather happens to prove bad, that you cannot turn your glasses, it will be of great service to the plants to wipe off all moisture two or three times a day with a woollen cloth to prevent its dropping upon the plants. When the plants are firmly rooted, and begin to grow, you must observe to give them air every day, more or less, as the weather is cold or hot, to prevent their drawing up too fast, which greatly weakens their stems.

In about three weeks or a month's time, these plants will have grown so as to meet, and will stand in need of another hot-bed, which should be of a moderate temper, and covered with the same rich earth about six inches thick, into which they should be removed, observing to take with them as much earth about their roots as possible, and plant them six or seven inches distance every way, giving them some water to settle the earth about their roots; but be very careful not to water them heavily, so as to bear down the plants, as was before directed; and keep them shaded in the heat of the day, until they have taken fresh root; and be sure to refresh them often gently with water, and give them air in proportion to the heat of the weather, covering the glasses with mats every night, lest the cold chill your beds, and stop the growth of your plants.

The middle of May you must provide another hot-bed, which should be covered with a deep frame, that the plants may have room to grow. Upon this hot-bed you must set as many three-penny pots as can stand within the compass of the frame; these pots must be filled with good rich earth, and the cavities between each pot filled up with any common earth, to prevent the heat of the bed from evaporating, and filling the frame with noxious steams. When the bed is in good order to receive the plants, they should be carefully taken up with a trowel, observing to preserve as much earth to their roots as possible; then place each single plant in the middle of one of the pots, filling the pot up with the earth before described, and settle it close to the root of the plant with your hands; water them gently as before, and shade them in the heat of the day from the violence of the sun by covering the glasses with mats. In about three weeks more these plants will have grown to a considerable size and strength, so that you must now raise the glasses very much in the day-time; and when the air is soft, and the sun is clouded, draw off the glasses, and expose them to the open air; and repeat this as often as the weather will permit, which will harden them by degrees to be removed abroad into the places where they are to remain the whole season; but it is not advisable to set these plants in the open air until after the first week in July, observing to do it when the air is perfectly soft, and if possible in a gentle shower of rain. Let them at first be set in shelter for two or three days, where they may be screened from the violence of the sun, and from strong winds, to which they must be inured by degrees. These plants, when grown to a good stature, perspire very freely, and must be every day refreshed with water, if the weather proves hot and dry; otherwise they will stint, and never produce so large leaves as those which are skilfully treated. This is the proper management in order to have fine amaranths, which, if rightly followed, and the kinds are good, in a favourable season, will produce large fine leaves, and these plants are the greatest ornament to a good garden for upwards of two months in the latter part of summer.

The other sorts, being hardy enough to grow in the open air, may be sown on a bed of light earth in the spring, and, when the plants are fit to remove, they may be transplanted into any part of the garden, where they will thrive and produce plenty of seeds, which, if permitted to scatter, will stock the garden with plants.

AMARANTH, *f.* in poetry, is sometimes an imaginary flower, supposed, according to its name, never to fade:

VOL. I. No. 25.

Immortal *amaranth*! a flower which once
In paradise, fast by the tree of life,
Began to bloom; but soon, for man's offence,
To heav'n remov'd, where first it grew, there grows,
And flow'rs aloft, shading the fount of life,
And where the river of bliss, thro' midst of heav'n,
Rolls o'er Elysian flow'rs her amber stream:
With these, that never fade, the spirits elect
Bind their resplendent locks, inwreath'd with beams. *Milton.*

AMARANTH, GLOBE, *f.* in botany. See GOMPHRENA.
AMARANTH, SPICA, *f.* in botany. See PHRYMA.
AMARANTHINE, *adj.* [*amaranthinus*, Lat.] Relating to amaranths; consisting of amaranths:

By the streams that ever flow,
By the fragrant winds that blow
O'er the Elysian flow'rs;
By those happy souls that dwell
In yellow meads of asphodel,
Or *aramanthine* bow'rs.

Pope.

AMARANTH, AFFINIS, *f.* in botany. See GOMPHRENA and ILLECEBRUM.

AMARANTHOIDES, *f.* in botany. See CELOSIA, GOMPHRENA, and ILLECEBRUM.

AMARANTHUS, *f.* in botany. See ACHYRANTHES, AMARANTH, CELOSIA, ILLECEBRUM, IRESINE, and RIVINA.

AMARANTHUS LUTEUS, *f.* in botany. See GNAPHALIUM.

AMARELLA, *f.* in botany. See GENTIANA.

AMARITUDE, *f.* [*amaritudo*, Lat.] Bitterness.—What *amaritudo* or acrimony is comprehended in choler, it acquires from a commixture of inclancholy, or external malign bodies. *Harvey.*

AMARULENCE, *f.* [*amaritudo*, Lat.] Bitterness.

AMARYLLIS, *f.* [the name of a shepherdess.] In botany, a genus of the hexandria monogynia class, ranking in the natural order of lilia or liliaceæ. The generic characters are—Calyx: spathe oblong, obtuse, compressed, emarginate, gaping on the flat side and withering. Corolla: petals six, lanceolate; nectary six very short scales without the base of the filaments. Stamina: filaments six, awl-shaped; with oblong, incumbent, rising, antheræ. Pistillum: germ roundish, furrowed, inferior; style filiform, almost of the length and in the situation of the filaments; stigma trifid, slender. Pericarpium: a subovate, three-celled, three-valved capsule. Seeds, several.—*Essential Character.* Corolla, hexapetaloid, irregular; filaments inserted into the throat of the tube, bending down, unequal in proportion or direction.

Species. 1. *Amaryllis lutea*, or yellow amaryllis, or autumnal narcissus: spathe undivided, obtuse; flower sessile; corolla bell-shaped, erect, shortly tubular at the base; stamens erect, alternately shorter. The flowers of yellow amaryllis seldom rise above three or four inches high; they are shaped something like those of the large yellow crocus; the green leaves come up at the same time, like the saffron, and, after the flowers are past, the leaves increase all the winter. The roots are shaped like those of the narcissus. Is a native of the south of France, Spain, Italy, and Thrace, and flowers in September.

2. *Amaryllis pumilio*, or dwarf amaryllis: spathe two-leaved, one-flowered; corolla funnel-shaped, equal, segments revolute; stamens bent in, alternately shorter. It is a native of the Cape of Good Hope, where it was found by Mr. Francis Maïson. It flowers in November.

3. *Amaryllis atamasco*, or atamasco lily: spathe bifid, acute; flower pedicelled, corolla bell-shaped, nearly equal, erect, shortly tubular at the base; stamens bent down, equal. The flowers of the atamasco lily, at their first appearance, are of a fine carnation colour on the outside, but fade till they are almost white. They are nearly as large as those of the small orange lily, but do not grow above six or eight inches high; they appear the end of May, or beginning of June, and sometimes in August. It is a native

of Virginia and Carolina, where it grows plentifully in the fields and woods, and makes a beautiful appearance when in flower.

4. *Amaryllis formosissima*, or *Jacobæa lily*: spathe undivided; flower pedicelled; corolla two-lipped, nodding, deeply six-parted; stamens and pistil bent down. The flower-stems of the *Jacobæa lily* are produced from the sides of the bulbs, so that, after the flower produced on one side is decayed, another stalk arises from the other side of the bulb; but there is usually no more than one flower produced on the same stalk. The flowers are large, and of a very deep red; the under petals are very large, and the whole flower stands nodding on one side of the stalk, making a most beautiful appearance. Sometimes, but rarely, two flowers proceed from the same spathe. It is a native of South America, and was first known in Europe in 1593.

5. *Amaryllis reginæ*, or Mexican lily: spathe with about two flowers; pedicels divaricating; corollas bell-shaped, shortly tubular, nodding; throat of the tube hirsute; leaves lanceolate patulous. It flowered in Mr. Fairchild's garden, at Hoxton, in 1728, when the late Dr. James Douglass caused a figure of it to be drawn, and wrote a folio pamphlet on it. He gave it the title of *lilium reginæ*, because it was in full beauty on the first of March, which was the late queen's birth-day. It flowers constantly in the spring, when it is placed in a very warm stove. It is in beauty in February, and those which are in a moderate temperature of air will flower in March or April.

6. *Amaryllis purpurea*, or purple-flowered *amaryllis*: spathe with about two flowers, corollas somewhat erect, tubular at the base, throat of the tube smooth; leaves linear-lanceolate. This species is very nearly allied to the foregoing; inasmuch, that Monf. L'Héritier doubts whether it be a distinct species. It is a native of the Cape of Good Hope, where it was found by Thunberg and Maffon.

7. *Amaryllis equestris*, or Barbadoes lily: spathe with about two flowers, pedicels erect shorter than the spathe, tube filiform horizontal, border spreading open obliquely and curved upwards, throat hairy. This species is a native of the West Indies.

8. *Amaryllis reticulata*, or flat-stalked *amaryllis*: spathe with about two flowers, corollas tubular at the base and nodding, throat of the tube smooth, scape compressed, leaves oblong attenuated at the base. This is distinguished by the petals being transversely veined, and by the smoothness of the throat. It flowers in April, and is a native of Brazil.

9. *Amaryllis belladonna*, or belladonna lily: corollas somewhat erect, six-petalled, petals flat; scape compressed; leaves sharply channelled, bluntly keeled, very smooth. This differs from the fifth species, in having the edges of the petals waved, and not reversed at the tip. It was first brought into England about the year 1712, from Portugal, where the gardens formerly abounded with these flowers; but the *Jacobæa lily* has since supplanted this in most of their gardens, and the bulbs imported thence for this of late years have generally proved to be the *Jacobæa lily*. The gardens in Italy have great quantities of these flowers, especially about Florence, where they are commonly sold in the markets, under the name of *Narcissus Belladonna*. This sort usually flowers about the end of September, or the beginning of October, in England; and, if the roots are strong, the stem will rise upwards of two feet high. If the season is favourable, or the flowers are screened from frosts, violent winds, and heavy rains, they will continue in beauty a month or longer; and are very ornamental plants to a garden, at a season when there is a great scarcity of flowers. Native of the West Indies, on shady hills, by the side of streams.

10. *Amaryllis vittata*, or superb or ribband *amaryllis*: flowers pedicelled, corollas wedge-funnel-shaped, the rachis of the outer fastened to the edge of the inner petals, scape round, stigmas grooved. This species, when it

blossoms in perfection, deserves the name of superb, which the late Mr. Aiton has given it; the stem rising to the height of three feet or more, and producing from two to five beautiful flowers. It usually blossoms in April or May, but may be forwarded by artificial heat. Of what country it is a native is not known with certainty, but most probably of the Cape.

11. *Amaryllis falcata*, or sickle-leaved *amaryllis*, or *crinum*: corollas peduncled, erect, six-petalled; scape compressed, length of the unbel; leaves flat, pressed to the ground, about the edge sickle-shaped, white-cartilaginous crenate. Professor N. J. Jacquin received the bulb of this species from the Cape in 1770. Introduced here in 1774, by Mr. Francis Maffon.

12. *Amaryllis ornata*, or Cape Coast lily or *amaryllis*: flowers sessile, corollas tubular at the base, tube longer than the spathe and border, curved, segments of the border oblong, awned, lowest segment divaricate, concave. This is a native of Guinea, and flowers with us in June and July.

13. *Amaryllis longifolio*, or long-leaved *amaryllis*: flowers pedicelled, from twelve to twenty flowers in a spathe, corollas tubular at the base, tube curved short, segments of the border lanceolate obtuse, leaves broad-subulate channelled flaccid at the tip. It is a native of the Cape of Good Hope; flowers in July.

14. *Amaryllis revoluta*, or revolute *amaryllis*: flowers pedicelled, corollas tubular at the base, tube filiform short curved, leaves linear narrow channelled long flaccid from their origin. This is a native of the Cape of Good Hope, and flowers in September.

15. *Amaryllis aurea*, or golden *amaryllis*: flowers pedicelled somewhat erect, corollas funnel-form club-shaped, almost six-petalled, segments linear-lanceolate, stamens and style straight; leaves linear, erect, channelled, with a reflex smooth margin. This species is a native of China, and flowers in August and September.

16. *Amaryllis orientalis*, or broad-leaved African *amaryllis*: spathe many-flowered, flowers pedicelled, six-parted, considerably shorter than the peduncles, irregular; germs wedge-shaped, angular. It grows naturally at the Cape of Good Hope; from whence Mr. Miller says that he received the roots, which succeeded at Chelsea.

17. *Amaryllis farniensis*, or Guernsey lily: petals linear, flat, stamens and pistil straightish longer than the corolla, stigmas parted, revolute. The flowers begin to come out at the end of August, and the head is usually three weeks in expanding gradually. This beautiful plant is a native of Japan, and has been long naturalized in Guernsey. According to Cornutus, it was brought from Japan to Paris, and cultivated in Morin's garden before 1634. It was in the royal garden before 1666. In England, it was cultivated by general Lambert, at Wimbledon, in 1659, but it seems then to have been little known. In 1664 it was grown more common. It does not appear to have been in Holland before the year 1695. The plants are reputed to owe their origin in Guernsey to the shipwreck of a vessel in its return from Japan, probably before the middle of the last century.

18. *Amaryllis undulata*, or waved-flower African *amaryllis*: petals linear channelled waved, stamens and pistil bent down, shorter than the corolla, stigmas obsolete. The flowers are void of scent, and expand from November till the beginning of January. Native of the Cape of Good Hope; flowers here from April to June.

19. *Amaryllis radiata*, or snow-drop-leaved *amaryllis*: petals lanceolate waved, stamens and pistil bent down, diverging, twice as long as the corolla, stigma obsolete. It is not known where it grows naturally. It flowers in June.

20. *Amaryllis montana*: spathe many-flowered, leaves linear-subulate, petals alternate mucronate, stamens and style erect. Native of the higher parts of mount Lebanon.

21. *Amaryllis tubispatha*: spathe one-leaved tubular bifid one-flowered, peduncle twice as long as the spathe. Found at Buenos Ayres, by Commerçon.

22. *Amaryllis*

22. *Amaryllis tubiflora*: spathe one-flowered two-leaved, corolla funnel-shaped, with a very long tube. This species is found in Peru.

23. *Amaryllis spiralis*: spathe two-leaved, few-flowered, peduncles filiform, very long, leaves subulate. Discovered by Bruguere, in sandy grounds near the Cape of Good Hope.

24. *Amaryllis maculata*: spathe one-flowered, two-leaved linear, flower peduncled, stamens and style bent down. Found in Chili, by Dombey.

25. *Amaryllis chilensis*: spathe one or two-flowered, one or two leaved, lanceolate, flowers peduncled, leaves linear. This has flowers of a purple colour. Found also in Chili, by Dombey.

26. *Amaryllis clavata*: spathe one-flowered, two-leaved, subulate, corolla club-shaped. This species is a native of the southern part of Africa.

27. *Amaryllis zeylanica*, or Ceylon lily: spathe many-flowered, corollas reclining, tube filiform, very long, segments uncinat. 28. *Amaryllis latifolia*: spathe many-flowered, flowers pedicelled, somewhat reclining, tubular at the base; leaves oblong-lanceolate. Natives of the East Indies.

29. *Amaryllis cinnamomea*: spathe many-flowered, corollas subhexapetalous lanceolate waved, stamens and pistil erect, shorter than the corolla. Found at the Cape of Good Hope, by Bruguere.

Propagation and Culture. These plants are of the liliaceous or bulbous tribe; most of them have flowers of singular beauty, highly deserving the care and attention of the curious botanist and florist. The yellow autumnal amaryllis is very hardy, and increases fast by offsets. The season for transplanting these roots is any time from May to the end of July, when their leaves are decayed, after which it will be too late to remove them; for they will begin to push out new fibres by the middle of August, or sooner if the season be moist, and many times they flower the beginning of September; so that, if they are transplanted, it will spoil their flowering. This plant will grow in any soil or situation; but it will thrive best in a fresh, light, dry, soil, and in an open situation; not under the dripping of trees, nor too near walls. It is commonly called by the gardeners, the yellow autumnal narcissus, &c. and is usually sold by them, with colchicums, for autumnal ornaments to gardens; for which purpose this is a pretty plant, as it will frequently keep flowering from the beginning of September to the middle of November, provided the frost is not so severe as to destroy the flowers; for, although there is but one flower in each cover, yet there is a succession of flowers from the same root, especially when they are suffered to remain three or four years unremoved. The *Jacobæa* lily is now become pretty common in the curious gardens in England, the roots sending forth plenty of offsets, especially when they are kept in a moderate warmth in winter: for the roots of this kind will live in a good green-house, or may be preserved through the winter under a common hot-bed frame; but then they will not flower so often, nor send out so many offsets, as when they are placed in a moderate stove in winter. This will produce its flowers two or three times in a year, and is not regular to any season; but from March to the beginning of September the flowers will be produced when the roots are in vigour. It is propagated by offsets, which may be taken off every year; the best time to shift and part these roots is in August, that they may take good root before winter; in doing this, there should be care taken not to break off the fibres from their roots. They should be planted in pots of a middling size; and, if they are kept in a moderate degree of warmth, they will produce their flowers in plenty, and the roots will make great increase.

The Mexican lily, being not so hardy as the foregoing or the *Belladonna* lily, must be placed in a warm stove; and, if the pots are plunged into a hot-bed of tanner's bark, the roots will thrive better, and the flowers will be

strong. It is increased by offsets, as the others, and flowers usually the beginning of spring, when it makes a fine appearance in the stove.

The method in which Mr. Miller cultivated the *Belladonna* lily with great success, we shall give in his own words: "I prepared a border close to a wall which had a fourth-west aspect, of about six feet wide, in the following manner, viz. I removed all the earth to the depth of three feet, then I put some very rotten dung in the bottom, six inches thick, upon which I laid light garden mould about twenty inches deep; after making this level, I placed the roots at six inches distance every way, and then covered them over with light sandy earth, to the height of the border, whereby the upper part of the roots were five or six inches buried; and in the winter I covered the border all over with rotten tanner's bark, three inches deep, to prevent the frost from penetrating the ground; and, when the frost was very severe, I laid some mats or straw over the leaves to protect them from being killed. With this management the roots have greatly increased, and have constantly flowered every year; some of them have put out two or three stems, which grew near three feet high, and produced many flowers in each umbel, which have made a fine appearance during the month of October. The green leaves come up soon after, and abide all the winter and spring until June, at which time they decay; soon after which the roots should be transplanted, for, if they are let stand till July, they will have sent forth new fibres, when it will greatly injure the roots, if they are disturbed. If some of these roots are planted in a warm border, close to a fourth wall, and on a dry soil, they will thrive very well, especially if they are covered in severe frost; and these roots will flower much stronger than those which are kept in pots, and will multiply faster."

The *Guernsey* lily is supposed to come originally from Japan, but has been many years cultivated in the gardens of *Guernsey* and *Jersey*; in both which places it seems to thrive as well as if it was their native country; and from those islands their roots are sent annually to the curious in most parts of Europe. The bulbs are generally brought over in June and July; but, the sooner they are taken out of the ground after their leaves decay, the better they are: for, although the roots which are taken up when their flower-stems begin to appear will flower, yet their flowers will not be so large, nor will their roots be near so good after, as those which were removed before they had sent out fresh fibres. When these roots come over, they should be planted in pots filled with fresh, light, sandy, earth, mixed with a little very rotten dung, and placed in a warm situation, observing now and then to refresh the earth with water: but by no means let them have too much wet, which would rot their roots, especially before they come up. About the middle of September, such of the roots as are strong enough to flower will begin to shew the bud of their flower-stem, which is commonly of a red colour; therefore you should remove these pots into a situation where they may have the full benefit of the sun, and may be sheltered from strong winds: but by no means place them too near a wall, nor under glasses, which would draw them up weak, and render them less beautiful. At this season they should be gently refreshed with water, if the weather be warm and dry; but, if it should prove very wet, they should be screened from it. When the flowers begin to open, the pots should be removed under shelter, to prevent the flowers from being injured by too much wet; but they must not be kept too close, nor placed in a situation too warm, which would occasion their colour to be less lively, and hasten their decay. The flowers of this plant will continue in beauty, if rightly managed, a full month; and, though they have no scent, yet, for the richness of their colour, they are justly esteemed in the first rank of the flowery tribe. After the flowers are decayed, the leaves will begin to shoot forth in length, and, if sheltered from severe cold, will continue growing all the winter; but they must have

have as much free air as possible in mild weather, and be covered only in great rains or frosts; for which purpose, a common hot-bed frame is the properest shelter for them; because the glasses may be taken off constantly every day in dry open weather, which will encourage the leaves to grow strong and broad; whereas when they are placed in a green-house, or not exposed to the open air, they will grow long and slender, and have a pale weak aspect, whereby the roots will become weak, so that it seldom happens that they produce flowers under such management.

These roots should be transplanted every fourth or fifth year towards the latter end of June, or beginning of July, and planted into fresh earth, but they should not be oftener removed, for that would retard their flowering. The offsets should also be taken off, and planted into several pots, which, in three years time, will produce flowers; so that, after a person is once stocked with these roots, he may increase them, so as to have a supply of blowing roots, without being at the trouble or expence of sending to Guernsey every year for fresh roots; and the roots preserved here will flower stronger than those which are usually brought from thence, for the inhabitants of those islands are not very curious in cultivating them. Their usual method is to plant them at a great distance in a bed of common earth, where they let them remain for many years; in which time they produce such a number of offsets, that many times one single cluster has contained above a hundred roots; by which means, those which grow on the inside are so much compressed by the outer roots, that they are perfectly flatted; and from the number of roots growing in each cluster, they are all rendered weak, and unfit to produce such large stems of flowers, as those which have grown single, and are of a spherical figure. But, when a person is possessed of a large number of these roots, it will be troublesome to preserve them in pots, therefore there should be a bed prepared of the following earth, in some well-sheltered part of the garden, viz. Take a third part of fresh virgin earth from a pasture ground, which is light, then put near an equal part of sea-sand, to which you should add rotten dung, and sifted lime-rubbish, of each an equal quantity. With this earth, when well mixed and incorporated, you should make your bed about two feet thick, raising it about four or five inches above the surface of the ground, if the situation be dry; but, if the ground be wet, it should be raised eight or nine inches higher. In this bed, about the beginning of July, as was before directed, you should plant the roots about six or eight inches asunder each way; and in the winter, when the frost begins, you should either cover the bed with a frame, or arch it over, and cover it with mats and straw, to prevent their leaves from being pinched with cold; but in the spring the covering may be entirely removed, and the bed kept constantly clear from weeds during the summer, observing to stir the surface of the earth now and then; and every year, when the leaves are decayed, you should sift a little fresh earth over the beds, to encourage the roots. In this bed the roots may remain until they are strong enough to produce flowers, when they may be taken up and planted in pots, as was before directed, or suffered to remain in the same bed to flower. The roots of these plants do not flower again the succeeding year, as in many other sorts of bulbs; but if their bulbs contain two buds in their center, as is often the case, they very often flower twice within the compass of three years; after which, the same individual root does not flower again in several years, but only the offsets from it.

The Ceylon lily is tender, and must be treated in the same manner as the Mexican lily; this is more common in the gardens in Holland than in this country; and, as it is a plant which increases but slowly, will not be very common here. It flowers usually in June and July, and sometimes the same root will flower again in autumn; for, if the pots are plunged into a bed of tanner's bark, the roots generally flower twice every year, but the flowers are not of long duration.

The best time to transplant the roots of all the species is about the beginning of August, when their leaves are quite decayed, before they put out new fibres, for it will be very improper to remove them afterwards. All these bulbous-rooted flowers delight in a loose sandy earth, mixed with good kitchen-garden mould; and in the culture of them there should be but little water given them at those times when their leaves decay, and the roots are not in a growing state, for much moisture at that time will often cause them to rot; but when they are growing, and putting out their flower-stems, they should be frequently refreshed with water, but not given in too great quantities at a time. The pots, with the tender sorts, should constantly be kept in the stove, and in summer they should have as much free air as possible; for, although some of these sorts may be kept abroad in summer, yet those do not thrive so well, nor flower so constantly, as those which are treated in the manner here described.

AMARYLLIS CAPENSIS, *f.* in botany. See HYPOXIS STELLATA.

AMARYLLIS CILIARIS, *f.* in botany. See HÆMANTHUS CILIARIS.

AMARYLLIS DISTICHA, *f.* in botany. See HÆMANTHUS TOXICARIUS.

AMARYLLIS UMBRELLA, *f.* in botany. See CYRTANTHUS OBLIQUUS.

AMARYNTHIA, a surname of Diana, taken from a village of Eubœa, where she was worshipped.

AMARYNTHUS, anciently a hamlet of Eretrias, in the island of Eubœa, about seven stadia distant from its walls. Here Diana was worshipped by an annual solemnity, at which those of Carytus assisted; hence the title of the goddess was *Amarynthia* and *Amarysia*.

AMA'SA, [אמאסא Heb. i. e. sparing the people.] The son of Abigail.

AMA'SIA, now Marburg, a city in the landgraviate of Hesse on the Lahn. According to others, it is Embden in Westphalia.

AMASIA, an ancient town of Turkey, in Natolia, remarkable for the birth of Strabo the geographer. It is the residence of a bashaw, and gives its name to the province it stands in, where there are the best wines and the best fruits in Natolia. It is seated near the river Iris or Casal-mack; and was anciently the residence of the kings of Cappadocia. Lat. 39. 33. N. lon. 36. 10. E.

AMASIA, the name of the northern division of Lesser Asia, lying on the south shore of the Euxine Sea in Natolia. It takes its name from Amasia the capital, mentioned in the preceding article.

To AMA'SS, *v. a.* [*amasser*, Fr.] To collect together in one heap or mass.—When we would think of infinite space, or duration, we, at first step, usually make some very large idea, as perhaps of millions of ages, or miles, which possibly we double and multiply several times. All that we thus *amass* together in our thoughts, is positive, and the assemblage of a great number of positive ideas of space or duration. *Locke*.—In a figurative sense, to add one thing to another, generally with some share of reproach, either of eagerness or indiscrimination.—Do not content yourselves with mere words, lest your improvements only *amass* a heap of unintelligible phrases. *Watts*.

AMASS, *f.* [*amas*, Fr.] An assemblage; an accumulation.—This pillar is but a medley or *amass* of all the precedent ornaments, making a new kind by stealth. *Wotton*.

AMASSMENT, *f.* [from *amass*.] A heap; an accumulation; a collection.—What is now, is but an *amassment* of imaginary conceptions, prejudices, ungrounded opinions, and infinite impostures. *Glanville*.

AMASO'NIA, *f.* [from *Amason*, a traveller into America]. In botany, a genus of the didynamia angiospermia class. The generic characters are—Calyx: perianthium one-leaved, bell-shaped, semiquinquefid, acute, equal, permanent. Corolla: one-petalled, tubulous, longer than the calyx: border quinquefid, subequal, spreading, small. Stamina: filaments four, at the upper side of the corolla

and

and longer than it; bending in at the end; two of them shorter; antheræ oval, incumbent. Pistillum: germ ovate; style in the situation and form of the stamens; stigmas two, sharp. Seeds: an ovate, one-celled nut, of the same length with the calyx.—*Essential Character.* Corolla: tubulous; limb small, quinquefid; nut ovate, one-celled.

This is a native of Surinam. The stem is three feet in height. The flowers in a simple terminal raceme, a foot long, with about three flowers on a pedicle. Bractes ovate, sessile, a little longer than the flowers, which are yellow, nodding, and grow all on one side of the stalk.

AMAS'TRIS, or AMASTRO, a seaport of Aratolia, but its two harbours have been long ago choaked up with sand, and there now remains little of its ancient splendour, except some ruins.

AMATA, the wife of King Latinus. She had betrothed her daughter Lavinia to Turnus, before the arrival of Æneas in Italy. She zealously favoured the interest of Turnus, and, when her daughter was given to Æneas, she hung herself.

To AMA'TE, *v. a.* [from *a* and *mate*.] To accompany; to entertain as a companion. It is now obsolete:

A lovely bevy of fair ladies fate,
Courtied of many a jolly paramour,
The which did them in modest wife amate,
And each one fought his lady to aggrate. *Fairy Queen.*

To terrify; to strike with horror. In this sense, it is derived from the old French word *matter*, to crush or subdue.

AMATHIA, one of the fifty Nereids, according to Homer.

AMATHUS, a very ancient town in the south of Cyprus: so called from Amathus the founder; or, according to others, from Amath, a Phœnician town sacred to Venus, with a very ancient temple of Adonis and Venus: and hence Venus is denominated *Amathusia*. According to Ovid, it was a place rich in copper-ore, and where the inhabitants became *Cerastra*, or horned. Now called *Limisso*.

AMATHUS, anciently a town of the tribe of Gad, beyond Jordan; but whether at a greater or less distance from it, is not so easy to determine. Eusebius places it in the Lower Peræa; Reland, in Ramoth-Gilead. Gabinius, proconsul of Syria, established five juridical conventions in Judea; two of which were on the other side Jordan; one at Gadara, the other at Amathus.

AMATHUSIA, a surname of Venus, taken from a city in the island of Cyprus, particularly dedicated to her.

AMATORCULIST, *f.* [*amatorculus*, Lat.] A little insignificant lover; a pretender to affection.

AMATORII MUSCULI, in anatomy, a term sometimes used for the obliquus superior and obliquus inferior muscles of the eye, as these muscles assist in ogling or drawing the eye sideways.

A'MATORY, *adj.* [*amatorius*, Lat.] Relating to love; causing love.—It is the same thing whether one ravish Lucretia by force, as Tarquin, or by *amatory* potions not only allure, but necessitate, her to satisfy his lust, and incline her effectually, and draw her inevitably, to follow him spontaneously. *Bramham.*

AMATRICE, a city of the kingdom of Naples, in the farther Abruzzo, upon the confines of the pope's territories, and the marquise of Ancona.

AMAURO'SIS, *f.* [*αμαυρωσις*, *q. d.* darkness, Gr.] a deprivation of sight, the eye remaining fair and seemingly unaffected. See MEDICINE.

To AMAZE, *v. a.* [from *a* and *maze*, perplexity.] To confuse with terror. To put into confusion with wonder. To put into perplexity.

Go, heav'nly pair, and with your dazzling virtues,
Your courage, truth, your innocence and love,
Amaze and charm mankind. *Smith.*

AMAZE, *f.* [from the verb *amaze*.] Astonishment; confusion, either of fear or wonder.

Vol. I. No. 25.

AMAZEDLY, *adv.* [from *amazed*.] Confusedly; with amazement; with confusion:

—Stands Macbeth thus *amazedly*?
Come, sisters, cheer we up his spirits. *Shakespeare.*

AMAZEDNESS, *f.* [from *amazed*.] The state of being amazed; astonishment; wonder; confusion.—I was by at the opening of the farthel, heard the old shepherd deliver the manner, how he found it; whereupon, after a little *amazement*, we were all commanded out of the chamber. *Shakespeare.*

AMAZEMENT, *f.* [from *amaze*.] Such a confused apprehension as does not leave reason its full force; extreme fear; horror:

But look! *amazement* on thy mother sits;
O step between her and her fighting soul:
Conceit in weakest bodies strongest works. *Shakespeare.*

Extreme dejection. Height of admiration. Astonishment; wonder at an unexpected event.—They knew that it was he which sat for alms at the beautiful gate of the temple, and they were filled with wonder and *amazement* at that which had happened unto him. *Acts.*

AMAZING, *part. adj.* [from *amaze*.] Wonderful; astonishing.—It is an *amazing* thing to see the present desolation of Italy, when one considers what incredible multitudes it abounded with during the reigns of the Roman emperors. *Addison.*

AMAZINGLY, *adv.* [from *amazing*.] To a degree that may excite astonishment; wonderfully.—If we arise to the world of spirits, our knowledge of them must be *amazingly* imperfect, when there is not the least grain of sand but has too many difficulties belonging to it for the wisest philosopher to answer. *Watts.*

AMAZON, or ORELLANA, a river of South America, which has its source among the Andes, in Peru, not far from the South Sea, from whence running eastward, it pours into the ocean directly under the equinoctial line. This largest of all rivers is, at its mouth, 150 miles broad, and 1500 miles from its mouth, thirty or forty fathoms deep. It runs at least 3000 miles, forms during its course many islands in itself, receives near two hundred other rivers, many of which have a course of 500 or 600 leagues, some of them not inferior to the Danube, or the Nile; and, in pouring itself into the ocean, repels the briny waters of the sea, to the distance of many leagues from the land.

AMAZONIA, is that part of South America which the aboriginal Indians still possess. It is situated between the equator and twenty degrees of south latitude; its length is 1400 miles, and its breadth 900. It is bounded on the north by Terra Firma, and Guiana; on the east by Brasil; on the south by Paraguay; and on the west by Peru. The air is cooler in this country than could be expected, considering it is situated in the torrid zone. This is partly owing to the heavy rains which occasion the rivers to overflow their banks one half of the year, and partly to the cloudy atmosphere, which obscures the sun great part of the time he is above the horizon. During the rainy season this country is subject to dreadful storms of thunder and lightning. The soil is extremely fertile, producing cocoa-nuts, pine-apples, bananas, plantains, and a great variety of tropical fruits; cedar, red-wood, pak, ebony, log-wood, and many other sorts of dying wood; also tobacco, sugar-canes, cotton, potatoes, balsam, honey, &c. The woods abound with tigers, wild boars, buffaloes, deer, and game of various kinds. The rivers and lakes abound with fish. Here are also sea-cows and turtles; but the crocodiles and water-serpents render fishing a dangerous employment.

The natives of this country, like all the other Americans, are of a good stature, have handsome features, long black hair, and copper complexions. They are said to have a taste for the imitative arts, especially painting and sculpture, and make good mechanics. Their cordage is

made of the bark of trees, and their sails of cotton; their hatchets of tortoise-shells or hard stones; their chisels, planes, and wimbles, of the horns and teeth of wild beasts; and their canoes are trees hollowed. They spin and weave cotton cloth, build their houses with wood and clay, and thatch them with reeds. Their arms in general are darts and javelins, bows and arrows, with targets of cane or fish-skins. The several nations are governed by their respective chiefs or caziques. The regalia, which distinguish these chiefs, are a crown of parrot's feathers, a chain of tiger's teeth or claws, which hangs round the waist, and a wooden sword. This part of South America has hitherto remained unsubdued; the original inhabitants, therefore, enjoy there native freedom and independence.

AMAZONIUS, a name of Apollo, given him by the Laedæmonians on account of the assistance he gave them against the Amazons.

AMAZIAH, [Army of my strength, and of the Lord, Heb. i. e. the strength of the Lord.] A king of Judah.

AMAZONS, [of α priv. and $\mu\alpha\varsigma\tau\epsilon\rho\alpha$, a pap.] In antiquity, a nation of female warriors, who founded an empire in Asia Minor, upon the river Thermoodon, along the coasts of the Black Sea. They are said to have formed a state out of which men were excluded. What commerce they had with that sex was only with strangers; they killed all their male children; and they cut off the right breasts of their females, to make them more fit for the combat. From which last circumstance it is that they are supposed to take their name, viz. from the privative α , and $\mu\alpha\varsigma\tau\epsilon\rho\alpha$, *mamma*, "breast." But Dr. Bryant, in his *Analysis of Ancient Mythology*, explodes this account as fabulous; and observes, that in general they were Cuthite colonies from Egypt and Syria, who formed settlements in different countries, and that they derived their name from *zon*, "the sun," which was the national object of worship. Vol. iii. p. 463. It has indeed been controverted even among ancient writers, whether ever there really were such a nation as that of the Amazons. Strabo, Pausanias, Diodorus Siculus, Trogus Pompeus, Justin, Pliny, Mela, Plutarch, &c. expressly assert it.

M. Petit, a French physician, published a Latin dissertation in 1685, to prove that there really was a nation of Amazons. It contains abundance of curious inquiries relating to their habit, their arms, the cities built by them, &c. Others of the moderns also maintain, that their existence is sufficiently proved by the testimony of such of the historians of antiquity as are most worthy of credit; by the monuments which many of them have mentioned; and by medals, some of which are still remaining; and that there is not the least room to believe that what is said of them is fabulous.

The Amazons are mentioned by the most ancient of the Greek writers. In the third book of the *Iliad*, Homer represents Priam speaking of himself as having been present, in the earlier part of his life, in a battle with the Amazons: and some of them afterwards came to the assistance of that prince during the siege of Troy. Herodotus informs us, that the Grecians fought a battle with the Amazons on the river Thermoodon, and defeated them. After their victory, they carried off all the Amazons they could take alive in three ships. But, whilst they were out at sea, these Amazons conspired against the men, and killed them all. Having, however, no knowledge of navigation, nor any skill in the use of the rudder, sails, or oars, they were driven by wind and tide, till they arrived at the precipices of the lake Mæotis, in the territories of the Scythians. Here the Amazons went ashore, and, marching into the country, seized and mounted the first horses they met with, and began to plunder the inhabitants. The Scythians at first conceived them to be men; but after they had had skirmishes with them, and taken some prisoners, they discovered them to be women. They were then unwilling to carry on hostilities against them; and by degrees a number of the young Scythians formed

connections with them, and were desirous that these gentle dames should live with them as wives, and be incorporated with the rest of the Scythians. The Amazons agreed to continue their connection with their Scythian husbands, but refused to associate with the rest of the inhabitants of the country, and especially with the women of it. They afterwards prevailed upon their husbands to retire to Sarmatia, where they settled. "Hence," says Herodotus, "the wives of the Sarmatians still continue their ancient way of living. They hunt on horseback in the company of their husbands, and sometimes alone. They march with their armies, and wear the same dress with the men. The Sarmatians use the Scythian language, but corrupted from the beginning, because the Amazons never learned to speak correctly. Their marriages are attended with this circumstance: no virgin is permitted to marry till she has killed an enemy in the field; so that some always grow old before they can qualify themselves as the law requires."

Diodorus Siculus says, "There was formerly a nation who dwelt near the river Thermoodon, which was subjected to the government of women, and in which the women, like men, managed all the military affairs. Among these female warriors was one, who excelled the rest in strength and valour. She assembled together an army of women, whom she trained up in military discipline, and subdued some of the neighbouring nations. Afterwards, having by her valour increased her fame, she led her army against the rest; and, being successful, she was so puffed up, that she styled herself the daughter of Mars, and ordered the men to spin wool, and do the work of the women within doors. She also made laws, by which the women were enjoined to go to the wars, and the men to be kept at home in a servile state, and employed in the meanest offices. They also debilitated the arms and thighs of those male children who were born to them, that they might be thereby rendered unfit for war. They seared the right breasts of their girls, that they might be no hindrance to them in fighting: from whence they derived the name of Amazons. Their queen, having become extremely eminent for skill and knowledge in military affairs, at length built a large city at the mouth of the river Thermoodon, and adorned it with a magnificent palace. In her enterprizes she exactly adhered to military discipline and good order; and she added to her empire all the adjoining nations, even to the river Tanais. Having performed these exploits, she at last ended her days like a hero, falling in a battle in which she had fought courageously. She was succeeded in the kingdom by her daughter, who imitated the valour of her mother, and in some exploits excelled her. She caused the girls from their very infancy to be exercised in hunting, and to be daily trained up in military exercises. She instituted solemn festivals and sacrifices to Mars and Diana, which were named Tauropoli. She afterwards carried her arms beyond the river Tanais, and subdued all the people of those regions, even unto Thrace. Returning then with a great quantity of spoils into her own kingdom, she caused magnificent temples to be erected to the deities before-mentioned; and she gained the love of her subjects by her mild and gentle government. She afterwards undertook an expedition against those who were on the other side of the river, and subjected to her dominion a great part of Asia, extending her arms as far as Syria."

Diodorus also mentions another race of Amazons who dwelt in Africa; and whom he speaks of as being of greater antiquity than those who lived near the river Thermoodon, and is unquestionably the race of people spoken of by Pigafetta, as bordering on Sofala and Monomotapa. "In the western parts of Libya (says he), upon the borders of those tracts that are habitable, there was anciently a nation under the government of women, and whose manners and mode of living were altogether different from ours. It was the custom of these women to manage all military affairs; and, for a certain time, during which they

they preserved their virginity, they went out as soldiers into the field. After some years employed in this manner, when the time appointed for this purpose was expired, they associated themselves with men, in order to obtain children. But the magistracy, and all public offices, they kept entirely in their own hands. The men, as the women are with us, were employed in household affairs, submitting themselves wholly to the authority of their wives. They were not permitted to take any part in military affairs, or to have any command or any public authority, which might have any tendency to encourage them to cast off the yoke of their wives. As soon as any child was born, it was delivered to the father, to be fed with milk, or such other food as was suitable to its age. If females were born, they seared their right breast, that it might not be burdensome to them when they grew up, for they considered it as a great hindrance in fighting."

Justinian represents the Amazonian republic to have taken its rise in Scythia. The Scythians had a great part of Asia under their dominion upwards of 400 years, till they were conquered by Ninus, the founder of the Assyrian empire. After his death, which happened about 1150 years before the Christian æra, and that of Semiramis and their son Ninias, Ilinus and Scolopites, princes of the royal blood of Scythia, were driven from their country by other princes, who like them aspired to the crown. They departed with their wives, children, and friends; and, being followed by a great number of young people of both sexes, they passed into Asiatic Sarmatia, beyond mount Caucasus, where they formed an establishment, supplying themselves with the riches they wanted by making excursions into the countries bordering on the Euxine Sea. The people of those countries, exasperated by the incursions of their new neighbours, united, surprised and massacred the men.

The women then resolving to revenge their death, and at the same time to provide for their own security, determined to form a new kind of government, to choose a queen, enact laws, and maintain themselves, without men, even against the men themselves. This design was not so very surprising as at first sight appears: for the greatest number of the girls among the Scythians had been inured to the same exercises as the boys; to draw the bow, to throw the javelin, to manage other arms; to riding, hunting, and even the painful labours that seem reserved for men; and many of them, as among the Sarmatians, accompanied the men in war. Hence they had no sooner formed their resolution, than they prepared to execute it, and exercised themselves in all military operations. They soon secured the peaceable possession of the country; and, not content with shewing their neighbours that all their efforts to drive them thence or subdue them were ineffectual, they made war upon them, and extended their own frontiers. They had hitherto made use of the instructions and assistance of a few men that remained in the country; but finding at length that they could stand their ground, and aggrandize themselves, without them, they killed all those whom flight or chance had saved from the fury of the Sarmatians, and for ever renounced marriage, which they now considered as an unsupportable slavery. But, as they could only secure the duration of their new kingdom by propagation, they made a law to go every year to the frontiers, to invite the men to come to them; to deliver themselves up to their embraces, without choice on their part, or the least attachment; and to leave them as soon as they were pregnant. All those whom age rendered fit for propagation, and were willing to serve the state by breeding girls, did not go at the same time in search of men: for, in order to obtain a right to promote the multiplication of the species, they must first have contributed to its destruction; nor was any thought worthy of giving birth to children till she had killed three men.

If from this commerce they brought forth girls, they educated them; but with respect to the boys, if we may believe Justin, they strangled them at the moment of their

birth. According to Diodorus Siculus, they twisted their legs and arms, so as to render them unfit for military exercises; but Quintus Curtius, Philostratus, and Jardanus, say, that the less savage sent them to their fathers. It is probable, that at first, when their fury against the men was carried to the greatest height, they killed the boys; that when this fury abated, and most of the mothers were filled with the greatest horror at depriving the little creatures of the lives they had just received from them, they fulfilled the first duties of a mother; but, to prevent their causing a revolution in the state, maimed them in such a manner as to render them incapable of war, and employed them in the mean offices which these warlike women thought beneath them. In short, that, when their conquests had confirmed their power, their ferocity subsiding, they entered into political engagements with their neighbours; and, the number of the males they had preserved becoming burdensome, they, at the desire of those who rendered them pregnant, sent them the boys, and continued still to keep the girls.

As soon as the age of the girls permitted, they took away the right breast, that they might draw the bow with the greater force. The common opinion is, that they burnt that breast, by applying to it, at eight years of age, a hot brazen instrument, which insensibly dried up the fibres and glands; some think that they did not make use of so much ceremony, but that when the part was formed they got rid of it by amputation: some again, with much greater probability, assert, that they employed no violent measures; but, by a continual compression of that part from infancy, prevented its growth, at least so far as to hinder its ever being inconvenient in war.

Plutarch, in his life of Theseus, gives some account of a battle which had been fought between the Athenians and the Amazons at Athens; and he relates some particulars of this battle which had been recorded by an ancient writer named Clidenus. He says, "That the left wing of the Amazons moved towards the place which is yet called Amazonium, and the right to a place called Pryx, near Chrysa; upon which the Athenians, issuing from behind the temple of the Muses, fell upon them; and that this is true, the graves of those that were slain, to be seen in the streets that lead to the gate Piræica, by the temple of the hero Chalcoedus, are a sufficient proof. And here it was that the Athenians were routed, and shamefully turned their backs to women, as far as to the temple of the Furies. But fresh supplies coming in from Palladium, Ardetus, and Lyceum, charged their right wing, and beat them back into their very tents; in which action a great number of the Amazons were slain." In another place he says, "It appears that the passage of the Amazons through Thessaly was not without opposition; for there are yet to be seen many of their sepulchres near Scotufæa and Cynocephalæ." And in his life of Pompey, speaking of the Amazons, Plutarch says, "They inhabit those parts of mount Caucasus that look towards the Hyrcanian sea (not bordering upon the Albanians, for the territories of the Getæ and the Leges lie betwixt): and with these people do they yearly, for two months only, accompany and cohabit, bed and board, near the river Thermodoon. After that they retire to their own habitations, and live alone all the rest of the year."

Quintus Curtius says, "The nation of the Amazons is situated upon the borders of Hyrcania, near the river Thermodoon. Their queen was named Thalestris, and she had under her subjection all the country that lies between mount Caucasus and the river Phasis. This queen came out of her dominions, in consequence of an ardent desire she had conceived to see Alexander; and, being advanced near the place where he was, she previously sent messengers to acquaint him, that the queen was come to have the satisfaction of seeing and conversing with him. Having obtained permission to visit him, she advanced with 300 of her Amazons, leaving the rest of her troops behind. As soon as she came within sight of the king, she leaped.

leaped from her horse, holding two javelins in her right hand. The apparel of the Amazons does not cover all the body; for their left side is naked down to the stomach; nor do the skirts of their garments, which they tie up in a knot, reach below their knees. They preserve their left breast entire, that they may be able to suckle their female offspring; and they cut off and sear their right, that they may draw their bows, and cast their darts, with the greater ease. Thalestris looked at the king with an undaunted countenance, and narrowly examined his person; which did not, according to her ideas, come up to the fame of his high exploits: for the barbarians have a great veneration for a majestic person, esteeming those only to be capable of performing great actions on whom nature has conferred a dignified appearance. The king having asked her whether she had any thing to desire of him, she replied, without scruple or hesitation, that she was come with a view to have children by him, she being worthy to bring him heirs to his dominions. Their offspring, if of the female sex, she would retain herself; and, if of the male sex, it should be delivered to Alexander. He then asked her, whether she would accompany him in his wars? But she declined, alleging, that she had left nobody to take care of her kingdom. She continued to solicit Alexander, that he would not send her back without conforming to her wishes; but it was not till after a delay of thirteen days that he complied. She then returned to her own kingdom."

Justin also repeatedly mentions this visit of Thalestris to Alexander; and in one place he says, that she made a march of twenty-five days in order to obtain this meeting with him. The interview between Alexander and Thalestris is likewise mentioned by Diodorus Siculus. The learned Goropius, as he is quoted by Dr. Petit, laments, in very pathetic terms, the hard fate of Thalestris, who was obliged to travel so many miles, and to encounter many hardships, in order to procure this interview with the Macedonian prince; and, from the circumstances, is led to consider the whole account as incredible. But Dr. Petit, with equal erudition, with equal eloquence, and superior force of reasoning, at length determines, that her journey was not founded upon irrational principles, and that full credit is due to those grave and venerable historians by whom this transaction has been recorded.

The Amazons are represented as being armed with bows and arrows, with javelins, and also with an axe of a particular construction, which was denominated the axe of the Amazons. According to the elder Pliny, this axe was invented by Penthesilea, one of their queens. On many ancient medals are representations of the Amazons, armed with these axes. They are also said to have had bucklers in the shape of a half moon. Yet, that there should have been women, who, without the assistance of men, built cities and governed them, raised armies and commanded them, administered public affairs, and extended their dominion by arms, is undoubtedly so contrary to all that we have seen and known of human affairs, as to appear in a very great degree incredible, as is therefore by many considered as fabulous; but that women may have existed sufficiently robust, and sufficiently courageous, to have engaged in warlike enterprises, and even to have been successful in them, is certainly not impossible, however contrary to the usual course of things. In support of this side of the question, it may be urged, that women who have been early trained to warlike exercises, to hunting, and to an hard and laborious mode of living, may be rendered more strong, and capable of more vigorous exertions, than men who have led indolent, delicate, and luxurious lives, and who have seldom been exposed even to the inclemencies of the weather. The limbs of women, as well as of men, are strengthened and rendered more robust by frequent and laborious exercise. A nation of women, therefore, brought up and disciplined as the ancient Amazons are represented to have been, would be superior to an equal number of effeminate men; though

they might be much inferior to an equal number of hardy men, trained up and disciplined in the same manner.

That much of what is said of the Amazons is fabulous, there can be no reasonable doubt; but it does not therefore follow, that the whole is without foundation. The ancient medals and monuments on which they are represented are very numerous, as are also the testimonies of ancient writers. It seems not rational to suppose that all this originated in fiction, though it may be much blended with it. The abbé Guyon speaks of the history of the Amazons as having been regarded by many persons as fabulous, "rather from prejudice than from any real and solid examination;" and it must be acknowledged, that the arguments in favour of their existence, from ancient history, and from ancient monuments, are extremely powerful.

Instances of heroism in women have occasionally occurred in modern times, somewhat resembling that of the ancient Amazons. The times and the manners of chivalry in particular, by bringing great enterprises, bold adventures, and extravagant heroism, into fashion, inspired the women with the same taste. The women, in consequence of the prevailing passion, were now seen in the middle of camps and of armies. They quitted the soft and tender inclinations, and the delicate offices, of their own sex, for the toils and the toilsome occupation of ours. During the crusades, animated by the double enthusiasm of religion and of valour, they often performed the most romantic exploits; obtained indulgences on the field of battle, and died, with arms in their hands, by the side of their lovers or of their husbands.

In Europe, women have attacked and defended fortifications; princesses have commanded armies, and obtained victories. Such was the celebrated Joan de Montfort, disputing for her duchy of Bretagne, and fighting herself. Such was that still more celebrated Margaret of Anjou, that active and intrepid general and soldier, whose genius supported a long time a feeble husband; which taught him to conquer; which replaced him upon the throne; which twice relieved him from prison; and, oppressed by fortune and by rebels, which did not bend till after she had decided in person twelve battles.

The warlike spirit among the women, consistent with ages of barbarism, when every thing is impetuous because nothing is fixed, and when all excess is the excess of force, continued in Europe upwards of 400 years, shewing itself from time to time, and always in the middle of convulsions, or on the eve of great revolutions. But there were eras and countries in which that spirit appeared with particular lustre. Such were the displays it made in the 15th and 16th centuries in Hungary, and in the islands of the Archipelago and the Mediterranean, when they were invaded by the Turks.

Among the striking instances of Amazonian conduct in modern ladies, may be mentioned that of Jane of Belleville, widow of M. de Clisson, who was beheaded at Paris, in the year 1343, on a suspicion of carrying on a correspondence with England and the count de Montfort. This lady, filled with grief for the death of her late husband, and exasperated at the ill treatment which she considered him as having received, sent off her son secretly to London; and, when her apprehensions were removed with respect to him, she sold her jewels, fitted out three ships, and put to sea, to revenge the death of her husband upon all the French with whom she should meet. This new corsair made several descents upon Normandy, where she stormed castles; and the inhabitants of that province were spectators more than once, whilst their villages were all in a blaze, of one of the finest women in Europe, with a sword in one hand and a torch in the other, urging the carnage, and eyeing with pleasure all the horrors of war.

We read in Mezeray, under the article of the Croisade preached by St. Bernard in the year 1147, "That many women did not content themselves with taking the cross, but that they also took up arms to defend it, and composed squadrons

squadrons of females, which rendered credible all that has been said of the prowess of the Amazons."

In the year 1590, the League party obtained some troops from the king of Spain. Upon the news of their being disembarked, Barri de St. Aunez, Henry IV.'s governor at Leucate, set out to communicate a scheme to the duke de Montmorency, commander in that province. He was taken in his way by some of the troops of the League, who were also upon their march with the Spaniards towards Leucate. They were persuaded, that by thus having the governor in their hands, the gates of that place would be immediately opened to them, or at least would not hold out long. But Constantia de Cecelli his wife, after having assembled the garrison, put herself so resolutely at their head, pike in hand, that she inspired the weakest with courage; and the besiegers were repulsed wherever they presented themselves. Shame and their great loss rendered them desperate, they sent a message to this courageous woman, acquainting her, that, if she continued to defend herself, they would hang her husband. She replied, with tears in her eyes, "I have riches in abundance: I have offered them, and I do still offer them, for his ransom; but I would not ignominiously purchase a life which he would reproach me with, and which he would be ashamed to enjoy. I will not dishonour him by treason against my king and country." The besiegers, having made a fresh attack without success, put her husband to death, and raised the siege. Henry IV. afterwards sent to this lady the brevet of governess of Leucate, with the reversion for her son. The famous Maid of Orleans, also, is an example known to every reader.

The abbé Arnaud, in his Memoirs, speaks of a countess de St. Balmont, who used to take the field with her husband, and fight by his side. She sent several Spanish prisoners of her taking to marshal l'euquier; and, what is not a little extraordinary, this Amazon at home was all affability and sweetness, and gave herself up to reading and acts of piety.

Dr. Johnson seems to have given credit to the accounts which have been transmitted down to us concerning the ancient Amazons; and he has endeavoured to shew, that we ought not hastily to reject ancient historical narrations because they contain facts repugnant to modern manners, and exhibit scenes to which nothing now occurring bears a resemblance. "Of what we know not (says he), we can only judge by what we know. Every novelty appears more wonderful, as it is more remote from any thing with which experience or testimony have hitherto acquainted us; and if it passes farther, beyond the notions that we have been accustomed to form, it becomes at last incredible. We seldom consider, that human knowledge is very narrow; that national manners are formed by chance; that uncommon conjunctures of causes produce rare effects; or that what is impossible at one time or place may yet happen in another. It is always easier to deny than to enquire. To refuse credit confers for a moment an appearance of superiority which every little mind is tempted to assume, when it may be gained so cheaply as by withdrawing attention from evidence, and declining the fatigue of comparing probabilities. Many relations of travellers have been slighted as fabulous, till more frequent voyages have confirmed their veracity; and it may reasonably be imagined, that many ancient historians are unjustly suspected of falsehood, because our own times afford nothing that resembles what they tell. Few narratives will either to men or women appear more incredible than the histories of the Amazons; of female nations, of whose constitution it was the essential and fundamental law, to exclude men from all participation, either of public affairs or domestic business; where female armies marched under female captains, female farmers gathered the harvest, female partners danced together, and female wits diverted one another. Yet several ages of antiquity have transmitted accounts of the Amazons of Caucasus; and of the Amazons of America, who have given their name to the greatest

river in the world. Condamine lately found such memoirs as can be expected among erratic and unlettered nations, where events are recorded only by tradition, and new swarms settling in the country from time to time confuse and efface all traces of former times."

No author has taken so much pains upon this subject as Dr. Petit. But, in the course of his work, he has given it as his opinion, that there is great difficulty in governing the women even at present, though they are unarmed and unpractised in the art of war. After all his elaborate enquiries and discussions, therefore, this learned writer might probably think, that it is not an evil of the first magnitude that the race of Amazons now ceases to exist.

Rousseau says, "The empire of the woman is an empire of softness, of address, of complacency. Her commands are caresses, her menaces are tears." But the empire of the Amazons was certainly an empire of a very different kind. Upon the whole we may conclude with Dr. Johnson: "The character of the ancient Amazons was rather terrible than lovely. The hand could not be very delicate that was only employed in drawing the bow and brandishing the battle-axe. Their power was maintained by cruelty, their courage was deformed by ferocity; and their example only shews, that men and women live best together."

AMAZONIAN HABIT, in antiquity, denotes a dress formed in imitation of the Amazons. Marcia, the famous concubine of the emperor Commodus, had the appellation of *Amazonian*, because she charmed him most in a habit of this kind. Hence also that prince himself engaged in combat in the amphitheatre in an Amazonian habit; and of all titles the *Amazonius* was one of those he most delighted in. In honour either of the gallant or his mistress, the month December was also denominated *Amazonius*. Some also apply Amazonian habit to the hunting-dress worn by many ladies among us.

AM'BA, *f.* an Abylinian or Ethiopic word, signifying a rock. The Abylinians give names to each of their rock, as *amba-dorho*, the rock of a hen, &c. Some of these rocks are said to have the name of *aorni*; and are of such a stupendous height, that the Alps and Pyrenees are but low in comparison of them. Amongst the mountains, and even frequently in the plains, of this country, arise steep and craggy rocks of various forms, some resembling towers, others pyramids, &c. so perpendicular and smooth on the sides, that they seem to be the works of art; inasmuch, that men, cattle, &c. are craned up by the help of ladders and ropes; and yet the tops of these rocks are covered with woods, meadows, fountains, fishponds, &c. which very copiously supply the animals seated thereon with all the conveniences of life. The most remarkable of these rocks is called *Amba-Gessen*. It is prodigiously steep, in the form of a castle built of free stone, and almost impregnable. Its summit is about half a Portuguese league in breadth, and the circumference at the bottom about half a day's journey. The ascent at first is easy; but grows afterwards so steep, that the Abyssinian oxen, which will otherwise clamber like goats, must be craned up and let down with ropes. Here the princes of the blood were formerly confined, in low cottages amongst shrubs and wild cedars, with an allowance barely sufficient to keep them alive. There is, according to Kircher, in this country, a rock so curiously hollowed by nature, that at a distance it resembles a looking-glass; and opposed to this another, on the top of which nothing can be so softly whispered but it may be heard a great way off. Between many of these rocks and mountains are vast abysses, which appear very dreadful to the eye.

AM'BACHT, *f.* in topography, denotes a kind of jurisdiction or territory, the possessor whereof has the administration of justice, both in *alto* and *basso*. In some ancient writers, *ambacht* is particularly used for the jurisdiction, government, or chief magistracy, of a city.

AMBA'GES, *f.* [Lat.] A circuit of words; a circumlocutory form of speech; a multiplicity of words; an in-

direct manner of expression.—They gave those complex ideas names, that they might the more easily record and discourse of things they were daily conversant in, without long *ambages* and circumlocutions; and that the things they were continually to give and receive information about, might be the easier and quicker understood. *Locke*.

AMBA'GIOUS, *adj.* [from *ambages*, Lat.] Circumlocutory; perplexed; tedious.

AMBAMAR'JAM, or **AMBA'RA**, the capital of Abyssinia, near the head of the Nile. Lat. 13. 12. N. lon. 35. 14. E.

AMBAPA'YA, *f.* in botany. See **CARICA**.

AMBARVA'LIA, *f.* [of *ambio*, to surround, and *arva*, Lat. the grounds.] A feast in honour of Ceres, celebrated by the ancient Romans to obtain a good harvest of the gods. They sacrificed a heifer according to Virgil, but Tibullus says a lamb, which was carried three times in procession about their fields. This festival was generally kept at the time of the harvest, and sometimes when the product of the earth was in danger. It was sometimes celebrated at Rome, and the priests who performed the ceremonies were called *arvales*.

AMBASSA'DE, *f.* [ambassade, Fr.] Embassy; character or business of an ambassador. A word not now in use:

When you disgrac'd me in my *ambassade*,
Then I degraded you from being king. *Shakespeare*.

AMBAS'SADOR, *f.* [ambassadeur, Fr. *embaxador*, Span. It is written differently, as it is supposed to come from the French or Spanish language; and the original derivation being uncertain, it is not easy to settle its orthography. Some derive it from the Hebrew *בשר*, to tell, and *משר* a messenger; others from *ambastus*, which in the old Gaulish signified a servant; whence *ambascia*, in low Latin, is found to signify service, and *ambasciator*, a servant; others deduce it from *ambacht*, in old Teutonic, signifying a government, and Junius mentions a possibility of its descent from *αμβαστω*; and others from *am* for *ad*, and *bassus*, low, as supposing the act of sending an ambassador, to be in some sort an act of submission. All these derivations lead to write *ambassador*, not *embassador*.] A person sent in a public manner from one sovereign power to another, and supposed to represent the power from which he is sent. The person of an ambassador is inviolable. Ambassadors are either ordinary or extraordinary. Ambassador in ordinary, is he who constantly resides in the court of another prince, to maintain a good understanding, and look to the interest of his master. Till about 200 years ago, ambassadors in ordinary were not heard of: all, till then, were ambassadors extraordinary; that is, such as are sent on some particular occasion, and who retire as soon as the affair is dispatched. By the law of nations, none under the quality of a sovereign prince can send or receive an ambassador. At Athens, ambassadors mounted the pulpit of the public orators, and there opened their commission, acquainting the people with their errand. At Rome, they were introduced to the senate, and delivered their commissions to the fathers.

Ambassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein: nor must they go into mourning on any occasion of their own, because they represent the person of their prince. By the civil law, all writs and processes, whereby the person of any ambassador or other public minister of any foreign prince or state, or of any of his domestics or domestic servants, may be arrested, or his goods distrained, shall be void. Provided, that no merchant or other trader, within the description of any of the statutes against bankrupts, shall have any benefit of this act; nor any servant of an ambassador, unless the name of such servant be registered in the office of one of the secretaries of state, and by him transmitted to the sheriffs of London and Middlesex. 7 *An. c.* 12.

Generally, the rights, powers, duties, and privileges, of ambassadors, are determined by the law of nature and nations, and not by any municipal constitutions: for, as

they represent the persons of their respective masters, who owe no subjection to any laws but those of their own country, their actions are not subject to the controul of the private law of that state wherein they are appointed to reside. 1 *Black.* 253.

If an ambassador grossly offends, or makes an ill use of his character, he may be sent home, and accused before his master, who is bound either to do justice upon him, or avow himself the accomplice of his crimes; but the general practice throughout Europe seems now to be, not to punish him in the country where he executes the function of ambassador. *Id.*

AMBAS'SADRESS, *f.* [ambassadrice, Fr.] The lady of an ambassador. In ludicrous language, a woman sent on a message:

Well, my *ambassadresses*——
Come you to menace war, and loud defiance?
Or does the peaceful olive grace your brow. *Rowe*.

AM'BASSAGE, *f.* [from *ambassador*.] An embassy; the business of ambassador.—Maximilian entertained them with dilatory answers; so as the formal part of their *ambassage* might well warrant their further stay. *Bacon*.

AMBAY'BA, *f.* in botany. See **CECROPIA**.

AM'BE, [αμβη, Gr.] The ridge or edge of a hill. In surgery, a superficial jutting out of the bones.

AMBE, or **AMBI**, an instrument used in dislocations of the humerus. Hippocrates has taken notice of it in his treatise de Articul. sect. vi. and it is called Hippocrates's *ambe*. Galen explains the word *ambe*, by αμφοδης επιανυστης, "an eminence like a border;" and says, that the whole of the machine takes that name, because its extremity runs out with an edge like the lip or brim of a pot towards the interior cavity, which, as well as the edge or border of any thing on the top or extremity, are signified by the word *ambe*. When the head of the humerus rests in the axilla, this instrument is sometimes of service, but in no other case; and even here it is rarely used, for, when gentle methods fail, violence seldom succeeds.

AM'BEL, *f.* in botany. See **NYMPHÆA**.

AMBELA'NIA, in botany. See **WILLUGHBEIA**.

Succinum AM'BER, *f.* [ambre, Fr. *ambar*, Lat. of αμβαρ, Gr.] A solid, hard, semipellucid, bituminous, substance, of a particular nature, of use in medicine and in several of the arts. Amber has been of great repute in the world from the earliest times. Plato, Aristotle, Herodotus, Æschylus, and others, have commended its virtues. In the times of the Romans, it became in high esteem as a gem; and in the luxurious reign of Nero, immense quantities of it were brought to Rome, and used for ornamenting works of various kinds. The most remarkable property of this substance is, that when rubbed it draws or attracts other bodies to it: and this, it is observed, it does even to those substances which the ancients thought it had an antipathy to; as oily bodies, drops of water, human sweat, &c. By friction it is brought to yield light pretty copiously in the dark; whence it is reckoned among the native phosphori. The property which amber possesses, of attracting light bodies, was very anciently observed. Thales of Miletus, 600 years before Christ, concluded from hence, that it was animated. But the first person who expressly mentions this substance, is Theophrastus, about the year 300 before Christ. The attractive property of amber is likewise occasionally taken notice of by Pliny, and other later naturalists, particularly by Gassendus, Kenelm Digby, and Sir Thomas Brown; but it is generally apprehended that this quality was peculiar to amber and jet, and perhaps agate, till Gilbert published his treatise *De Magnete*, in the year 1600. From αμντρον, the Greek name for amber, is derived the term *electricity*, which is now very extensively applied, not only to the power of attracting light bodies inherent in amber, but to other similar powers, and their various effects, in whatever bodies they reside, or to whatever bodies they may be communicated.

Amber assumes all figures in the ground; that of a pear,

pear, an almond, a pea, &c. In amber there have been said to be letters found very well formed; and even Hebrew and Arabic characters. Within some pieces, leaves, insects, &c. have likewise been found included; which seems to indicate, either that the amber was originally in a fluid state, or that, having been exposed to the sun, it was once softened, and rendered susceptible of the leaves, insects, &c. which came in its way. The latter of these suppositions seems the more agreeable to the phenomenon; because those insects, &c. are never found in the centre of the pieces of amber, but always near the surface. It is observed by the inhabitants of those places where amber is produced, that all animals, whether terrestrial, aerial, or aquatic, are extremely fond of it, and that pieces of it are frequently found in their excrements. The bodies of insects, found buried in amber, are viewed with admiration by all the world; but of the most remarkable of these, many are to be suspected as counterfeit, the great price at which beautiful specimens of this kind sell having tempted ingenious cheats to introduce animal bodies in such artful manners into seemingly whole pieces of amber, that it is not easy to detect the fraud.

Of those insects which have been originally inclosed in amber, some are plainly seen to have struggled hard for their liberty, and even to have left their limbs behind them in the attempt; it being no unusual thing to see, in a mass of amber that contains a stout beetle, the animal wanting one, or perhaps two, of its legs; and those legs left in different places, nearer that part of the mass from which it has travelled. This also may account for the common accident of finding legs or wings of flies, without the rest of their bodies, in pieces of amber; the insects having, when entangled in the yet soft and viscid matter, escaped at the expence of leaving those limbs behind them. Drops of clear water are sometimes also preserved in amber. These have doubtless been received into it while soft, and preserved by its hardening round them. Beautiful leaves of a pinnated structure, resembling some of the ferns, or maiden hairs, have been found in some pieces; but these are rare, and the specimens of great value. Mineral substances are also found at times lodged in masses of amber. Some of the pompous collections of the German princes boast of specimens of native gold and silver in masses of amber; but as there are many substances of the marcasite, and other kinds, that have all the glittering appearance of gold and silver, it is not to be too hastily concluded, that these metals are really lodged in these beds of amber. Iron is found in various shapes immersed in amber; and as it is often seen eroded, and sometimes in the state of vitriol, it is not impossible but that copper, and the other metals, may be also sometimes immersed in it in the same state.

Naturalists have been greatly divided as to the origin of this substance, and what class of bodies it belongs to; some referring it to the vegetable, others to the mineral, and some even to the animal kingdom. Pliny describes it as "a resinous juice, oozing from ancient pines, others say poplars; whereof there are whole forests on the coasts of Sweden; and discharged thence into the sea, where, undergoing some alteration, it is thrown, in this form, upon the shores of Prussia, which lie very low: he adds, that it was hence the ancients gave it the denomination *succinum*; from *succus*, juice." According to Hartman, amber is formed of bitumen, mixed with vitriol and other salts. But, though this were allowed him with regard to the fossil amber, many dispute whether the sea-amber be so produced. It is, however, apparent, that all amber is of the same origin, and probably that which is found in the sea has been washed thither out of the cliffs; though Hartman thinks it very possible, that some of it may be formed in the earth under the sea, and be washed up thence. The sea-amber is usually finer to the eye than the fossil; but the reason is, that it is divested of that coarse coat with which the other is covered while in the earth. Upon the whole, it seems generally agreed upon, that

amber is a true bitumen of fossil origin. In a late volume of the *Journal de Physique*, however, we find it asserted by Dr. Girtanner to be an animal product, a sort of honey or wax formed by a species of large ant called by Linnaeus *formica rufa*. These ants, our author informs us, inhabit the old pine forests, where they sometimes form hills about six feet in diameter; and it is generally in these ancient forests, or in places where they have been, that fossil amber is found. This substance is not so hard as that which is taken up in the sea at Prussia, and which is well known to naturalists. It has the consistence of honey or of half-melted wax, but it is of a yellow colour like common amber; it gives the same product by chemical analysis, and it hardens like the other when it is suffered to remain some time in a solution of common salt. This accounts for the insects that are so often found inclosed in it. Among these insects ants are always the most prevailing; which tends farther, Dr. Girtanner thinks, to the confirmation of his hypothesis. Amber, then, in his opinion, is nothing but a vegetable oil rendered concrete by the acid of ants, just as wax is nothing but an oil hardened by the acid of bees; a fact incontestably proved, we are told, since Mr. Metherie has been able to make artificial wax by mixing oil of olives with the nitrous acid, and which wax is not to be distinguished from the natural.

Amber of the finest kind has been found in England. It is frequently thrown on the shores of Yorkshire and many other places, and found even in our clay-pits; the pits dug for tile-clay between Tyburn and Kensington gravel-pits, and that behind St. George's Hospital at Hyde-park corner, have afforded fine specimens. Poland, Silesia, and Bohemia, are famous for the amber dug up there at this time. Germany affords great quantities of amber, as well dug up from the bowels of the earth as tossed about on the shores of the sea and rivers there. Saxony, Misnia, and Sweden, and many other places in this tract of Europe, abound with it. Denmark has afforded, at different times, several quantities of fossil amber; and the shores of the Baltic abound with it. But the countries lying on the Baltic afford it in the greatest abundance of all; and of these the most plentiful country is Prussia, and the next is Pomerania. Prussia was, as early as the times of Theodoric the Goth, famous for amber; for, this substance coming into great repute with this prince, some natives of Prussia, who were about his court, offered their service to go to their own country, where that substance, they said, was produced, and bring back great stores of it. They accordingly did so; and from this time Prussia had the honour to be called the Country of Amber, instead of Italy, which had before undeservedly that title. This article alone brings his Prussian majesty a revenue of 26,000 dollars annually. The amber of Prussia is not only found on the sea-coasts, but in digging; and, though that of Pomerania is generally brought from the shores, yet people who dig, on different occasions, in the very heart of the country, constantly find amber. In the mines where it is found, the upper surface is composed of sand, under which is a stratum of loam, and under this a bed of wood partly entire, but chiefly mouldered or changed into a bituminous substance. Under the wood is a stratum of vitriolic or rather aluminous mineral, in which the amber is found. Strong sulphureous exhalations are often perceived in the pits.

The specific gravity of amber is from 1,065 to 1,000; its fracture is even, smooth, and glossy; it is capable of a fine polish, and, when rubbed or heated, gives a fragrant aromatic smell, particularly when it melts, that is at 550 of Fahrenheit, but it then loses its transparency; projected on burning coals, it burns with a whitish flame, and a whitish-yellow smoke, but gives very little soot, and leaves brownish ashes; it is insoluble in water and spirit of wine, though this latter, when highly rectified, extracts a reddish colour from it; but it is soluble in the vitriolic acid, which then acquires a reddish purple colour, and is precipitable from it by water; no other acid dissolves it, nor is it soluble

soluble in fixed alkalies, nor in essential nor expressed oils, without some decomposition and long digestion; but balsams dissolve it readily; 75 grains of it alkalize 100 of nitre; by distillation it affords a small quantity of water, an oil of the nature of petrol, and a peculiar acid.

Amber having been formerly considered as a valuable substance, and the specimens, which are large, or contain entire or perfect insects within them, being still of considerable price, the methods of softening it so as to introduce these extraneous bodies, or of uniting smaller pieces together, have been kept as profitable secrets, if it be true that they ever were discovered. It is said that two pieces of this substance may be united by wetting them with oil of tartar, and applying them together with heat; and Wallerius mentions, that pieces of yellow amber may be softened, formed into one, and even dissolved, by means of oil of turnip-seed, in a gentle heat; and that, according to some authors, it may be rendered transparent by boiling in rape-seed oil, linseed oil, salt water, &c. Neumann, however, denies that either salt water or linseed oil produce this effect; though he states, as the common practices of workmen, the following methods: the one consists in surrounding the amber with sand in an iron pot, and cementing it with a gradual fire for forty hours, some small pieces placed near the sides of the vessel being occasionally taken out for judging of the effect of the operation; the second method, which he says is that most generally practised, is by digesting and boiling the amber about twenty hours with rape-seed oil, by which it is rendered both clear and hard.

Amber is principally of two colours, white and yellow. The white is the most esteemed for medicinal purposes, as being the most odoriferous, and containing the greatest quantity of volatile salt; though the yellow is most valued by those who manufacture beads and other toys with it, by reason of its transparency. Amber is the basis of all varnishes, by solution in the way described under the article VARNISH.

Could amber be dissolved without impairing its transparency, the art of embalming might possibly be carried to a great height by it, if we could preserve the human corpse in a transparent case of amber, as the bodies of flies, spiders, grasshoppers, &c. are to a great perfection. Something of a substitute of this kind we have in fine rosin; which being dissolved by heat, and the bodies of small animals several times dipped in it, they are thus coated with colophony, that in some degree resembles amber; but this must be kept from dust.

Amber in substance has been much recommended as a nervous and cordial medicine; and alleged to be very efficacious in promoting the menstrual discharge, and the exclusion of the fœtus and secundines in labour; but, as in its crude state it is quite insoluble by our juices, it certainly can have very little effect on the animal system, and therefore it is now seldom given in substance. The forms in which amber is prepared are, a tincture, a salt, and an oil, the preparations and uses of which are described in the proper place under the article PHARMACY.

AM'BERBOI, *f.* in botany. See CENTAUREA.

AM'BER-TREE, *f.* in botany. See ANTHOSPERMUM.

AM'BERG, a city of Germany, the capital of the palatinate of Bavaria, with a good castle, ramparts, bastions, and deep ditches. It is seated near the confines of Franconia, on the river Ills, forty miles E. of Nuremburg. It drives a great trade in iron and other metals, found in the neighbouring mountains. Lat. 49. 30. N. lon. 12. 7. E.

AMBERGREASE, AMBERGRISE, or GREY AMBER, *f.* [*amber gris*, Fr.] is a solid, opaque, ash-coloured, fatty, inflammable, substance, variegated like marble, remarkably light, rugged and uneven in its surface, and has a fragrant odour when heated. It is found in the sea, or on the sea-coast, or in the sand near the sea-coast; especially in the Atlantic Ocean, on the sea-coast of Brazil, and that of Madagascar; on the coast of Africa, of the East Indies, China, Japan, and the Molucca islands; but most of the ambergrease which is brought to England

comes from the Bahama islands, from Providence, &c. where it is found on the coast. It is also found in the abdomen of whales by the whale-fishermen, always in lumps of various shapes and sizes, weighing from half an ounce to an hundred and more pounds.

There have been many different opinions concerning the origin of this substance. It has been supposed to be a fossil bitumen or nephtha, exuding out of the bowels of the earth in a fluid form, and distilling into the sea, where it hardens and floats on the surface. But the most satisfactory account of the real origin of ambergrease is given by Dr. Swedjar, in the Philosophical Transactions for 1783.

We are told by all writers on ambergrease, that sometimes claws and beaks of birds, feathers of birds, parts of vegetables, shells, fish, and bones of fish, are found in the middle of it, or variously mixed with it. Of a very large quantity of pieces, however, which the doctor examined, he found none that contained any such thing; though he allows that such substances may sometimes be found in it: but, in all the pieces of any considerable size, whether found on the sea or in the whale, he constantly found a considerable quantity of black spots, which, after the most careful examination, appeared to be the beaks of the *Sepia octopodia*; and these beaks, he thinks, might be the substances which have hitherto been always mistaken for claws or beaks of birds, or for shells.

According to the best information Dr. Swedjar could obtain from several of the most intelligent persons employed in the spermaceti-whale-fishery, and in procuring and selling ambergrease, it appears, that this substance is found in the belly of the whale, but in that particular species only which is called the *spermaceti whale*, and which, from its description and delineation, appears to be the *Physeter macrocephalus* Linnæi. The New England fishermen, according to their account, have long known that ambergrease is to be found in the spermaceti whale; and they are so convinced of this fact, that whenever they hear of a place where ambergrease is found, they always conclude that the seas in that part are frequented by this species of whale.

The persons who are employed in the spermaceti-whale-fishery, confine their views for ambergrease to the *Physeter macrocephalus*. Whenever they hook a spermaceti whale, they observe, that it constantly not only vomits up whatever it has in its stomach, but also generally discharges its feces at the same time; and, if this latter circumstance takes place, they are generally disappointed in finding ambergrease in its belly. But whenever they discover a spermaceti whale, male or female, which seems torpid and sickly, they are always pretty sure to find ambergrease, as the whale in this state seldom voids its feces upon being hooked. They likewise generally meet with it in the dead spermaceti whales, which they sometimes find floating on the sea. It is observed also, that the whale in which they find ambergrease often has a morbid protuberance, or, as they express it, a kind of gathering, in the lower part of its belly, in which, if cut open, ambergrease is found. It is observed, that all those whales in whose bowels ambergrease is found, seem not only torpid and sick, but are also constantly leaner than others; so that, if we may judge from the constant union of these two circumstances, it would seem that a larger collection of ambergrease in the belly of the whale is a source of disease, and probably sometimes the cause of its death. As soon as they hook a whale of this description, torpid, sickly, emaciated, or one that does not dung on being hooked, they immediately either cut up the above-mentioned protuberance, if there be any, or they rip open its bowels from the orifice of the anus, and find the ambergrease sometimes in one sometimes in different lumps, of generally from three to twelve and more inches in diameter, and from one pound to twenty or thirty pounds in weight, at the distance of two, but most frequently of about six or seven, feet from the anus, and never higher up in the intestinal canal; which, according to their description, is in all probability the intestine cæcum, hitherto mistaken for a peculiar bag made

made by nature for the secretion and collection of this singular substance. That the part they cut open to come at the ambergrease, is no other than the intestinal canal is certain, because they constantly begin their incision at the anus, and find the cavity every where filled with the faeces of the whale, which, from their colour and smell, it is impossible for them to mistake. The ambergrease found in the intestinal canal is not so hard as that which is found on the sea or sea-coast, but soon grows hard in the air: when first taken out it has nearly the same colour, and the same disagreeable smell, though not so strong, as the more liquid dung of the whale has; but, on exposing it to the air, it by degrees not only grows greyish, and its surface is covered with a greyish dust, like old chocolate, but it also loses its disagreeable smell, and, when kept for a certain length of time, acquires the peculiar odour which is so agreeable to most people.

In considering whether there be any material difference between the ambergrease found upon the sea or sea-coast, and that found in the bowels and among the dung of the whale, the doctor refutes the opinion, that all ambergrease found in whales is of an inferior quality, and therefore much less in price. Ambergrease, he observes, is only valued for its purity, lightness, compactness, colour, and smell. There are pieces of ambergrease found on different coasts, which are of a very inferior quality; whereas there are often found in whales pieces of it of the first value; nay, several pieces found in the same whale, according to the above-mentioned qualities, are more or less valuable. All ambergrease found in whales, has at first, when taken out of the intestines, very near the same smell as the liquid excrements of that animal have; it has then also nearly the same blackish colour: they find it in the whale sometimes quite hard, sometimes rather softish, but never so liquid as the natural faeces of that animal. And it is a matter of fact, that, after being taken out and kept in the air, all ambergrease grows not only harder and whiter, but also loses by degrees its smell, and assumes such an agreeable one, as that in general has which is found swimming upon the sea; therefore the goodness of ambergrease seems rather to depend on its age. By being accumulated after a certain length of time in the intestinal canal, it seems even then to become of a whiter colour, and less ponderous, and acquire its agreeable smell. The only reason why ambergrease found floating on the sea generally possesses the above-mentioned qualities in a superior degree, is because it is commonly older, and has been longer exposed to the air. It is more frequently found in males than females; the pieces found in females are in general smaller, and those found in males seem constantly to be larger and of a better quality; and therefore the high price in proportion to the size is not merely imaginary for the rarity sake, but in some respect well founded, because such large pieces appear to be of greater age, and possess the above-mentioned qualities in general in a higher degree of perfection than smaller pieces.

It is known, that the sepia octopodia, or cuttle-fish, is the constant and natural food of the spermaceti whale, or physeter macrocephalus. Of this the fishers are so well persuaded, that, whenever they discover any recent relics of it swimming on the sea, they conclude that a whale of this kind is, or has been, in that part. Another circumstance which corroborates the fact is, that the spermaceti whale on being hooked generally vomits up some remains of the sepia. Hence it is easy to account for the many beaks, or pieces of beaks, of the sepia, found in all ambergrease. The beak of the sepia is a black horny substance, and therefore passes undigested through the stomach into the intestinal canal, where it is mixed with the faeces; after which it is either evacuated with them, or, if these latter be preternaturally retained, forms concretions with them, which render the animal sick and torpid, and produce an obfipation, which ends either in an abscess of the abdomen, as has been frequently observed, or becomes fatal to the animal; whence, in both the cases, on

the bursting of its belly, that hardened substance known under the name of *ambergrease* is found swimming on the sea or thrown upon the coast.

From the preceding account, and his having constantly found the above-mentioned beaks of the sepia in all pieces of ambergrease of any considerable size, Dr. Swediaur concludes, that all ambergrease is generated in the bowels of the physeter macrocephalus, or spermaceti whale; and there mixed with the beaks of the sepia octopodia, which is the principal food of that whale. He therefore defines ambergrease to be the preternaturally hardened dung or faeces of the physeter macrocephalus, mixed with some indigestible relics of its food. Mr. Magellan, however, mentions an undoubtedly vegetable ambergrease, gathered from a tree which grows in Guyana, and is called *cuma*. Specimens of this were presented to him by Mr. Aublet, author of the *Histoire de la Guyane*, published in 1774, who himself collected it on the spot; and Mr. Magellan presented part of it to the late Dr. Fothergill, and also to Dr. Combe. It is of a whitish brown colour, with a yellowish shade; melts and burns like wax on the fire, but is rather of a more powdery consistence than any ambergrease he had seen.

The use of ambergrease in Europe is now nearly confined to perfumery, though it has been recommended in medicine by several eminent physicians. It is soluble in boiling spirit of wine; from which, if the saturated solution be set in a very cold place, a part of the ambergrease concretes into a whitish unctuous substance. Distilled it yields an aqueous phlegm, a brown acidulous spirit, a deep-coloured oil, a thicker balsam, and sometimes a little concrete salt. The spirit, oil, balsam, and salt, are similar to those obtained from amber, except that the oil is more agreeable to the smell. Rectified spirit of wine takes up near one-twelfth of its weight of ambergrease. According to Neumann, if the spirit is impregnated with a little essential oil, the ambergrease will dissolve more readily in it. A deeper coloured tincture is made with alcohol, but not a stronger. Dulcified acids and alkaline spirits have no effect upon it; water and expressed oils have as little. It is one of the most agreeable perfumes; it heightens the natural odour of other bodies; but the great secret to this end is, to add it so sparingly, that while it improves the smell of that to which it is added, its own may not be discovered. From two grains to a scruple it is a high cordial and powerful antispasmodic; though the common dose is from two to four grains, which may be given in an egg lightly poached. Riverius says, that ambergrease is a specific against the fumes canina.

In Asia, and part of Africa, ambergrease is not only used as a medicine and as a perfume, but considerable use is also made of it in cookery, by adding it to several dishes as a spice. A great quantity of it is also constantly bought by the pilgrims who travel to Mecca; probably to offer it there, and make use of it in fumigations, in the same manner as frankincense is used in catholic countries.

Ambergrease may be known to be genuine by its fragrant scent when a hot needle or pin is thrust into it, and its melting like fat of an uniform consistence; whereas the counterfeit will not yield such a smell, nor prove of such a fat texture. One thing, however, is very remarkable, that this drug, which is the most sweet of all the perfumes, should be capable of being resembled in smell by a preparation of one of the most odious of all stinks. Mr. Homberg found, that a vessel in which he had made a long digestion of the human faeces, acquired a very strong and perfect smell of ambergrease, inasmuch that any one would have thought a great quantity of essence of ambergrease had been made in it. The perfume was so strong and offensive, that the vessel was forced to be removed out of the laboratory.

AM'BERT, a town in the department of Puy-de-Dome, and in the late province of Auvergne. It is seated in a beautiful valley, on the river Ore. It carries on the paper manufacture very extensively, and has also a trade in coarse laces, cumblets, ferrets, &c. It is twenty-one
5 K miles

miles E. of Iffoire, and 300 from Paris. Lat. 45. 25. N. lon. 3. 50. E.

AMBIANCUTIVA, a kingdom and town of Ethiopia, on the river Nile.

AMBIA'NI, or **AMBIANEN'SIS CIVITAS**, now Amiens, a city of Picardy. It is called Samarobriva by Cæsar and Cicero; which, according to Valesius, signifies the bridge of the Samara, or Somme. Ambiani is a later name, taken from that of the people, after the usual manner of the lower age.

AMBIDEX'TER, *f.* a person who can use both hands with the same facility, and for the same purposes, that the generality of people do their right hands. As to the natural cause of this faculty, some, as Hæfer, attribute it to an extraordinary supply of blood and spirits from the heart and brain, which furnish both hands with the necessary strength and agility; others, as Nicholas Massa, to an erect situation of the heart, inclining neither to the right hand nor left; and others to the right and left subclavian arteries being of the same height, and same distance from the heart, by which the blood is propelled with equal force to both hands. But these are only conjectures, or rather chimeras. Many think, that, were it not for education and habit, all mankind would be ambidexters; and, in fact, we frequently find nurses obliged to be at a good deal of pains before they can bring children to forego the use of their left hands. How far it may be an advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occasions in life, when it would be better to have the equal use of both hands. Surgeons and oculists are of necessity obliged to be ambidexters; bleeding, &c. in the left arm or left ankle, and operations on the left eye, cannot be well performed but with the left hand. Various instances occur in history, where the left hand has been exercised preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exercise both hands alike; and Plato enjoins ambidexterity to be encouraged in his republic.

AMBIDEXTER, among the English lawyers, a juror or embracer, who accepts money of both parties, for giving his verdict: an offence for which he is liable to be imprisoned, for ever excluded from a jury, and to pay ten times the sum he accepted of.

AMBIDEXTERITY, *f.* The quality of being able equally to use both hands. Double dealing.

AMBIDEX'TROUS, *adj.* Having, with equal facility, the use of either hand. Double dealing; practising on both sides.—Æsop condemns the double practices of trimmers, and all false, shuffling, and *ambidextrous*, dealings. *L'Etrange*.

AMBIDEX'TROUSNESS, *f.* The quality of being ambidextrous.

AM'BIENT, *adj.* [*ambiens*, Lat.] Surrounding; encompassing; investing. It is chiefly applied to such bodies, especially fluids, as encompass others on all sides: thus, the air is frequently called an ambient fluid, because it is diffused round the earth:

This which yields or fills
All space, the ambient air wide interfus'd. *Milton*.

AMBIGENÆ OVES, *f.* in the heathen sacrifices, an appellation given to such ewes as, having brought forth twins, were sacrificed, together with their two lambs, one on each side.

AMBIGENAL HYPER'BOLA, *f.* a name given by Sir Isaac Newton to one of the triple hyperbolas of the second order, having one of its infinite legs falling within an angle formed by the asymptotes, and the other without.

AMBIGU, *f.* [*Fr.*] An entertainment, consisting not of regular courses, but of a medley of dishes set on together:

When straiten'd in your time, and servants few,
You'd richly then compose an *ambigu*;
Where first and second course, and your desert,
All in one single table have their part.

King.

AMBIGU'ITY, *f.* [from *ambiguous*.] Doubtfulness of meaning; uncertainty of signification; double meaning.—With *ambiguities* they often entangle themselves, not marking what doth agree to the word of God in itself, and what in regard of outward accidents. *Hooker*.

AMBIGUOUS, *adj.* [*ambigu*, *Fr.* *ambiguo*, *It.* and *Sp.* of *ambiguus*, of *ambo*, both, and *ago*, Lat. to drive.] Doubtful; having two meanings; of uncertain signification. Applied to persons using doubtful expressions. It is applied to expressions, or those that use them, not to a dubious or suspended state of mind:

Th' *ambiguous* god, who rul'd her lab'ring breast,
In these mysterious words his mind express'd;
Some truths reveal'd, in terms involv'd the rest. *Dryden*.

AMBIGUOUSLY, *adv.* In an ambiguous manner; doubtfully; uncertainly; with double meaning.

AMBIGUOUSNESS, *f.* The quality of being ambiguous; uncertainty of meaning; duplicity of signification.

AMBI'LOGY, *f.* [*ambilogium*, or *ambiloquium*, Lat. of *ambo*, both, and *λογος*, a word or speech.] Talk of ambiguous or doubtful signification.

AMBI'LOQUOUS, *adj.* [from *ambo* and *loquor*, Lat.] Using ambiguous and doubtful expressions.

AMBI'LOQUY, *f.* [*ambiloquium*, Lat.] The use of doubtful and indeterminate expressions; discourse of doubtful meaning.

AM'BIT, *f.* [*ambitus*, Lat.] The compass or circuit of any thing; the line that encompasses any thing.

AMBIT of a **FIGURE**, in geometry, is the perimeter or line, or sum of the lines, by which the figure is bounded.

AMBIT was particularly used, in antiquity, to denote a space of ground to be left vacant betwixt one building and another. By the laws of the twelve tables, houses were not to be built contiguous, but an ambit or space of two feet and a half was to be left about each for fear of fire. The ambitus of a tomb or monument denoted a certain number of feet, in length and breadth, around the same, within which the sanctity assigned to it was limited. The whole ground wherein a tomb was erected was not to be secreted from the common uses; for this reason, it was frequent to inscribe the ambit on it, that it might be known how far its sanctity extended: thus, *in fronte pedes tot, in agrum pedes tot*.

AMBI'TION, *f.* [*ambitio*, Lat. the desire of something higher than is possessed at present.] The desire of preferment or honour.—Who would think, without having such a mind as Antiphras, that so great goodness could not have bound gratefulness? and so high advancement not have satisfied his *ambition*? *Sidney*.—The desire of any thing great or excellent:

Urge them, while their souls
Are capable of this *ambition*;
Left zeal, now melted by the windy breath
Of soft petitions, pity, and remorse,
Cool and congeal again to what it was. *Shakespeare*.

It is used with *to* before a verb, and *of* before a noun.—I had a very early *ambition* to recommend myself to your lordship's patronage. *Addison*.—There was an *ambition* of wit, and an affectation of gaiety. *Pope*.

Ambition is one of those passions that is never to be satisfied. It swells gradually with success; and every acquisition serves but as a spur to further attempts. "If a man (it has been well observed) could at once accomplish all his desires, he would be a miserable creature; for the chief pleasure of this life is to wish and desire. Upon this account, every prince who aspires to be despotic aspires to die of weariness. Searching every kingdom for the man who has the least comfort in life, Where is he to be found?—In the royal palace.—What! his majesty? Yes; especially if he be despotic."

Marius, so famous in the Roman history, was a man that had but one passion, the desire of aggrandizing himself, to which he never made any scruple to sacrifice every thing;

for

for he never knew either integrity, sincerity, or gratitude, when the pursuit of his views was in question. It was this ambition that made him quit the plough and take up the profession of arms, by which he was in hopes of making his fortune. He succeeded beyond all expectations: but after having passed through every honour in the Roman government; having acquired a considerable fortune, and made a good alliance, by marrying Julia, Cæsar's aunt; instead of being satisfied with his uncommon success, and enjoying the fruits of his toils and dangers, at the age of seventy, when he was become exceedingly gross and heavy, and oppressed with many infirmities, he was determined to take on him the war against Mithridates king of Pontus. He imagined, that this war furnished an occasion of acquiring great glory and riches, without much danger. But Sylla, as consul, was general of the Roman armies, and had a just right to appropriate the first and most glorious province to himself: he was likewise appointed to this command by the senate. Marius opposed him. The contest ran high: and a civil war ensued. Sylla besieges the city of Rome, and Marius is obliged to save himself by flight. Sylla makes an alteration in the government, and an order is issued out in all the cities of Italy, to seize and kill Marius wherever he should be found. After wandering from place to place, and suffering a variety of difficulties, dangers, and distresses, both by sea and land, he is at last treacherously set on shore in the province of an enemy, without aid, without defence, and abandoned by all the world. He, however, did not abandon himself; but crossing marshes, ditches full of water, and muddy grounds, he came at length to a poor wood-cleaver's cottage. He threw himself at his feet, and conjured him to save a man, who, if he escaped danger, would reward him beyond his hopes. The peasant, whether he knew him, or was struck with the loftiness and majesty of his appearance, which his misfortunes had not effaced, answered, "That, if he only wanted rest, he might find it in his cottage; but, if he fled from enemies, he would shew him a safer retreat." Marius having accepted the last offer, the man conducted him to a hollow place, near a marsh, where he covered him with leaves, reeds, and rushes. Marius had scarcely entered this dismal retreat, before he heard his enemies in pursuit of him. They questioned, pressed, and menaced, the woodman, for concealing an enemy of the public, condemned to die by the Roman senate. Marius had no resource left: he quitted his retreat, undressed himself, and plunged into the black and muddy water of the marsh. This dirty asylum could not conceal him. His pursuers ran to him; and having drawn him out of the water naked, and all covered with mud, they put a cord about his neck, and dragged him to Minturnæ, where they delivered him to the magistrates. Let us here consider Marius attentively in his deplorable state at this moment! What might then be his thoughts? How much ought he to have abhorred a fatal ambition that, from the height of greatness and glory, had plunged him into an abyss of misery below the condition of mankind! And what a lesson is this to those who are never contented with their condition; and who imagine they want all things, when but a single object is wanting to their insatiable avidity! But such are the vicissitudes of human life, that even when hope forsook him, and while the hand was lifted up, he escaped the blow. From the lowest state of misery, he yet rose to the pinnacle of what is falsely called honour and greatness. By the intrigues of a faction, he returned to Rome, where he gave the most melancholy proofs that his misfortunes had neither made him wiser nor better, had neither taught him humility, compassion, nor moderation. Being at first, as it were, only protected by Cinna, who was then master of Rome, he affected an air of dejection; but his unextinguished ambition soon rendered him the soul of the party. Having now the sword in his hand, and burning with revenge and indignation, he cut down all before him: naturally merciless and cruel, he spared neither age, dignity, nor

virtue; a look, a nod, determined at once the fate of the most illustrious persons; every one whom he in the least suspected or disliked were put to death without the least form or ceremony. The slaughter, attended with plundering of houses, and the most criminal violences, continued five days and five nights in Rome, which became one general scene of horror; unpitied shrieks and cries were every where heard, the canals poured down with human blood, while the lifeless bodies, even of the most eminent senators, were trampled under foot; for it was prohibited to give them burial. These were the glorious fruits of ambition! By these, without doubt, Marius intended to render himself great and happy; but he found it quite otherwise. The state of prosperity in which he was, did not calm the disquiets occasioned by the fear of Sylla's return, who was carrying on the war with Mithridates. So formidable an avenger made Marius tremble; and he could not even dissemble his fears. These thoughts tormented him continually, and occasioned his nights to pass without sleep, which began to affect his health and spirits. He therefore abandoned himself to the excesses of the table; and to spend his nights in drinking with his friends and dependants. By this regimen he soon inflamed his blood. He was attacked with a fever, which presently seized his head; and, in his delirium, he raved of nothing but the war with Mithridates: he imagined he had the command of it; and not only spoke, but made gestures, and assumed the attitude of a man that fights, or of a general giving orders: so violent and incurable was the passion, and so deeply had it taken root in his heart, with which ambition and jealousy uniting, had inspired him for that command. Thus, says Plutarch, at the age of seventy, the only man who had been seven times consul, and possessing riches that might have sufficed for several kings, lamented as one suffering indigence, and died before he could put his views in execution.

AMBITION, a Roman deity, who had a temple at Rome. She was represented with wings on her back, and naked feet.

AMBITIOUS, *adj.* [*ambitiosus*, Lat.] Seized or touched with ambition; desirous of advancement; eager of honours; aspiring. It has the particle *of* before the object of ambition, if a noun; *to*, if expressed by a verb:

We seem *ambitious* God's whole work *t'* undo. *Donne.*

The neighb'ring monarchs, by thy beauty led,

Contend in crowds, *ambitious* of thy bed:

The world is at thy choice, except but one,

Except but him thou canst not choose alone. *Dryden.*

AMBITIOUSLY, *adv.* In an ambitious manner; with eagerness of advancement or preference.

AMBITIOUSNESS, *f.* The quality of being ambitious.

AMBITUDE, *f.* [*ambitudo*, Lat. of *ambio*, to surround.] Compass; circuit; circumference.

AMBITUS, *f.* in Roman antiquity, the setting up for some magistracy or office, and formally going round the city to solicit the interest and votes of the people. *Ambitus* differed from *ambition*, as the former lies in the act, the latter in the mind. *Ambitus* was of two kinds; one lawful, the other infamous. The first, called also *ambitus popularis*, was when a person offered his service to the republic frankly, leaving it to every body to judge of his pretensions as they found reasonable. The second kind was that wherein force, cajoling, money, or other extraordinary influence, was made use of. This was held infamous, and severely punished, as a source of corruption and other mischiefs.

The practice ceased from the time of the emperors, by reason posts were not then to be had by courting the people, but by favour from the prince. Persons who had caused depending practised the same, going about among the judges to implore their favour and mercy. They who practised this were called *ambitiosi*. Hence we also meet with *ambitiosa decreta*, and *ambitiosa jura*, used for such sentences

sentences and decrees as were thus procured from the judges, contrary to reason and equity, either gratuitously or for money.

To AM'BLE, *v. n.* [*ambler*, Fr. *ambulo*, Lat. to walk.] To move easily, without hard shocks; or shaking.—Who ambles time withal? A rich man that hath not the gout; for he lives merrily, because he feels no pain; knowing no burthen of heavy tedious penury: him time ambles withal. *Shakespeare*.—In a ludicrous sense, to move with submission, and by direction; as, A horse that ambles uses a gait not natural. To walk daintily and affectedly:

I am rudely stamp'd, and want love's majesty,
To strut before a wanton ambling nymph.

Shakespeare.

AMBLE, *f.* A pace or movement in which the horse removes both his legs on one side; as, on the far side, he removes his fore and hinder leg of the same side at one time, whilst the legs on the near side stand still; and, when the far legs are upon the ground, the near side removes the fore leg and hinder leg, and the legs on the far side stand still. An amble is the first pace of young colts, but, when they have strength to trot, they quit it. There is no amble in the manage; riding-masters allow only of walk, trot, and gallop. A horse may be put from a trot to a gallop without stopping; but he cannot be put from an amble to a gallop without a stop, which interrupts the justness of the manage.

AM'BLER, *f.* A horse that has been taught to amble; a pacer.

AMBLINGLY, *adv.* With an ambling movement.

AM'BLESIDE, Westmoreland, is a small market-town, having a market on Wednesday, and two fairs annually, viz. Whitfun-Wednesday, and 29th of October. No principal manufacture is carried on here; the goods made being chiefly for the manufacturers in Kendal, from which it is distant thirteen miles and a quarter; from Kewick sixteen miles; and from London two hundred and seventy-one miles. It stands at the head of Windermere Lake; and is noted for a manufactory of cloth, and for a considerable waterfall. The town is situated on the steep decline of a hill, over which many high mountains arise towards the north. In Camden's time, many ruins of the ancient Amboglana of the Romans were to be seen here; the extent of the fortrefs, as he gives its dimensions, was 132 ells in length and eighty in breadth. Roman bricks, urns, and other earthen vessels, glass lachrymals, coins, mill-stones, or quern-stones, as he calls them, were frequently found here; the ground, in which the traces of such places is now to be seen, forms an oblong square with obtuse angles, and lies near the river Brathay. The traces of its antiquity are, however, almost defaced; the modern inhabitants have preserved few of the Roman monuments which were formerly discovered. Ambleside lies in the direct road from Kendal, through Kewick and Cockermouth, to Whitehaven; and is distant from Cockermouth twenty-eight miles; and from Whitehaven forty-one. Lat. 54. 28. N. lon. 3. 6. W.

AM'BLETEUSE, a sea-port in the department of the Straits of Calais. It is eight miles north of Boulogne. Lat. 50. 49. N. lon. 1. 41. E.

AMBLO'TICS, *f.* [*ambloïtica*, Lat. *αμβλωτικά*, Gr.] Medicines that cause abortion.

AM'BLYGON, *f.* of *αμβλυνος*, blunt, and *γωνία*, Gr. a corner.] In geometry, denotes an obtuse-angled triangle, or a triangle one of whose angles consists of more than ninety degrees.

AMBLYOG'MOS, or AMBLYOSMOS, *f.* from *αμβλυνος*, Gr. dull.] Dimness of sight. Hippocrates often uses this word, and says, this dimness of sight, and corruscations of sight seeming to dart before the eyes, are among the symptoms of an approaching hæmorrhage in continual fevers and genuine tertians. Sometimes he uses the word *amblyosmos* to express the same thing. Galen explains this word by *abortus*, but he mistakes it.

AMBLYO'PIA, *f.* [from *αμβλυνος*, dull, and *ὄψις*, the eye.] This is a debility of sight, absolute or relative, with ocular inopacity. The principal symptom of which disease is an obscurity of sight without any apparent opacity of the cornea, or interior part of the eye. Actuarius says, that there is a manifest, but not visible, cause of this dulness of sight, for neither the coats, nor the humours, of the eye, are disordered; and that a defect of the nervous influence is the probable cause. See his work, De Meth. Med. lib. ii. cap. 7.

The amblyopia is said by some others to be fourfold: see; 1st, *Myopia*, or short-sightedness. 2dly, *Presbyta*, or seeing only at a great distance. 3dly, *Nyctalopia*, or seeing only in the night, which Celsus names *imbecillitas oculorum*. 4thly, *Amaurosis*, dulness of sight. Dr. Cullen places this word in his Nosology as synonymous with the word *dyfopia*, which is his generic term for those disorders in and of the eye, called myopia, &c. The amblyopia of some writers, is the amaurosis of Dr. Cullen; for the different species of which see MEDICINE.

AM'BO, or AMBON, *f.* [of *αμβων*, Gr. to mount.] A kind of pulpit or desk, in the ancient churches, where the priests and deacons stood to read or sing part of the service, and preach to the people; called also *analogium*. The ambo was mounted upon two sides; whence some derive the appellation from the Latin *ambo*, "both." Besides the gospel, which was read at the top of the ambo, and the epistle, which was read a step lower, they likewise published from this place the acts of the martyrs, the commemoration of departed saints, and the letters of peace and communion sent by one church to another. Here, too, converts made a public profession of their faith; and bishops their defence, when accused: treaties also were sometimes concluded, and the coronations of emperors and kings performed, in the same place. The modern reading-desks and pulpits have been generally substituted to the ancient ambos; though, in some churches, remains of the ambos are still seen. In that of St. John de Lateran at Rome, there are two moveable ambos.

AMBOHITSME'NE, or VOHITSANGHOM'BE, a province of the island of Madagascar, so called from some red mountains of the same name, lying in south lat. 20°. These mountains are very high, resembling the Tafelberg of the Cape of Good Hope. On one side of this ridge the sea extends into the country for fifteen leagues; on the other is a flat country, abounding in ponds and marshes. Here is also a lake fifteen leagues in length, and the same in breadth, containing many small islands. The inhabitants of the mountains are called *Zaferahongs*; and have plenty of gold, iron, cattle, silk, &c.

AMBOISE (George D'), of the illustrious house of Amboise in France, was born in 1460. Being destined at a very early age for the church, he was elected bishop of Montauban when only fourteen. He was afterwards made one of the almoners to Louis XI. to whom he behaved with great prudence. After the death of this prince in 1480, he entered into some of the intrigues of the court with a design to favour the duke of Orleans, with whom he was closely connected; but, those intrigues being discovered, D'Amboise and his protector were both imprisoned. The duke of Orleans was at last restored to his liberty; and this prince, having negotiated the marriage of the king with the princess Anne of Brittany, acquired great reputation and credit at court. Of this his favourite D'Amboise felt the happy effects, for soon after the archbishopric of Narbonne was bestowed on him. The king dying in 1498, the duke of Orleans ascended the throne, by the name of Louis XII. and D'Amboise became his prime minister. By his first operation in that office, he conciliated the affection of the whole nation. It had been a custom, when a new monarch ascended the throne, to lay an extraordinary tax on the people, to defray the expences of the coronation, but, by the counsel of D'Amboise, this tax was not levied; and the imposts were soon reduced one-tenth. Some time after D'Amboise was received at Paris, with

grea

great magnificence, in quality of legate from the pope. During this legation, he laboured to reform many of the religious orders, as the Jacobins, the Cordeliers, and those of St. Germain des Près. He died in 1510, in the convent of the Celestines, at Lyons, of the gout in his stomach, aged 50 years. This minister has been greatly praised for having laboured for the happiness of France; but he has been much censured for having advised his master to sign the treaty of Blois, in 1504, by which France ran the risk of being dismembered. He governed both the king and the state; laborious, kind, honest, he possessed good sense, firmness, and experience; but he was not a great genius, nor were his views extensive. The desire he had to ease the people in their taxes, procured him during his life, but much more after his death, the title of Father of the People.

There were several other distinguished men of this name, as, 2. Aimery D'Amboise, a brother of the former, who was grand master of the order of St. John of Jerusalem. The great naval victory he obtained over the sultan of Egypt, near Montenegro, in 1510, made his name celebrated, not only among his own order, but throughout Europe. He died about two years after. Abbé Verrot has drawn his character as "a wise prince, able in government, and happy in all his enterprises; who enriched his order with the spoils of the infidels, without appropriating any to himself." 3. Francis D'Amboise, surgeon to king Charles IX. of France, who died about the year 1620. He is said to have been the editor of Abelard's Works, in quarto, in 1616, and the author of a lively comedy, called *Les Neapolitains*. 4. Adrian D'Amboise, brother of the latter, who was author of a tragedy called *Holoferne*. 5. James D'Amboise, a doctor of physic, and rector of the university of Paris, was brother to the two last. Under his rectorate the university of Paris swore allegiance to Henry IV. 6. Michel D'Amboise, *seigneur de Chevillon*, a natural son of Michel D'Amboise, admiral of France.

AMBOISE, a town of France, in the department of Indre and Loire, and in the late province of Touraine, seated at the confluence of the rivers Loire and Maifée. The town is rendered famous in history by the conspiracy of the Protestants in 1560, which opened the fatal wars of religion in France. The castle is situated on a craggy rock, extremely difficult of access, and the sides of which are almost perpendicular. At its foot flows the Loire, which is divided into two streams by a small island. To this fortress the duke of Guise, when he expected an insurrection among the Hugonots, removed Francis II. as to a place of perfect security. Charles VIII. was born and died at Amboise. Lat. 47. 25. N. lon. 0. 54. E.

AMBO'RA, *f.* in botany. See MITHRIDATA.

AMBOULE, a province of Madagascar, somewhat to the northward of south lat. 23°. It is a fertile and agreeable country, watered by the river Manampani. The country produces plants and fruits in plenty. Iron mines are also found here. The black cattle are extremely fat, and their flesh excellent. In this province stands a large town of the same name; near which is a fountain of hot water, within twenty feet of a small river whose sand is almost burning. The water of the fountain is said to boil an egg hard in two hours; and the inhabitants affirm it to be a sovereign remedy against the gout.

AMBOYNA, one of the Molucca islands in the East Indies. It lies in S. lat. 4. 0. and E. lon. 127. 0. and is remarkable for being the centre of the commerce for nutmegs and cloves, which is entirely monopolized by the Dutch East-India company. It is about twenty-four leagues in circumference. Besides cloves, it likewise abounds in most of the tropical fruits and fish; nor is there here any deficiency of good water; but flesh is very scarce. This scarcity, however, proceeds more from the policy of the Dutch than either the intemperature of the climate or the barrenness of the soil: for, excepting cloves, they have in Amboyna, as well as the Moluccas, industriously discouraged the cultivation of every esculent commodity, with the view of withholding subsistence from those who

might be tempted to invade them. Of the natives, the men wear large whiskers, but leave little hair upon their chin; and have only a slight piece of stuff wrapped round their middle. The women tie their hair in knots: the maids are bought of their fathers before they are married; and, if the wife proves barren, the marriage is dissolved. Some of the natives are Mahometans, and some Christians. Their houses are built of bamboo-canes and sago-trees. They sleep on mats. Their weapons are bows and arrows, javelins, scymitars, and targets.

Amboyna was first discovered by the Portuguese, who built a fort upon it, which was taken from them by the Dutch, in 1605. They did not, however, become masters of the whole island at once. The English had here five factories, which lived under the protection of the Dutch castle; holding themselves safe, in respect of the friendship between the two nations. Great differences had arisen between the Dutch and English colonists in this part of the world; till at last, the English East India company applying to king James, a treaty was concluded in 1619, by which the concerns both of the English and Dutch were regulated, and certain measures agreed upon for preventing future disputes. This was an additional security to the English; and, by virtue of the treaty, they continued two years in Amboyna, trading with the Dutch. During this time, however, several disputes happened; which occasioning mutual discontents, the complaints were sent to Jacatra, in the island of Java Major, to the council of defence of both nations there residing: but, they not agreeing, a state of the matter was sent over to Europe, to be decided by the East-India companies of both nations; or, in case they could not agree, by the king of England and the states of Holland, according to an article in the treaty of 1619. But, before these disputes could be decided in a legal way, the Dutch, in order to give the more specious colouring to the violent seizure which they meditated of the island of Amboyna, made use of the stale pretext of a conspiracy being formed by the English and Japanese to dispossess them of one of their forts in this place. The plot, it was alleged, had been confessed by a Japanese and Portuguese in the English service, who were most inhumanly tortured till they should answer in the affirmative such interrogatories as might favour the secret design of those cruel inquisitors. Upon the injurious evidence of this constrained declaration, they immediately accused the English factors of the pretended conspiracy. Some of them they imprisoned, and others they loaded with irons, and sent on-board their ships; seizing at the same time all the English merchandize, with their writings and books.

These acts of violence were followed by a scene of horror unexampled in the punishment of the most atrocious offenders. Some of the factors they tortured, by compelling them to swallow water till their bodies were distended to the utmost pitch; then taking the miserable victims down from the boards to which they had been fastened, and causing them to disgorge the water; if they did not acknowledge the imputed guilt, the process of torture was repeated. Others of the English they consumed by burning them gradually from the feet upwards, in order to extort the confession of a conspiracy, which was only pretended by the infernal policy of those savage tormentors. Some had the nails of their fingers and toes torn off; and in some they made holes in their breasts, filling the cavities with inflammable materials, to which they afterwards put fire. Those who did not expire under the agonies of torture, were consigned to the hands of the executioner. This tragical event happened in 1622.

The allegation of this pretended conspiracy was equally void of probability and truth. The Dutch had a garrison of 300 men in the fort, besides the burghers in the town, and several other forts and garrisons in the island, while the number of the English did not amount to twenty men; nor were even those provided with arms or ammunition to effect such a design as that with which they were charged. There likewise was not one English vessel in the harbour,

whereas the Dutch had eight ships riding near the town : neither, when the Dutch broke open the desks and trunks of the factors, was there found a single paper or letter which could be contrived into the most distant relation to any conspiracy. Add to all this, that such of the unhappy sufferers as could speak to be heard, declared in the most solemn manner their innocence of the plot with which they were charged. The whole of the transaction affords the most irrefragable testimony, that it was founded entirely upon a political fiction of the Hollanders, who had themselves formed the design of monopolizing the trade of the Spice Islands; for the accomplishment of which they perpetrated, about the same time, a similar tragedy at Pooleron, where they put to the torture 162 of the natives, whom they likewise charged with a pretended conspiracy. It may justly be reckoned singular in the fortune of this commercial republic, that they have ever since been permitted to enjoy in peace those invaluable islands, which were originally obtained by such atrocious infringements of humanity and the laws of nations, as will stain the Dutch annals, to the latest ages, with indelible infamy. The more effectually to preserve this trade, the Dutch have had all the clove-trees in the adjacent islands grubbed up. Sometimes also, when the harvest is very large, part of the produce of Amboyna itself is burnt. To prevent the rearing of cloves in any of the neighbouring islands, or the inhabitants from selling them to strangers, the governor of Amboyna makes the tour of his government with a fleet of curricurries, consisting sometimes of twenty, and at others of thirty, forty, or fifty, sail. This expedition is made with all the pomp imaginable, in order to gratify the pride and folly of the Indian chiefs. The true reason of their taking all this pains is, because experience has shewn, that no contracts, however solemn, can prevent the inhabitants of those islands from selling their spice to strangers : and even now, frauds are so frequently practised by the Dutch themselves, though the company is inexorable in punishing them, that the common people call the cloves *galcken-kruid*, that is, the gallows-spice. Besides the cloves, coffee is also cultivated here by the Dutch, and a gold mine has been lately discovered. This was accidentally found, by the quantities of gold-dust that were washed from some mountains by the torrents. Here also grow several kinds of valuable wood, of which they make tables, chairs, escrutoirs, &c. for the principal persons in the government; and the rest is sold all over the Indies, at a very extravagant rate.

Amboyna is divided into two parts, viz. a greater and lesser peninsula. The former, called *Hiton*, is twelve leagues in length, and two and a half broad. In this the Dutch have no less than five forts, or rather strong redoubts, mounted with cannon. The other is called *Leytimor*, five leagues in length, and one and a half broad, which is the southern part of the island; on this stands the fort of Victoria, which is the residence of the governor and his council, composed of fifteen gentlemen or merchants. The fortress is a square, the ramparts mounted with sixty pieces of brass cannon, and the garrison usually composed of 600 men. It is so strong by nature and art, as to be in a manner impregnable; and so effectually does it command the harbour, that no vessel could come in or go out without being sunk by the cannon, if the governor chose. The inhabitants of Amboyna are computed at 70 or 80,000, of whom but a small number are Dutch; and this obliges the latter to be continually upon their guard, and to keep a component number of troops in each of their forts, particularly in that of Middleburgh, which stands upon the isthmus that connects these peninsulas. There are also redoubts and garrisons in all the islands of this government.

AMBRA'CIA, one of the most considerable cities of ancient Epirus, situated on the river Aracthus, at a small distance from the sea. At first it was a free city; but was afterwards reduced by the *Æacidæ* kings of Epirus, who chose it for their place of residence. In process of time, the *Ætolians* made themselves masters of it, and held it

till the year before Christ 189, when it fell into the hands of the Romans. At this time Ambracia was a place of great strength. It was defended on one side by the river Aracthus, and on the other by steep and craggy hills; and surrounded with a high and thick wall, above three miles in compass. The Roman consul Fluvius began the siege by forming two camps, separated by the river, but with a communication between them; the Romans were posted in one, and the Epirots, their allies, in the other. He then threw up two lines, one of circumvallation, and the other of contravallation; and built a wooden tower, in form of a castle, over-against the citadel, which stood on a hill. The *Ætolians*, however, before the lines were quite finished, found means to throw about 1000 men into the place.

The lines being completed, the city was attacked in five different places at once. The battering-rams shook the walls on all sides: and the Romans, from their moveable towers, pulled down the battlements with a kind of scythes, which they fastened to long beams. The besieged made a vigorous defence. They were night and day on the walls, and indefatigable in preventing the effects of the rams and scythes. The strokes of the former they deadened, by letting down beams, large stones, lumps of lead, &c. by means of pulleys, upon them when they were in motion: the others they rendered useless, by pulling the beams to which they were fastened into the city with hooks contrived for the purpose.

While Fluvius was carrying on the siege, Nicander, the *Ætolian* prætor, found means to throw 500 men into the city, under the command of one Nicodamus, with whom Nicander agreed to attack the Roman camp in the night; not doubting, that, if the garrison from within, and the army from without, fell upon them at the same time, they would be obliged to raise the siege. Nicodamus narrowly watched the time at which he was ordered to sally; and, though Nicander did not appear, he marched out at the head of the garrison, armed with fire-brands and torches. The Roman centinels, surprised at this sight, ran to awake the legionaries, and soon spread a general alarm all over the camp. The legionaries marched in small bodies as they happened to meet, to repulse the enemy, whom they engaged in three different places. Two parties of the garrison were driven back; but the third, commanded by two *Ætolian* generals, made a great slaughter of the Romans; and, not finding themselves seconded by Nicander, retired in good order into the city.

Though the besieged were thus abandoned, and had no hopes of assistance, they continued to defend themselves with incredible vigour and resolution. The Romans had no sooner made a breach in the wall, but it was repaired, and a new one built behind it. The consul, therefore, altered his measures; and, instead of making breaches with the ram, began to undermine the wall, in hopes of throwing down great part of it at once, and entering the city before the besieged could have time to build a new wall. The miners, being covered, were not observed by the garrison, till the great quantities of earth brought out of the mine gave the alarm. The *Ætolians* immediately began to countermine; and, having dug a trench of the depth they supposed the mine to be, they carried it along the wall, where they heard the strokes of the pick-axes of the Romans. When the two mines met, a battle ensued, first with pick-axes and spades, and then with swords and spears: but this attack did not last long, each party making themselves a kind of rampart with the loose earth. The *Ætolians*, in order to drive their enemies quite out of the mine, invented a machine, which they brought to the place where the two mines met: this was an hollow vessel with an iron bottom, bored through in many places, and armed with spikes at proper distances, to prevent the enemy from approaching it: this vessel they filled with feathers, which they set on fire, and, with bellows driving the smoke on the besiegers, obliged them to leave the mine, half-suffocated. This interval the *Ætolians* made use of in repairing the foundations of the wall.

The

The vigorous resistance made by the Ambracians, however, did not raise the courage of the nation in general, who were determined on a peace with Rome at all events. Fluvius, in the mean time, being desirous of getting possession of Ambracia before the conclusion of the peace, employed Amynder, king of the Athamanes, to persuade the inhabitants to surrender. As Amynder had great interest in Ambracia, having long resided there, he easily persuaded them to capitulate on the following terms, viz. That the Ætolian garrison should have leave to march out of the city; that the inhabitants should pay 500 talents; and that they should deliver to the consul all the prisoners and deserters that were in the city. The gates were then opened to Fluvius; and he was presented with a crown of gold, together with many costly statues and pictures, of which there were great numbers in the city, it having been the capital of Pyrrhus, who had enriched it with every thing valuable and curious. From this time the city of Ambracia made no figure in history. It is scarcely known at present where the city stood; but that called *Arba*, in Upper Albania, seems best to agree with what is said of the ancient situation of this city. The river Aracthus, on which Ambracia was situated, is now called by the natives *Spagmuri*.

AMBRA'RIA, *f.* in botany. See ANTHOSPERMUM.

AMBRAS, AM'RAS, or OM'BRA, a town of Austria, with a castle or fort of the same name, which was, as its name (shade) rather imports, a summer retreat for the arch-dukes. The statues, medals, treasures of gold, precious stones, and rarities, are immense; among the last, there is the trunk of an oak, inclosing the whole body of a deer, which is supposed to have perished in the snow, and to have been covered with the mud and wreck of the trees, &c. washed from the mountains on the thaw. That a tree, thus deposited, and taking root, inclosed with its roots the body of the animal, and, in its further growth, raised the body up with it. Here is also a good library, with a gallery of busts and admirable paintings.

AMBRESBURY, Wilts, an ancient town, standing on the river Avon, in a fine open champaign country, distant from London 80 miles. It had its name from the valiant Ambrosius Aurelius, a British prince, who rebuilt the monastery after it had been destroyed by the Saxons, and filled it with 300 monks, to pray for the souls of those noble Britons who were slain by the perfidious Hengist the Saxon, who massacred here, in cold blood, 300 of the British nobility, whom he had invited to meet him without arms, to treat of a league of amity, and to keep a feast together. This treachery was revenged by the noble Aurelius, who, in the declension of the Roman empire, assumed the government of Britain, and with the assistance of the valiant Arthur, repelled all foreign invaders; but was at length killed in a battle on Salisbury plain, and buried under Stonehenge, which is one mile from Ambresbury. See *STONEHENGE*. The monastery was afterwards converted into a nunnery; and Eleanor, king Henry III's queen, retired and died here; whose example induced the princess Mary, king Edward II's daughter, with thirteen noblemen's daughters, to take the veil together, in this house. In the wall of the abbey is still to be seen an old grave-stone, supposed of queen Gunever, king Arthur's wife. The town at present consists of two streets that intersect each other; at which place is the church. It is a great thoroughfare to Warminster, Frome, Wells, &c. and has two good inns. A charity-school was erected and endowed here in 1715, for fifteen boys and as many girls. The town suffered greatly by fire, in the year 1753. It is said to be remarkable for a little fish, taken in the river, of a very delicate flavour, called a loach; and near this town is dug the best clay in the kingdom for making tobacco-pipes. It has a market on Fridays; and four annual fairs, viz. on May 17; June 22; October 6; and the first Wednesday after the 12th of December. Here is a noble seat which belonged to the duke of Queensbury, and was built by Inigo Jones. The pre-

sent duke made great improvements in the gardens and grounds, having inclosed and planted a large steep hill, at the foot of which the Avon beautifully winds, as also through the greatest part of the gardens. It is now occupied by some emigrated nuns.

AMBRO'NES, a Gaulish people, who lived near the foot of the Alps, between Switzerland and Provence. They invaded the Roman territories in conjunction with the Cimbri and Teutones; but were defeated with great slaughter by Marius, about 101 years before Christ. Their women, who had staid during the engagement in a kind of fortification made with their carts, on seeing their husbands flying, and the Romans at their heels, armed themselves with axes, and, gnashing with their teeth, fell with fury on the pursuers and the pursued. Their first rage being spent, they desired to surrender themselves, upon the single condition that their chastity should not be violated; but, this equitable request being denied, they first killed their children, and then themselves, not one remaining alive out of the whole multitude.

AMBRO'MA, *f.* in botany. See AEROMA.

AM'BROSE, [*αμβροσιος*, Gr. immortal.] A proper name of men.

AMBROSE (St.), bishop of Milan, one of the most eminent fathers of the fourth century, born in Gaul, in the year 333 according to Dr. Cave, or in 340 as Mr. Du Pin affirms. His father was at this time *præfælus prætoris* in Gaul, and resided at Arles, the capital of Gallia Narbonensis. The birth of Ambrose is said to have been followed with a remarkable presage of his future eloquence; for, we are told, that a swarm of bees came and settled upon his mouth as he lay in his cradle. He soon made himself master of the several parts of secular learning; and pleaded causes before Probus with so much eloquence, that he was appointed his assessor, and soon after governor of the provinces of Liguria and Æmilia; he settled at Milan; where, in the year 374, upon the death of Auxentius, bishop of that city, there being a great contest between the Catholics and Arians concerning the choice of a new bishop, Ambrose thought it his duty, as governor, to go to the church, in order to compose the tumult. He accordingly addressed himself to the people in a pathetic speech, exhorting them to proceed to their choice in a calm and friendly manner. While he was speaking to them, the whole assembly cried out with one voice, "Let Ambrose be bishop!" Such a sudden and unexpected incident surprised him extremely; so that he retired immediately, and used every method to divert them from their resolution of choosing him: but at last he was obliged to comply; and was baptised (being but a catechumen before), and ordained bishop towards the latter end of the year 374. About the year 377, the barbarous nations making an incursion into the Roman empire, he fled to Illyricum, and afterwards to Rome. In the year 384, he was sent to the tyrant Maximus, who had usurped the empire, and prevailed on him not to pass into Italy. The heathens, encouraged by these intestine commotions, attempted to restore their religion, and employed Q. Aurelius Symmachus, prefect of Rome, a man of great eloquence, to plead their cause. This gave rise to the famous contest between St. Ambrose and him about repairing the altar of Victory. But Symmachus, having lost his cause, was expelled the city, and commanded not to approach within an hundred miles of it. The petition which he sent to Valentinian the younger, is still extant. We find in it the strongest figures of rhetoric, and the greatest force of eloquence: St. Ambrose wrote a confutation of this petition; but he has been thought guilty of many paralogisms; and yet he protests, "that he endeavoured only after the solidity of reasoning, leaving Symmachus all the glory of eloquence and politeness; it being (says he) the peculiar privilege of the pagan philosophers to amuse the mind with colours as false as their idols; and to say *great* things, not being able to say *true* ones." Ambrose met with a good deal of opposition from the Arians, against whom he acted with great

great spirit and intrepidity. Justina the empress, and mother of Valentinian, who was an Arian, resolved to restore Arianism at Milan, began with demanding of St. Ambrose one of the churches, which was called the Portian church: but he refused it; and, the people surrounding the palace in a body, she was obliged to leave him in possession of his church, and even desire him to pacify the people. He died at Milan, the 4th of April, 397, being fifty-seven years of age, according to Mr. Du Pin and some other writers; but Dr. Cave and Olearius say that he was sixty-four years old at his death. He was buried in the great church at Milan. He wrote several works, the most considerable of which is that *De Officiis*. Paulinus wrote his life, and dedicated it to St. Augustin: this life is prefixed to St. Ambrose's works; the best edition of which is reckoned to be that published by the Benedictine monks, in two volumes, folio, Paris, 1686 and 1690.

AMBROSE (Isaac), an eminent dissenting minister, was educated at Brazen-nose-college, Oxford, where he took the degree of bachelor of arts, and became minister of Preston, and afterwards of Garstang, in Lancashire, where he was, in 1662, ejected for nonconformity. It was usual with him to retire every year for a month into a little hut in a wood, where he shunned all society, and devoted himself to religious contemplation. Dr. Calamy observes, that he had a very strong impulse on his mind of the approach of death, and took a formal leave of his friends at their house a little before his departure; and the last night of his life he sent his discourse concerning *angels* to the press. The next day he shut himself up in his parlour, where, to the great surprise and regret of all who saw him, he was found just expiring. He died in 1663-4, in the seventy-second year of his age. He wrote several other books; as the *Prima, Media, et Ultima*, or the First, Middle, and Last, Things; War with Devils, Looking unto Jesus, &c.

AMBROSE, or St. Ambrose in the Wood, an order of religious, who use the Ambrosian office, and wear an image of that saint engraven on a little plate: in other respects they conform to the rule of the Augustines.

AMBROSIA, *f.* [*ambrosie*, Fr. *ambrosia*, Ital. Sp. and Lat. *αμβροσία*, Gr. compounded of the particle *α* and *βροτος*, immortal, as being supposed to render those immortal who fed on it.] In heathen antiquity, denotes the solid food of the gods, in contradistinction from the drink, which was called *nectar*; from which every thing eminently pleasing to the smell or taste is called ambrosia.

AMBROSIA is also a pompous kind of title given by some physicians to certain alexipharmic compositions of extraordinary virtue. The name was particularly given to a famous antidote of Philip of Macedon, against all poisons, bites, and stings of venomous creatures, as well as many internal diseases.

AMBROSIA, *f.* in botany, a genus of the monoecia pentandria class, ranking in the natural order of compositæ nucamentaceæ. The generic characters are—I. Male flowers compound. Calyx: perianthium common, one-leaved, flat, of the same length with the floscules. Corolla: compound, uniform, tubulous, equal, hemispherical; proper, one-petalled, tubulous, funnel-shaped, erect, quinquefid. Stamina: filaments very small; antheræ erect, parallel, acuminate. Pistillum: style filiform, length of the stamens; stigma orbiculate, membranaceous. Receptaculum: common, scarcely any, naked. II. Female flowers below the males, doubled. Calyx: perianthium one-leaved, acuminate, entire, permanent, the belly five-toothed, one-flowered. Pistillum: germ ovate, in the bottom of the calyx; style filiform, of the same length with the calyx; stigmas two, setaceous, long, divaricate. Pericarpium: a subovate nut, formed from the calyx hardened, one-celled, not opening, crowned with the five acuminate teeth of the calyx. Seed single, roundish.—*Essential Character*. Male. Calyx common, one-leaved. Corolla one-petalled, trifid, funnel-shaped. Receptaculum naked. Female. Calyx one-leaved, entire, the belly

five-toothed, one-flowered. Corolla, none. Nut of the hardened calyx one-seeded.

Species. 1. *Ambrosia trifida*, or trifid-leaved ambrosia: leaves three-lobed serrate. It is a common weed in North America; it often grows eight or ten feet high; and if it be planted in a rich moist soil, or often watered, it will grow much higher, and spread out into many branches; in which case they must be supported by stakes, being very subject to break with strong winds. The flowers are not more conspicuous than those of hemp, and therefore this plant is preserved only by persons curious in botany. It is an annual.

2. *Ambrosia eliator*, or tall ambrosia: leaves pinnatifid; racemes panicled, terminal, smooth. This is an annual herbaceous plant, from two to three feet in height, upright and branched. Native of Jamaica, in barren, sandy, and rocky, situations, by river sides, in the southern part of the island. It flowers there from February to June; but with us in July and August. It has the appearance and taste of wormwood. Mr. Miller affirms, that he has frequently received the seeds from Virginia and Carolina, as well as from the West-India islands.

3. *Ambrosia artemisiifolia*, or mugwort-leaved ambrosia: leaves bipinnatifid, the first leaves at the origin of the smaller branches undivided, and quite entire. This is an annual, and a native of North America.

4. *Ambrosia maritima*, or sea ambrosia: leaves multifid, spikes solitary, hairy, subscissile. Annual; grows naturally in Cappadocia, Tuscany, and the county of Nice, on sandy shores.

5. *Ambrosia arborescens*, or tree ambrosia: leaves pinnatifid, hirsute, racemes solitary terminating, stem shrubby. Grows to the height of ten or twelve feet, with a woody stem, dividing into several branches. This species is perennial; a native of Peru.

Propagation and Culture. The seeds, when sown in the spring, seldom germinate the first year, but frequently remain in the ground until the following spring; so that, when the plants do not appear, the ground must not be disturbed till after the spring following. When the plants come up, some of them may be transplanted into a moist rich soil, allowing them at least four or five feet room every way. If the seeds ripen and are suffered to scatter, they will vegetate the following spring, provided the ground be not disturbed; or, if the seeds be sown in autumn, the plants will come up in the spring, and may be treated as above. See ARTEMISIA and COCHLEARIA.

AMBROSIA, a daughter of Atlas, and one of the Hyades.

AMBROSIAL, *adj.* Partaking of the nature or qualities of ambrosia; fragrant; delicious; delectable:

Thus while God spake, *ambrosial* fragrance fill'd
All heaven, and in the blessed spirits elect
Sense of new joy ineffable diffus'd.

Milton.

To farthest shores th' *ambrosial* spirit flies,
Sweet to the world, and grateful to the skies.

Pope.

AMBROSIAL OFFICE, or RITE, *f.* in church history, a particular formula of worship in the church of Milan, which takes its name from St. Ambrose, who instituted that office in the fourth century. Each church originally had its particular office; and when the pope, in after-times, took upon him to impose the Roman office upon all the western churches, that of Milan sheltered itself under the name and authority of St. Ambrose; from which time the Ambrosian ritual has prevailed.

AMBROSIN, *f.* in middle-age writers, denotes a coin struck by the lords or dukes of Milan, whereon was represented St. Ambrose on horseback, with a whip in his hand.

AMBROSIN'IA, *f.* [from Bartolomeo and Hyacinto *Ambrosini*, Professors of Botany at Bologna fifty-two years.] In botany, a genus of the gynandria polyandria class, ranking in the natural order of: pipéritæ. The generic characters are—I. Males. Calyx: spathe one-leaved, cowed; convolute at the base, converging at the tip; partition membranaceous. Stamina: filaments none; antheræ

theræ very many, solitary, within the hinder cell of the spathe, in the upper part of the partition, digested in a distinct order. Nectaries two, roundish, concave, at the base of the antheræ. II. Female. Calyx: spathe common with the males. Pistillum: germ in the anterior cell of the spathe, and the lower part of the partition, solitary, roundish; style cylindrical, shorter than the spathe; stigma obtuse. Pericarpium: capsule roundish, one-celled. Seeds very many, ovate, nestling.—*Essential Character.* Spathe one-leaved, separated by a partition; stamens on the inner, pistils on the outer, side of it.

Description. Root perennial, tuberous, acrid. Leaves radical, petiolate, ovate, shining. Spadix quite simple, cylindrical. Spathe fleshy, greenish white on the outside, deeper green on the inside, with purple spots, ending in a sharp recurved point. The leaves appear at the beginning of autumn, and decay in the spring. It is a native of Sicily, near Palermo; and was first found, described, and figured, by Bocconi. It requires the protection of a green-house, and may be increased from the root. There is but one species.

AMBROSIUS, AURELIANUS, or AURELIUS AMBROSIVS, a famous general of the ancient Britons, of Roman extraction. He was educated at the court of Aldroen of Amoria; who, at the request of the Britons, sent him over with ten thousand men, to assist them against the Saxons, whom Vortigern had invited into Britain. Ambrosius had such success against the Saxons, that the Britons chose him for their king, and compelled Vortigern to give up to him all the western part of the kingdom divided by the Roman highway called *Watling-street*. Some time after, the Britons being discontented with Vortigern, and having withdrawn their allegiance from him, he returned to a castle in Wales, where being besieged by Ambrosius, and the castle taking fire, he perished in the flames, and left his rival sole monarch of Britain; who now took upon him the imperial purple, after the manner of the Roman emperors. Geoffrey of Monmouth tells us, that Ambrosius built Stonehenge near Salisbury in Wiltshire. Ambrosius, according to this historian, coming to a monastery near Caeracardoc, now Salisbury, where three hundred British lords, massacred by Hengist, lay buried, and resolving to perpetuate the memory of this action, he ordered his workmen to prepare a large quantity of stones and other materials. But having, at the instigation of Tremounus archbishop of Caerleon, consulted the famous Merlin, this magician advised him to send over to Ireland for certain great stones, called *chorea gigantum*, the giant's dance, placed in a circle on a hill called *Killair*, having been brought thither by giants from the farthest borders of Africa. A body of forces were accordingly sent into Ireland, under Pendragon, Ambrosius's brother, to fetch these stones; but were opposed in their attempt by Gillomanus king of the country, who derided the folly of the Britons in undertaking so ridiculous an expedition. Nevertheless, the Britons, having vanquished this prince in battle, brought away the stones; and by the direction and assistance of Merlin, who had accompanied them, these wonderful stones, by order of Ambrosius, were placed over the graves of the British lords, and are now what is called *Stonehenge*. Alexander Meham celebrates this fable in his poem *De divinæ sapientiæ laudibus*. Polydore Virgil assigns another origin of Stonehenge; he tells us it was erected by the Britons as a monument to their general Ambrosius, on the place where he fell in battle, to perpetuate the memory of his glorious actions and services done to his country. Both these stories are rejected by our best antiquaries; who, however, are by no means agreed as to the true origin of this famous piece of antiquity. See *STONEHENGE*.

After the Britons had defeated the Saxons, and obliged them to retire northward, Ambrosius is said to have convened the princes and great men at York, where he gave orders for repairing the churches destroyed by the Saxons, and restoring the exercise of religion to its former lustre.

This is confirmed by Matthew of Westminster; who highly applauds the great zeal of Ambrosius in repairing the churches, encouraging the clergy, and restoring the honour of religion. The Monmouth historian gives this prince a very high character: "He was a man," says he, "of such bravery and courage, that when he was in Gaul no one durst enter the lists with him; for he was sure to unhorse his antagonist, or to break his spear into shivers. He was, moreover, generous in bestowing, careful in performing religious duties, moderate in all things, and more especially abhorred a lie. He was strong on foot, stronger on horseback, and perfectly qualified to command an army." The same author tells us he was poisoned at Winchester by one Eopa a Saxon, disguised as a physician, and hired for that purpose by Pascentius one of the sons of Vortigern: but the generally-received opinion is, that he was killed in a battle which he lost in the year 508, against Cerdic, one of the Saxon generals.

AM'BRY, *f.* [a word corrupted from *almonry*.] The place where the almoner lives, or where alms are distributed. The place where plate, and utensils for house-keeping, are kept; also a cupboard for keeping cold victuals: a word obsolete, though still used in the northern counties, and in Scotland. In the ancient abbeys and priories, there was an office under this denomination, wherein were laid up all charities for the poor.

AM'BS-ACE, *f.* [from *ambo*, Lat. and *ace*.] A double ace; so called when two dice turn up the ace.—I had rather be in this choice, than throw *ambs-ace* for my life. *Shakespeare*.

AMBUBA'JÆ, in Roman antiquity, were immodest women, who came from Syria to Rome, where they lived by prostitution, and by playing on the flute: the word is derived from the Syriac *abub*, which signifies a flute; although others make it to come from *am* and *Baïæ*, because these prostitutes often retired to Baïæ. According to Cruquius, these women used likewise to sell paint for ornamenting the face, &c. so that the present fashion among the females may shelter itself under the authority of the remotest antiquity.

AM'BULANT, or AMBULATORY, *f.* They formerly gave in France the name of *ambulant commissioners* to those commissioners, or clerks of the king's farms, who had no settled office; but visited all the offices within a certain district, to see that nothing were done in them against the king's right and the interest of the farm.

AMBULANT, is also used to denote those brokers at Amsterdam, or exchange agents, who have not been sworn before the magistrates. They transact brokerage business, but their testimony is not received in the courts of justice.

AMBULA'TION, *f.* [*ambulatio*, of *ambulo*, Lat. to walk.] The act of walking.—From the occult and invisible motion of the muscles, in station, proceed more offensive lassitudes than from *ambulation*. *Brown*.

AM'BULATORY, *adj.* [*ambulo*, Lat.] That which has the power and faculty of walking. That which happens during a passage or walk. Moveable; as, an *ambulatory* court; a court which moves from place to place for the exercise of its jurisdiction.

AMBUL'LI, a name given to Jupiter, Minerva, and the Tyndarides. It signifies prolongation, for they thought these gods prolonged life.

AM'BULO, *f.* The name of a disease, called also *furiosus flatulentus*, and also *status furiosus*. It is a distention or inflation attended with pain, and variously periodical. It is caused by vapours shooting through various parts of the body.

AMBUR'BIUM, *f.* in Roman antiquity, a procession made by the Romans round the city and pomærium, in which they led a victim, and afterwards sacrificed it, to avert some calamity that threatened the city.

AM'BURY, or ANBURY, *f.* among farriers, denotes a tumour, wart, or swelling, which is soft to the touch, and full of blood. This is cured by tying a horse-hair very hard about its root; and, when it has fallen off, which commonly

commonly happens in about eight days, firing some powder of verdigrease upon the part, to prevent the return of the complaint. If the tumour be so low that nothing can be tied about it, they cut it out with a knife, or else burn it off with a sharp hot iron; and, in sinewy parts, where a hot iron is improper, they eat it away with oil of vitriol, or white sublimate.

AM'BUSCADE, *f.* [*embuscade* Fr.] A private station in which men lie to surprise others; ambush.

Then waving high her torch, the signal made,
Which rous'd the Grecians from their *ambuscade*. *Dryden*.

—When I behold a fashionable table set out, I fancy that gout, fevers, and lethargies, with innumerable distempers, lie in *ambuscade* among the dishes. *Addison*.

AMBUSCA'DO, *f.* [*emboscada*, Span.] A private post, in order to surprise an enemy:

Sometimes she driveth o'er a soldier's neck,
And then he dreams of cutting foreign throats,
Of breaches, *ambuscadoes*, Spanish blades,
Of healths five fathom deep.

Shakespeare.

AM'BUSH, *f.* [*ambusche*, Fr. from *bois*, a wood; whence *embuscher*, to hide in woods, ambushes being commonly laid under the concealments of thick forests.] The post where soldiers or assassins are placed, in order to fall unexpectedly upon an enemy. The act of surprising another, by lying in wait or lodging in a secret post:

—Nor shall we need,
With dangerous expedition, to invade
Heav'n, whose high walls fear no assault or siege,
Or *ambush* from the deep.

Milton.

The state of being posted privately, in order to surprise; the state of lying in wait. Perhaps the persons placed in private stations:

For you, my noble lord of Lancaster,
Once did I lie in *ambush* for your life.

Shakespeare.

AM'BUSHED, *adj.* [from *ambush*.] Placed in ambush; lying in wait:

Thick as the shades, there issue swarming bands
Of *ambush'd* men, whom, by their arms and drefs,
To be Taxallan enemies I guess.

Dryden.

AM'BUSHMENT, *f.* [from *ambush*.] Ambush; surprise: a word now not used.

Like as a wily fox, that having spied
Where on a sunny bank the lambs do play,
Full closely creeping by the hinder side,
Lies in *ambushment* of his hoped prey.

Spenser.

AMBU'ST, *adj.* [*ambustus*, Lat.] Burnt; scalded.

AMBUS'TA, *f.* in medicine, burns or scalds, called also *causis*, *ambustio*, *ambustura*. Dr. Cullen places this case as a variety of the phlogosis erythema. Burns and scalds differ not as to any consideration respecting the cure. A burn is from solid substances, but considered as to the effect on the injured body: a scald is a burn from any hot fluid, or solid when in a fluid state. Their danger is according to the degree, the part injured, the peculiarity of the constitution, and consequent symptoms; and wounds from burns are more liable to form a cicatrix than when they are produced by other causes. Burns may be ranked into four kinds. 1. When a redness in the part is attended with heat and pain. 2. When after the burn there arise pustules or blisters, with pain. 3. When the skin and subjacent fat are burnt to a crust. 4. When the burning goes to the bone. The two first resemble an inflammation, and are to be considered as such, from an external cause; the third a gangrene, and the fourth a sphacelus. In general, burns and scalds of any consequence require bleeding, and repeated gentle purging, to prevent or to reduce inflammation. If lightning was the cause, the internal use of cordials is required; and if the pain is great, though a fever attends, anodynes internally will be necessary.

AMBUS'TION, *f.* [*ambustio*, Lat.] A burn or scald.

AM'BY, a town of the Netherlands, in the province of Limburg, situated opposite to Maestricht, on the east side of the river Maese, in lat. 56. 52. N. lon. 5. 41. E.

AME'DIANS, in church-history, a congregation of religious in Italy, so called from their professing themselves *amantes Deum*, "lovers of God;" or rather *amati Deo*, "beloved of God." They wore a grey habit and wooden shoes, had no breeches, and girt themselves with a cord. They had twenty-eight convents; and were united by Pope Pius V. partly with the Cistercian order, and partly with that of the Socolanti, or wooden-shoe wearers.

AMEDNAGUR', a city of Hindostan, in the Decan, once the capital of the soubah of the same name, which is now better known by that of Dowlatabad. This place was the residence of the Emperor Aurengzebe, during his conquest of the Decan and the Carnatic. It is 181 miles by Poonah from Bombay. Lat. 22. 58. N. lon. 72. 37. E.

A'MEL, *f.* [*email*, Fr.] The matter with which the variegated works are overlaid, which we call *enamelled*.—The materials of glass melted with calcined tin, compose an undiaphanous body. This white *amel* is the basis of all those fine concretes that goldsmiths and artificers employ in the curious art of enamelling. *Boyle*.

AMELANCHIER', *f.* in botany. See CHIONANTHUS and MESPILUS.

AME'LAND, an island of the United Provinces, in the German ocean, near the coast of Friesland, from which it is separated by a strait called the Wadt.

A'MELCORN, *f.* [not unlikely of *amylum*, starch, Lat. q. d. *amyle corn*.] French rice, a kind of grain of which starch is made.

AME'LIA, formerly AMERIA, or ÆMILIA, a small city in the pope's territories, seated on a mountain, between the Tiber and Nira, in a fertile country, twenty miles south-west of Spoleto, and forty-five north of Rome. Lat. 42. 33. N. lon. 12. 30. E.

AMEL'LOIDES, *f.* in botany. See CINERARIA.

AMEL'LUS, *f.* [from *mel* honey.] In botany, a genus of the syngenesia polygamia superflua class, ranking in the natural order of compositæ oppositifoliæ. The generic characters are—Calyx: common imbricate, roundish. Corolla: compound radiate; corollets hermaphrodite, very many in the disk. Females very many in the ray. Proper of the hermaphrodite tubulous, five-cleft. Female ligulate, lax, two or three toothed. Stamina: in the hermaphrodites, filaments five, capillary, short. Antheræ cylindrical, tubulous. Pistillum: in the hermaphrodites germ obovate. Style filiform, the length of the stamens. Stigmas two, filiform. Females very like the hermaphrodites. Pericarpium: none. Calyx unchanged. Seeds: to the hermaphrodites solitary obovate; down capillary, to the females, very like the others. Receptaculum: chaffy.—*Essential Character*. Calyx, imbricate. Corollets of the ray undivided. Down simple. Receptaculum, chaffy.

Species. 1. *Amellus lychnitis*, or trailing amellus: leaves opposite, lanceolate, obtuse, downy, peduncles one-flowered. Rises from two to three feet high, sending out branches on every side, terminated by flower-stalks, each supporting one violet-coloured flower, with a yellow disk, and appearing in July or August. It grows naturally at the Cape of Good Hope.

2. *Amellus umbellatus*, or umbelled amellus: leaves opposite, three-nerved, downy underneath, flowers umbelled. This has herbaceous, upright, simple, round, hairy, stems, two feet high, or at most two feet and a half. It is a native of Jamaica, in the cooler woods and mountains, and flowers there in summer.

Propagation and Culture. The first is a perennial plant, easily propagated by cuttings, planted in the shade during any of the summer months, and duly watered. These should be taken up with balls of earth to their roots, and planted in pots, that they may be sheltered in winter, either under a common frame, or in a green-house, where they may

may have plenty of air in mild weather, otherwise they will draw up weak and have little beauty. The second may be propagated by seeds, which should be sown on a hot-bed in the spring; when the plants are fit to remove, two or three of them should be planted in pots, then plunged into a hot-bed of tan, to bring them forward to get ripe seeds in the autumn, otherwise the plants will require a stove in winter.

AMELLUS, *f.* in botany. See CALFA and ERIGERON.

AMELLUS VIRGILII, *f.* in botany. See ASTER.

AMELOT' DE LA HOUSSE (Nicholas), born at Orleans in 1634, was much esteemed at the court of France, and appointed secretary of an embassy which that court sent to the commonwealth of Venice, as appears by the title of his Translation of Father Paul's History of the Council of Trent; but he afterwards published writings which gave such offence, that he was imprisoned in the Bastille. The first works he printed were the History of the Government of Venice, and that of the Uscocks, a people of Croatia. In 1683 he published his translations into French of Machiavel's Prince, and Father Paul's History of the Council of Trent, and Political Discourses of his own upon Tacitus. These performances were well received by the public. His translation of Father Paul was attacked by the partisans of the pope's unbounded power and authority. In France, however, it met with great success; all the advocates for the liberty of the Gallican church promoting it to utmost of their power, though at the same time there were three memorials presented to have it suppressed. In 1684, he printed, at Paris, a French translation of Baltasar Gracian's *Oraculo Manual*, with the title of *L'Homme de Cour*. In 1686, he printed *La Morale de Tacite de la Flatterie*; in which work he collected several particular facts and maxims, which represent in a strong light the artifices of court-flatterers, and the mischievous effect of their poisonous discourses. He wrote several other works; and died at Paris in 1706, being then almost seventy-three years of age.

AMELOT (Denis), a celebrated French writer, was born at Saintonge in 1606. He maintained a close correspondence with the fathers of the Oratory, a congregation of priests founded by Philip of Neri. He wrote the life of Charles de Gondren, second superior of this congregation, and published it at Paris in 1643. Amelot's translation of the New Testament, in 4 vols octavo, was printed in the years 1666, 1667, and 1668. Amelot wrote also an Abridgement of Divinity, a Catechism for the Jubilee, and a kind of Christian Manual for every day. Towards the end of his life, he entered into the congregation of the Oratory in 1650; and continued amongst them till his death; which happened in 1678.

A'MEN, *adv.* [a word of which the original has given rise to many conjectures. Scaliger writes, that it is Arabic; and the rabbies make it the compound of the initials of three words, signifying *the Lord is a faithful king*; but the word seems merely Hebrew, אמן, which, with a long train of derivatives, signifies, firmness, certainty, fidelity.] A term constantly used in devotions, by which, at the end of a prayer, we mean, *so be it*; at the end of a creed *so it is*. It was a sort of affirmation used often by our Saviour: *Αμην, αμην, λεγω υμιν, Verily, verily, I say unto you*. Lastly, it is understood as expressing a wish; as, *Amen, so be it*; Numb. v. 22. or an affirmation, *Amen, yes, I believe it*, 1 Cor. xiv. 16. The Hebrews, and the five books of Psalms, according to their way of distributing them, with the words *Amen, amen*; which the Septuagint have translated, *Γεννητο, γεννητο*; and the Latins, *Fiat, fiat*. The Greek and Latin churches have preserved this word in their prayers, as well as *alleluia* and *hoshannah*; because they observed more energy in them than in any terms which they could use in their own languages. At the conclusion of the public prayers, the people answered with a loud voice, *Amen*; and St. Jerome says, that at Rome, when the people answered *Amen*, the sound of their voices was like a clap of thunder: *In similitudinem caelestis tonitru*

Amen reboat. The Jews assert, that the gates of heaven are opened to him who answers *Amen* with all his might.

AMENABLE, *adj.* [*amenable*, Fr. *amener quel'un*, in the French courts, signifies, to oblige one to appear to answer a charge exhibited against him.] Responsible; subject so as to be liable to enquiries or accounts.—Again, because the inferior sort were loose and poor, and not *amenable* to the law, he provided, by another act, that five of the best and eldest persons of every sept should bring in all the idle persons of their surname to be justified by the law. *Sir John Davies*.

AMENABLE, [from the French *main*, a hand.] In law, signifies tractable, *ad manum*, that may be led or governed. In the modern sense, it signifies to be responsible, or subject to answer in a court of justice.

AM'ENAGE, or AMENANCE, *f.* [They seem to come from *amener*, Fr.] Conduct; behaviour; mien: words disused.

To AMEN'D, *v. a.* [*amender*, Fr. *emendâr*, Sp. *emendo*, It. and Lat.] To correct; to change any thing that is wrong to something better. To reform the life, or leave wickedness. In these two cases we usually write *mend*.—*Amend* your ways and your doings, and I will cause you to dwell in this place. *Jerem. vii. 3*.—To restore passages in writers, which the copiers are supposed to have depraved; to recover the true reading.

"Little said, soon amended," or "silence seldom does harm." Lat. *Nulli tacuisse nocet esse locutum*. H. Ger. *Reden thut mehr schaden als stillschweigen*. Loquacity is more hurtful than silence. And indeed, if we consider the fatal consequences which in all ages have attended those who have given too great a loose to their tongue, and the serious misfortunes this little member has brought upon mankind in general, every wise man would be very cautious how he placed his words. How often does the talkative man expose himself to derision, and what pains does he not take to appear a greater fool than perhaps he in reality is; whereas the man who speaks little, and with caution, has often a greater share of wisdom ascribed to him than he deserves.

To AMEND, *v. n.* To grow better. To *amend* differs from *improve*; to *improve* supposes or not denies that the thing is well already, but to *amend* implies something wrong.

AMEN'DE, *f.* [French] This word, in French, signifies a fine, by which recompence is supposed to be made for the fault committed. We use, in a cognate signification, the word *amends*.

AMEN'DER, *f.* [from *amend*.] The person that amends any thing.

AMEND'MENT, *f.* [*amendment*, Fr.] A change from bad for the better.—Man is always mending and altering his works; but nature observes the same tenor, because her works are so perfect, that there is no place for *amendments*; nothing can be reprehended. *Ray*.—Reformation of life.—Behold! famine and plague, tribulation and anguish, are sent as scourges for *amendment*. 2 *Esdra*s, xvi. 19.—Recovery of health:

Your honour's players, hearing your *amendment*,

Are come to play a pleasant comedy.

Shakespeare.

AMENDMENT, [*amendatio*.] in law, is the correction of an error committed in any process which may be amended after judgment; but, if there be any error in giving the judgment, the party is driven to his writ of error: though, where the fault appears to be in the clerk who wrote the record, it may be amended. *Terms of the Law*. Formerly suitors were much perplexed by writs of error brought upon very slight and trivial grounds, as mis-spellings and other mistakes of the clerks, all which might be amended at the common law, while all the proceedings were in paper, for they were then considered only *in feri*, and therefore subject to the controul of the courts. But, when once the record was made up, it was formerly held, that by the common law, no *amendment* could be permitted; unless within the very term in which the judicial act so

recorded

recorded was done; for, during the term the record is in the breast of the court, but afterwards it admitted of no alteration: but now the courts are become more liberal, and, where justice requires it, will allow of amendments at any time while the suit is depending, notwithstanding the record be made up, and the term be past; for they, at present, consider the proceedings as *in fieri* till judgment is given; and therefore, that till then they have power to permit amendments by the common law; but, when judgment is once given and inrolled, no amendment is permitted in any subsequent term. Mistakes are also frequently helped by the statutes of amendment and jeofails, so called, because when a pleader perceives any slip in the form of his proceedings, and acknowledges such error (*jeo faile*, I have failed), he is at liberty by those statutes to amend it; which amendment is seldom actually made, but the benefit of the acts is attained by the court's overlooking the exceptions. 3 *Black.* 406.

AMENDS, *f.* [*amende*, Fr. from which it seems to be accidentally corrupted.] Recompence; compensation; atonement:

There I, a pris'ner chain'd, scarce freely draw
The air imprison'd also, close and damp,
Unwholesome draught; but here I feel *amends*,
The breath of heav'n fresh blowing, pure and sweet,
With day-spring born; here leave me to respire. *Milton.*

—It is a strong argument for retribution hereafter, that virtuous persons are very often unfortunate, and vicious persons prosperous; which is repugnant to the nature of a Being, who appears infinitely wise and good in all his works; unless we may suppose that such a promiscuous distribution, which was necessary for carrying on the designs of providence in this life, will be rectified and made *amends* for in another. *Spektator.*

AMENITY, *f.* [*amenité*, Fr. *amanitas*, Lat.] Pleasantness; agreeableness of situation.—If the situation of Babylon was such at first as in the days of Herodotus, it was a seat of *amenity* and pleasure. *Brown.*

AMENTACEOUS, *adj.* [*amentatus*, Lat.] Hanging as by a thread.—The pine-tree hath *amentaceous* flowers or catkins. *Miller.*

AMEN'TUM, *f.* in botany, the name of a species of calyx, consisting of valves, and hanging down in different directions from the calulis. Common oats afford a good example of the amentum.

AMENTUM, *f.* in Roman antiquity, a thong tied about the middle of a javelin or dart, and fastened to the forefinger, in order to recover the weapon as soon as it was discharged. The ancients made great use of the amentum, thinking it helped to enforce the blow. It also denotes a latchet that bound their sandals.

AME'RADE, *f.* a kind of officers among the Saracens, answering to the governor of provinces among the Europeans. The name is originally the same with that of emir.

To AME'RCE, *v. a.* [*amercier*, Fr. *εφθαλμων μεν αμερσει*, seems to give the original.] To punish with a pecuniary penalty; to exact a fine; to inflict a forfeiture. It is a word originally juridical, but adopted by other writers, and is used by Spenser of punishments in general. Sometimes with the particle *in* before the fine.—They shall *amerce* him *in* an hundred shekels of silver, and give them unto the father of the damsel, because he hath brought up an evil name upon a virgin of Israel. *Deut.* xxii. 19. Sometimes it is used, in imitation of the Greek construction, with the particle *of*:

Millions of spirits, for his fault *amerc'd*
Of heav'n, and from eternal splendours flung
For his revolt.

Milton.

AME'RCER, *f.* He that sets a fine upon any misdemeanour; he that decrees or inflicts any pecuniary punishment or forfeiture.

AME'RCEMENT, or AME'RCIAMENT, *f.* The pecuniary punishment of an offender, who stands at the mercy of the king, or other lord in his court. *Cowell.*—All *amercements* and fines that shall be imposed upon them, shall come unto themselves. *Spenser.*

AMERCMENT, in law, is to be at the king's mercy with regard to the *quantum* of a fine imposed. By *magna charta*, c. 14. no man shall have a larger amercement imposed upon him than his circumstances or personal estate will bear, saving to the land-owner his land, to the trader his merchandize, and to the husbandman his team and instruments of husbandry: in order to ascertain which, the great charter also directs, that the amercement, which is always inflicted in general terms, shall be set or reduced to a certainty by the oath of a jury. In the court-leet and court-baron, this is usually done by *assessors*, or jurors sworn to *assesse*; that is, to tax and moderate the general amercement according to the particular circumstances of the offence and offender. In limitation of which, in courts superior to these, the ancient practice was, to inquire by a jury, when a fine was imposed upon any man, how much he was able to pay by the year, saving the maintenance of himself, his wife, and children. And, since the disuse of such inquest, it is never usual to assess a larger fine than a man is able to pay, without touching the implements of his livelihood, but to inflict corporal punishment, or a stated imprisonment, which is better than an excessive fine, for that amounts to imprisonment for life; and by the bill of rights it is particularly declared, that excessive fines ought not to be imposed. 4 *Black.* 372.

AME'RI, *f.* in botany. See INDIGOFERA.

AME'RICA, [from *Americus Vesputius*, who falsely assumed the honour of being the first discoverer of that continent.] One of the four quarters of the globe, and by far the largest; which, from its late discovery, is frequently denominated the *New World*. This vast country extends from the 80th degree of north to the 56th degree of south latitude; and, where its breadth is known, from the 35th to the 136th degree west longitude from London; stretching near 9000 miles in length, and in its greatest breadth 3690. It sees both hemispheres, has two summers and a double winter, and enjoys all the variety of climates which the earth affords. It is washed by the two great oceans. To the eastward it has the Atlantic, which divides it from Europe and Africa; to the west it has the Pacific or Great South Sea, by which it is separated from Asia. By these seas it carries on a direct and increasing commerce with the other three parts of the world.

It is with great reason believed, that the ancients had some imperfect notion of America; and many authors are quoted in confirmation of this opinion. In a book ascribed to Aristotle, we are told that the Carthaginians discovered an island far beyond the pillars of Hercules, large, fertile, and finely watered with navigable rivers, but uninhabited. This island was distant a few days sailing from the continent; its beauty induced the discoverers to settle there; but the policy of Carthage dislodged the colony, and laid a strict prohibition on all the subjects of the state not to attempt any future establishment. This account is also confirmed by an historian of no mean credit, who relates, that the Tyrians would have settled a colony on the new-discovered islands, but were opposed by the Carthaginians for state reasons. Seneca, and other authors, are also quoted in support of this belief. But, however this may be, nobody ever believed the existence of this continent so firmly as to go in quest of it; at least, there are no accounts well supported that America received any part of its first inhabitants from Europe prior to the 15th century. The Welsh fondly imagine, that their country contributed, in 1170, to people the New World, by the adventure of Madoc, son of Owen Gwynedd, who, on the death of his father, failed there, and colonized part of the country. All that is advanced in proof is, a quotation from one of the British poets, which proves no more than

than that he had distinguished himself by sea and land. It is pretended that he made two voyages; that, sailing west, he left Ireland so far to the north, that he came to a land unknown, where he saw many strange things; that he returned home, and, making a report of the fruitfulness of the new-discovered country, prevailed on numbers of the Welsh of each sex to accompany him on a second voyage, from which he never returned. The favourers of this opinion assert, that several Welsh words, such as *gwando*, "to hearken or listen;" the isle of *Cresfo*, or "welcome;" Cape Breton, from the name of Britain; *gwynndwr*, or, "the white water;" and *pengwin*, or, "the bird with a white head;" are to be found in the American language. But likeness of sound in a few words will not be deemed sufficient to establish the fact; especially if the meaning has been evidently perverted: for example, the whole penguin tribe have unfortunately not only black heads, but are not inhabitants of the northern hemisphere; the name was also bestowed on them by the Dutch, à *pinguedine*, from their excessive fatness; but the inventor of this, thinking to do honour to his country, inconsiderately caught at a word of European origin, and unheard of in the New World. It may be added, that the Welsh were never a naval people; that the age in which Madoc lived was peculiarly ignorant in navigation; and the most which they could have attempted must have been a mere coasting voyage.

The Norwegians seem to claim a share of the glory, on grounds rather better than the Welsh. By their settlements in Iceland and in Greenland, they had arrived within so small a distance of the New World, that there is at least a possibility of its having been touched at by a people so versed in maritime affairs, and so adventurous, as the ancient Normans were. The proofs are much more numerous than those produced by the British historians; for the discovery is mentioned in several of the Icelandic manuscripts. The period was about the year 1002, when it was visited by one Biorn; and the discovery pursued to greater effect by Leif, the son of Eric, the discoverer of Greenland. It does not appear that they reached farther than Labrador; on which coast they met with the Esquimaux, on whom they bestowed the name of *Skrælingues*, or dwarfish people, from their small stature. They were armed with bows and arrows, and had leathern canoes, such as they have at present. All this is probable; nor should the tale of the German, called *Tuckil*, one of the crew, invalidate the account. He was one day missing; but soon returned, leaping and singing, with every mark of joy, on discovering the inebriating fruit of his country, the grape. Torseus even says, that he returned in a state of intoxication. To convince his commander, he brought several bunches, who, from that circumstance, named the country *Vinland*. It is not to be denied, that North America produces the true vine; but it is found in far lower latitudes than our adventurers could reach in the time employed in their voyages, which was comprehended in a very small space. There appears no reason to doubt of the discovery; but, as the land was never colonized, nor any advantages made of it, it may fairly be conjectured, that they reached no farther than the barren country of Labrador. In short, it is from a much later period that we must date the real discovery of America.

Towards the close of the fourteenth century, the navigation of Europe was scarcely extended beyond the limits of the Mediterranean. The mariner's compass had been invented and in common use for more than a century; yet, with the help of this sure guide, prompted by the most ardent spirit of discovery, and encouraged by the patronage of princes, the mariners of those days rarely ventured from the sight of land. They acquired great applause by sailing along the coast of Africa and discovering some of the neighbouring islands; and, after pushing their researches with the greatest industry and perseverance for more than half a century, the Portuguese, who were

the most fortunate and enterprising, extended their discoveries southward no farther than the equator.

The rich commodities of the East had for several ages been brought into Europe by the way of the Red Sea and the Mediterranean; and it had now become the object of the Portuguese to find a passage to India, by sailing round the southern extremity of Africa, and then taking an eastern course. This great object engaged the general attention of mankind, and drew into the Portuguese service adventurers from every maritime nation in Europe.

Among the foreigners whom the fame of the discoveries made by the Portuguese had allured into their service, was Christopher Colon, or Columbus, a subject of the republic of Genoa. Neither the time nor place of his birth are known with certainty; but he was descended of an honourable family, though reduced to indigence by various misfortunes. His ancestors having betaken themselves for subsistence to a sea-faring life, Columbus discovered, in his early youth, the peculiar character and talents which mark out a man for that profession. His parents, instead of thwarting this original propensity of his mind, seem to have encouraged and confirmed it, by the education which they gave him. After acquiring some knowledge of the Latin tongue, the only language in which science was taught at that time, he was instructed in geometry, cosmography, astronomy, and the art of drawing. To these he applied with such ardour and predilection, on account of their connection with navigation, his favourite object, that he advanced with rapid proficiency in the study of them. Thus qualified, in the year 1461, he went to sea at the age of fourteen, and began his career on that element which conducted him to so much glory. His early voyages were limited principally to those places which had before been discovered, in which nothing very remarkable happened, except that in a sea-fight, off the coast of Portugal, with some Venetian coasters, the vessel on-board which he served took fire, together with one of the enemy's, to which it was fast grappled; upon which he threw himself into the sea, laid hold of a floating oar, and by the support of it, and his dexterity in swimming, he reached the shore, though more than six miles distant, and thus preserved a life designed for great undertakings.

Soon after this he went to Lisbon, where he married a daughter of Bartholomew Perestrelo, one of the captains employed by prince Henry in his early voyages, and who had discovered and planted the islands of Porto Santo and Madeira. The journals and charts of this experienced navigator, his father-in-law, fell into his hands, and he, with avidity, availed himself of the valuable information they contained. His impatience to visit the places which Perestrelo had seen and described, became irresistible; and he made a voyage to Madeira, and spent several years in trading with that island, the Canaries, the Azores, the settlements in Guinea, and all other places which the Portuguese had discovered on the continent of Africa.

By the experience acquired during such a variety of voyages, Columbus became one of the most skilful navigators of Europe. But his ambition did not suffer him to rest satisfied with that praise. He aimed at something more. A project had been conceived of finding out a passage by sea to the East Indies. The accomplishment of this became a favourite object with Columbus. The Portuguese sought this route by steering towards the south, in hope of arriving at India, by turning to the east, after they had sailed round the farther extremity of Africa; which passage was afterwards effected in 1497, by Vasco de Gama, a Portuguese navigator. Columbus contemplated a shorter and more direct passage to the East Indies, by sailing towards the west, across the Atlantic Ocean. The principles and arguments which induced him to adopt this opinion, then considered as chimerical, were highly rational and philosophical. The sphericity and magnitude of the earth, were at that period ascertained with some

degree of accuracy. From this it was evident, that the continents of Europe, Asia, and Africa, formed but a small part of the terraqueous globe. It appeared likewise extremely probable, that the continent on the one side of the globe was balanced by a proportional quantity of land in the other hemisphere. These conclusions concerning the existence of another continent, drawn from the figure and structure of the globe, were confirmed by the observations and conjectures of modern navigators, and from pieces of timber artificially carved, canes of an enormous size, trees torn up by the roots, and the dead bodies of two men with singular features, which had been discovered and taken up, floating before a westerly wind, or driven on the coasts of the Azores. The force of this united evidence, arising from theoretical principles and practical observations, led Columbus to conclude, that by sailing directly towards the west, across the Atlantic Ocean, new countries, which probably formed a part of the vast continent of India, must infallibly be discovered. As early as the year 1474, he communicated his ingenious theory to Paul, a physician of Florence, eminent for his knowledge of cosmography. He warmly approved of the plan; suggested several facts in confirmation of it, and encouraged Columbus to persevere in an undertaking so laudable, and which must redound so much to the honour of his country, and the benefit of Europe.

Columbus now became impatient to bring to the test of experiment the truth of his system, and to set out upon a voyage of discovery. The first step towards this was to secure the patronage of some of the considerable powers of Europe. With this view he laid his scheme before the senate of Genoa, and, making his native and beloved country the first tender of his service, offered to sail, under the banners of the republic, in quest of new regions which he expected to discover. But they, incapable of forming just ideas of his principles, inconsiderately rejected his proposal as chimerical. He then submitted his plan to the Portuguese, who perfidiously attempted to rob him of the honour of accomplishing it, by privately sending another person to pursue the same track which he had proposed. But the pilot, who was thus basely employed to execute Columbus's plan, had neither the genius nor the fortitude of its author. Contrary winds arose; no land appeared; his courage failed; and he returned to Lisbon, execrating a plan which he had not abilities to execute. On discovering this flagrant treachery, Columbus immediately quitted the kingdom in disgust, and landed in Spain, towards the close of the year 1484. Here he resolved to propose it in person to Ferdinand and Isabella, who at that time governed the united kingdoms of Castile and Arragon. He, in the mean time, sent his brother Bartholomew to England, to propose his plan to Henry VII.

After experiencing a series of mortifying disappointments, during eight tedious years, Columbus, in deep anguish, withdrew from court, determined to repair to England as his last resource. At this juncture the affairs of Spain, which had been perplexed in consequence of a war with the Moors, took a favourable turn. Quintanilla and Santangel, two powerful, vigilant, and discerning, patrons of Columbus, seized this favourable opportunity to make one more effort in behalf of their friend. They addressed themselves to Isabella, with such forcible arguments as produced the desired effect. They dispelled all Isabella's doubts and fears: she ordered Columbus, who had proceeded on his journey, to be instantly recalled; declared her resolution to employ him on his own terms; and, regretting the low state of her finances, generously offered to pledge her own jewels, in order to raise as much money as might be needed in making preparations for the voyage. Santangel, in a transport of gratitude, kissed the queen's hand; and, in order to save her from having recourse to such a mortifying expedient for procuring money, engaged to advance, immediately, the sum that was requisite.

Columbus had proceeded some leagues on his voyage to

England, when the messenger from Isabella overtook him. He returned with joy mingled with some degree of fear, lest he should again be disappointed. The manner of his reception by the queen was, however, such as quickly dispelled his fears. A negotiation commenced, and was forwarded with dispatch, and an agreement was finally entered into and signed, on the 7th of April, 1492. The chief articles of it were, 1. Ferdinand and Isabella, as sovereigns of the ocean, constituted Columbus their high-admiral in all the seas, islands, and continents, which should be discovered by his industry; and stipulated, that he and his heirs for ever should enjoy this office, with the same powers and prerogatives which belonged to the high-admiral of Castile, within the limits of his jurisdiction. 2. They appointed Columbus their viceroy in all the islands and continents which he should discover; but if, for the better administration of affairs, it should be necessary to establish a separate governor in any of those countries, they authorized Columbus to name three persons, of whom they would chuse one for that office; and the dignity of viceroy, with all its immunities, was likewise to be hereditary in the family of Columbus. 3. They granted to Columbus, and his heirs for ever, the tenth of the free profits accruing from the productions and commerce of the countries which he should discover. 4. They declared, if any controversy or law-suit should arise, with respect to any mercantile transaction, in the countries which shall be discovered, it should be determined by the sole authority of Columbus, or of judges to be appointed by him. 5. They permitted Columbus to advance one-eighth part of what should be expended in preparing for the expedition, and in carrying on commerce with the countries which he should discover, and intitled him, in return, to an eighth part of the profit.

Though the name of Ferdinand appears conjoined with that of Isabella in this transaction, his distrust of Columbus was so violent, that he refused to take any part of the enterprise, as king of Arragon. As the whole expence of the expedition was to be defrayed by the crown of Castile, Isabella reserved for her subjects of that kingdom an exclusive right to all the benefits which might redound from its success.

After all the efforts of Isabella and Columbus, the armament was suitable, neither to the dignity of the power who equipped it, nor to the importance of the service to which it was destined. It consisted of three vessels; the largest, a ship of no considerable burden, was commanded by Columbus, as admiral, who gave it the name of *Santa Maria*. Of the second, called the *Pinta*, Martin Pinzon was captain, and his brother Francis pilot. The third, named the *Niña*, was under the command of Vincent Yanez Pinzon. These two last-mentioned were light vessels, hardly superior in burden or force to large boats. This little squadron was victualled for twelve months, and had on-board ninety men, mostly sailors, together with a few adventurers, who followed the fortune of Columbus, and some gentlemen of Isabella's court, whom she appointed to accompany him. The sum employed in fitting out this squadron did not exceed 4000l. sterling.

On the 3d of August, 1492, being Friday, Columbus set sail, in the presence of a vast crowd of spectators, who offered fervent supplications to heaven for his success, which they rather wished than expected. He steered directly for the Canary islands, and, in the short run thither, found his ships crazy and ill appointed, and very unfit for so long and dangerous a navigation as he had undertaken. After resitting them as well as he could, he left the Canaries on the 6th of September, and here properly commenced the voyage of discovery. He held his course due west, and immediately left the usual track of navigation, and stretched into unknown and unfrequented seas. By the 14th of September, the fleet was about 200 leagues west of the Canaries, at a greater distance from land than any Spaniard had been before that time.

Columbus early discovered, from the spirit of his followers,

lowers, that he must prepare to struggle, not only with the unavoidable difficulties which might be expected from the nature of his undertaking, but with such also as were likely to arise from the ignorance and timidity of the people under his command. All the art and address he was master of was hardly sufficient to quell the mutinous disposition of his sailors, who grew the more turbulent in proportion as their distance from home increased. What most astonished Columbus, during the voyage, was the variation of the magnetic needle. He observed that it did not point exactly to the polar star, but varied towards the west. This appearance, then one of the mysteries of nature, though now familiar, filled the companions of Columbus with terror. They were now in the midst of a trackless ocean; nature herself seemed to be altered, and the only guide they had left was about to fail them. Columbus, with no less quickness than ingenuity, invented a reason for this appearance, which, though it did not satisfy himself, seemed so plausible to them, that it dispelled their fears and silenced their murmurs.

On the evening of the 11th of October, Columbus was so confident, from various appearances, of being near land, that he ordered the sails to be furled, and the ships to lie to, and strict watch to be kept lest they should be driven on-shore in the night. During this interval of suspense and expectation, no man shut his eyes, all kept on deck, gazing intently towards that quarter where they expected to discover the land, which had so long been the object of their wishes. A little before midnight, Columbus, from the fore-castle, discovered a light at a distance; and, shortly after, the joyful sound of *land! land!* was heard from the Pinta, which always kept a-head of the other ships. At the dawn of day, an island was seen from every ship, at the distance of about two leagues north, whose verdant aspect indicated a most delightful country. The crews of all the ships, with tears of joy and transports of congratulation, unitedly sang *Te Deum*; as a hymn of thanksgiving to God. They then, with feelings of self-condemnation, mingled with reverence, threw themselves at the feet of Columbus, begged him to forgive their ignorance, incredulity, and insolence, which had given him so much unnecessary disquiet; acknowledged his superior abilities, and promised obedience in future.

At sun-rising, the boats were manned and armed, and they rowed towards the island with their colours displayed, with warlike music and other martial pomp. As they approached the coast, they saw it covered with a multitude of people, whom the novelty of the spectacle had drawn together, whose attitudes and gestures expressed wonder and astonishment at the strange objects before them. Columbus was the first European who set foot in the New World which he had discovered. He landed in a rich dress, and with a naked sword in his hand. His men followed, and, kneeling down, they all kissed the ground which they had so long desired to see. They next erected a crucifix, and, prostrating themselves before it, returned thanks to God for conducting their voyage to so happy an issue. They then took a solemn and formal possession of the country for the crown of Castile and Leon.

The dress of the Spaniards, their beards, their arms, the vast machines with which they traversed the ocean, the thundering roar of the cannon, accompanied with lightning and smoke, filled the natives with surprise and terror, and they began to consider them as children of the sun, who had descended to visit mortals here below. The Spaniards were hardly less amazed in their turn. The productions of the island were different from any thing they had seen in Europe. The inhabitants appeared in the simple innocence of nature, entirely naked. Their black hair, long and uncurled, floated upon their shoulders, or was bound in tresses round their heads. They had no beards, and every part of their body was perfectly smooth. Their complexion was of a dusky copper colour; their features singular rather than disagreeable, and their aspect gentle and timid. They were shy at first, through fear,

but soon became familiar with the Spaniards, and with transports of joy received from them various kinds of trinkets, in return for which they gave provisions, and some cotton yarn, the only commodity of value they could produce. Thus in the first interview between the inhabitants of the old and new worlds, every thing was conducted amicably, and to their mutual satisfaction.

The island on which Columbus first landed he called San Salvador. It is one of that large cluster of islands known by the name of the Lucaya or Bahama islands, and is above 3000 miles west of the Canaries. He afterwards touched at several islands in the same cluster, inquiring every where for gold, which he thought was the only object of commerce worth his attention. In steering southward, he discovered the islands of Cuba and Hispaniola, abounding in all the necessaries of life, and inhabited by a humane and hospitable people.

On his return to Spain he was overtaken by a storm, which had nearly proved fatal to his ships and their crews. At a crisis when all was given up for lost, Columbus had presence of mind enough to retire into his cabin, and to write upon parchment a short account of his voyage. This he wrapped in an oiled cloth, which he inclosed in a cake of wax, put it into a tight cask, and threw it into the sea, in hopes that some fortunate accident might preserve a deposit of so much importance to the world. He arrived at Palos, in Spain, whence he had sailed the year before, on the 15th of March, 1493. He was welcomed with all the acclamations which the populace are ever ready to bestow on great and glorious characters; and the court received him with marks of the greatest respect.

In September, of this year, (1493), Columbus sailed upon his second voyage to America; during the performance of which he discovered the islands of Dominica, Margarite, Guadaloupe, Montserrat, Antigua, Porto Rico, and Jamaica; and returned to Spain in 1496.

In 1498, he sailed a third time for America; and on the first of August discovered the continent, at the mouth of the river Orinoco. He then coasted along westward, making other discoveries, for 200 leagues, to Cape Vela, from which he crossed over to Hispaniola, where he was seized by a new Spanish governor, and sent home in chains.

In 1502, Columbus made his fourth, and last, voyage to Hispaniola; thence he went over to the continent; discovered the bay of Honduras; thence sailed along shore easterly 200 leagues, to Cape Gracias a Dios, Veragua, Porto Bello, and the Gulf of Darien, searching, in vain, for a passage to the East Indies. During this voyage, he was shipwrecked on the island of Jamaica, where he suffered almost inconceivably from the cruelty of the inhabitants, the mutiny of his men, and especially from the infamous conduct of the governor of Hispaniola. He returned to Spain in 1504. On his arrival he received the fatal news of the death of his patroness, queen Isabella.

The jealous and avaricious Spaniards, not immediately receiving those golden advantages from these new discoveries which they had promised, and lost to the feelings of humanity and gratitude, suffered their esteem and admiration of Columbus to degenerate into ignoble envy. The latter part of his life was therefore made wretched by the cruel persecutions of his enemies. Queen Isabella, his friend and patroness, was no longer alive to afford him relief. He sought redress from Ferdinand, but in vain. Disgusted with the ingratitude of a monarch whom he had served with so much fidelity and success, exhausted with hardships, and broken with the infirmities which these brought upon him, Columbus ended his active and useful life at Valladolid, on the 20th of May, 1506, in the 59th year of his age. He died with a composure of mind suited to the magnanimity which distinguished his character, and with sentiments of piety becoming that supreme respect for religion which he manifested in every occurrence of his life. He was grave though courteous in his deportment, circumspect in his words and actions, irreproachable in his morals, and exemplary in all the duties of his religion.

Among

Among other adventurers to the new world, in pursuit of gold, was Americus Vesputius, a Florentine gentleman, whom Ferdinand had appointed to draw sea-charts, and to whom he had given the title of chief pilot. This man accompanied Ojeda, an enterprising Spanish adventurer, to America; and having, with much art, and some degree of elegance, drawn up an amusing history of his voyage, he published it to the world. It circulated rapidly, and was read with admiration. In his narrative, he had insinuated that the glory of having first discovered the new world belonged to him. This was in part believed, and the country began to be called after the name of its supposed first discoverer. The unaccountable caprice of mankind has perpetuated the error; so that now, by the universal consent of all nations, this new quarter of the globe is called America. The bold pretensions of a fortunate impostor have, after him, thus robbed the discoverer of the new world of a distinction which belonged to him. The name of Americus has supplanted that of Columbus; and mankind are left to regret an act of injustice, which, having been sanctioned by time, they can never redress.

GENERAL DESCRIPTION of the AMERICAN CONTINENT.

AMERICA is not of equal breadth throughout its whole extent; but is divided into two great continents, called *North and South America*, by an isthmus 1500 miles long, and which at Darien, about lat. 9° N. is only sixty miles over. This isthmus forms, with the northern and southern continents, a vast gulph, in which lie a great number of islands, called the *West Indies*, in contradistinction to the eastern parts of Asia, which are called the *East Indies*.

Between the New World and the Old, there are several very striking differences; but the most remarkable is the general predominance of cold throughout the whole extent of America. Though we cannot, in any country, determine the precise degree of heat merely by the distance of the equator, because the elevation above the sea, the nature of the soil, &c. affect the climate; yet, in the ancient continent, the heat is much more in proportion to the vicinity to the equator than in any part of America. Here the rigour of the frigid zone extends over half that which should be temperate by its position. Even in those latitudes where the winter is scarcely felt on the old continent, it reigns with great severity in America, though during only a short period. Nor does this cold, prevalent in the new world, confine itself to the temperate zones; but extends its influence to the torrid zone also, considerably mitigating the excess of its heat. Along the eastern coast, the climate, though more similar to that of the torrid zone in other parts of the earth, is nevertheless considerably milder than in those countries of Asia and Africa which lie in the same latitude. From the southern tropic to the extremity of the American continent, the cold is said to be much greater than in parallel northern latitudes even of America itself.

For this remarkable difference between the climate of the new continent and the old, various causes have been assigned by different authors. The following is the opinion of Dr. Robertson on this subject: "Though the utmost extent of America towards the north be not yet discovered, we know that it advances nearer to the pole than either Europe or Asia. The latter have large seas to the north, which are open during part of the year; and, even when covered with ice, the wind that blows over them is less intensely cold than that which blows over land in the same latitudes. But, in America, the land stretches from the river St. Laurence towards the pole, and spreads out immensely to the west. A chain of enormous mountains, covered with snow and ice, runs through all this dreary region. The wind passing over such an extent of high and frozen land, becomes so impregnated with cold, that it acquires a piercing keenness, which it retains in its pro-

gress through warmer climates; and is not entirely mitigated until it reaches the gulph of Mexico. Over all the continent of North America, a north-westerly wind and excessive cold are synonymous terms. Even in the most sultry weather, the moment that the wind veers to that quarter, its penetrating influence is felt in a transition from heat to cold no less violent than sudden. To this powerful cause we may ascribe the extraordinary dominion of cold, and its violent inroads into the southern provinces in that part of the globe.

"Other causes, no less remarkable, diminish the active power of heat in those parts of the American continent which lie between the tropics. In all that portion of the globe, the wind blows in an invariable direction from east to west. As this wind holds its course across the old continent, it arrives at the countries which stretch along the western shore of Africa, inflamed with all the fiery particles which it hath collected from the sultry plains of Asia, and the burning sands in the African deserts. The coast of Africa is accordingly the region of the earth which feels the most fervent heat, and is exposed to the unmitigated ardour of the torrid zone. But this same wind, which brings such an accession of warmth to the countries lying between the river of Senegal and Caffraria, traverses the Atlantic Ocean before it reaches the American shore. It is cooled in its passage over this vast body of water; and is felt as a refreshing gale along the coasts of Brazil and Guiana, rendering those countries, though amongst the warmest in America, temperate, when compared with those which lie opposite to them in Africa. As this wind advances in its course across America, it meets with immense plains covered with impenetrable forests; or occupied by large rivers, marshes, and stagnant waters, where it can recover no considerable degree of heat. At length it arrives at the Andes, which run from north to south through the whole continent. In passing over their elevated and frozen summits, it is so thoroughly cooled, that the greater part of the countries beyond them hardly feel the ardour to which they seem exposed by their situation. In the other provinces of America, from Terra Firma westward to the Mexican empire, the heat of the climate is tempered, in some places, by the elevation of the land above the sea; in others, by their extraordinary humidity; and in all, by the enormous mountains scattered over this tract. The islands of America in the torrid zone are either small or mountainous, and are fanned alternately by refreshing sea and land breezes.

"The causes of the extraordinary cold towards the southern limits of America, and in the seas beyond it, cannot be ascertained in a manner equally satisfying. It was long supposed, that a vast continent, distinguished by the name of *Terra Australis Incognita*, lay between the southern extremity of America and the antarctic pole. The same principles which account for the extraordinary degree of cold in the northern regions of America, were employed in order to explain that which is felt at Cape Horn and the adjacent countries. The immense extent of the southern continent, and the rivers which it poured into the ocean, were mentioned and admitted by philosophers as causes sufficient to occasion the unusual sensation of cold, and the still more uncommon appearances of frozen seas in that region of the globe. But the imaginary continent to which such influence was ascribed having been searched for in vain, and the space which it was supposed to occupy having been found to be an open sea, new conjectures must be formed with respect to the causes of a temperature of climate so extremely different from that which we experience in countries removed at the same distance from the opposite pole.

"The most obvious and probable cause of this superior degree of cold towards the southern extremity of America, seems to be the form of the continent there. Its breadth gradually decreases as it stretches from St. Antonio southwards, and from the bay of St. Julian to the straits of Magellan its dimensions are much contracted. On the

east and west sides, it is washed by the Atlantic and Pacific oceans. From its southern point, it is probable that an open sea stretches to the antarctic pole. In whichever of these directions the wind blows, it is cooled before it approaches the Magellanic regions, by passing over a vast body of water; nor is the land there of such extent, that it can recover any considerable degree of heat in its progress over it. These circumstances concur in rendering the temperature of the air in this district of America more similar to that of an insular, than to that of a continental, climate; and hinder it from acquiring the same degree of summer-heat with places in Europe and Asia in a corresponding northern latitude. The north wind is the only one that reaches this part of America, after blowing over a great continent. But, from an attentive survey of its position, this will be found to have a tendency rather to diminish than augment the degree of heat. The southern extremity of America is properly the termination of the immense ridge of the Andes, which stretches nearly in a direct line from north to south, through the whole extent of the continent. The most sultry regions in South America, Guiana, Brazil, Paraguay, and Tucuman, lie many degrees to the east of the Magellanic regions. The level country of Peru, which enjoys the tropical heats, is situated considerably to the west of them. The north wind, then, though it blows over land, does not bring to the southern extremity of America an increase of heat collected in its passage over torrid regions; but, before it arrives there, it must have swept along the summit of the Andes, and come impregnated with the cold of that frozen region."

Another particularity in the climate of America, is its excessive moisture in general. In some places, indeed, on the western coast, rain is not known; but, in all other parts the moistness of the climate is as remarkable as the cold. The forests wherewith it is every where covered, no doubt, partly occasion the moisture of its climate; but the most prevalent cause is the vast quantity of water in the Atlantic and Pacific oceans, with which America is environed on all sides. Hence those places where the continent is narrowest are deluged with almost perpetual rains, accompanied with violent thunder and lightning, by which some of them, particularly Porto Bello, are rendered in a manner uninhabitable.

This extreme moisture of the American climate is productive of much larger rivers than there are in any other part of the world. The Danube, the Nile, the Indus, or the Ganges, are not comparable to the Mississippi, the river St. Laurence, or that of the Amazons; nor are such large lakes to be found any where as those which North America affords. To the same cause we are also partly to ascribe the excessive luxuriance of all kinds of vegetables in almost all parts of this country. In the southern provinces, where the moisture of the climate is aided by the warmth of the sun, the woods are almost impervious, and the surface of the ground is hid from the eye, under a thick covering of shrubs, herbs, and weeds. In the northern provinces, the forests are not encumbered with the same luxuriance of vegetation; nevertheless, they afford trees much larger of their kind than what are to be found any where else.

With regard to population in America, there are no data from which we can estimate the number of its inhabitants with any degree of accuracy. All calculations must proceed on uncertain grounds. The population of most of those countries which have been settled by Europeans has not been ascertained; who then is capable of estimating the number of inhabitants in those numerous countries which have been very particularly explored, and those which are altogether unknown to any European or other civilized nation? and such are those vast regions west, north-west, and north, of the Mississippi and the lakes, and immense countries in the interior parts of South America. The number of provinces, kingdoms, and even of nations, is unknown. We can therefore hardly guess at the number of inhabitants.

It has been common in estimating the population of the whole world to give 150 millions to America. The calculations of P. Riccioli, make them 300 millions. Sufimilch, in one part of his work, computes them at 100 millions, in another at 150 millions. M. de Pauw says, that political arithmeticians do not reckon more than 100 millions; but it is his own opinion that there are not more than from thirty to forty millions of "real Americans." We know not the principles upon which either of these authors grounded their calculations. Some of them are far beyond the truth; and M. de Pauw seems to have erred on the other hand.

Let us suppose the continent of America to contain fourteen millions of square miles; including the islands, fifteen millions. The United States contain one million square miles, or one fifteenth part of the American continent and islands. We will suppose (merely for the purpose of calculation), that every other part of America is as populous as the United States. Probably there may be some parts, particularly the West-India islands, and some provinces in Spanish America, which are more populous, but there are many other parts which are by no means so populous. The probability is, that the other parts of America, collectively considered, are not nearly so thickly inhabited as the territory of the United States. There is certainly no reason to believe that they are more populous. American population is thin: and vast tracts of deserts, marshes, and mountains, are uninhabited. In the United States we reckon four millions of inhabitants, Anglo-Americans, Negroes, Mulattoes, and Indians, within the jurisdiction of the general government. Besides these, there may be about 50,000 Indians independent of the United States, and subject to their own princes. The whole population of the United States we reckon at 4,050,000. If then we suppose America to contain fifteen millions of square miles, and that in every part it is equally as populous as the United States, that is, that there are in every million of square miles 4,050,000 inhabitants, the whole number will be 60,750,000.

That America was peopled very anciently and soon after the flood, is very probable: 1. Because the aboriginal Americans, till they became acquainted with Europeans, were ignorant of those arts and inventions, such, among others, as those of wax and oil for light, which being very ancient in Europe and Asia, on the one hand, are, on the other, most useful, not to say necessary, and when once discovered are never forgotten. 2. Because the polished nations of the new world, and particularly those of Mexico, preserve in their traditions and paintings the memory of the creation of the world, the building of the tower of Babel, the confusion of languages, and the dispersion of the people, though blended with some fables, and had no knowledge of the events which happened afterwards in Asia, Africa, or in Europe, many of which were too remarkable to escape the memory. 3. Because neither was there among the Americans any knowledge of the people of the old continent, nor among the latter any account of the passage of the former to the new world. These reasons render it at least probable that America was peopled early after the flood.

On the two questions how and from whence America was first peopled, much has been said. Those who call in question the authority of the sacred writings say, the Americans are not descendants from Adam, that he was the father of the Asiatics only, and that God created other men to be the patriarchs of the Europeans, Africans, and Americans. But this is one among the many weak hypotheses of unbelievers, and is wholly unsupported by history. It is contrary to the tradition of the Americans, who, in their paintings, and in their hymns, called themselves the descendants of those who escaped from the general deluge. The Mexicans, Toltecas, and several other nations, were agreed in this point. They all said their ancestors came from other parts into those countries; they pointed out the road they came, and even preserved the

names, true or false, of their first progenitors, who, after the confusion of languages, separated from the rest of mankind. These traditions, with many others, considered in connection with the sacred writings, must convince us that we ought to seek among the descendants of Noah for the first peoplers of America.

But who were they? To recite all the opinions given in answer to this question, would lead us far beyond the limits of our plan. Dr. Robertson and the abbé Clavigero have extensively and learnedly investigated the subject; and we cannot expect to afford the reader more satisfaction than to give him the result of their enquiries. Dr. Robertson, having recapitulated and canvassed the most plausible opinions on the subject, comes to the following conclusions:

America, he says, was not peopled by any nation from the ancient continent which had made any considerable progress in civilization; because, when America was first discovered, its inhabitants were unacquainted with the necessary arts of life, which are the first essays of the human mind toward improvement; and if they had ever been acquainted with them, for instance, the plough, the loom, and the forge, their utility would have been so great and obvious, that it is impossible they should have been lost. Therefore the ancestors of the first settlers in America were uncivilized and unacquainted with the necessary arts of life.

America could not have been peopled by any colony from the more southern nations of the ancient continent; because none of the rude tribes of these parts possessed enterprize, ingenuity, or power, sufficient to undertake such a distant voyage: but more especially, because, that in all America there is not an animal, tame or wild, which properly belongs to the warm or temperate countries of the eastern continent. The first care of the Spaniards, when they settled in America, was to stock it with all the domestic animals of Europe. The first settlers of Virginia and New England brought over with them horses, cattle, sheep, &c. Hence it is obvious that the people who first settled in America did not originate from those countries where these animals abound, otherwise, having been accustomed to their aid, they would have supposed them necessary to the improvement, and even support, of civil society. And since the animals in the northern regions of America correspond with those found in Europe in the same latitudes, while those in the tropical regions are indigenous, and widely different from those which inhabit the corresponding regions on the eastern continent, it is more than probable that all the original American animals were of those kinds which inhabit northern regions only, and that the two continents, towards the northern extremity, are so nearly united as that these animals might pass from one to the other.

It having been established beyond a doubt, by the discoveries of Capt. Cook in his last voyage, that at Kamtschatka, in about latitude 66° north, the continents of Asia and America are separated by a strait only eighteen miles wide, and that the inhabitants on each continent are similar, and frequently pass and repass in canoes from one continent to the other; from these and other circumstances it is rendered highly probable, that America was first peopled from the north-east parts of Asia. But since the Esquimaux Indians are manifestly a separate species of men, distinct from all the nations of the American continent, in language, in disposition, and in habits of life; and in all these respects bear a near resemblance to the northern Europeans, it is believed that the Esquimaux Indians emigrated from the north-west parts of Europe. Several circumstances confirm this belief. As early as the ninth century the Norwegians discovered Greenland, and planted colonies there. The communication with that country, after long interruption, was renewed in the last century. Some Lutheran and Moravian missionaries, prompted by zeal for propagating the Christian faith, have ventured to settle in this frozen region. From them we learn, that the north-west coast of Greenland is separated from Ame-

rica but by a very narrow strait, if separated at all; and that the Esquimaux of America perfectly resemble the Greenlanders in their aspect, dress, mode of living, and probably language. By these decisive facts, not only the consanguinity of the Esquimaux and Greenlanders is established, but the possibility of peopling America from the north-west parts of Europe. On the whole, it appears rational to conclude, that the progenitors of all the American nations, from Cape Horn to the southern limits of Labrador, from the similarity of their aspect, colour, &c. migrated from the north-east parts of Asia; and that the nations that inhabit Labrador, Esquimaux, and the parts adjacent, from their unlikeness to the American nations, and their resemblance to the northern Europeans, came over from the north-west parts of Europe.

Such is the opinion of Dr. Robertson, on the question before us; and, for want of information, it is in several respects inaccurate and without foundation. The opinion of the abbé Clavigero, who was a native of America, and had much better advantages for knowing its history than Dr. Robertson, and who also is a later writer, is far less exceptionable, and has much better grounds for its support. He explains his opinion in the following conclusions:

The Americans are descended from different nations, or from different families dispersed after the confusion of tongues. No person will doubt of the truth of this who has any knowledge of the multitude and great diversity of the American languages. In Mexico alone thirty-five have already been discovered. In South America still more are known. In the beginning of the last century the Portuguese counted fifty in Maragnon. Between some of these languages, there is indeed a great affinity; but others are as different from each other as the English and the Hebrew. It is a truth, that no living or dead languages can differ more than the languages of the Mexicans, Otomies, Tarascas, Mayas, and Miztecas, five languages prevailing in different provinces of Mexico. It would therefore be absurd to say, that languages so different were different dialects of one original. Is it probable, or even possible, that a nation should alter its primitive language to such a degree, or multiply its dialects so variously, as that there should not be, even after many centuries, if not some words common to all, at least an affinity between them, or some traces left of their origin?

The Americans do not derive their origin from any people now existing as a nation on the eastern continent; at least there is no reason to affirm that they do. This inference is founded on the same argument with the preceding; since, if the Americans are descendants from any of these nations, it would be possible to trace their origin by some marks in their languages, in spite of the antiquity of their separation: but any such traces have not yet been discovered, although most diligent and attentive search has been made, as appears from the work of Dominican Garcia. We have, says Clavigero, leisurely compared the Mexican and other American languages with many others which are now living, and with those which are dead, but have not been able to discover the least affinity between them. This argument is strong with respect to the Americans, as they shew great firmness and constancy in retaining their languages. The Mexicans preserve their language among the Spaniards, and the Otomies retain their difficult dialect among the Spaniards and Mexicans, after communication with both for more than two centuries and an half.

If the Americans descended from different families dispersed soon after the confusion of tongues, as we believe, and have since been separated from those others who peopled the countries on the eastern continent, authors will labour in vain to seek, in the language or customs of the Asiatics, for the origin of the people of America. But the most difficult point in the problem of the population of America remains to be solved, and that is, how did the inhabitants and animals originally pass to America, and from what parts did they come? Among the various
opinions

opinions of authors upon this point, the following is the abbé Clavigero's:

The men and animals of America passed there from the old continent. This is confirmed by the sacred writings. Moses, who declares Noah the common father of all men who survived the deluge, says expressly, that in that general inundation of the earth all its quadrupeds, birds, and reptiles, perished, except a few of the several species, which were saved alive in the ark, to re-peopple the earth with their kind. The repeated expressions which the sacred historian uses to signify its universality, do not permit us to doubt, that all quadrupeds, birds, and reptiles, which are in the world, descended from those few individuals which were saved from the general inundation.

The first inhabitants of America might pass there in vessels by sea, or travel by land or by ice. 1. They might either pass there in vessels designedly, if the distance by water were but small, or be carried upon it accidentally by favourable winds. 2. They might pass by land, on the supposition of the union of the continents. 3. They might also make that passage over the ice of some frozen arm of the sea.

The ancestors of the nations which peopled *Anahuac*, (now called New Spain,) might pass from the northern countries of Europe into the northern parts of America, or, which is more probable, from the most eastern parts of Asia to the most western parts of America. This conclusion is founded on the constant and general tradition of those nations, which unanimously say, that their ancestors came into *Anahuac* from the countries of the north and north-west. This tradition is confirmed by the remains of many ancient edifices, built by these people in their migrations. In a journey made by the Spaniards in 1606, from New Mexico unto the river which they call *Tizon*, 600 miles from that province towards the north-west, they found there some large edifices, and met with some Indians who spoke the Mexican language, and who told them, that a few days journey from that river, towards the north, was the kingdom of *Tollan*, and many other inhabited places, whence the Mexicans migrated. In fact, the whole people of *Anahuac* have usually affirmed, that towards the north were the kingdoms and provinces of *Tollan*, *Aztlan*, *Copalla*, and several others, which have all Mexican names. *Boturini* says, that in the ancient paintings of the *Toltecas* was represented the migration of their ancestors through Asia and the northern countries of America, until they established themselves in the country of *Tollan*; and even endeavours to ascertain, in his general history, the route they pursued in their travels.

With respect to the other nations of America, as there is no tradition among them concerning the way by which their ancestors came to the new world, we can say nothing certain of them. It is possible, that they all passed by the same way in which the ancestors of the Mexicans passed; but it is far more probable that they passed by a very different route. We conjecture, that the ancestors of the nations of South America went there by the way in which the animals proper to hot countries passed; and that the ancestors of those nations inhabiting *Esquimaux* and *Labrador*, and the countries adjacent, passed thither from the north-west part of Europe. The difference of character which is discoverable in the three above-mentioned classes of aboriginal Americans, and the situation of the countries which they occupied, afford ground to suspect that they had different origins, and that their ancestors came there by different routes.

The quadrupeds and reptiles of the new world must have passed there by land. This fact is manifest from the improbability and inconsistency of all other opinions. St. Augustin solves the difficulty of peopling the islands with wild beasts and destructive animals by supposing, either that the angels transported them thither, (a solution, which, though it cuts off every difficulty in the passage of animals to the new world, would not be satisfactory in the present age;) or that they might swim to the islands; or that they

might have been carried there by men for the sake of hunting; or that they might have been formed there by the Creator in the beginning. Others have imagined that beasts might pass over some frozen strait or arm of the sea. But, as neither of these opinions can be supported, the probability is, that the quadrupeds as well as the reptiles which were found in America passed thither by land, and of course that the two continents were formerly united. This was the opinion of *Acosta*, *Grotius*, *Buffon*, and other writers of credit. That this earth has experienced great changes since the deluge will not admit of a doubt. Earthquakes have swallowed up large tracts of land in some places; subterraneous fires have thrown up others; the sea in some places has been forced to retreat many miles from the shore; in other places it has made encroachments; and in many instances separated territories which were formerly united. Very considerable tracts of land have been also formed at the mouths of rivers. We have many examples of all these revolutions: *Sicily* was formerly united to the continent; the straits of *Gibraltar*, as *Diodorus*, *Strabo*, and other ancient authors, affirm, were formed by a violent irruption of the ocean upon the land between the mountains *Abyla* and *Calpe*. The people of *Ceylon* have a tradition, that a similar irruption of the sea separated their island from the peninsula of *India*. The same is believed by the inhabitants of *Malabar* with respect to the isles of *Maldivia*, and by the *Malayans* with respect to *Sumatra*. *Ceylon*, as *Buffon* asserts, has lost thirty or forty leagues of land, by the sea; and *Tongres*, a place in the Low Countries, has gained thirty leagues of land from the sea; and *Florida* and the southern American States have gained as much from the bay of *Mexico*, and the islands between North and South America. The northern part of *Egypt* owes its existence to inundations of the Nile; and the province of *Yellow-River* in *China*, and part of *Louisiana* in America, have both been formed by the mud of rivers. The peninsula of *Yucatan* has every appearance of having once formed a part of the bed of the sea. In the strait which separates America from Asia, many islands are found which probably were the mountains belonging to that part of the land which we suppose to have been swallowed up by earthquakes; and this is rendered possible by the multitude of volcanoes discovered in the peninsula of *Kamtchatka*. The sinking of that land, however, and the separation of the two continents, was probably occasioned by those extraordinary earthquakes mentioned in the histories of the Americans, which formed an era almost as memorable as that of the deluge.

The quadrupeds and reptiles of America passed by different places from the one continent to the other. Among the American beasts there are many whose natures are averse to cold; such are apes, dantes, crocodiles, &c. There are others formed to inhabit cold countries; such are martins, rein-deer, and gluttons. The former could not go to America through any country in the frigid zone; their natures would not have admitted it; they would have perished in their passage. We cannot indeed imagine what inducement they could have to quit a climate congenial to their nature, and undertake a journey they knew not whether, through a region whose cold they could not endure. How did they know there was a country friendly to their natures in America? The apes which are in New Spain passed there, certainly, from South America. Time was when they did not inhabit that country; and it is known that they came from the south. The centre of their population is the country under the equator, and fourteen or fifteen degrees on each side of it. It decreases as you depart from this tract on either side, till you arrive at the tropics, when it ceases, and none are found, except in some few districts, which, from the peculiarity of their situation, are as hot as the equinoctial country. None can imagine that this species of animals travelled to the new world through the cold regions of the north: nor can we believe that they were transported thither by men; for, not to mention

mention that some of them are of a ferocious disposition, and very unlikely to be selected for companions on a long voyage, to people a new country, there is another still greater difficulty: as they could not have been conducted over the seas and countries of the north, on account of the cold, they must have been transported from the warm countries of the old, to the warm countries of the new, world, over a sea subject to a climate not dissimilar to the native country of those quadrupeds, that is, by the countries of the southern parts of Asia, to about the same latitudes in America, over the Indian and Pacific oceans; or from the western countries of Africa, to the eastern countries of America, over the Atlantic ocean. If, therefore, men transported those animals from the one to the other world, they did it across those seas. But was this navigation accidental or designed? If the former, how, and why, did they carry so many animals with them? If the latter, if they were determined to pass from the old to the new continent, who gave them intelligence of the new world? Who shewed them the situation of those countries? How did they venture to cross such vast seas without a compass? In what vessels did they pass? If they landed there happily, why does there not remain, among the Americans, some memory of their constructions? But it is needless to start more objections; these already mentioned can never be answered.

Besides, in the torrid zone, and the warm climates that border upon it, in the new world, crocodiles are common animals which require a hot or temperate climate, and live alternately on land or in sweet water: how did such animals pass there? Not by the north; they could not endure the cold. No one will believe they were transported by men: or that they swam thither 2000 miles through an ocean of salt water. There remains no other solution but that of admitting an ancient union between the equinoctial countries of America and those of Africa; and a connection of the northern countries of America with Europe on the east, and Asia on the west: so that there has probably been a period, since the flood, when there was but *one* continent. The beasts of cold climes passed over the northern isthmuses, which probably connected Europe, America, and Asia; and the animals and reptiles peculiar to hot countries passed over the isthmus that connected South America with Africa. For the reasons already mentioned induce us to believe that there was formerly a tract of land, which united the most eastern part of Brazil to the most western part of Africa; and that all the space of land may have been sunk by violent earthquakes, leaving only some traces of it in that chain of islands of which Cape de Verd, Fernando, de Norona, Ascension, and St. Matthew's, islands, make a part; and also in those many sand-banks discovered by different navigators, and particularly by de Bauche, who founded that sea with great exactness. These islands and sand-banks may, probably, have been the highest parts of that sunken isthmus. In like manner it is probable the north-western part of America was united to the north-eastern part of Asia by a neck of land which has been sunk or washed away, and the north-eastern parts of America to the north-western parts of Europe, by Greenland, Iceland, &c.

On the whole, we cannot but believe that the quadrupeds and reptiles of the new world passed there by land, and by different routes, from the old continent. All other suppositions are subject to heavy difficulties; and this is not without some, which however are not altogether insurmountable. The greatest is the improbability of an earthquake so great as to sink a space of land for more than 1500 miles in length, which, according to our supposition, united Africa and South America. But we do not ascribe this stupendous revolution to a single shock; it may have been effected by a succession of earthquakes, similar to those which lately happened in Calabria. It is well known that they are common in the climates where we suppose the isthmus to have been. It is not impossible

nor improbable, that such an effect should be produced by earthquakes, nor is history unfurnished with such examples to our purpose. The earthquake which was felt in Canada in 1663, overwhelmed a chain of mountains of free-stone more than 300 miles long, and the whole of that immense tract was changed into a plain. How great then must have been the convulsion which was occasioned by those extraordinary earthquakes, mentioned in the histories of America, when the world was thought to be coming to an end!

It may farther be objected to this system, that, if beasts passed by land from one continent to the other, it is not easy to assign the cause why some species passed there without leaving a single individual in the old continent; and, on the contrary, that some entire species should remain in the old continent, and not a single individual of them pass to America. But this objection operates with equal force against all other opinions, except that which employs angels in the transportation of beasts. But, suppose it did not, we have a satisfactory answer to it. All the quadrupeds of the earth are not yet known; we cannot therefore say how many are in the one which are not in the other continent. The knowledge of the best-informed zoologists is very imperfect, and they differ among themselves. The count de Buffon numbers only 200 species of quadrupeds; Bomare, who wrote a little after him, makes them 265; but to say how many more there may be, and of what kinds they are, until we have examined the interior regions of Africa, of a great part of Tartary, the country of the Amazons, and the vast territory west of the Mississippi, and various other unexplored and extensive countries, which together constitute a great part of the whole globe, would be mere conjecture. No argument, therefore, can be inferred from the difference of the animals in the two continents against our system, till the animals in these unexplored regions shall have been examined. We have dwelt the longer on this subject, as it must be interesting to every inquisitive mind, and the discussion of it is blended with much useful information.

Having stated the present population of America, from the best data we could find, and given the most probable accounts of the manner in which it was originally peopled, we shall now describe the character, manners, &c. of its inhabitants.

The present Americans, whose number we have reckoned at about 60 millions, may be divided into two general classes. First, the proper Americans, commonly called Indians, sometimes Aborigines, or those who are descended from the first inhabitants of the new world, and who have not mixed their blood with the inhabitants of the old continent. Secondly, those who have migrated, or have been transported to America, since its discovery by Columbus, and their descendants. The former may be subdivided into three classes; first, the South American Indians, who came over in the manner we have supposed, from the northern and western parts of Africa, and the southern parts of Asia and Europe. Secondly, the Mexicans and all the Indians south of the lakes and west of the Mississippi. Thirdly, the inhabitants of Esquimaux, Labrador, and the countries around them. The latter may also be distinguished into three classes: First, Europeans of many different nations, who have migrated to America, and their descendants, of unmixed blood. In this class we include the Spaniards, English, Scotch, Irish, French, Portuguese, Germans, Dutch, Swedes, &c. both in North and South America. Secondly, Africans, who have been transported to America and its islands, and their descendants. Thirdly, the mixed breeds, called by the Spaniards *Castas*, by the English *Mulattoes*, that is, those who are descended from an European and an American, or from an European and African, or from an African and American. Leaving the second class, viz. the migrants to America since its discovery by Columbus, and their descendants, to be described when we shall treat of the countries they respectively inhabit, we shall, under this article, confine ourselves

ourselves to the proper aboriginal Americans or Indians. With respect to the South Americans, various have been the accounts given of them. Some historians exalt them to the rank of the best and happiest people on earth; others seem unwilling to give them a place among human beings. We presume these historians, who differ so widely, spoke of different nations; and on this ground, with proper allowances for exaggeration on both sides, we may reconcile them. Columbus gives the following account of the Indians of Hispaniola, to Ferdinand and Isabella: "I swear to your majesties, that there is not a better people in the world than these; more affectionate, affable, and mild; they love their neighbours as themselves; their language is the sweetest, the softest, and the most cheerful, for they always speak smiling; and, although they go naked, let your majesties believe me, their customs are very becoming; and their king, who is served with great majesty, has such engaging manners, that it gives great pleasure to see him, and also to consider the great retentive faculty of that people, and their desire of knowledge, which invites them to ask the causes and effects of things."

Las Casas, the first bishop of Chiapa, who resided several years in different parts of America, speaks thus of them: "The Americans are a people of a bright and lively genius, easy to be taught, and to apprehend every good doctrine, extremely ready to embrace our faith, and the people, of all others in the world, who feel least embarrassment by it." In another place, this writer says, "The Indians have as good an understanding, and acute a genius, as much docility and capacity for the moral and speculative sciences, and are, in most instances, as rational in their political government, as appears from many of their very prudent laws, and are as far advanced in our faith and religion, in good customs and civilization, where they have been taught by persons of religious and exemplary life, and are arriving at refinement and polish as fast as any nation ever did since the times of the apostles."

Dr. Robertson, speaking of the Mexicans and Peruvians, whom he is not disposed to rank with those nations which merit the name of civilized, has the following remarks: "When compared with other parts of the new world, Mexico and Peru may be considered as polished states. Instead of small, independent, hostile, tribes, struggling for subsistence amidst woods and marshes, strangers to industry and arts, unacquainted with subordination, and almost without the appearance of regular government, we find countries of great extent subjected to the dominion of one sovereign, the inhabitants collected together in cities, the wisdom and foresight of rulers employed in providing for the maintenance and security of the people, the empire of laws in some measure established, the authority of religion recognised, many of the arts essential to life brought to some degree of maturity, and the dawn of such as are ornamental beginning to appear." These are testimonies respecting the Indians who inhabit the more northern parts of South America, and the islands; who appear to have made greater advances in civilization than those farther south, concerning whom our information is very imperfect.

Charlevoix, in his history of Paraguay, has collected from the Jesuits perhaps the best information respecting the more southern Indians. Comparing his particular descriptions of the numerous nations who inhabit the southern division of South America, we give the following as the leading traits in their general character. They are generally of an olive complexion, some darker, others lighter, and some as white as the Spaniards. Their stature is rather below than above the middling size; though some nations rank among the tallest of the human species; most of them are thick legged and jointed, and have round and flat faces. Almost all the men and children, in the warm climates, and in the summer, in cold regions, go quite naked. The women wear no more covering than the most relaxed modesty seems absolutely to require.

Every nation have a different dialect, and a different mode of adorning themselves. The clothing of such as make use of it, is made of the skins of beasts, of feathers sewed together, and in the southern and colder regions, where they raise sheep, of wool manufactured into stuffs and blankets. They are represented as almost universally addicted to drunkenness. There seems to be no other vice common to them all. A few of them are cannibals, and some nations are idolaters; in general they have some notion of a Supreme Being, and have words in their various languages to express their ideas of him. They believe in the immortality of the soul, and have some imperfect ideas of future rewards and punishments. They are universally addicted to various superstitions, and have much to do with witches and evil spirits. Father Pastor, a Jesuit, one day visited one of the old women of the Aisipone nation, a reputed witch, and at the point of death, and told her, that, if she died without baptism, her soul would be eternally tormented by the devils. She very calmly answered, that they had been her friends for a long time, and she was therefore very sure they would do her no harm. A great proportion of these people lead a wandering life, are extremely indolent, dirty, and wretched, living on fish, and the flesh of the various wild animals, birds, and even reptiles, which inhabit the forests. "All the Indians of South America," says Charlevoix, "have hot stomachs," which can digest all sorts of food, and in great quantities, and they are in general "excessively voracious." Their notions of religion and government, with a few exceptions, are very rude. Some nations live compactly in towns, and cultivate the earth, raising, among other productions, wheat, which they bruise between two stones, and make into cakes. Some nations are represented as dull, cruel, and inconstant; others as fierce, cunning, and thievish; others as humane, ingenuous, and hospitable; and in general they are kind and attentive to strangers, so long as they are well used by them; and we seldom read of their being first in a quarrel with those who pass their territories, or sojourn among them. The astonishing success of the Jesuits in converting such multitudes of them to their faith, is a convictive proof of their capacity to receive instruction; of their docility, humanity, and friendly dispositions. All accounts agree that the middle and southern parts of South America are very thinly inhabited, being interspersed with extensive ridges of mountains, immense barren plains, and numerous marshes.

As to the second class of American Indians, who formerly inhabited, and who yet inhabit, Mexico and the country south of the lakes and west of the Mississippi, and who came over, as we have supposed, from the north-east parts of Asia; they seem, from whatever cause, to be advanced somewhat higher in the scale of human beings than the South Americans, if we except the Peruvians, who appear to have made greater progress in civilization than even the Mexicans. Concerning the nations of the vast country of Anahuac or New Spain, composing a large portion of the second class of the proper Americans, the abbé Clavigero has the following observations: "We have had intimate commerce for many years with the Americans, have lived several years in a seminary destined for their instruction, had some Indians among our pupils, had particular knowledge of many American rectors, many nobles, and numerous artists; attentively observed their character, their genius, their dispositions, and manner of thinking; and have examined, besides, with the utmost diligence, their ancient history; their religion, their government, their laws, and their customs; after such long experience and study of them, from which we imagine ourselves able to decide without danger of erring, we declare that the mental qualities of the American Indians are not in the least degree inferior to those of the Europeans; that they are capable of all, even the most abstract sciences, and that, if equal care and pains were taken in their education, we should see rise among them philosophers, mathematicians, and divines, who would

rival the first in Europe. But it is not possible to make great progress in the sciences, in the midst of a life of misery, servitude, and oppression. Their ancient government, their laws, and their arts, evidently demonstrate that they suffered no want of genius."

This same author, who appears to be a competent judge, describes the Mexicans as being of a good stature, rather exceeding the middle size; well-proportioned in all their limbs; as having a fine olive complexion; narrow foreheads; black eyes; clean, firm, regular, white teeth; thick, black, coarse, glossy hair; thin beards, and generally no hair on their legs, thighs, and arms. They are neither very handsome nor the reverse, but hold a middle place between the extremes. Some of the women are fair and beautiful. Deformities are scarcely known among them. Their senses are very acute, especially that of sight, which they enjoy unimpaired to the greatest age. They are moderate eaters, but much addicted to intemperance in drinking, which, as far as we know, is true of all the American Indians. They are patient of injuries and hardships, and grateful for benefits. Good faith is not so much respected as it deserves to be. They are naturally unsocial, serious, and austere, and are more anxious to punish crimes than to reward virtues. Generosity and perfect disinterestedness are striking traits in their character. Their religion is blended with much superstition; and some of the more ignorant are very prone to idolatry. The respect paid by children to their parents, and by the young to the old, among those people, is highly commendable. Parents are fond of their children. The affection of husbands for their wives is less than the wives for their husbands; and it is very common for men to love their neighbours' wives better than they do their own. Courage and cowardice seem alternately to affect their minds, and it is difficult to determine which predominates. They can meet dangers in war, and such as proceed from natural causes, with great intrepidity; but are panic-struck by the stern look of a Spaniard. On the whole, their character, like that of all other nations, is a mixture of good and bad. Of their morality, the following exhortation of a Mexican to his son may serve as a specimen: "My son, who art come into the light from the womb of thy mother like a chicken from the egg, and like it art preparing to fly through the world, we know not how long heaven will grant to us the enjoyment of that precious gem which we possess in thee; but, however short the period, endeavour to live exactly, praying God continually to assist thee. He created thee: thou art his property. He is thy father, and loves thee still more than I do; repose in him thy thoughts, and day and night direct thy sighs to him. Reverence and salute thy elders, and hold no one in contempt. To the poor and distressed be not dumb, but rather use words of comfort. Honour all persons, particularly thy parents, to whom thou owest obedience, respect, and service. Guard against imitating the examples of those wicked sons, who, like brutes that are deprived of reason, neither reverence their parents, listen to their instruction, nor submit to their correction; because whoever follows their steps will have an unhappy end, will die in a desperate or sudden manner, or will be killed and devoured by wild beasts.

"Mock not, my son, the aged or the imperfect. Scorn not him whom you see fall into some folly or transgression, nor make him reproaches; but restrain thyself, and beware lest thou fall into the same error which offends thee in another. Go not where thou art not called, nor interfere in that which does not concern thee. Endeavour to manifest thy good breeding in all thy words and actions. In conversation, do not lay thy hands upon another, nor speak too much, nor interrupt nor disturb another's discourse. When any one discourses with thee, hear him attentively, and hold thyself in an easy attitude, neither playing with thy feet, nor putting thy mantle to thy mouth, nor spitting too often, nor looking about you here and there, nor rising up frequently if thou art sitting;

for such actions are indications of levity and low breeding." He proceeds to mention several particular vices which are to be avoided, and concludes: "Stal not, nor give thyself to gaming; otherwise thou wilt be a disgrace to thy parents, whom thou oughtest rather to honour for the education they have given thee. If thou wilt be virtuous, thy example will put the wicked to shame. No more, my son; enough hath been said in discharge of the duties of a father. With these counsels I wish to fortify thy mind. Refuse them not, nor act in contradiction to them; for on them thy life and all thy happiness depend."

Although so much cannot be said with truth, perhaps, in favour of the more northern Indians, whom we have included in the second class, owing to the inferiority of their advantages, yet we are far from thinking them inferior, in point of corporeal or mental endowments, to the Mexicans. In their complexion, size, and form, they are not in general unlike the Mexicans. In social and domestic virtues, in agriculture, arts, and manufactures, they are far behind the Mexicans; in their hospitality, equal; and in their eloquence in council, and bravery in war, perhaps superior. Their mode of life, and the state of society among them, afford few objects for the display either of their literary or political abilities.

M. Buffon has given an humiliating picture of the Aborigines of North America, in the following words: "In the American savage, the organs of generation are small and feeble. He has no hair, no beard, no ardour for the female. Though nimbler than the European, because more accustomed to running, his strength is not so great. His sensations are less acute; and yet he is more timid and cowardly. He has no vivacity, no activity of mind. The activity of his body is not so much an exercise or spontaneous motion, as a necessary action produced by want. Destroy his appetite for victuals and drink, and you will at once annihilate the active principle of all his movements: he remains in stupid repose, on his limbs or couch, for whole days. It is easy to discover the cause of the scattered life of these savages, and of their estrangement from society. They have been refused the most precious spark of nature's fire: they have no ardour for women, and, of course, no love to mankind. Unacquainted with the most lively and most tender of all attachments, their other sensations of this nature are cold and languid. Their love to parents and children is extremely weak. The bonds of the most intimate of all societies, that of the same family, are feeble; and one family has no attachment to another. Hence no union, no republic, no social state, can take place among them. The physical cause of love gives rise to the morality of their manners. Their heart is frozen, their society cold, and their empire cruel. They regard their females as servants destined to labour, or as beasts of burden, whom they load unmercifully with the produce of their hunting, and oblige, without pity or gratitude, to perform labours which often exceed their strength. They have few children, and pay little attention to them. Every thing must be referred to the first cause: they are indifferent, because they are weak; and this indifference to the sex is the original stain which disgraces nature, prevents her from expanding, and, by destroying the germs of life, cuts the root of society. Hence man makes no exception to what has been advanced. Nature, by denying him the faculty of love, has abused and contracted him more than any other animal." Mr. Jefferson's answer to M. Buffon, is so full of the most valuable information on this subject, that it must not be omitted in this place. "Of the Indians of South America," says Mr. Jefferson, "I know nothing; for I would not honour with the appellation of knowledge, what I derive from the fables published of them. These I believe to be just as true as the fables of *Æsop*. This belief is founded on what I have seen of man, white, red, and black, and what has been written of him by authors, enlightened themselves, and writing amidst an enlightened people. The Indian of North America being more within

our reach, I can speak of him somewhat from my own knowledge, but more from the information of others better acquainted with him, and on whose truth and judgment I can rely. From these sources I am able to say, in contradiction to this representation, that he is neither more defective in ardour, nor more impotent with his female, than the white reduced to the same diet and exercise: that he is brave, when an enterprise depends on bravery; education with him making the point of honour consist in the destruction of an enemy by stratagem, and in the preservation of his own person free from injury; or perhaps this is nature, while it is education which teaches us to honour force more than fineness: that he will defend himself against an host of enemies, always choosing to be killed, rather than to surrender, though it be to the whites, who he knows will treat him well: that in other situations also he meets death with more deliberation, and endures tortures with a firmness unknown almost to religious enthusiasm with us: that he is affectionate to his children, careful of them, and indulgent in the extreme: that his affections comprehend his other connections, weakened, as with us, from circle to circle, as they recede from the center: that his friendships are strong and faithful to the uttermost; a remarkable instance of which appeared in the case of the late colonel Byrd, who was sent to the Cherokee nation to transact some business with them. It happened that some of our disorderly people had just killed one or two of that nation. It was therefore proposed in the council of the Cherokees that colonel Byrd should be put to death, in revenge for the loss of their countrymen. Among them was a chief called Silouee, who, on some former occasion, had contracted an acquaintance and friendship with colonel Byrd. He came to him every night, in his tent, and told him not to be afraid, they should not kill him. After many days deliberation, however, the determination was, contrary to Silouee's expectation, that Byrd should be put to death, and some warriors were dispatched as executioners. Silouee attended them, and, when they entered the tent, he threw himself between them and Byrd, and said to the warriors, "this man is my friend: before you get at him, you must kill me." On which they returned, and the council respected the principle so much as to recede from their determination.

The sensibility of the American savage is remarkably keen, since even the warriors weep most bitterly on the loss of their children, though in general they endeavour to appear superior to human events: and his vivacity and activity of mind is equal to ours in the same situation; and hence his eagerness for hunting, and for games of chance. The women are submitted to unjust drudgery. This I believe is the case with every barbarous people. With such, force is law. The stronger sex therefore imposes on the weaker. It is civilization alone which replaces women in the enjoyment of their natural equality. That first teaches us to subdue the selfish passions, and to respect those rights in others which we value in ourselves. Were we in equal barbarism, our females would be equal drudges. The man with them is less strong than with us, but their women stronger than ours; and both for the same obvious reason; because our man and their woman is habituated to labour, and formed by it. With both races, the sex which is indulged with ease is least athletic. An Indian man is small in the hand and wrist, for the same reason for which a sailor is large and strong in the arms and shoulders, and a porter in the legs and thighs. They raise fewer children than we do. The causes of this are to be found, not in a difference of nature, but of circumstance. The women very frequently attending the men in their parties of war and hunting, child-bearing becomes extremely inconvenient to them. It is said, therefore, that they have learnt the practice of procuring abortion by the use of some vegetable; and that it even extends to prevent conception for a considerable time after. During these parties they are exposed to numerous hazards, to excessive exertions, to the greatest extremities

of hunger. Even at their homes the nation depends for food, through a certain part of every year, on the gleanings of the forest: that is, they experience a famine once in every year. With all animals, if the female be badly fed, or not fed at all, her young perish: and, if both male and female be reduced to like want, generation becomes less active, less productive. To the obstacles then of want and hazard, which nature has opposed to the multiplication of wild animals, for the purpose of restraining their numbers within certain bounds, those of labour and of voluntary abortion are added with the Indian. No wonder then if they multiply less than we do. Where food is regularly supplied, a single farm will shew more of cattle, than a whole country of forests can of buffaloes. The same Indian women, when married to white traders, who feed them and their children plentifully and regularly, who exempt them from excessive drudgery, who keep them stationary and unexposed to accident, produce and raise as many children as the white women. Instances are known, under these circumstances, of their rearing a dozen children. An inhuman practice once prevailed in this country of making slaves of the Indians. It is a fact well known with us, that the Indian women, so enslaved, produced and raised as numerous families as either the whites or blacks among whom they lived. It has been said, that Indians have less hair than the whites, except on the head. But this is a fact of which fair proof can scarcely be had. With them it is disgraceful to be hairy on the body. They say it likens them to hogs. They therefore pluck the hair as fast as it appears. But the traders who marry their women, and prevail on them to discontinue this practice, say, that nature is the same with them as with the whites. Nor, if the fact be true, is the consequence necessary which has been drawn from it. Negroes have notoriously less hair than the whites; yet they are more ardent. But, if cold and moisture be the agents of nature for diminishing the races of animals, how comes she all at once to suspend their operation as to the physical man of the new world, and to let loose their influence on his moral faculties? How has this combination of the elements and other physical causes, so contrary to the enlargement of animal nature in this new world, these obstacles to the development and formation of great germs, been arrested and suspended, so as to permit the human body to acquire its just dimensions; and by what inconceivable process has their action been directed on his mind alone? To judge of the truth of this, to form a just estimate of their genius and mental powers, more facts are wanting, and great allowance to be made for those circumstances of their situation which call for a display of particular talents only. This done, we shall probably find that they are formed, in mind as well as in body, on the same model with the "Homo sapiens Europæus." The principles of their society forbidding all compulsion, they are to be led to duty and to enterprise by personal influence and persuasion. Hence eloquence in council, bravery and address in war, become the foundations of all consequence with them. To these acquirements all their faculties are directed. Of their bravery and address in war we have multiplied proofs, because we have been the subjects on which they were exercised. Of their eminence in oratory we have fewer examples, because it is displayed chiefly in their own councils. Some, however, we have of very superior lustre. I may challenge the whole orations of Demosthenes or Cicero; and of any more eminent orator, if Europe has furnished a more eminent, to produce a single passage superior to the speech of Logan, a Mingo chief, to lord Dunmore, when governor of this state. And, as a testimony of their talents in this line, I beg leave to introduce it, first stating the incidents necessary for understanding it. In the spring of the year 1774, a robbery and murder was committed on an inhabitant of the frontiers of Virginia, by two Indians of the Shawanee tribe. The neighbouring whites, according to their custom, undertook to punish this outrage

in a summary way. Col. Cresap, a man infamous for the many murders he had committed on those much-injured people, collected a party, and proceeded down the Kan-haway in quest of vengeance. Unfortunately a canoe of women and children, with one man only, was seen coming from the opposite shore, unarmed, and unsuspecting an hostile attack from the whites. Cresap and his party concealed themselves on the bank of the river, and, the moment the canoe reached the shore, singled out their objects, and, at one fire, killed every person in it. This happened to be the family of Logan, who had long been distinguished as a friend to the whites. This unworthy return provoked his vengeance: he accordingly signalized himself in the war which ensued. In the autumn of the same year, a decisive battle was fought at the mouth of the Great Kan-haway, between the collected forces of the Shawanees, Mingoes, and Delawares, and a detachment of the Virginia militia. The Indians were defeated, and sued for peace. Logan, however, disdained to be seen among the suppliants. But, lest the sincerity of a treaty should be distrusted from which so distinguished a chief absented himself, he sent by a messenger the following speech to be delivered to Lord Dunmore:

"I appeal to any white man to say, if ever he entered Logan's cabin hungry, and he gave him not meat; if he ever came cold and naked, and he clothed him not. During the course of the last long and bloody war, Logan remained idle in his cabin, an advocate for peace. Such was my love for the whites, that my countrymen pointed as they passed, and said, 'Logan is the friend of white men.' I had even thought to have lived with you, but for the injuries of one man. Col. Cresap, the last spring, in cold blood, and unprovoked, murdered all the relations of Logan, not sparing even my women and children. There runs not a drop of my blood in the veins of any living creature. This called on me for revenge. I have sought it: I have killed many: I have fully glutted my vengeance. For my country, I rejoice at the beams of peace. But do not harbour a thought that mine is the joy of fear. Logan never felt fear. He will not turn on his heel to save his life. Who is there to mourn for Logan?—Not one."

Before we condemn the Indians of this continent as wanting genius, we must consider that letters have not yet been introduced among them. Were we to compare them in their present state with the Europeans north of the Alps, when the Roman arms and arts first crossed those mountains, the comparison would be unequal, because at that time, those parts of Europe were swarming with numbers; because numbers produce emulation, and multiply the chances of improvement, and one improvement begets another. Yet I may safely ask, how many good poets, how many able mathematicians, how many great inventors in arts or sciences, had Europe, north of the Alps, then produced? And it was sixteen centuries after this before a Newton could be formed. I do not mean to deny, that there are varieties in the race of man, distinguished by their powers both of body and mind. I believe there are, as I see to be the case in the races of other animals. I only mean to suggest a doubt, whether the bulk and faculties of animals depend on the side of the Atlantic on which their food happens to grow, or which furnishes the elements of which they are compounded? Whether nature has enlisted herself as a Cis or Trans-Atlantic partisan?

No people in the world have higher notions of military honour than the American Indians. The fortitude, the calmness, and even exultation, which they manifest while under the extremest torture, is owing to their education, to their exalted ideas of military glory, and their rude notions of future happiness, which they believe they shall forfeit by the least manifestation of fear, or uneasiness, under their sufferings. They are as bitter and determined in their resentments as they are sincere in their friendships, and often pursue their enemies several hun-

dred miles through the woods, surmounting every difficulty, in order to be revenged.

The following fact of an Algonquin woman, is a remarkable proof of their innate thirst of blood. That nation being at war with the Iroquois, she happened to be taken prisoner, and was carried to one of the villages belonging to them. Here she was stripped naked, and her hands and feet bound with ropes in one of their cabins. In this condition she remained ten days, the savages sleeping round her every night. The eleventh night, while they were asleep, she found means to disengage one of her hands, with which she immediately freed herself from the ropes, and went to the door. Though she had now an opportunity of escaping unperceived, her revengeful temper could not let slip so favourable an opportunity of killing one of her enemies. The attempt was manifestly at the hazard of her own life; yet, snatching up a hatchet, she killed the savage that lay next her; and, springing out of the cabin, concealed herself in a hollow tree, which she had observed the day before. The groans of the dying person soon alarmed the other savages, and the young ones immediately set out in pursuit of her. Perceiving, from her tree, that they all took their course one way, and that no savage was near her, she left her sanctuary, and, flying by an opposite direction, ran into a forest without being perceived. The second day after this happened, her footsteps were discovered; and they pursued her with such expedition, that the third day she discovered her enemies at her heels. Upon this she threw herself into a pond of water; and, diving among some weeds and bulrushes, she could just breathe above water without being perceived. Her pursuers, after making the most diligent search, were forced to return. For thirty-five days this woman held on her course through woods and deserts, without any other sustenance than roots and wild berries. When she came to the river St. Lawrence, she made with her own hands a kind of wicker raft, on which she crossed it. As she went by the French for Trois Rivières, without well knowing where she was, she perceived a canoe full of savages; and, fearing they might be Iroquois, ran again into the woods, where she remained till sun-set. Continuing her course soon after, she saw Trois Rivières; and was then discovered by a party whom she knew to be Hurons, a nation in alliance with the Algonquins. She then squatted down behind a bush, called out to them that she was not in a condition to be seen, because she was naked. They immediately threw her a blanket, and then conducted her to the fort, where she recounted her story.

In their public councils, the Indians observe the greatest decorum. In the foremost rank sit the old men, who are the counsellors; then the warriors; and next the women and children. As they keep no records, it is the business of the women to notice every thing that passes, to imprint it on their memories, and tell it to their children. They are, in short, the records of the council; and, with surprising exactness, preserve the stipulations of treaties entered into a hundred years back. Their kindness and hospitality are scarcely equalled by any civilized nation. Their politeness in conversation is even carried to excess, since it does not allow them to contradict anything that is asserted in their presence. In short, there appears to be much truth in Dr. Franklin's observation: "We call them savages, because their manners differ from our's, which we think the perfection of civility; they think the same of their's." Society among the American Indians, we are sorry to say, has not been improved, but in most instances corrupted, by their intercourse with Europeans. It is believed by many, that the wars with them generally originate in the injustice, avarice, and pride, of their opposers and vanquishers. None, however, can justify their savage mode of carrying on a war, when once it has commenced. If the guilty, or those who should conceal and defend the guilty, were the sole objects of their vengeance, we could not condemn them. But when those who never did or

meant them an injury, when defenceless women, and children, and even babes, are made the victims of their shocking barbarity, we cannot but deeply lament their want of that humanity, and just discrimination between the innocent and the guilty, which are the peculiar fruits of civilization. We wish we could say, that they never had any examples of indiscriminate barbarity from their European neighbours, who ought to have taught them better.

The Indians many times treat their prisoners in the most cruel and barbarous manner; but they often use them with the greatest humanity, feeding and clothing them, even better than themselves, and adopting them as fathers and mothers, sons and daughters, brothers and sisters, and treating them in all respects as such. There have been instances of whites, thus adopted, while young, who have become chiefs of the nations that adopted them. Compulsion has frequently been found necessary to separate from their Indian relations, those white prisoners who have resided a few years with them; and many men and women, who have been ransomed and delivered up by the Indians to their white parents or relations, have returned back to their Indian friends, and, of choice, married and settled among them.

Mr. Stewart, a late enterprising traveller into the country west of the Mississippi, who took his course west-south-west from the posts on the lakes, and penetrated to the head of the Missouri, and thence due west, till he arrived within about 500 miles of the Pacific Ocean, informs us, that beyond the Missouri he met with many powerful nations of Indians, who were in general courteous and hospitable. The nations which he visited to the westward appeared to be a polished civilized people, having regularly-built towns, and enjoying a state of society not far removed from the European; and, in order to be perfectly equal, wanting only the use of iron and steel. Their clothing is of skins, cut in an elegant manner, and in many respects preferable to the garments in use among the whites. Adjacent to these nations is a vast range of mountains, which may be called the *Alleghany* of the western parts of America, and serves as a barrier against the too frequent incursions of the coast Indians, who, Mr. Stewart relates, appear to be inveterate enemies to the tribes eastward of the mountains.

The American Indians are unacquainted with letters, and their history is preserved in some few instances by hieroglyphic paintings and sculpture, but principally by tradition. They often discover great ingenuity in communicating information to the absent. The following instance of Indian hieroglyphic writing, Dr. Mitchell was himself an eye-witness of. Being in company with several other gentlemen, as they were proceeding up Onondago river, to an Indian treaty, they overtook several canoes of Senaka Indians, who encamped with them at night near fort Brewington; and, the next day proving rainy, they continued in company till the weather became so favourable as to permit them to cross the Oneida lake. During the storm, one of the Indian canoes stove, and became unfit for service. The commissioners took the crew on-board their boat, and carried them to a landing-place some distance up Wood Creek. Here one of them, before he left the water, took the following method to let his companions, who were left behind, know when and whither they had proceeded. He took a piece of wood, and hewed it flat and smooth, and then raked his fire for a suitable coal, with which he rudely delineated, on the slab, the figure of an Indian carrying a gun reversed on his shoulder. In front of him he drew a crooked line, which reached to a man with a long coat and a cocked hat, and holding a cane in his hand; and behind him a framed house. He then took a strait pole, and tied some weeds and grass upon one end of it, and fixed the other in the earth, in such a manner, that, in the position the sun then was, which was six o'clock in the morning, it cast no shadow; or, in other words, he pointed it exactly towards the sun. The meaning of all, was this: "Sufquewewah

(the name of the Indian) left this spot at six o'clock in the morning, or when the sun was in the place where the pole pointed, and has proceeded up Wood Creek, (which is remarkably crooked,) to the settlement where the commissioners of the state of New York are assembled to hold a treaty with the Indians." All these *insignia* were arranged so conspicuously on the margin of the creek, that his companions behind could scarcely avoid observing them as they passed.

In the interior parts of America various monuments of art have been found, which discover greater ingenuity in their construction than the present generation of Indians appear to possess. Two miles west of the Genesee river, in the state of New York, we have been informed, by the Rev. Mr. Kirkland, missionary to the Six Nations, who visited this place in 1788, are the remains of an ancient Indian fort. It encloses about four acres; is encompassed with a ditch eight feet wide and five or six deep, and has six gateways. Its form is circular, except on one part, which is defended by nature with a high bank, at the foot of which is a fine stream of water; there is an appearance of there having been a deep covered way through the middle of the bank to the water. Some of the trees on the bank and in the ditch look as if they had been growing 150 or 200 years. Half a mile south, on an eminence, are the ruins of another Indian fortified town, of smaller dimensions, and more advantageously situated for defence. The old Indians say, these forts were built before the Senakas were admitted into confederacy with the Mohawks, Onondagos, Oneidas, and Cayogas, and while the Senakas were at war with the Mississaugas, and other Indians, on the great lakes, which Mr. Kirkland conjectures, from various accounts that he received from different tribes, was at least 300 years ago.

A few miles from the above-mentioned forts, at a place which the Senakas call Tegateenedaghque, signifying a town with a fort at each end, are the remains of two other forts, constructed nearly in the same form, with six gates, a ditch, and a stream of water, and a covered way to it. Near the northern fort are the ruins of a funeral pile, six feet high, and twenty or thirty feet diameter, where were buried 800 Indians, who, according to tradition, fell in a famous battle fought at this place, between the Senakas, who were the victors, and the western Indians. The weapons of war then in use were bows and arrows, the spear or javelin pointed with bone, and the war-club, or death-mall. When the former sort of weapons were expended, they came to close engagement with the latter. The warriors wore a sort of jacket made of willow sticks, or of moose wood, laced tight round their bodies; on their heads they wore a cap of the same kind, but commonly wove double, the better to secure them against a mortal blow from the death-mall. The battle above-mentioned was fought some of the Indians say 300, some 400, and some 500, lives or ages ago, and long before the arrival of the Europeans. They commonly reckon a life, or an age, one hundred winters or colds.

Mr. Kirkland observes, that there are similar vestiges of ancient fortified towns throughout the extensive territories of the Six Nations; and, by Indian report, in various other parts, and particularly on a branch of the Delaware river, which appear to be very ancient. He adds, "I find on inquiring, that a tradition prevails among the Indians in general, that all Indians came from the west." This is a confirmation of the opinion that this second class of Indians, of whom we have been speaking, and of which the Six Nations make a part, came over from the north-east of Asia, to the north-west coast of America, whence they migrated south towards Mexico, and eastward into the present territory of the United States.

Judging of the ancient Indians from the traditional accounts of them, and the ruins we have been describing, we are led to conceive of them as a more civilized, ingenious, and warlike, people than their descendants at the present time. We are at a loss for the causes of their degeneracy,

generacy, unless we mention as such the introduction of spirituous liquors among them, a deep sense of their inferiority in military skill to the white people, and their chagrin and broken-heartedness at the loss of their lands, and being forced to give place to their supposed enemies.

The third class of American Indians, viz. those who inhabit Esquimaux, Labrador, and the countries around, are much less known than either of the afore-mentioned classes. Those who profess to be best acquainted with them say, they differ in size and shape from the other American Indians, and resemble the Laplanders and Samoides of Europe, from whom it is conjectured they descended.

In the years 1771 and 1772, Mr. Hearne, an ingenious young gentleman, travelled many hundred miles into these dreary countries; and, in his journal, draws a plain and artless picture of the savage modes of life, the scanty means of subsistence, and the singular wretchedness in almost every respect, of the various tribes, who, without fixed habitations, pass their lives in roving over dreary deserts and frozen lakes, of the extensive tract of continent thro' which he passed. The following extracts from his Journal will give the reader a better and more just idea of these Indians, than has hitherto been furnished from any other source:

"We arrived at the Copper-mine river on the 13th of July 1771, at about forty miles from its exit into the sea. On our arrival at the river, the Indians dispatched three men before, as spies, to see if any Esquimaux Indians were about the river; and, on the 15th of the same month, as I was continuing my survey, I met the spies, who informed me there were five tents of Esquimaux on the west side of the river, and, by their accounts of the distance, I judged they were about twelve miles off. On receiving this news, no more attention was paid to my survey, but their whole thought was engaged on planning the best method of stealing on them the ensuing night, and killing them while asleep. The better to complete their design it was necessary to cross the river, and, by the account of the spies, no place was so proper for that purpose as where we were, it being fine and smooth, and at some distance from any cataract. Accordingly, after they had put their guns, targets, spears, &c. in order, we were ferried over the river, the doing of which (as we had only three canoes) took up a considerable time. It must be observed that, before we set out on the west side, all the men painted their targets, some with the image of the sun, others with the moon, others with different kinds of birds and beasts of prey, and some had the images of fairies and other imaginary beings on them, which, according to their silly imaginations, are inhabitants of the different elements, as the earth, sea, air, &c. By a strict enquiry into the reason of this superstition, I found that each man had the image of that being painted on his target, which he relied most on for success in the intended battle with the Esquimaux: and some were contented with a single representation, whilst others, doubtful, I suppose, of the power of any single being, would have their targets covered to the very margin with hieroglyphics, quite unintelligible.

"This piece of superstition being completed, we began to advance towards the tents of the Esquimaux, always walking in low grounds, and being very careful how we crossed any hills, for fear of being seen by the inhabitants. The number of my gang being so far superior to the five tents of Esquimaux, and the warlike manner in which they were equipped, in proportion to what might be expected of the poor Esquimaux, rendered a total massacre inevitable, unless kind Providence should work a miracle for their preservation. The land was so situated that we walked under cover of the hills till we came within 200 yards of their tents, where the Indians that were with me lay some time in ambush, watching the motions of the Esquimaux. The Indians advised me to stay here till the fight was over, with which I would by no means comply, for I thought, when the Esquimaux were surprised, they would fly every way for refuge, and if they found me

alone, not knowing me from an enemy, they would lay violent hands on me when there was none to assist. I therefore determined to accompany them, assuring them at the same time that I would have no hand in the murder unless I found it necessary for my own safety. They seemed highly pleased with my proposal, and directly fixed a spear and bayonet for me, but I had no target. By the time this was all settled it was near one o'clock in the morning, when, finding all the Esquimaux asleep in their tents, they ran on them without being discovered, until they came close to their very doors. They then began the cruel massacre, while I stood neuter in the rear, and in a few seconds a scene truly shocking presented itself to my view. For, as the poor unhappy victims were surprised in the midst of their sleep, they had neither power nor time to make any resistance, but men, women, and children, ran out of their tents quite naked. But, alas! where could they fly for shelter! They every soul fell a sacrifice to Indian barbarity, in all near thirty. The shrieks and groans of the poor expiring souls were truly horrible, and this was much increased by the sight of one poor girl (about eighteen years old) whom they killed so near to me, that, when the first spear was struck into her, she fell down and twisted about my feet and legs, and it was with much difficulty I disengaged myself from her dying grasps. As the Indians pursued her, I solicited for her life; but so far was it from being granted, that I was not fully assured of my own being in entire safety for offering to speak in her behalf. When I begged her life, the two fellows that followed her made no reply, till they had both their spears through her fixed into the ground: they then both looked me sternly in the face, and began to upbraid me, by asking if I wanted an Esquimaux wife; at the same time paying no regard to the loud shrieks of the poor girl, who was twining round the spears like an eel. Indeed I was obliged at last to desire that they would be more expeditious in dispatching her out of her misery, lest otherwise I should be obliged out of pity to assist in performing that friendly office. The brutish manner in which they used the bodies, which they had deprived of life, is too shocking, and would be too indecent to describe; and the terror of mind I was in from such a situation is so much easier to be conceived than described, that I shall not attempt it. When they had completed this most inhuman murder, we observed seven more tents on the opposite side of the river. The Indians of these tents were soon in great confusion, but did not offer to make their escape. The Indians who were with me fired many shot at them across the river, but the poor Esquimaux were so unacquainted with the nature of guns, that when the bullets struck the rocks they ran in great bodies to see what was sent them, and seemed curious in examining the pieces of lead which they found flatted on the rocks, till at last one man was shot through the leg, after which they embarked in their canoes, with their wives and children, and paddled to a shoal in the river. When my Indians had made all their observations on the bodies, as above-mentioned, and had plundered their tents of all their copper-work (which they and the Copper Indians used instead of iron), they assembled at the top of an high hill, standing in a circle with their spears erect in the air, and gave shouts of victory, calling *Tima! Tima!* by way of derision to the surviving Esquimaux who were standing on the shoal. We then went up the river about half a mile, to the place where our canoes and baggage were, with an intent to cross over and plunder the other seven tents. It taking up a considerable time to get all across the river, as we had only three canoes, and being entirely under cover of the rocks, the poor Esquimaux, whom we left on the shoal, thought we were gone about our own business, and had returned to their tents again. And the land was so situated on the east side, that the Indians went under cover of the hills until they were within a hundred yards of their tents, where they saw the Esquimaux busy in tying up their bundles. They ran on them again with great fury; but,

having

having their canoes ready, they all embarked, and reached the shoals before-mentioned, except one poor old man, who, being too attentive in tying up his things, had not time to reach his canoe, but fell a sacrifice to their fury. After the Indians had plundered these tents of what they thought worth their notice, they threw their tent-poles into the river, broke their stone-kettles, and did all they could to distress the poor survivors. We found an aged woman at a small distance up the river, snaring of salmon, whom they butchered in the same manner, every man having a thrust at her with his spear."

The other extract is as follows: "This day, January the 11th, 1772, as the Indians were hunting, some of them saw a strange snow-shoe track, which they followed, and at a considerable distance came to a little hut, where they found a young woman sitting alone. They brought her to the tents, and on examining her found that she was one of the western dog-ribbed Indians, and had been taken prisoner by the Arathapescow Indians, in the summer of 1770; and when the Indians, who took her prisoner, were near this place in 1771, she eloped from them, with an intent to return to her own country. But it being so far off, and when she was taken prisoner having come all the way in canoes, with the windings of rivers and lakes, she had forgot the way, and had been in this little hut ever since the beginning of fall. By her account of the moons passed since her elopement, it appears to have been the middle of last July when she left the Arathapescow Indians, and she had not seen a human face since. She had supported herself by snaring rabbits, partridges, and squirrels, and was now in good health, and I think as fine a woman, of a real Indian, as I have seen in any part of North America. She had nothing to make snares of but the sinews of rabbits legs and feet, which she twisted together for that purpose; and of the rabbits-skins had made a neat and warm winter's clothing. The stock of materials she took with her when she eloped, consisted of about five inches of an iron hoop for a knife, a stone steel, and other hard stones for flints, together with fire-tackle, as tinder, &c. about an inch and an half of the shank of the shoing of an arrow, of iron, of which she made an awl. She had not been long at the tents, before half a score of men wrestled to see who should have her for a wife. She says, that when the Arathapescow Indians took her prisoner they stole upon the tents in the night, when all the inhabitants were asleep, and murdered every soul except herself and three other young women. Her father, mother, and husband, were in the same tent with her, and they were all killed. Her child, of about five months old, she took with her, wrapt in a bundle of her own clothing, undiscovered, in the night. But when she arrived at the place where the Arathapescows had left their wives, which was not far off, it being then day-break, these Indian women immediately began to examine her bundle, and, having there found the child, took it from her and killed it immediately. The relation of this shocking scene only served the savages of my gang for laughter. Her country is so far to the westward, that she says she never saw any iron or other metal till she was taken prisoner; those of her tribe making their hatchets and chisels of deer's horns, and knives of stone and bone; their arrows are shod with a kind of slate, bone, and deer's horns, and their instruments to make their wood-work are nothing but beaver's teeth. They have frequently heard of the useful materials that the nations to the east of them are supplied with from the English, but instead of drawing nearer to be in the way of trading for iron-work, &c. are obliged to remove farther back to avoid the Arathapescow Indians, as they make surprising slaughter among them every year, both winter and summer."

The Esquimaux, according to Mr. Pennant, are distinguished from the tribes south of them, chiefly by their dress, their canoes, and their instruments of chase. He divides them into two varieties. About Prince William's

Sound they are of the largest size. As we advance northward they decrease in height, till they dwindle into the dwarfish tribes, which occupy some of the coasts of the icy sea, and the maritime parts of Hudson's Bay, of Greenland, and Labrador. Their dwarfishness is doubtless occasioned by the scantiness of their provisions, and the severity of their climate. Beyond the 67th degree of north latitude, according to Capt. Ellis's account, there are no inhabitants. The Arctic countries in America, Asia, and Greenland, if inhabited at all, have very few inhabitants; and those are of a dwarfish kind, scattered on the banks of rivers, lakes, and seas, and subsist miserably upon fish, and the flesh of the animals which inhabit those frozen regions, with the skins of which they clothe themselves.

Mr. Crantz gives it as his opinion, that the Esquimaux came originally from the north-east regions of Great Tartary, between the icy sea and Mungalia; because he observes a greater affinity between them and the Calmucs, Tunguses, and Kamikadales, who inhabit those regions, than between them and the Laplanders, the Samoiedes, and Ostiacks, who inhabit the north-west parts of Europe, whence, it has generally been conjectured, the Esquimaux migrated. It is his opinion also, that Greenland was settled in the 14th century, from the north-eastern parts of America; for, till that period, Greenland appears not to have had any inhabitants. The route which the first migrants took, he supposes was first into Tartary, after the dispersion of the nations, thence into Kamtschaka, thence across the strait which separates the two continents, whence they spread themselves unmolested, into the then uninhabited country round Hudson's Bay, and down as far south as Canada; and here they were found in the 11th century by the Norwegians, in their Wineland. Afterwards these more southerly regions were conquered by the more numerous and powerful tribes south of the lakes, and the Esquimaux were forced to retire as far north as the 60th degree of north latitude. Here Capt. Ellis found the Esquimaux in his voyage to Hudson's Bay, and discovered that they had the same aspect, dress, boats, hunting and fishing implements, habitations, manners, and usages, as the Greenlanders. They are often pursued and hunted by the other Indians, who live about the south and west shores of Hudson's Bay, and who appear to be quite a different people.

The newly-discovered American Indians about Nootka Sound disguise themselves after the manner of the ancient Scythians, in dresses made of the skins of wolves and other wild beasts, and even wear the heads fitted to their own. These habits they use in the chase to circumvent the animals of the field.

Concerning the religion of the Indians much has been said, and much that has no foundation. In general it may be said, that they all have an idea of a Supreme Being, whom they worship under different names, and with a great variety of superstitious rites and ceremonies. Some, particularly the nations of the Algonquin language, call their Supreme God, the *Great Hare*; some *Michabou*, and others *Atahocan*. The Being opposed to this *first spirit*, whom they considered as the creator and governor of the world, they style the *Great Tyger*. The name of the Hurons' supreme god, or more properly their god of war, is *Areskoui*; of the Iroquois, *Ageskouse*; but most of the nations south of the lakes, as far as Louisiana, denominate their supreme god, the *Great*, the *Good*, or the *Grand Spirit*, to whom they ascribe a kind of omnipresence, and whom they invoke as their guardian. To their evil geni they never address themselves, except to entreat them not to do them any injury; and to appease their wrath they often sacrifice to them. Mr. Kirkland mentions a small lake, which he visited, situated at the foot of a precipice, nearly fifty feet perpendicular height, in the territory of the Six Nations, in which, the old Indians affirm, resided formerly a demon in the shape of a dragon, and that he

had been seen frequently to disgorge balls of liquid fire. To appease his wrath, they said, many a sacrifice of tobacco had been made at the lake by the fathers.

With regard to the general character of the Indian nations, M. de Pauw reasons in the following manner:—
 “As the most ancient histories agree in representing every race of men rising gradually out of savage life to the first rudiments of arts, and of society, there is just reason to believe, that the first men were thrown on this globe without other notions or advantages than those which are found in ordinary savages; containing, in themselves the elements of perfectibility, they were at a mighty distance from the attainment: in their creation, brutal and unenlightened, they owe to themselves their manners, their laws, and their sciences. They had no common model, no fixed rule of conduct; accordingly, they have differed very much, as well in the means of attaining to civilized life, as in the institutions on which their civilization depended: climate has governed them full as much as reason; the different degrees of heat and cold have clearly inspired legislators with opposite ideas: on comparing the legislative codes of the temperate with those of the torrid zone, or its neighbourhood, all is contrast, nothing analogous. It is agriculture that has led man by the hand from a savage state to a politic constitution: the more cultivated the soil, the more abundant the harvest, the sooner will the cultivators humanize. The first effect of agriculture is to render men sedentary; from that moment they are half civilized; from hence we may determine the classes in which the several species of savages should be placed, in proportion to their comparative distance from moral perfection. Cultivators are the first by pre-eminence, though the last in time, because their subsistence is the least precarious, their mode of life the least turbulent; they have time to invent and to perfect their instruments; they have leisure to think, and to reflect. Pastors come next, but differ from the former, in that, being obliged to look out for fresh pastures, and attend their flocks, they are never established. The Tartars, Arabians, Moors, and Laplanders, are those of this class the best known; from their manners are to be collected the best ideas we can have of this mode of life, intermediate between the savage and civil, and at an equal distance from the two points. The third class consists of those who live on the roots and fruits of the earth, without culture; their manners depend much on the quality of the productions, and the fertility of the soil; those who had the cocoa and the palm-tree, were more at their ease, and less savage, than those whose first resource was in the beech-mast and acorn. Those who live on fish form the fourth class; their mode of life differs little from that of the pastors, except that the latter have a resource in their tamed cattle, while the fishers depend on chance or dexterity for their subsistence. Hunters constitute the last order, and are of all the most savage; wandering, unassured of their subsistence, they must dread the union and multiplication of similar tribes as the greatest of evils; because game, much less abundant than fish, decreases in every country in proportion as the number of men increases. The savage hunter's scene of action is the wilderness; he avoids every human habitation, and gets to a greater distance at every step from social life. If he builds a hut, it is rather for a retreat than a dwelling; never at peace with either men or animals, his instinct is ferocious, his manners rude; the more his thoughts are employed on the means of procuring subsistence, the less he reflects on the means of his improvement; he is, in human kind, what the carnivorous beast is among quadrupeds, solitary and unsocial.

“That America and its inhabitants should continue savage to so late a period as the fifteenth century, has been a subject of wonder to our greatest philosophers. To suppose, with Buffon, an after-creation, or with others, a modern deluge, is a mere assertion; an assumption of a cause to answer a particular purpose. In coun-

tries temperate in climate, and rich in vegetables, society has been established infinitely sooner than in the cold and barren. One sees it pass, and, as it were, travel from Asia into Egypt; thence into Greece, and so in gradation into Italy, Gaul, and Germany, following the degrees of natural or cultivable advantages in each particular country. Where property is undetermined, men fight with fury to prevent its establishment; as every establishment tends to contract their means of subsistence. Where property is fixed, men fight with equal fury to defend or enlarge it; in either case, men are so hostile to each other, that the highest effort of virtue is, to bring one's self to love them: nay, such is our propensity to disturb each other, that even in the most polished societies, the primitive instincts of man break through all restraints, and the philosopher in theory is a savage in practice. In the Peloponnesian war, the petty states of Greece were so many tribes of savages in malignity, treachery, and every species of barbarity; with this difference in favour of the untutored savage, that he fights that he may eat; the Greeks fought to prevent each other from eating. But the character of war, we are told, has been humanized since those times; that is, we advance to battle without motive or rancour; carnage is tempered by etiquette, and we make peace to draw breath, and begin again. But are the causes of war more legitimate, or do fewer men fall by the sword? The *jus gentium*, so happily defined in books, is a dead letter in the field: did it prevent the humane, the generous, Turenne, from burning, wasting, and destroying, until he had converted the Palatinate, the finest province of Germany, into a desert? Could a Huron or an Iroquois have done more?

SETTLEMENT OF NORTH AMERICA.

NORTH AMERICA was discovered in the reign of Henry VII. a period when the arts and sciences had made very considerable progress in Europe. Many of the first adventurers were men of genius and learning, and were careful to preserve authentic records of such of their proceedings as would be interesting to posterity. These records afford ample documents for American historians. Perhaps no people on the globe can trace the history of their origin and progress with so much precision as the inhabitants of North America; particularly that part of them who inhabit the territory of the United States.

The fame which Columbus had acquired by his first discoveries on this western continent, spread through Europe, and inspired many with the spirit of enterprise. As early as 1496, four years only after the first discovery of America, John Cabot, a Venetian, obtained a commission from Henry VII. to discover unknown lands and annex them to the crown. In the spring he sailed from England with two ships, carrying with him his three sons. In this voyage, which was intended for China, he fell in with the north side of Terra Labrador, and coasted northerly as far as the 67th degree of latitude. The next year he made a second voyage to America, with his son Sebastian, who afterwards proceeded in the discoveries which his father had begun. On the 24th of June, 1497, he discovered Bonavista, on the north-east side of Newfoundland. Before his return he traversed the coast from Davis's Straits to Cape Florida.

In 1502, Sebastian Cabot fell in with Newfoundland; and, on his return, carried three of the natives of that island to Henry VII. In the spring of 1513, John Ponce sailed from Porto Rico northerly, and discovered the continent in 30° 8' north latitude. He landed in April, a season when the country round was covered with verdure, and in full bloom. This circumstance induced him to call the country *Florida*, which, for many years was the common name for North and South America. In 1516, Sir Sebastian Cabot and Sir Thomas Pert explored the coast as far as Brazil in South America. This vast extent of country, the coast whereof was thus explored, remained unclaimed and unsettled by any European power, (except

(except by the Spaniards in South America) for almost a century from the time of its discovery.

It was not till the year 1524 that France attempted discoveries on the American coast. Stimulated by his enterprising neighbours, Francis I. who possessed a great and active mind, sent John Verrazano, a Florentine, to America, for the purpose of making discoveries. He traversed the coast from latitude 28° to 50° north. In a second voyage, some time after, he was lost. The next year Stephen Gomez, the first Spaniard who came upon the American coast for discovery, sailed from Groyne, in Spain, to Cuba and Florida, thence northward to Cape Razo, in latitude 46° degrees north, in search of a north-west passage to the East Indies.

In the spring of 1534, by the direction of Francis I. a fleet was fitted out at St. Malo's, in France, with design to make discoveries in America. The command of this fleet was given to James Cartier. He arrived at Newfoundland in May of this year. Thence he sailed northerly; and, on the day of the festival of St. Lawrence, he found himself in about latitude $48^{\circ} 30'$ north, in the midst of a broad gulf, which he named St. Lawrence. He gave the same name to the river which empties into it. In this voyage, he sailed as far north as latitude 51° , expecting in vain to find a passage to China. The next year he sailed up the river St. Lawrence 300 leagues, to the great and swift Fall. He called the country New France; built a fort, in which he spent the winter, and returned in the following spring to France.

In 1542, Francis la Roche, lord of Robewell, was sent to Canada, by the French king, with three ships and 200 men, women, and children. They wintered there in a fort which they had built, and returned in the spring. About the year 1550, a large number of adventurers failed for Canada, but were never after heard of. In 1598, the king of France commissioned the marquis de la Roche to conquer Canada, and other countries not possessed by any Christian prince. We do not learn, however, that la Roche ever attempted to execute his commission, or that any further attempts were made to settle Canada during this century. On the 12th of May, 1539, Ferdinand de Soto, with 900 men, besides seamen, sailed from Cuba, having for his object the conquest of Florida. On the 30th of May he arrived at Spirito Santo, from whence he travelled northward 450 leagues from the sea. Here he discovered a river a quarter of a mile wide and 19 fathoms deep, on the bank of which he died and was buried, May 1542, aged forty-two years. Alverdo, his successor, built seven brigantines, and the year following embarked upon the river. In seventeen days he proceeded down the river 400 leagues, where he judged it to be fifteen leagues wide. From the largeness of the river at that place of his embarkation, he concluded its source must have been at least 400 leagues above, so that the whole length of the river, in his opinion, must have been more than 800 leagues. As he passed down the river, he found it opened by two mouths into the gulph of Mexico. These circumstances led us to conclude, that this river, so early discovered, was the one which we now call the *Mississippi*. On the 6th of January, 1549, king Henry VII. granted a pension for life to Sebastian Cabot, in consideration of the important services he had rendered to the kingdom by his discoveries in America.

The admiral of France, Chatillon, early in the year 1562, sent out a fleet under the command of John Ribalt. He arrived at Cape Francis, on the coast of Florida, near which, on the first of May, he discovered and entered a river which he called *May* river. It is more than probable that river is the same which we now call St. Mary's, which forms a part of the southern boundary of the United States. As he coasted northward, he discovered eight other rivers, one of which he called *Port Royal*, and sailed up it several leagues. On one of the rivers he built a fort, and called it *Charles*, in which he left a colony under the direction of captain Albert. The severity of Albert's

measures excited a mutiny, in which, to the ruin of the colony, he was slain. Two years after, Chatillon sent René Laudonier, with three ships, to Florida. In June he arrived at the river May, on which he built a fort, and, in honour to his king, Charles IX. he called it *Carolina*. In August, this year, Capt. Ribalt arrived at Florida the second time, with a fleet of seven vessels to recruit the colony, which, two years before, he had left under the direction of the unfortunate Capt. Albert. The September following, Pedro Melandes, with six Spanish ships, pursued Ribalt up the river on which he had settled, and, overpowering him in numbers, cruelly massacred him and his whole company. Melandes, having in his way taken possession of the country, built three forts, and left them garrisoned 1200 soldiers. Laudonier, and his colony on May river, receiving information of the fate of Ribalt, took the alarm, and escaped to France.

A fleet of three ships, sent from France to Florida, in 1567, under the command of Dominique de Gourges. The object of this expedition was to dispossess the Spaniards of that part of Florida which they had cruelly and unjustifiably seized three years before. He arrived on the coast of Florida in April, 1568, and soon after made a successful attack upon the forts. The recent cruelty of Melandes and his company, excited revenge in the breast of Gourges, and roused the unjustifiable principle of retaliation. He took the forts; put most of the Spaniards to the sword; and, having burned and demolished all their fortresses, returned to France. During the fifty years next after this event, the French enterprised no settlements in America. In 1576, Capt. Frobisher was sent to find out a north-west passage to the East Indies. The first land which he made on the coast was a cape, which, in honour to the queen, he called *Queen Elizabeth's Foreland*. In coasting northerly he discovered the straits which bear his name. He prosecuted his search for a passage into the western ocean, till he was prevented by the ice, and then returned to England. In 1579, Sir Humphrey Gilbert obtained a patent from queen Elizabeth, for lands not yet possessed by any Christian prince, provided he would take possession within six years. With this encouragement he sailed for America, and on the first of August, 1583, anchored in Conception Bay. Afterwards he discovered and took possession of St. John's Harbour, and the country south. In pursuing his discoveries, he lost one of his ships on the shoals of Sablon; and, on his return home, a storm overtook him, in which he was unfortunately lost, and the intended settlement was prevented.

In 1584, two patents were granted by queen Elizabeth, one to Adrian Gilbert, the other to Sir Walter Raleigh, for lands not possessed by any Christian prince. By the direction of Sir Walter, two ships were fitted and sent out, under the command of Philip Amidas and Arthur Barlow. In July they arrived on the coast, and anchored in a harbour seven leagues west of the Roanoke. On the 13th of July, they, in a formal manner, took possession of the country, and, in honour of their virgin queen Elizabeth, they called it *Virginia*. Till this time the country was known by the general name of Florida. After this Virginia became the common name for all North America. The next year, 1585, Sir Walter Raleigh sent Sir Richard Greenville to America, with seven ships. He arrived at Wococon Harbour in June. Having stationed a colony of more than a hundred people at Roanoke, under the direction of Capt. Ralph Lane, he coasted northerly as far as Chesapeake Bay, and returned to England. The colony under Capt. Lane endured extreme hardships, and must have perished, had not Sir Francis Drake fortunately returned to Virginia, and carried them to England, after having made several conquests for the queen in the West Indies and other places. A fortnight after, Sir Richard Greenville arrived with new recruits; and, although he did not find the colony which he had before left, and knew not but they had perished, he had the rashness to leave fifty men at the same place. The next year,

1587, Sir Walter sent another company to Virginia, under governor White, with a charter and twelve assistants. In July he arrived at Roanoke. Not one of the second company remained. He determined, however, to risk a third colony. Accordingly he left 115 people at the old settlement, and returned to England. August 13, this year, *Manto* was baptised in Virginia. He was the first native Indian who received that ordinance in that part of America. On the 18th of the same month, Mrs. Dare was delivered of a daughter, whom she called *Virginia*. She was the first child that was born of English parents in North America. In 1590, governor White came over to Virginia with supplies and recruits for his colony; but, to his great grief, not a man was to be found. They had all miserably famished with hunger, or were massacred by the Indians. In the spring of 1602, Bartholomew Gosnold, with thirty-two persons, made a voyage to North Virginia, and discovered and gave names to Cape Cod, Martha's Vineyard, and Elizabeth Islands, and to Dover Cliff. Elizabeth Island was the place which they fixed for their first settlement. But the courage of those who were to have tarried sailing, they all went on-board and returned to England. All the attempts to settle this continent which were made by the Dutch, French, and English, from its discovery to the present time, a period of 110 years, proved ineffectual. The Spaniards only, of all the European nations, had been successful. There is no account of there having been one European family, at this time, in all the vast extent of coast from Florida to Greenland. In 1603, Martin Pring and William Brown were sent by Sir Walter Raleigh, with two small vessels, to make discoveries in North Virginia. They came upon the coast, which was broken with a multitude of islands, in latitude $43^{\circ} 30'$ north. They coasted southward to Cape Cod Bay; thence round the cape into a commodious harbour in latitude $41^{\circ} 25'$, where they went ashore and tarried seven weeks, during which time they loaded one of their vessels with saffaras, and returned to England. The same year Bartholomew Gilbert, in a voyage to South Virginia, in search of the third colony which had been left there by governor White in 1587, having touched at several of the West-India islands, landed near Chesapeake Bay, where, in a skirmish with the Indians, he, and four of his men, were unfortunately slain. The rest, without any further search for the colony, returned to England.

France being at this time in a state of tranquillity, in consequence of the edict of Nantz in favour of the protestants, passed by Henry IV. and of the peace with Philip king of Spain and Portugal, was induced to pursue her discoveries in America. Accordingly the king signed a patent in favour of De Mons, in 1603, of all the country from the 40th to the 46th degrees of north latitude, under the name of *Acadia*. The next year De Mons ranged the coast from St. Lawrence to Cape Sable, and quite round to Cape Cod.

In May, 1605, George's Island and Pentecost Harbour were discovered by Capt. George Weymouth. In May he entered a large river in latitude $40^{\circ} 20'$, (variation $11^{\circ} 15'$ west,) which Mr. Prince, in his Chronology, supposes must have been Sagadahok; but, from the latitude, it was more probably the Piscataqua. Capt. Weymouth carried with him to England five of the natives.

In the spring of 1606, James I. by patent, divided Virginia into two colonies. The southern included all lands between the 34th and 41st degrees of north latitude. This was styled the first colony, under the name of South Virginia, and was granted to the London Company. The northern, called the second colony, and known by the general name of North Virginia, included all lands between the 38th and 45th degrees north latitude, and was granted to the Plymouth Company. Each of these colonies had a council of thirteen men to govern them. To prevent disputes about territory, the colonies were prohibited to plant within an hundred miles of each other. There appears to be an inconsistency in these grants, as

the lands lying between the 38th and 41st degrees are covered by both patents. Both the London and Plymouth companies enterprised settlements within the limits of their respective grants: with what success will now be mentioned. Mr. Piercy, brother of the earl of Northumberland, in the service of the London Company, went over with a colony to Virginia, and discovered Powhatan, now James-river. In the mean time the Plymouth Company sent Capt. Henry Challons, in a vessel of fifty-five tons, to plant a colony in North Virginia; but in his voyage he was taken by a Spanish fleet and carried to Spain.

The London Company, in the spring of 1607, sent Capt. Christopher Newport, with three vessels, to South Virginia. On the 26th of April he entered Chesapeake Bay, and landed, and soon after gave to the most southern point the name of *Cape Henry*, which it still retains. Having elected Mr. Edward Wingfield president for the year, they next day landed all their men, and began a settlement on James-river, at a place which they called James-town. This is the first town that was settled by the English in North America. The June following Capt. Newport sailed for England, leaving with the president 104 persons. In August following died Capt. Bartholomew Gosnold, the first projector of this settlement, and one of the council. The following winter James-town was burnt.

During this time the Plymouth Company fitted out two ships, under the command of admiral Rawley Gilbert. They sailed for North Virginia on the 31st of May, with one hundred planters, and Capt. George Popham for their president. They arrived in August, and settled about nine or ten leagues to the southward of the mouth of Sagadahok river. A great part of the colony, however, disheartened by the severity of the winter, returned to England in December, leaving their president, Capt. Popham, with only forty-five men. It was in the fall of this year, that the famous Mr. Robinson, with part of his congregation, who afterwards settled at Plymouth, in New England, removed from the north of England to Holland to avoid the cruelties of persecution, and for the sake of enjoying "purity of worship and liberty of conscience." This year a small company of merchants at Dieppe and St. Malo's founded Quebec; or rather the colony which they sent built a few huts there, which did not take the form of a town until the reign of Lewis XIV.

The Sagadahok colony suffered incredible hardships after departure of their friends, in December, 1608. In the depth of winter, which was extremely cold, their storehouse caught fire and was consumed, with most of their provisions and lodgings. Their misfortunes were increased, soon after, by the death of their president. Rawley Gilbert was appointed to succeed him. Lord-chief-justice Popham made every exertion to keep this colony alive, by repeatedly sending them supplies. But the circumstance of his death, which happened this year, together with that of president Gilbert's being called to England to settle his affairs, broke up the colony, and they all returned with him to England. The unfavourable reports which these first unfortunate adventurers propagated respecting the country, prevented any further attempts to settle in North Virginia for several years after.

The London Company, in 1608, sent Capt. Nelson, with two ships and 120 persons, to James-town; and in 1609, Capt. John Smith, afterwards president, arrived on the coast of South Virginia, and by sailing up a number of the rivers discovered the interior country. In September, Capt. Newport arrived with seventy persons, which increased the colony to 200 souls. Mr. Robinson and his congregation, who had settled at Amsterdam, removed this year to Leyden, where they remained more than eleven years, till a part of them came over to New England. The council for South Virginia having resigned their old commission, requested and obtained a new one; in consequence of which they appointed Sir Thomas West lord de la War, general of the colony; Sir Thomas Gates, his lieutenant; Sir George Somers, admiral; Sir Thomas Dale, high marshal;

marshal; Sir Ferdinand Wainman, general of the horse; and Capt. Newport, vice-admiral. In June, Sir Thomas Gates, admiral Newport, and Sir George Somers, with seven ships and a ketch and pinnace, having 500 souls on-board, men, women, and children, sailed from Falmouth for South Virginia. In crossing the Bahama gulph, on the 24th of July, the fleet was overtaken by a violent storm, and separated. Four days after, Sir George Somers ran his vessel ashore on one of the Bermudas islands, which, from this circumstance, have been called the *Somers Islands*. The people on-board, 150 in number, all got safe on-shore, and there remained until the following May. The remainder of the fleet arrived at Virginia in August. The colony was now increased to 500 men. Capt. Smith, then president, a little before the arrival of the fleet, had been very badly burnt, by means of some powder which had accidentally caught fire. This unfortunate circumstance, together with the opposition he met with from those who had lately arrived, induced him to leave the colony and return to England, which he accordingly did. Francis West, his successor in office, soon followed him, and George Percy was elected president.

The year following, the South Virginia or London Company sealed a patent to lord De la War, constituting him governor and captain-general of South Virginia. He soon after embarked for America with Capt. Argal and 150 men, in three ships. The unfortunate people, who, the year before, had been shipwrecked on the Bermudas islands, had employed themselves during the winter and spring, under the direction of Sir Thomas Gates, Sir George Somers, and admiral Newport, in building a sloop to transport themselves to the continent. They embarked for Virginia on the 10th of May, with about 150 persons on-board, leaving two of their men behind, who chose to stay, and landed at James-town on the 23d of the same month. Finding the colony, which, at the time of Capt. Smith's departure, consisted of 500 souls, now reduced to sixty, and those in a distressed and wretched situation, they, with one voice, resolved to return to England; and for this purpose, on the 7th of June, the whole colony repaired on-board their vessels, broke up their settlement, and sailed down the river on their way to their native country. Fortunately, lord De la War, who had embarked for James-town the March before, met them the day after they sailed, and persuaded them to return with him to James-town, where they arrived and landed the 10th of June. The government of the colony of right devolved on lord De la War. From this time we may date the effectual settlement of Virginia.

As early as the year 1608 or 1609, Henry Hudson, an Englishman, under a commission from the king his master, discovered Long Island, New York, and the river which still bears his name, and afterwards sold the country, or rather his right, to the Dutch. Their writers, however, contend that Hudson was sent out by the East-India company, in 1609, to discover a north-west passage to China; and that, having first discovered Delaware Bay, he came and penetrated Hudson's River as far as latitude 43°. It is said, however, that there was a sale, and that the English objected to it, though for some time they neglected to oppose the Dutch settlement of the country. In 1610, Hudson sailed again to this country, then called by the Dutch *New Netherlands*; and, four years after, the States-General granted a patent to sundry merchants for an exclusive trade on the north river, who, in 1614, built a fort on the west side, near Albany. From this time we may date the settlement of New York.

Conception Bay, on the island of Newfoundland, was settled in the year 1610, by about forty planters, under governor John Guy, to whom king James had given a patent of incorporation.

Champlain, a Frenchman, had begun a settlement at Quebec, in 1608; St. Croix, Mount Mansel, and Port-Royal, were settled about the same time. These settlements remained undisturbed till 1613, when the Virgi-

nians, hearing that the French had settled within their limits, sent Capt. Argal to dislodge them. For this purpose he sailed to Sagadahoc, took their forts at Mount Mansel, St. Croix, and Port-Royal, with their vessels, ordnance, cattle, and provisions, and carried them to James-town, in Virginia. Quebec was left in possession of the French.

In 1614, Capt. John Smith, with two ships and forty-five men and boys, made a voyage to North Virginia, to make experiments upon a gold and copper mine. His orders were, to fish and trade with the natives, if he should fail in his expectations with regard to the mine. To facilitate this business, he took with him *Tantum*, an Indian, perhaps one that Capt. Weymouth carried to England in 1605. In April he reached the island Monahigan, in latitude 43° 30'. Here Capt. Smith was directed to stay and keep possession, with ten men, for the purpose of making a trial of the whaling business; but, being disappointed in this, he built seven boats, in which thirty-seven men made a very successful fishing voyage. In the mean time, the captain himself, with eight men only, in a small boat, coasted from Penobscot to Sagadahoc, Acocisco, Passataquack, Tragabizanda, now called Cape Ann, thence to Acomak, where he skirmished with some Indians; thence to Cape Cod, where he sent his Indian, Tantum, ashore, and left him, and returned to Monahigan. In this voyage he found two French ships in the bay of Massachusetts, who had come there six weeks before, and, during that time, had been trading very advantageously with the Indians. It was conjectured that there were, at this time, 3000 Indians upon the Massachusetts islands. In July, Capt. Smith embarked for England in one of the vessels, leaving the other under the command Capt. Thomas Hunt, to equip for a voyage to Spain. After Capt. Smith's departure, Hunt perfidiously allured twenty Indians (one of whom was *Squanto*, afterwards so serviceable to the English) to come on-board his ship at Patuxit, and seven more at Naust, and carried them to the island of Malaga, where he sold them, for twenty pounds each, to be slaves for life. This conduct, which fixes an indelible stigma upon the character of Hunt, excited in the breasts of the Indians such an inveterate hatred of the English, as that, for many years after, all commercial intercourse with them was rendered exceedingly dangerous. Capt. Smith arrived at London the last of August, where he drew a map of the country, and called it *New England*. From this time North Virginia assumed the name of *New England*, and the name *Virginia* was confined to the southern colony. Between the years 1614 and 1620, several attempts were made by the Plymouth Company to settle New England, but by various means they were all rendered ineffectual. During this time, however, an advantageous trade was carried on with the natives. In the year 1617, Mr. Robinson and his congregation, influenced by several weighty reasons, meditated a removal to America. Various difficulties intervened to prevent the success of their designs, until the year 1620, when a part of Mr. Robinson's congregation went over and settled at Plymouth. At this time commenced the settlement of New England.

In order to preserve the chronological order in which the several colonies, not grown into independent states, were first settled, it will be necessary just to mention, that, the next year after the settlement of Plymouth, Capt. John Mason obtained of the Plymouth council a grant of a part of the present state of New Hampshire. Two years after, under the authority of this grant, a small colony fixed down near the mouth of Piscataqua river. From this period we may date the settlement of New Hampshire.

In 1627, a colony of Swedes and Fins came over and landed at Cape Henlopen; and afterwards purchased of the Indians the land from Cape Henlopen to the Falls of Delaware, on both sides the river, which they called *New Swedeland Stream*. On this river they built several forts, and

and made settlements. On the 19th of March, 1628, the council for New England sold to Sir Henry Roswell, and five others, a large tract of land, lying round Massachusetts Bay. The June following, Capt. John Endicott, with his wife and company, came over and settled at Nahunkeag, now called Salem. This was the first settlement made in Massachusetts Bay. Plymouth, indeed, which is now included in the commonwealth of Massachusetts, was settled eight years before, but at this time it was a separate colony, under a distinct government, and continued so until the second charter of Massachusetts was granted by William and Mary, in 1691; by which Plymouth, the province of Main, and Sagadahok, were annexed to Massachusetts.

In the reign of Charles I. June 13, 1633, lord Baltimore, a Roman Catholic, applied for and obtained a grant of a tract of land upon Chesapeake Bay, about 140 miles long and 130 broad. Soon after this, in consequence of the rigour of the laws of England against the Roman Catholics, lord Baltimore, with a number of his persecuted brethren, came over and settled it; and, in honour of queen Henrietta Maria, they called it Maryland.

The first grant of Connecticut was made by Robert earl of Warwick, president of the council of Plymouth, to lord Say and Seal, to lord Brook, and others, in the year 1631. In consequence of several smaller grants made afterwards by the patentees to particular persons, Mr. Fenwick made a settlement at the mouth of Connecticut river, and called it *Saybrook*. Four years after, a number of people from Massachusetts Bay came and began settlements at Hartford, Wethersfield, and Windfor, on Connecticut river. Thus commenced the English settlement of Connecticut.

Rhode Island was first settled in consequence of religious persecution. Mr. Roger Williams, who was among those who early came over to Massachusetts, not agreeing with some of his brothers in sentiment, was very unjustifiably banished the colony, and went with twelve others, his adherents, and settled at Providence, in 1635. From this beginning arose the colony, now state, of Rhode Island.

On the 20th of March, 1664, Charles II. granted to the duke of York, what is now called New Jersey, then a part of a large tract of country known by the name of New Netherland. Some parts of New Jersey were settled by the Dutch as early as about 1615.

In 1662, Charles II. granted to Edward earl of Clarendon, and seven others, almost the whole territory of the three southern states, North and South Carolinas and Georgia. Two years after he granted a second charter, enlarging their boundaries. The proprietors, by virtue of authority vested in them by their charter, engaged Mr. Locke to frame a system of laws for the government of their intended colony. Notwithstanding these preparations, no effectual settlement was made till the year 1669, (though one was attempted in 1667,) when governor Sayle came over with a colony, and fixed on a neck of land between Ashley and Cooper rivers. Thus commenced the settlement of Carolina, which then included the whole territory between 29 degrees and 36° 30' north latitude, together with the Bahama islands, lying between latitude 22° and 27° north.

The royal charter for Pennsylvania was granted to William Penn, on the 4th of March, 1681. The first colony came over the next year, and settled under the proprietor, William Penn, who acted as governor from October, 1682, to August, 1684. The first assembly in the province of Pennsylvania was held at Chester, on the 4th of December, 1682. Thus William Penn, a quaker, justly celebrated as a great and good man, had the honour of laying the foundation of the present populous and very flourishing state of Pennsylvania.

The proprietary government in Carolina was attended with so many inconveniences, and occasioned such violent dissensions among the settlers, that the parliament of Great Britain was induced to take the province under their immediate care. The proprietors (except lord Granville) accepted of 22,500l. sterling, from the crown, for the property and jurisdiction. This agreement was ratified by act of parliament, in 1729. A clause in this act reserved to lord Granville his eighth share of the property and arrears of quit-rents, which continued legally vested in his family till the revolution, in 1776. Lord Granville's share made a part of the present state of North Carolina. About the year 1729, the extensive territory belonging to the proprietors was divided into North and South Carolina. They remained separate royal governments until they became independent states. For the relief of poor indigent people of Great Britain and Ireland, and for the security of Carolina, a project was formed for planting a colony between the rivers Savannah and Alamaha. Accordingly, application being made to George II. he issued letters patent, bearing date June 9, 1732, for legally carrying into execution the benevolent plan. In honour of the king, who greatly encouraged the plan, they called the new province *Georgia*. Twenty-one trustees were appointed to conduct the affairs relating to the settlement of the province. The November following, 115 persons, one of whom was general Oglethorpe, embarked for Georgia, where they arrived, and landed at Yamacraw. In exploring the country, they found an elevated pleasant spot of ground on the bank of a navigable river, upon which they marked out a town, and, from the Indian name of the river which passed by it, called it Savannah. From this period we may date the settlement of Georgia.

The country now called Kentucky was well-known to the Indian traders many years before its settlement. They gave a description of it to Lewis Evans, who published his first map of it as early as the year 1752. James Macbride, and some others, explored this country in 1754. Colonel Daniel Boone visited it in 1769.

Four years after, in 1773, colonel Boone and his family, with five other families, who were joined by forty men from Powle's Valley, began the settlement of Kentucky, which is now one of the most growing colonies, perhaps, in the world, and was erected into an independent state, by act of congress, December 6, 1790, and received into the union, June 1, 1792.

The tract of country called Vermont, before the late war, was claimed both by New York and New Hampshire. When hostilities commenced between Great Britain and her colonies, the inhabitants considering themselves as in a state of nature, as to civil government, and not within any legal jurisdiction, associated and formed for themselves a constitution of government. Under this constitution, they have ever since continued to exercise all the powers of an independent state. Vermont was not admitted into union with the other states till March 4, 1791; yet we may venture to date her political existence as a separate government, from the year 1777, because, since that time, Vermont has, to all intents and purposes, been a sovereign and independent state. The first settlement in this state was made at Bennington, as early as about 1764.

The extensive tract of country lying north-west of the Ohio river, within the limits of the United States, was erected into a separate temporary government, by an ordinance of congress, passed the 13th of July, 1787.

Thus we have given a summary account of the first discoveries and progressive settlement of North America, in their chronological order. The following recapitulation will comprehend the whole in one view.

Names

Names of Places. When settled.

Quebec,	1608
Virginia,	June 10, 1610
Newfoundland,	June, 1610
New York,	} about 1614
New Jersey,	
Plymouth,	1620
New Hampshire,	1623
Delaware,	} 1627
Pennsylvania,	
Massachusetts Bay,	1628
Maryland,	1633
Connecticut,	1635
Rhode Island,	1635
New Jersey,	1664
South Carolina,	1669
Pennsylvania,	1682
North Carolina,	about 1728
Georgia,	1732
Kentucky,	1773
Vermont,	about 1764
Territory N. W. of Ohio river	1787

By whom.

By the French.
By lord Dé la War.
By governor John Guy.
By the Dutch.
By part of Mr. Robinson's congregation.
By a small English colony near the mouth of Piscataqua river.
By the Swedes and Fins.
By captain John Endicot and company.
By lord Baltimore and a colony of Roman Catholics.
By Mr. Fenwick, at Saybrook, near the mouth of Connecticut river.
By Mr. Roger Williams and his persecuted brethren.
Granted to the duke of York by Charles II. and made a distinct government, and settled some time before this by the English.
By governor Sayle.
By William Penn, with a colony of Quakers.
Erected into a separate government, settled before by the English.
By general Oglethorpe.
By colonel Daniel Boon.
By emigrants from Connecticut and other parts of New England.
By the Ohio and other companies.

The above dates are from the periods when the first permanent settlements were made.

North America comprehends all that part of the western continent which lies north of the Isthmus of Darien, extending north and south from about the 10th degree north latitude to the north pole; and east and west from the Atlantic to the Pacific Ocean, between the 45th and 165th degrees west longitude from London. Beyond the 70th degree N. lat. few discoveries have been made. In July 1779, Capt. Cook proceeded as far as latitude 71°, when he came to a solid body of ice extending from continent to continent.

Of the bays, sounds, straits, and islands, except those in the United States, we know but little more than their names. Baffin's Bay, lying between the 70th and 80th degrees north latitude, is the largest and most northern that has yet been discovered in North America. It opens into the Atlantic Ocean through Baffin's and Davis's Straits, between Cape Chidley, on the Labrador coast, and Cape Farewell. It communicates with Hudson's Bay to the south, through a cluster of islands. In this capacious bay or gulph is James Island, the south point of which is called Cape Bedford; and the smaller islands of Waygate and Disko. Davis's Straits separate Greenland from the American continent, and are between Cape Walsingham, on James Island, and South Bay in Greenland, where they are about sixty leagues broad, and extend from the 67th to the 71st degrees of latitude above Disko island. The most southern point of Greenland is called Cape Farewell.

Hudson's Bay took its name from Henry Hudson, who discovered it in 1610. It lies between 51 and 69 degrees of north latitude. The eastern boundary of the bay is Terra de Labrador; the northern part has a straight coast, facing the bay, guarded with a line of isles innumerable. A vast bay, called the Archiwinnip Sea, lies within it, and opens into Hudson's Bay, by means of Gulph Hazard, through which the Beluga whales pass in great numbers. The entrance of the bay, from the Atlantic Ocean, after leaving, to the north, Cape Farewell and Davis's Straits, between Resolution isles on the north, and Button's isles, on the Labrador coast, to the south, forming the eastern extremity of Hudson's Straits.

The coasts are very high, rocky, and rugged, at top; in some places precipitous, but sometimes exhibit extensive beaches. The islands of Salisbury, Nottingham, and Digges, are very lofty and naked. The depth of water in the middle of the bay is 140 fathoms. From Cape Churchill to the south end of the bay are regular soundings; near the shore, shallow, with muddy or sandy bottom. To the northward of Churchill, the soundings are irregular.

lar, the bottom rocky, and in some parts the rocks appear above the surface at low water.

James's Bay lies at the bottom, or most southern part, of Hudson's Bay, with which it communicates, and divides New Britain from South Wales. To the north-westward of Hudson's Bay is an extensive chain of lakes, among which is Lake Menichlich, latitude 61°, longitude 105° W. North of this is Lake Dobount, to the northward of which lies the extensive country of the northern Indians. West of these lakes, between the latitudes of 60 and 66 degrees, after passing a large cluster of unnamed lakes, lies the lake or sea Arathapescow, whose southern shores are inhabited by the Arathapescow Indians. North of this, and near the Arctic circle, is Lake Edlande, around which live the Dog-ribbed Indians. Further north is Buffalo Lake, near which, is Copper Mine river, in lat. 72° N. and long. 119° W. of Greenwich. The Copper Mine Indians inhabit this country.

Between Copper Mine river, which, according to Mr. Herne, empties into the Northern Sea, where the tide rises twelve or fourteen feet, and which in its whole course is encumbered with shoals and falls, and the north-west coast of America, is an extensive tract of unexplored country. As we descend from north to south on the western coast of America, just south of the arctic circle, we come to Cape Prince of Wales, opposite East Cape on the eastern continent; and here the two continents approach nearest to each other. Proceeding southward, we pass Norton Sound, Cape Stephen's, Shoalness, Bristol Bay, Prince William's Sound, Cook's River, Admiralty Bay, and Port Mulgrave, Nootka Sound, &c. From Nootka Sound proceeding south, we pass the unexplored country of New Albion, thence to California, and New Mexico.

The vast tract of country, bounded west by the Pacific Ocean, south and east by California, New Mexico, and Louisiana; the United States, Canada, and the Atlantic Ocean, and extending as far north as the country is habitable (a few scattered English, French, and some other European, settlements excepted), is inhabited wholly by various nations and tribes of Indians. The Indians also possess large tracts of country within the Spanish, American, and British dominions. Those parts of North America not inhabited by Indians, belong, if we include Greenland, to Denmark, Great Britain, the American States, and Spain. Spain claims East and West Florida, and all west of the Mississippi, and south of the northern boundaries of Louisiana, New Mexico, and California. Great Britain claims all the country, inhabited by Europeans,

lying north and east of the United States, except Greenland, which belongs to Denmark. The remaining part is the territory of the Fifteen United States. The particular provinces and states of North America are as follow :

Provinces & States.	N ^o of Inhabitants.	Chief Towns.
<i>United States.</i>		
Vermont	85,539	Windfor, Rutland
New Hampshire	141,885	Portsmouth, Concord
Massachusetts	387,787	Boston, Salem, Newbury Port
District of Maine	96,540	Portland, Hallowell
Rhode Island	68,825	Newport, Providence
Connecticut	237,946	New Haven, Hartford
New York	340,120	New York, Albany
New Jersey	184,139	Trenton, Burlington, Brunswick
Pennsylvania	434,373	Philadelphia, Lancaster
Delaware	59,094	Dover, Wilmington, New-castle
Maryland	319,728	Annapolis, Baltimore
Virginia	747,610	Richmond, Petersburg, Norfolk
Kentucky	73,677	Lexington
North Carolina	393,751	Newbern, Edenton, Halifax
South Carolina	249,073	Charlestown, Columbia
Georgia	82,548	Savannah, Augusta
Territory S. of Ohio	35,691	Abingdon
Territories N.W. of Ohio		Marietta
<i>British Provinces.</i>		
New Britain	unknown	
Upper Canada	20,000	Kingston, Detroit, Niagara
Lower Canada	130,000	Quebec, Montreal
Cape Breton Isl.	1,000	Sidney, Louisburgh
New Brunswick	35,000	Fredericktown
Nova Scotia		Halifax
St. John's Isl. in 1783	5,000	Charlottetown
Newfoundland Isl.	7,000	Placentia, St. John's
<i>Denmark.</i>		
Greenland	10,000	New Herrnhut
<i>Spanish Provinces.</i>		
East Florida		Augustine
West Florida		Penacola
Louisiana		New Orleans
New Mexico		St. Fee
California		St. Juan
Mexico, or New Spain		Mexico

For particulars relating to the history and present state of the above provinces, see under their respective heads.

SOUTH AMERICA

FORMS a part of the globe, where the human mind is successively surpris'd with the sublime and astonishing works of nature; where rivers of amazing breadth flow through beautiful and widely-extended plains, and where lofty mountains, whose summits are covered with eternal snow, intercept the clouds, and hide their heads from the view of mortals. In some parts of this extensive region, nature hath bountifully bestowed her treasures, and given every thing necessary for the convenience and happiness of society. We have only to regret, that avaricious men have successively drenched with innocent blood these plains, which are so beautifully formed and enriched by the hand of nature; and that the rod of Spanish despotism has prevented the population of a country, which might have supported millions of beings in affluence.

South America is an extensive peninsula, connected with North America by the isthmus of Darien, and divided between Spain, Portugal, France, Holland, &c. as follows:

SPANISH DOMINIONS,	{ Terra Firma, Peru,
	{ Chili, & Paraguay.
PORTUGUESE,	- - - Brazil.
FRENCH,	- - - Cayenne.
DUTCH,	- - - Surinam.
ABORIGINES,	- - - { Amazonia,
	{ Patagonia.

Terra Firma is situated between 60° and 82° west longitude, and the equator and 12° north latitude; its length is 1400 miles, and its breadth 700: it is bounded on the north by the Atlantic Ocean, (called there the North Sea;) on the east by the Atlantic Ocean and Surinam; on the south by Amazonia and Peru; and on the west by the Pacific Ocean. It is here divided into two grand divisions, North and South; these are again subdivided into provinces. The northern division containing, 1. Darien, or Terra Firma Proper: 2. Carthagena: 3. St. Martha; 4. Venezuela: 5. Comana: 6. Paria, or New Andalusia. The southern division containing, 1. New Granada: 2. Popayan.

Peru is situated between the equator and 25° south latitude, and 60° and 81° west longitude; its length is 1800 miles, and its breadth, according to some authors, 390, and others 600 miles; but the latest and most authentic accounts state it at about 500. It is bounded on the north by Terra Firma, on the west by the Pacific Ocean, on the south by Chili, and on the east by the mountains called the Andes. The empire of Peru, at the time it was subdued, extended along the South Sea, from the river of Emeralds to Chili, and on the land-side to Popayan, according to some geographers. It contained within its extent that famous chain of mountains which rises in the Terra Magellanica, and is gradually lost in Mexico, in order to unite, as it should seem, the southern parts of America with the northern. It is now divided into three grand divisions or audiences: 1. Quito: 2. Lima; or Los Reyes; and 3. Los Charcos. As to its climate, mines, soil, and produce, they differ greatly in different parts of the country.

Chili is situated between 25° and 45° south latitude, and 65° and 85° west longitude; its length is 1260 miles, and its greatest breadth 580; it is bounded on the north by Peru; on the east by Paragua, or La Plata; on the south by Patagonia; and on the west by the Pacific Ocean. It lies on both sides of the Andes; Chili Proper lies on the west, and Cuyo or Cutio on the east. The principal towns in the former are St. Jago and Baldivia; in the latter, St. John de Frontiera. The first attempt of the Spaniards upon this country was made by Almagro in the year 1535, after he and Pizaro had completed the conquest of Peru.

Paraguay is situated between 12° and 37° south latitude, and 50° and 75° west longitude; its length is 1500 miles, and its breadth 1000. It is bounded on the north by Amazonia; on the east by Brasil; on the south by Patagonia; and on the west by Chili and Peru. It is divided into six provinces, viz. Paraguay, Parana, Guaira, Uragua, Tucuman, and Rio de la Plata. This country, besides an infinite number of small rivers, is watered by three principal ones, the Paragua, Uragua, and Parana, which, united near the sea, form the famous Rio de la Plata, or Plate river, which annually overflow their banks; and, on their recess, leave them enriched with a slime that produces the greatest plenty of whatever is committed to it. This vast tract is far from being wholly subdued or planted by the Spaniards. There are many parts in a great degree unknown to them, or to any other people in Europe. The principal province of which we have any knowledge, is that which is called Rio de la Plata, towards the mouth of the above-mentioned rivers. The Spaniards first discovered this country by sailing up the river La Plata in 1515, and founded the town of Buenos Ayres, so called on account of the excellence of the air.

Brasil is situated between the equator and 35° south latitude, and 60° west longitude; it is about 1560 miles in length, and 1000 in breadth; but, measuring along the coast, it is 2000 miles long, and is bordered with mountains that open from time to time, and form good harbours where vessels may lie in safety. It is bounded by the mouth of the river Amazon and the Atlantic Ocean on the north; and by the same ocean on the east; on the south by the river Plata; on the west by morasses, lakes, rivers,

rivers, and mountains, which separate it from Amazonia and the Spanish possessions. On the coast are three small islands, where ships touch for provisions on their voyage to the South Seas, viz. Fernando, St. Barbaro, and St. Catharine's. It was accidentally discovered by the Portuguese in 1500.

Cayenne is bounded north and east, by the Atlantic Ocean; south, by the Amazon river; and west, by Guiana or Surinam. It extends 240 miles along the coast of Guiana, and nearly 300 miles within land, lying between the equator and the 5th degree of north latitude. The land along the coast is low, and very subject to inundations during the rainy seasons, from the multitude of rivers which rush down from the mountains with great impetuosity. Here the atmosphere is very hot, moist, and unwholesome, especially where the woods are not cleared away; but on the higher parts, where the trees are cut down, and the ground laid out in plantations, the air is more healthy, and the heat great, mitigated by the sea breezes. The soil in many parts is very fertile, producing sugar, tobacco, Indian corn, fruits, and other necessities of life. The French took possession of this in 1635.

Surinam is the only province belonging to the Dutch on the continent of America, and is situated between 5° and 7° north latitude, having the mouth of the Oronoko and the Atlantic, on the north; Cayenne, on the east; Amazonia, on the south; and Terra Firma on the west. The Dutch claim the whole coast from the mouth of Oronoko to the river Marowynne, on which are situated their colonies of Essequibo, Demerara, Berbice, and Surinam. The latter begins with the river Saramacha, and ends with the Marowynne, including a length of coast of one hundred and twenty miles. A number of fine rivers pass through this country, the principal of which are Essequibo, Surinam, Demerara, Berbice, and Conya. Essequibo is nine miles wide at its mouth, and is more than 300 miles in length. Surinam is a beautiful river, three quarters of a mile wide, navigable for the largest vessels four leagues, and for smaller vessels sixty or seventy miles farther. Its banks, quite to the water's edge, are covered with evergreen mangrove trees, which render the passage up this river very delightful. The Demerara is about three quarters of a mile wide where it empties into the Surinam, is navigable for large vessels 100 miles; 100 miles farther are several falls of easy ascent, above which it divides into the south-west and south-east branches.

Amazonia is situated between the equator and 20° south latitude; its length is 1400 miles, and its breadth 900 miles: it is bounded on the north by Terra Firma and Guiana; on the east by Brazil; on the south by Paraguay; and on the west by Peru. The air is cooler in this country than could be expected, considering it is situated in the torrid zone. This is partly owing to the heavy rains which occasion the rivers to overflow their banks one half of the year, and partly to the cloudiness of the weather, which obscures the sun great part of the time he is above the horizon. During the rainy season the country is subject to dreadful storms of thunder and lightning.

Patagonia is situated between 35° and 54° south latitude; its length 1100 miles and its breadth 350: it is bounded north by Chili and Paragua; east by the Atlantic Ocean; south by the Straits of Magellan; west by the Pacific Ocean. The climate is said to be much colder in this country than in the north under the same parallels of latitude, which is imputed to the Andes, which pass through it, being covered with eternal snow: it is almost impossible to say what the soil would produce, as it is not at all cultivated by the natives. The northern parts are covered with wood, among which is an inexhaustible fund of large timber; but towards the south, it is said, there is not a single tree large enough to be of use to mechanics. There are, however, good pastures, which feed incredible numbers of horned cattle and horses, first carried there by the Spaniards, and now increased to an amazing degree.—For

the history and present state of each of these provinces, see under their respective names.

POLITICAL HISTORY, and REVOLUTION, of NORTH AMERICA.

WE have seen that America was originally peopled by uncivilized nations, who lived mostly by hunting and fishing. The Europeans, who first visited these shores, treating the natives as wild beasts of the forests, which have no property in the woods where they roam, planted the standard of their respective masters where they first landed, and in their names claimed the country by right of discovery. Prior to any settlement in North America, numerous titles of this kind were acquired by the English, French, Spanish, and Dutch, navigators, who came hither for the purposes of fishing and trading with the natives. Slight as such titles were, they were afterwards the causes of contention between the European nations. The subjects of different princes often laid claim to the same tract of country, because both had discovered the same river or promontory; or because the extent of their respective claims was undetermined. While the settlements in this vast uncultivated country were inconsiderable and scattered, and the trade of it confined to the bartering of a few trinkets for furs, a trade carried on by a few adventurers, the interfering of claims produced no important controversy among the settlers or the nations of Europe. But in proportion to the progress of population, and the growth of the American trade, the jealousies of the nations, which had made early discoveries and settlements on this coast, were alarmed; ancient claims were revived; and each power took measures to extend and secure its own possessions at the expence of a rival.

By the treaty of Utrecht in 1713, the English claimed a right of cutting logwood in the Bay of Campeachy, in South America. In the exercise of this right, the English merchants had frequent opportunities of carrying on a contraband trade with the Spanish settlements on the continent. To remedy this evil, the Spaniards resolved to annihilate a claim, which, though often acknowledged, had never been clearly ascertained. To effect this design they captured the English vessels, which they found along the Spanish Main, and many of the British subjects were doomed to work in the mines of Potosi. Repeated severities of this kind produced a war between England and Spain, in 1739. Porto Bello was taken from the Spaniards by admiral Vernon. Commodore Anson, with a squadron of ships, sailed to the South Seas, distressed the Spanish settlements on the western shore of America, and took a galleon laden with immense riches. But, in 1741, a formidable armament, destined to attack Carthage, under the command of lord Cathcart, returned unsuccessful, with the loss of upwards 12000 British soldiers and seamen; and the defeat of the expedition raised a clamour against the minister, Sir Robert Walpole, which produced a change in the administration. This change removed the scene of war to Europe, so that America was not immediately affected by the subsequent transactions, except that Louisburgh, the principal fortress of Cape Breton, was taken from the French by general Pepperell, assisted by commodore Warren with a body of New England troops. This war ended in 1748, by the treaty of peace signed at Aix-la-Chapelle, by which restitution was made, on both sides, of all places taken during the war.

Peace however was of short duration. The French possessed Canada, and had made considerable settlements in Florida, claiming the country on both sides of the Mississippi, by right of discovery. To secure and extend their claims, they established a line of forts from Canada to Florida. They had secured the important pass at Niagara, and erected a fort at the junction of the Allegany and Monongahela rivers, called Fort du Quebec. They took pains to secure the friendship and assistance of the natives; encroachments were made upon the English pos-

sessions,

feussions, and mutual injuries succeeded. The disputes among the settlers in America, and the measures taken by the French to command all the trade of the St. Lawrence river on the north, and of the Mississippi on the south, excited a jealousy in the English nation, which soon broke out in open war. The next year three other expeditions were undertaken in America against the French. One was conducted by general Monckton, who had orders to drive the French from their encroachments on the province of Nova Scotia. This expedition was attended with success. General Johnson was ordered with a body of troops to take possession of Crown Point, but he did not succeed. General Shirley commanded an expedition against the Fort at Niagara, but lost the season by delay.

In 1755, general Braddock marched against Fort du Quefne, but, in penetrating through the wilderness, he incautiously fell into an ambuscade, and suffered a total defeat. General Braddock was killed; but the enemy not pursuing the vanquished across the river, being eager in plundering the baggage of the dead, a part of his troops were saved by flight under the conduct of general Washington, at that time a colonel, who then began to exhibit proofs of those military talents, by which he afterwards conducted the armies of America to victory, and that country to independence. The ill success of these expeditions left the English settlements in America exposed to the depredations of both the French and Indians. But the war now raged in Europe and the East Indies, and engaged the attention of both nations in those quarters.

It was not until the campaign in 1758, that affairs assumed a more favourable aspect in America. But, upon a change of administration, Mr. Pitt was appointed minister, and the operations of war became more vigorous and successful. General Amherst was sent to take possession of Cape Breton; and, after a warm siege, the garrison of Louisburgh surrendered by capitulation. General Forbes was successful in taking possession of Fort du Quefne, which the French thought fit to abandon. But general Abercrombie, who commanded the troops destined to act against the French at Crown Point and Ticonderoga, attacked the lines at Ticonderoga, and was defeated with a terrible slaughter of his troops. After this defeat, he returned to his camp at Lake George. The next year, more effectual measures were taken to subdue the French in America. General Prideaux and Sir William Johnson began the operations of the campaign by taking the French fort near Niagara. General Amherst took possession of the forts at Crown Point and Ticonderoga, which the French had abandoned. But the decisive blow, which proved fatal to the French interests in America, was the defeat of the French army, and the taking of Quebec, by the brave general Wolfe. This hero was slain in the beginning of the action on the plains of Abram, and M. Montcalm, the French commander, likewise lost his life. The loss of Quebec was soon followed by the capture of Montreal by general Amherst, and Canada has remained ever since in possession of the English. Colonel Grant, in 1761, defeated the Cherokees in Carolina, and obliged them to sue for peace. The next year Martinico was taken by admiral Rodney and general Monckton; and also the island of Grenada, St. Vincent's, and others. The capture of these was soon followed by the surrender of the Havannah, the capital of the island of Cuba.

In 1763, a definitive treaty of peace was concluded at Paris, between Great Britain, France, and Spain; by which the English ceded to the French several islands which they had taken from them in the West Indies, but were confirmed in the possession of all North America on this side the Mississippi, except the island of Orleans. But this war, however brilliant the successes and glorious the event, proved the cause of great and unexpected misfortunes to Great Britain. Engaged with the combined powers of France and Spain during several years, her exertions were surprising, and her expence immense. To discharge the debts of the nation, the parliament was obliged to

have recourse to new expedients for raising money. Previous to the last treaty in 1763, the parliament had been satisfied to raise a revenue from the American colonies by a monopoly of their trade.

It will be proper here to observe, that there were four kinds of government established in the British American colonies. The first was a charter government, by which the powers of legislation were vested in a governor, council, and assembly, chosen by the people: Of this kind were the governments of Connecticut and Rhode Island. The second was a proprietary government, in which the proprietor of the province was governor; although he generally resided abroad, and administered the government by a deputy of his own appointment; the assembly only being chosen by the people: Such were the governments of Pennsylvania and Maryland, and originally of New Jersey and Carolina. The third kind was that of royal government, where the governor and council were appointed by the crown, and the assembly by the people: Of this kind were the governments of New Hampshire, New York, New Jersey (after the year 1702), Virginia, the Carolinas after the resignation of the proprietors in 1728, and Georgia. The fourth kind was that of Massachusetts's, which differed from all the rest. The governor was appointed by the king; so far it was a royal government; but the members of the council were elected by the representatives of the people. The governor, however, had a right to negative a certain number, but not to fill up vacancies thus occasioned.

This variety of governments created different degrees of dependence on the crown. In the royal government, to render a law valid, it was constitutionally required that it should be ratified by the king; but the charter governments were empowered to enact laws, and no ratification by the king was necessary. It was only required that such laws should not be contrary to the laws of England. The charter of Connecticut was express to this purpose.

Such was the state of the British colonies at the conclusion of the war in 1763. Their flourishing condition at this time was remarkable and striking: their trade had prospered in the midst of all the difficulties and distresses of a war in which they were so nearly and so immediately concerned. Their population continued on the increase, notwithstanding the ravages and depredations that had been so fiercely carried on by the French, and the native Indians in their alliance. They abounded with spirited and active individuals of all denominations. They were flushed with the uncommon prosperity that had attended them in their commercial affairs and military transactions. Hence they were ready for all kind of undertakings, and saw no limits to their hopes and expectations.

Their improvements in the necessary and useful arts did honour to their industry and ingenuity. Though they did not live in the luxury of Europe, they had all the solid and substantial enjoyments of life, and were not unacquainted with many of its elegancies and refinements. A circumstance much to their praise is, that notwithstanding their peculiar addition to those occupations of which lucre is the sole object, they were duly attentive to cultivate the field of learning; and they have ever since their first foundation been particularly careful to provide for the education of the rising progeny. Their vast augmentation of internal trade and external commerce, was not merely owing to their position and facility of communication with other parts; it arose also from their natural turn and temper, full of schemes and projects; ever aiming at new discoveries, and continually employed in the search of means of improving their condition. Their industry carried them into every quarter from whence profit could be derived. There was scarcely any port of the American hemisphere to which they had not extended their navigation. They were continually exploring new sources of trade, and were found in every spot where business could be transacted. To this extensive and incessant application to commerce, they added an equal vigilance in the

the administration of their affairs at home. Whatever could conduce to the amelioration of the soil they possessed, to the progress of agriculture, or to the improvement of their domestic circumstances, was attended to with so much labour and care, that it may be strictly said, that nature had given them nothing of which they did not make the most. In the midst of this solicitude and toil in matters of business, the affairs of government were conducted with a steadiness, prudence, and activity, seldom experienced, and never exceeded, in the best regulated countries of Europe.

At the beginning of the war with France, commissioners from many of the colonies had assembled at Albany, and proposed that a great council should be formed by deputies from the several colonies, which, with a general governor to be appointed by the crown, should be empowered to take measures for the common safety, and to raise money for the execution of their designs. This proposal was not relished by the British ministry; but, in place of this plan, it was proposed, that the governors of the colonies, with one or two of their council, should assemble and concert measures for the general defence; erect forts, levy troops, and draw on the treasury of England for the monies that should be wanted; but the treasury to be reimbursed by a tax on the colonies, to be laid by the British parliament. To this plan, which would imply an avowal of the right of parliament to tax the colonies, the provincial assemblies objected with unshaken firmness. Hence it seems that the British parliament, even before the war, had it in contemplation to exercise the right of taxing the colonies, without permitting them to be represented. The colonies, however, with an uncommon foresight and firmness, defeated these attempts, and the war was carried on by requisitions on the colonies for supplies of men and money, or by voluntary contributions.

But no sooner was peace concluded, than the English parliament resumed the scheme of taxing America; and, in March, 1764, a bill was passed, by which heavy duties were laid on goods imported by the colonists from such West-India islands as did not belong to Great Britain; at the same time that these duties were to be paid into the exchequer in specie: and, in the same session, another bill was framed to restrain the currency of paper-money in the colonies themselves. These acts, coming so close upon each other, threw the whole colonies into the utmost ferment. Vehement remonstrances were made to the ministry, and every argument made use that reason or ingenuity could suggest, but to no purpose. The Americans, thus finding all arguments vain, united in an agreement to import no more of the manufactures of Great Britain, but to encourage to the utmost of their power every thing of that kind among themselves. Previous to this, indeed, several regulations were passed in favour of the commerce of the colonies; but they had now imbibed such unfavourable sentiments of the British ministry, that they paid very little regard to any thing pretended to be done in their favour; or, if these acts made any favourable impression, it was quickly obliterated by the news of the stamp-act. The reason given for this act so exceedingly obnoxious was, that a sum might be raised sufficient for the defence of the colonies against a foreign enemy; but this pretence was so far from giving any satisfaction to the Americans, that it excited their indignation to the utmost degree. They not only asserted that they were abundantly able to defend themselves against any foreign enemy, but denied that England had any right to tax them at all, unless they were allowed the privilege of sending representatives to the British parliament.

It would be superfluous to enter into any of the arguments used by the contending parties on this important occasion. The stamp-act, after a violent opposition, was passed, and its reception in America was such as might have been expected. The news, and the act itself, first arrived at Boston, where the bells were muffled and rung a funeral peal. The act was first hawked about the streets

with a death's head affixed to it, and styled the "Folly of England, and the ruin of America;" and afterwards publicly burnt by the enraged populace. The stamps themselves were seized and destroyed; those who were to receive the stamp-duties were compelled to resign their offices; and such of the Americans as sided with government had their houses plundered and burnt.

It was now found absolutely necessary either to yield to the Americans, by repealing the obnoxious statutes, or to enforce them by arms. The ferment had diffused itself universally throughout the colonies. Non-importation agreements were every where entered into; and it was even resolved to prevent the sale of any more British goods after the present year. American manufactures, though dearer, as well as inferior in quality to the British, were universally preferred. An association was entered into against eating of lamb, in order to promote the growth of wool; and the ladies with cheerfulness agreed to renounce the use of every species of ornament manufactured in Britain. Such a general and alarming confederacy determined the ministry to repeal some of the most obnoxious statutes; and to this they were the more inclined by a petition from the first American congress, held at New York in October 1765.

The stamp-act was therefore repealed, to the universal joy of the Americans, and indeed to the general satisfaction of the English, whose manufactures had begun to suffer very severely in consequence of the American association against them. The ministry were conscious, that, in repealing this obnoxious act, they yielded to the Americans; and therefore, to support, as they thought, the dignity of Great Britain, it was judged proper to publish a declaratory bill, setting forth the authority of the mother-country over her colonies, and her power to bind them by laws and statutes *in all cases whatever*. This much diminished the joy with which the repeal of the stamp-act was received in America. It was considered as a proper reason to enforce any claims equally prejudicial to the stamp-act, which might hereafter be set up; a spirit of jealousy pervaded the whole continent, and a strong party was formed, watchful on every occasion to guard against the supposed encroachments of the British power.

It was not long before an occasion offered, in which the Americans manifested a spirit of absolute independency; and that, instead of being bound by the British legislature in all cases, they would not be controuled by it in the most trivial affairs. The Rockingham ministry had passed an act, providing the troops stationed in different parts of the colonies with such accommodations as were necessary for them. The assembly of New York, however, took upon them to alter the mode of execution prescribed by the act of parliament, and to substitute one of their own. This gave great offence to the new ministry, and rendered them, though composed of those who had been active against the stamp-bill, less favourable to the colonies than in all probability they would have otherwise been. An unlucky circumstance at the same time occurred, which threw every thing once more into confusion. One of the new ministry, Mr. Charles Townshend, having declared that he could find a way of taxing the Americans without giving them offence, was called upon to propose his plan. This was by imposing a duty upon tea, paper, painters' colours, and glass, imported into America. The undutiful behaviour of the New York assembly, and that of Boston, which had proceeded in a similar manner, caused this bill to meet with less opposition than it otherwise might have done. As a punishment to the refractory assemblies, the legislative power was taken from that of New York, until it should fully comply with the terms of the act. That of Boston at last submitted with reluctance. The bill for the new taxes was quickly passed, and sent to America in 1768.

A ferment much greater than that occasioned by the stamp-act now took place, which was further augmented by the news that a number of troops had been ordered to

5 T . . . . . repair

repair to Boston, to keep the inhabitants in awe. A dreadful alarm pervaded the whole town; and the people called on the governor to convene a general assembly, in order to remove their fears of the military; who they said were to be assembled to overthrow their liberties, and force obedience to laws to which they were entirely averse. The governor replied, that it was no longer in his power to call an assembly; having, in his last instructions from England, being required to wait the king's orders, the matter being then under consideration at home. Being thus refused, the people took upon themselves the formation of an assembly, which they called a *Convention*. The proceedings and resolutions of this were conformable to their former behaviour; but now they went a step farther, and, under pretence of an approaching rupture with France, ordered the inhabitants to put themselves in a posture of defence against any sudden attack of an enemy; and circular letters were directed to all the towns in the province, acquainting them with the resolutions that had been taken in the capital, and exhorting them to proceed in the same manner. The town of Hatfield alone refused its concurrence; but this served only to expose them to the censure and contempt of the rest. The convention thought proper to assure the governor of their pacific intentions, and renewed their request that an assembly might be called; but being refused any audience, and threatened with being treated as rebels, they at last thought proper to dissolve of themselves, and sent over to England a circumstantial account of their proceedings, with the reason of their having assembled in the manner already mentioned.

The expected troops arrived at Boston on the very day on which the convention broke up, and had some houses in the town prepared for their reception. Their arrival had a considerable influence on the people, and for some time seemed to put an end to the disturbances; but the seeds of discord had taken such deep root, that it was impossible to quench the flame. The late spirited behaviour in Boston had given the greatest offence in England; and, notwithstanding all the efforts of opposition, an address from both houses of parliament was presented to the king; in which the daring behaviour of the colony of Massachusetts's Bay was circumstantially set forth, and the most vigorous measures recommended for reducing them to obedience. The Americans, however, continued steadfast in the ideas they had adopted. Though the troops had for some time quieted the disturbances, yet the calm continued no longer than they appeared respectable on account of their number; but, as soon as this was diminished by the departure of a large detachment, the remainder were treated with contempt, and it was even resolved to expel them altogether. The country people took up arms for this purpose, and were to have assisted their friends in Boston; but, before the plot could be put in execution, an event happened which put an end to every idea of reconciliation betwixt the contending parties.

On the 5th of March 1770, a scuffle happened between some soldiers and a party of the town's people. The soldiers, while under arms, were pressed upon, insulted, and pelted, by a mob armed with clubs, sticks, and snow-balls covering stones; they were also dared to fire. In this situation, one of the soldiers, who had received a blow, in resentment fired at the supposed aggressor. This was followed by a single discharge from six others; so that three of the inhabitants were killed, and five dangerously wounded. The town was immediately in commotion; and such was the temper, force, and number, of the inhabitants, that nothing but an engagement to remove the troops out of the town, together with the advice of moderate men, prevented the townsmen from falling on the soldiers. The killed were buried in one vault, and in a most respectful manner, in order to express the indignation of the inhabitants at the slaughter of their bretheren, by soldiers quartered among them, in violation of their civil liberties. Captain Preston, who commanded the party which fired on the inhabitants, was committed to jail, and

afterwards tried; but the captain, and six of the men, were acquitted, and two only brought in guilty of manslaughter; for it appeared on the trial, that the soldiers were insulted, threatened, and pelted, before they fired: and it was also proved, that only seven guns were fired by the eight prisoners; these circumstances, therefore, induced the jury to make a favourable verdict. The result of the trial reflected great honour on John Adams, and Josiah Quincy, Esqrs. the counsel for the prisoners; and also on the integrity of the jury, who ventured to give an upright verdict, in defiance of popular opinions. The consequences of this tragical event sunk deep into the minds of the people, and were made subservient to important purposes. The anniversary of it was observed with great solemnity for thirteen years, when eloquent orators were successively employed to deliver an annual oration, to preserve the remembrance of it fresh in their minds. On these occasions the blessings of liberty, the horrors of slavery, the dangers of a standing army, the rights of the colonies, and a variety of such topics, were represented to the public view under their most pleasing and alarming forms. These annual orations administered fuel to the fire of liberty, and kept it burning with an incessant flame.

The determination of the Americans now continued, if possible, more firm than ever, until at last government, resolved to act with vigour, and at the same time to behave with as much condescension as possible, repealed all the duties lately laid on, that of tea alone excepted. This was left on purpose to maintain the dignity of the crown of England; and it was thought that it could not be productive of any discontent in America, as being an affair of very little moment, the produce of which was not expected to exceed 16,000*l*. The opposition, however, were strenuous in their endeavours to get this tax likewise abrogated; insisting, that the Americans would consider it only as an inlet to others; and that the repeal of all the rest, without this, would answer no good purpose. The event shewed that their opinion was well founded. The Americans opposed the tea-tax with the same violence as they had done all the rest: and, at last, on the news that salaries had been settled on the justices of the superior court of Boston, the governor was addressed on the subject; the measure was condemned in the strongest terms; and a committee selected out of the several districts of the colony appointed to enquire into it.

The new assembly proceeded in the most formal manner to disavow the supremacy of the British legislature; and accused the parliament of Britain of having violated the natural rights of the Americans in a number of instances. Copies of the transactions of this assembly were transmitted to every town in Massachusetts, exhorting the inhabitants to rouse themselves, and exert every nerve in opposition to the iron hand of oppression, which was daily tearing the choicest fruits from the fair tree of liberty. The disturbances were also greatly heightened by an accidental discovery that Mr. Hutchison, governor of Massachusetts's Bay, had written several confidential letters to people in power in England, complaining of the behaviour of the province, recommending vigorous measures against them, and, among other things, asserting, that "there must be an abridgement of what is called British liberty." Letters of this kind had some how or other fallen into the hands of the agent for the colony at London. They were immediately transmitted to Boston, where the assembly was sitting, by whom they were laid before the governor, who was thus reduced to a very mortifying situation. Losing every idea of respect or friendship for him as their governor, they instantly dispatched a petition to the king, requesting him to remove the governor and deputy-governor from their places; but to this they not only received no favourable answer, but the petition itself was declared groundless and scandalous.

Matters were now ripe for the utmost extremities on the part of the Americans; and they were brought on in the following manner: Though the colonists had entered into a non-

a non-importation agreement against tea as well as all other commodities from Britain, it had nevertheless found its way into America, though in smaller quantities than before. This was sensibly felt by the East-India company, who had now agreed to pay a large sum annually to government; in recompence for which compliance, and to make up their losses in other respects, they were empowered to export their tea free from any duty payable in Britain; and, in consequence of this permission, several ships freighted with the commodity were sent to North America, and proper agents appointed for the disposing of it. The Americans, now perceiving that the tax was thus likely to be enforced whether they would or not, determined to take every possible method to prevent the tea from being landed, as well knowing that it would be impossible to hinder the sale should the commodity once be brought on shore. For this purpose the people assembled in great numbers, forcing those to whom the tea was consigned to resign their offices, and to promise solemnly never to resume them; and committees were appointed to examine the accounts of merchants, and make public tests, declaring such as would not take them enemies to their country. In the midst of this confusion, three ships laden with tea arrived at Boston; but so much were the captains alarmed at the disposition which seemed to prevail among the people, that they offered, provided they could obtain the proper discharges from the tea-connegees, custom-house, and governor, to return to England without landing their cargoes. The parties concerned, however, tho' they durst not order the tea to be landed, refused to grant the discharges required. The ships, therefore, would have been obliged to remain in the harbour; but the people, apprehensive that if they remained there the tea would be landed in small quantities, and disposed of in spite of every endeavour to prevent it, resolved to destroy it at once. This resolution was executed with equal speed and secrecy. The very evening after the above-mentioned discharges had been refused, a number of people, dressed like Mohawk Indians, boarded the ships, and threw into the sea their whole cargoes, consisting of 342 chests of tea; after which, they retired without making any further disturbance, or doing any more damage. No tea was destroyed in other places, though the same spirit was every where manifested. At Philadelphia the pilots were enjoined not to conduct the vessels up the river; and at New York, though the governor caused some tea to be landed under the protection of a man of war, he was obliged to deliver it up to the custody of the people, to prevent its being sold.

The destruction of the tea at Boston, which happened in November, 1773, was the immediate prelude to the disasters attending civil discord. Government, finding themselves every where insulted and despised, resolved to enforce their authority by all possible means; and, as Boston had been the principal scene of the riots and outrages, it was determined to punish that city in an exemplary manner. Parliament was acquainted, by a message from his majesty, with the undutiful behaviour of the city of Boston, as well as of all the colonies; recommending, at the same time, the most vigorous and spirited exertions to reduce them to obedience. The parliament in its addresses promised a ready compliance; and indeed the Americans, by their outrageous behaviour, had now lost many of their partisans. It was proposed to lay a fine on the town of Boston, equal to the price of the tea which had been destroyed, and to shut up its port by armed vessels, until the refractory spirit of the inhabitants should be subdued; which it was thought must quickly yield, as a total stop would thus be put to their trade. The bill was strongly opposed, on the same grounds that the other had been; and it was predicted, that, instead of having any tendency to reconcile or subdue the Americans, it would infallibly exasperate them beyond any possibility of reconciliation. The petitions against it, presented by the colony's agent, pointed out the same consequence in the strong-

est terms, and in the most positive manner declared, that the Americans never would submit to it: but such was the infatuation attending every rank and degree of men, that it never was imagined the Americans would dare to resist the parent state openly, but would in the end submit implicitly to her commands. In this confidence a third bill was proposed, for the impartial administration of justice on such persons as might be employed in the suppression of riots and tumults in the province of Massachusetts Bay. By this act it was provided, that should any persons acting in that capacity be indicted for murder, and not able to obtain a fair trial in that province, they might be sent by the governor to England, or to some other colony, if necessary, to be tried for the supposed crime. These three bills having passed, the ministry proposed a fourth, relative to the government of Canada; which, it was said, had not yet been settled on any proper plan. By this bill the extent of that province was greatly enlarged; its affairs were put under the direction of a council, in which Roman Catholics were to be admitted; the Roman Catholic clergy were secured in their possessions, and the usual perquisites from those of their own profession. The council above-mentioned were to be appointed by the crown, to be removable at its pleasure; and to be invested with every legislative power, excepting that of taxation.

No sooner were these laws made known in America, than they cemented the union of the colonies almost beyond any possibility of dissolving it. The assembly of Massachusetts Bay had passed a vote against the judges accepting salaries from the crown, and put the question, Whether they would accept them as usual from the general assembly? Four answered in the affirmative; but Peter Oliver, the chief-justice, refused. A petition against him, and an accusation, were brought before the governor; but the latter refused the accusation, and declined to interfere in the matter; but, as they still insisted for what they called justice against Mr. Oliver, the governor thought proper to put an end to the matter by dissolving the assembly.

In this situation of affairs, a new alarm was occasioned by the news of the port-bill. This had been totally unexpected, and was received with the most extravagant expressions of displeasure among the populace; and while these continued, the new governor, general Gage, arrived from England. He had been chosen to this office on account of his being well acquainted in America, and generally agreeable to the people; but human wisdom could not now point out a method by which the flame could be allayed. The first act of his office, as governor, was to remove the assembly to Salem, a town seventeen miles distant, in consequence of the late act. When this was intimated to the assembly, they replied by requesting him to appoint a day of public humiliation for deprecating the wrath of heaven, but met with a refusal. When met at Salem, they passed a resolution, declaring the necessity of a general congress composed of delegates from all the provinces, in order to take the affairs of the colonies at large into consideration; and five gentlemen, remarkable for their opposition to the British measures, were chosen to represent that of Massachusetts Bay. They then proceeded with all expedition to draw up a declaration, containing a detail of the grievances they laboured under, and the necessity of exerting themselves against lawless power; they set forth the disregard shewn to their petitions, and the attempts of Great Britain to destroy their ancient constitution; and concluded with exhorting the inhabitants of the colony to obstruct, by every method in their power, such evil designs; recommending, at the same time, a total renunciation of every thing imported from Great Britain, till a redress of grievances could be procured. Intelligence of this declaration was carried to the governor on the very day it was completed; on which he dissolved the assembly. This was followed by an address from the inhabitants of Salem, in favour of those of Boston,

ton, and concluding with these remarkable words: "By shutting up the port of Boston, some imagine that the course of trade might be turned hither, and to our benefit; but nature, in the formation of our harbour, forbids our becoming rivals in commerce with that convenient mart; and, were it otherwise, we must be dead to every idea of justice, and lost to all feelings of humanity, could we indulge one thought to seize on wealth, and raise our fortunes on the ruin of our suffering neighbours."

It had been fondly hoped by the ministerial party at home, that the advantages which other towns of the colony might derive from the annihilation of the trade of Boston, would make them readily acquiesce in the measure of shutting up that port, and rather rejoice in it than otherwise; but the words of the address above-mentioned seemed to preclude all hope of this kind; and subsequent transactions soon manifested it to be totally vain. No sooner did intelligence arrive of the remaining bills passed in the session of 1774, than the cause of Boston became the cause of all the colonies. The port-bill had already occasioned violent commotions throughout them all. It had been reprobated in provincial meetings, and resistance, even to the last, had been recommended against such oppression. In Virginia, the first of June, the day on which the port of Boston was to be shut up, was held as a day of humiliation, and a public intercession in favour of America was enjoined. The style of the prayer was, that "God would give the people one heart and one mind, firmly to oppose every invasion of the American rights." The Virginians, however, did not content themselves with acts of religion. They recommended, in the strongest manner, a general congress of all the colonies; as fully persuaded, that an attempt to tax any colony in an arbitrary manner, was in reality an attack upon the whole, and must ultimately end in the ruin of them all.

The provinces of New York and Pennsylvania were less sanguine than the rest, being so closely connected in trade with Great Britain, that the giving it up entirely appeared a matter of the most serious magnitude, and not to be thought of but after every other method had failed. The intelligence of the remaining bills respecting Boston, however, spread a fresh alarm throughout the continent, and fixed those who had seemed to be the most wavering. The proposal of giving up all commercial intercourse with Britain was again proposed; contributions for the inhabitants of Boston were raised in every quarter; and they every day received addresses, commending them for the heroic courage with which they sustained their calamity.

The Bostonians, on their part, were not wanting in their endeavours to promote the general cause. An agreement was framed, which, in imitation of former times, they called a "Solemn League and Covenant." By this the subscribers most religiously bound themselves to break off all communication with Britain after the expiration of the month of August ensuing, until the obnoxious acts were repealed; at the same time they engaged neither to purchase nor use any goods imported after that time, and to renounce all connection with those who did, or who refused to subscribe to this covenant; threatening to publish the names of the refractory, which at this time was a punishment by no means to be despised. Agreements of a similar kind were almost instantaneously entered into throughout all America. General Gage indeed attempted to counteract the covenant by a proclamation, wherein it was declared an illegal and traitorous combination, threatening with the pains of law such as subscribed or countenanced it. But matters were too far gone for his proclamation to have any effect. The Americans retorted the charge of illegality; and insisted, that the law allowed subjects to meet in order to consider of their grievances, and associate for relief from oppression.

Preparations were now made for holding the general congress so often proposed. Philadelphia, as being the most considerable town, was pitched upon for the place of its meeting. The delegates, of whom it was to be com-

posed, were chosen by the representatives of each province; and were in number from two to seven for each colony, though no province had more than one vote. The first congress, which met at Philadelphia, in the beginning of September, 1774, consisted of fifty-one delegates. The novelty and importance of the meeting excited an universal attention; and their transactions were such as could not but tend to render them respectable.

The first act of congress was an approbation of the conduct of Massachusetts Bay, and an exhortation to continue in the same spirit with which they had begun. Supplies for the suffering inhabitants (whom indeed the operation of the port-bill had reduced to great distress) were strongly recommended; and it was declared, that in case of attempts to enforce the obnoxious acts by arms, all America should join to assist the town of Boston; and should the inhabitants be obliged, during the course of hostilities, to remove farther up the country, the losses they might sustain should be repaired at the public expence.

Matters thus went on, until every idea of reconciliation or friendship with Britain was lost. The Americans, without ceremony, began to seize on the military stores and ammunition belonging to government. This first commenced at Newport in Rhode Island, where the inhabitants carried off forty pieces of cannon appointed for the protection of the place; and, on being asked the reason of this proceeding, they replied, that the people had seized them lest they should be made use of against themselves. After this the assembly met, and resolved, that ammunition and warlike stores should be purchased with the public money. New Hampshire followed the example of Rhode Island, and seized a small fort, for the sake of the powder and military stores it contained. In Pennsylvania a convention was held, which expressed an earnest desire of reconciliation with the mother-country; though, at the same time, in the strongest manner declaring, that they were resolved to take up arms in defence of their just rights; and the people were exhorted to apply themselves with the greatest assiduity to the prosecution of such manufactures as were necessary for their defence and subsistence, such as salt, salt-petre, gunpowder, steel, &c.

As the disturbances had originated in the province of Massachusetts Bay, and there continued with the greatest violence, so this was the province where the first hostilities were formally commenced. In the beginning of February, 1775, the congress met at Cambridge; and, as no friends to Britain could now find admittance to that assembly, the only consideration was, how to make speedy preparations for war. Expertness in military discipline was recommended in the strongest manner, and several military institutions were enacted; among which, that of the *minute-men* was one of the most remarkable. These were chosen from the most active and expert among the militia; and their business was to keep themselves in constant readiness at the call of their officers; from which perpetual vigilance they derived their title. It was now easily seen, that a slight occasion would bring on hostilities, which could not but be attended with the most violent and certain destruction to the vanquished party; for both were so much exasperated by a long course of reproaches and literary warfare, that they seemed to be filled with the utmost inveteracy against each other.

On the 26th of February, general Gage, having been informed that a number of field-pieces had been brought to Salem, dispatched a party to seize them. Their road was obstructed by a river, over which was a draw-bridge. This the people had pulled up, and refused to let down: upon which the soldiers seized a boat to ferry them over; but the people cut out her bottom. Hostilities would immediately have commenced, had it not been for the interposition of a clergyman; who represented to the military, on the one hand, the folly of opposing such numbers; and to the people, on the other, that, as the day was far spent, the military could not execute their design, so that they might, without any fear, leave them the quiet possession

of the draw-bridge. This was complied with; and the soldiers, after having remained for some time at the bridge, returned without executing their orders.

The next attempt was attended with more serious consequences. General Gage having been informed that a large quantity of ammunition and military stores had been collected at Concord, about twenty miles from Boston, and where the provincial congress was sitting, sent a detachment, under the command of colonel Smith and major Pitcairn, to destroy the stores, and, as was reported, to seize Messrs. Hancock and Adams, the leading-men of the congress. They set out before day-break, on the 19th of April, marching with the utmost silence, and securing every one they met on the road, that they might not be discovered. But, notwithstanding all their care, the continual ringing of bells and firing of guns as they went along soon gave them notice that the country was alarmed. About five in the morning they had reached Lexington, fifteen miles from Boston, where the militia of the place were exercising. An officer called out to them to disperse; but some shots, it is said, being at that moment fired from a house in the neighbourhood, the military made a discharge, which killed and wounded several of the militia. The detachment then proceeded to Concord, where, having destroyed the stores, they were encountered by the Americans; and a scuffle ensued, in which several fell on both sides. The purpose of their expedition being thus accomplished, it was necessary for the king's troops to retreat, which they did through a continual fire kept upon them from Concord to Lexington. Here their ammunition was expended; and they would have been unavoidably cut off, had not a considerable reinforcement, commanded by lord Percy, luckily met them. The Americans, however, continued their attack with great fury; and the British would still have been in the utmost danger, had it not been for two field-pieces which lord Percy brought with him. By these the impetuosity of the Americans was checked, and the British made good their retreat to Boston, with the loss of 263 killed and wounded: that of the Americans was eighty-eight.

By this engagement the spirits of the Americans were so raised, that they meditated nothing less than the total expulsion of the British troops from Boston. An army of 20,000 men was assembled, who formed a line of encampment from Roxbury to Mystic, through a space of about thirty miles; and here they were soon after joined by a large body of Connecticut troops, under general Putnam, an old officer of great bravery and experience. By this formidable force was the town of Boston now kept blocked up. General Gage, however, had so strongly fortified it, that the enemy, powerful as they were, durst not make an attack; while, on the other hand, his force was by far too insignificant to meet such an enemy in the field. But, towards the end of May, a considerable reinforcement having arrived, with generals Howe, Burgoyne, and Clinton, he prepared to act with more decision; while the Americans, on their part, did every thing to oppose him.

A considerable height, known by the name of Bunker's Hill, just at the entrance of the peninsula of Charlestown, was so situated as to make the possession of it a matter of great consequence to either of the contending parties. Orders were therefore, June 16, issued by the provincial commanders, that a detachment of 1000 men should entrench upon this height. By some mistake, Breed's Hill, high and large like the other, but situated nearer Boston, was marked out for the entrenchments, instead of Bunker's Hill. The provincials proceeded to Breed's hill, and worked with so much diligence, that between midnight and the dawn of the morning, they had thrown up a small redoubt about eight rods square. They kept such a profound silence, that they were not heard by the British on-board their vessels, though very near. These, having derived their first information of what was going on from the sight of the work near completion, began an incessant firing upon them. The provincials bore this with firmness,

VOL. I. No 28.

and, though they were only young soldiers, continued to labour till they had thrown up a small breastwork, extending from the east side of the breastwork to the bottom of the hill. As this eminence overlooked Boston, general Gage thought it necessary to drive the provincials from it. About noon, therefore, he detached major-general Howe, and brigadier-general Pigot, with the flower of the army, consisting of four battalions, ten companies of the grenadiers, and ten of light infantry, with a proportion of field artillery, to effect this business. These troops landed at Moreton's Point, and, June 17, formed after landing, but remained in that position till they were reinforced by a second detachment of light infantry and grenadier companies, a battalion of land forces, and a battalion of marines, making in the whole near 3000 men. While the troops who first landed were waiting for this reinforcement, the provincials, for their farther security, pulled up some adjoining post and rail fences, and set them down in two parallel lines at a small distance from each other, and filled the space between with hay, which, having been lately mowed, remained on the adjacent ground.

The king's troops formed in two lines, and advanced slowly, to give their artillery time to demolish the American works. While the British were advancing to the attack, they received orders to burn Charlestown. This was not done because they were fired upon from the houses in that town, but from the military policy of depriving enemies of a cover in their approaches. In a short time this ancient town, consisting of about 500 buildings, chiefly of wood, was in one great blaze. The lofty steeple of the meeting-house formed a pyramid of fire above the rest, and struck the astonished eyes of numerous beholders with a magnificent but awful spectacle. In Boston, the heights of every kind were covered with the citizens, and such of the king's troops as were not on duty. The hills around the adjacent country, which afforded a safe and distinct view, were occupied by the inhabitants of the country.

Thousands, both within and without Boston, were anxious spectators of the bloody scene. The honour of British troops beat high in the breasts of many, while others, with a keener sensibility, felt for the liberties of a great and growing country. The British moved on but slowly, which gave the provincials a better opportunity for taking aim. The latter, in general, reserved themselves till their adversaries were within ten or twelve rods, but then began a furious discharge of small arms. The stream of the American fire was so incessant, and did so great execution, that the king's troops retreated in disorder and precipitation. Their officers rallied them, and pushed them forward with their swords, but they returned to the attack with great reluctance. The Americans again reserved their fire till their adversaries were near, and then put them a second time to flight. General Howe and the officers redoubled their exertions, and were at last successful, though the soldiers discovered a great aversion to going on. By this time the powder of the Americans began to fail. The British also brought some cannon to bear, which raked the inside of the breastwork from end to end. The fire from the ships, batteries, and field artillery, was redoubled. The redoubt was attacked on three sides at once. Under these circumstances a retreat from it was ordered, but the provincials delayed, and made resistance with their discharged muskets as if they had been clubs, so long that the king's troops, who easily mounted the works, had half filled the redoubt before it was given up to them.

While these operations were going on at the breastwork and redoubt, the British light infantry were attempting to force the left point of the former, that they might take the American line in flank. Though they exhibited the most undaunted courage, they met with an opposition which called for its greatest exertions. The provincials here, in like manner, reserved their fire till their adversaries were near, and then poured it upon the light infantry, in so true a direction, as mowed down their ranks.

5 U

The

The engagement was kept up on both sides with great resolution. The persevering exertions of the king's troops could not compel the Americans to retreat, till they observed that their main body had left the hill. This, when begun, exposed them to new danger, for it could not be effected but by marching over Charlestown Neck, every part of which was raked by the shot of the Glasgow man of war, and two floating batteries. The incessant fire kept up across this neck prevented any considerable reinforcement from joining their countrymen who were engaged; but the few who fell on their retreat over the same ground proved, that the apprehensions of those provincial officers, who declined passing over to succour their companions, were without any solid foundation.

The number of Americans engaged amounted only to 1500. It was apprehended that the conquerors would push the advantages they had gained, and march immediately to American head quarters at Cambridge, but they advanced no farther than Bunker's Hill; there they threw up works for their own security. The provincials did the same on Prospect Hill in front of them. Both were guarding against an attack, and both were in a bad condition to receive one. The loss of the peninsula depressed the spirits of the Americans, and their great loss of men produced the same effect on the British. There have been few battles in modern wars, in which, all circumstances considered, there was a greater destruction of men than in this short engagement. The loss of the British, as acknowledged by general Gage, amounted to 1054. Nineteen commissioned officers were killed, and seventy more were wounded. The battle of Quebec in 1759, which gave Great Britain the province of Canada, was not so destructive to British officers as this affair of a slight entrenchment, the work only of a few hours. That the officers suffered so much, must be imputed to their being aimed at. None of the provincials in this engagement were riflemen, but they were all good marksmen. The whole of their previous military knowledge had been derived from hunting, and the ordinary amusements of sportsmen. The dexterity which by long habit they had acquired in hitting beasts, birds, and marks, was fatally applied to the destruction of British officers. From their fall much confusion was expected; they were therefore particularly singled out. Most of those who were near the person of general Howe were either killed or wounded, but the general, though he greatly exposed himself, was unhurt. The light infantry and grenadiers lost three-fourths of their men. Of one company not more than five, and of another not more than fourteen, escaped. The unexpected resistance of the Americans was such as wiped away the reproaches of cowardice, which had been cast on them by their enemies in Britain. The spirited conduct of the British officers merited and obtained great applause, but the provincials were justly entitled to a large portion of the same, for having made the utmost exertions of their adversaries necessary to dislodge them from lines, which were the work only of a single night. The Americans lost five pieces of cannon. Their killed amounted to 139. The wounded and missing to 314. Thirty of the former fell into the hands of the conquerors. They particularly regretted the death of general Warren.

This action at Breed's Hill, or Bunker's Hill, as it has been commonly called, produced many and very important consequences. The same determined spirit of resistance now every where appeared on the part of the Americans. The commencement of hostilities at Lexington determined the colony of New York, which had hitherto continued to waver, to unite with the rest; and, as the situation of New York renders it unable to resist an attack from the sea, it was resolved, before the arrival of a British fleet, to secure the military stores, send off the women and children, and to set fire to the city if it was still found incapable of defence. The exportation of provisions was every where prohibited, particularly to the British fishery on the banks of Newfoundland, or to such colonies of America as should

adhere to the British interest. Congress resolved on the establishment of an army, and of a large paper currency in order to support it. In the inland northern colonies, colonels Easton and Ethan Allen, without receiving any orders from congress, or communicating their design to any body, with a party of only 250 men, surprised the forts of Crown Point, Ticonderago, and the rest that form a communication betwixt the colonies and Canada. On this occasion 200 pieces of cannon fell into their hands, besides mortars and a large quantity of military stores, together with two armed vessels, and materials for the construction of others.

After the battle of Bunker's Hill, the provincials erected fortifications on the heights which commanded Charlestown, and strengthened the rest in such a manner that there was no hope of driving them from thence; at the same time that their activity and boldness astonished their adversaries, who had been accustomed to entertain too mean an opinion of their courage.

The British troops, thus shut up in Boston, were soon reduced to distress. Their necessities obliged them to attempt the carrying off the American cattle on the islands before Boston, which produced frequent skirmishes; but the provincials, better acquainted with the navigation of these shores, landed on the islands, destroyed or carried off whatever was of any use, burned the light house at the entrance of the harbour, and took prisoners the workmen sent to repair it, as well as a party of marines who guarded them. Thus the garrison was reduced to the necessity of sending out armed vessels to make prizes indiscriminately of all that came in their way, and of landing in different places to plunder for subsistence as well as they could.

The congress in the mean time continued to act with all the vigour which its constituents had expected. Articles of confederation and perpetual union were drawn up and solemnly agreed upon; and they proceeded formally to justify their conduct, in a declaration drawn up in terms remarkably expressive, and well calculated to excite attention.

"Were it possible," said they, "for men who exercise their reason, to believe that the divine Author of our existence intended a part of the human race to hold an absolute property in and unbounded power over others, marked out by His infinite goodness and wisdom as the objects of a legal domination, never rightfully resistable, however severe and oppressive; the inhabitants of these colonies might at least require from the parliament of Great Britain some evidence that this dreadful authority over them had been granted to that body: but a reverence for our Great Creator, principles of humanity, and the dictates of common sense, must convince all those who reflect upon the subject, that government was instituted to promote the welfare of mankind, and ought to be administered for the attainment of that end.

"The legislature of Great Britain, however, stimulated by an inordinate passion for power, not only unjustifiable; but which they know to be peculiarly reprobated by the very constitution of that kingdom; and despairing of success in any mode of contest where regard should be had to law, truth, or right; have at length, deserting those, attempted to effect their cruel and impolitic purpose of enslaving these colonies by violence, and have thereby rendered it necessary for us to close with their last appeal from reason to arms. Yet, however blinded that assembly may be, by their intemperate rage for unlimited domination, so to slight justice in the opinion of mankind, we esteem ourselves bound by obligations to the rest of the world to make known the justice of our cause."

After taking notice of the manner in which their ancestors left Britain, the happiness attending the mutual friendly commerce betwixt that country and her colonies, and the remarkable success of the late war, they proceed as follows: "The new ministry finding the brave foes of Britain, though frequently defeated, yet still contending, took up the unfortunate idea of granting them a hasty peace, and of then subduing her faithful friends.

"These

"These devoted colonies were judged to be in such a state as to present victories without bloodshed, and all the easy emoluments of statutable plunder. The uninterrupted tenor of their peaceable and respectful behaviour from the beginning of their colonization; their dutiful, zealous, and useful, services during the war, though so recently and amply acknowledged in the most honourable manner by his majesty, by the late king, and by parliament, could not save them from the intended innovations. Parliament was influenced to adopt the pernicious project; and, assuming a new power over them, has in the course of eleven years given such decisive specimens of the spirit and consequences attending this power, as to leave no doubt of the effects of acquiescence under it.

"They have undertaken to give and grant our money without our consent, though we have ever exercised an exclusive right to dispose of our own property. Statutes have been passed for extending the jurisdiction of the courts of admiralty, and vice-admiralty, beyond their ancient limits; for depriving us of the accustomed and inestimable rights of trial by jury, in cases affecting both life and property; for suspending the legislature of one of our colonies; for interdicting all commerce to the capital of another; and for altering fundamentally the form of government established by charter, and secured by acts of its own legislature; and solemnly confirmed by the crown; for exempting the murderers of colonists from legal trial, and in effect from punishment; for erecting in a neighbouring province, acquired by the joint arms of Great Britain and America, a despotism dangerous to our very existence; and for quartering soldiers upon the colonists in time of a profound peace. It has also been resolved in parliament, that colonists charged with committing certain offences shall be transported to England to be tried.

"But why should we enumerate our injuries in detail? By one statute it was declared, that parliament can of right make laws to bind us in all cases whatever. What is to defend us against so enormous, so unlimited, a power? Not a single person who assumes it is chosen by us, or is subject to our controul or influence; but, on the contrary, they are all of them exempt from the operation of such laws; and the American revenue, if not diverted from the ostensible purposes for which it is raised, would actually lighten their own burdens in proportion as it increases ours.

"We saw the misery to which such despotism would reduce us. We for ten years incessantly and ineffectually besieged the throne as supplicants; we reasoned, we remonstrated with parliament in the most mild and decent language; but administration, sensible that we should regard these measures as freemen ought to do, sent over fleets and armies to enforce them.

"We have pursued every temperate, every respectful, measure; we have even proceeded to break off all commercial intercourse with our fellow-subjects as our last peaceable admonition, that our attachment to no nation on earth would supplant our attachment to liberty: this we flattered ourselves was the ultimate step of the controversy; but subsequent events have shewn how vain was this hope of finding moderation in our enemies!

"The lords and commons, in their address in the month of February, said, that a rebellion at that time actually existed in the province of Massachusetts Bay; and that those concerned in it had been countenanced and encouraged by unlawful combinations and engagements entered into by his majesty's subjects in several of the colonies; and therefore they besought his majesty that he would take the most effectual measures to enforce due obedience to the laws and authority of the supreme legislature. Soon after the commercial intercourse of whole colonies with foreign countries was cut off by an act of parliament; by another, several of them were entirely prohibited from the fisheries in the seas near their coasts, on which they always depended for their subsistence; and large reinforcements of ships and troops were immediately sent over to general Gage.

"Fruitless were all the intreaties, arguments, and elo-

quence, of an illustrious band of the most distinguished peers and commoners, who nobly and strenuously asserted the justice of our cause, to stay, or even to mitigate, the heedless fury with which these accumulated outrages were hurried on. Equally fruitless was the interference of the city of London, of Bristol, and of many other respectable towns, in our favour."

After having reproached parliament, general Gage, and the British government in general, they proceeded thus: "We are reduced to the alternative of choosing an unconditional submission to tyranny or resistance by force. The latter is our choice. We have counted the cost of this contest, and find nothing so dreadful as voluntary slavery. Honour, justice, and humanity, forbid us tamely to surrender that freedom which we received from our gallant ancestors, and which our innocent posterity have a right to receive from us. Our cause is just; our union is perfect; our internal resources are great; and, if necessary, foreign assistance is undoubtedly attainable. We fight not for glory or conquest; we exhibit to mankind the remarkable spectacle of people attacked by unprovoked enemies. They boast of their privileges and civilization, and yet proffer no milder conditions than servitude or death. In our own native land, in defence of the freedom that is our birthright, for the protection of our property acquired by the honest industry of our forefathers and our own, against violence actually offered, we have taken up arms; we shall lay them down when hostilities shall cease on the part of our aggressors, and all danger of their being renewed shall be removed,—and not before."

These are some of the most striking passages in the declaration of congress on taking up arms against Great Britain, dated July 6, 1775. Without enquiring whether the principles on which it is founded are right or wrong, the determined spirit which it shews ought to have convinced us, that the conquest of America was an event scarcely ever to be expected. In every other respect an equal spirit was shewn; and the rulers of the British nation had the mortification to see those whom they styled *rebels* and *traitors* succeed in negotiations in which they themselves were utterly foiled. In the passing of the Quebec-bill, ministry had flattered themselves that the Canadians would be so much attached to them on account of restoring the French laws, that they would very readily join in any attempt against the colonists who had reprobated that bill in such strong terms: but in this they found themselves mistaken. A scheme had been formed for general Carleton, governor of the province, to raise an army of Canadians wherewith to act against the Americans; and, so sanguine were the hopes of administration in this respect; that they had sent 20,000 stand of arms, and a great quantity of military stores, to Quebec for the purpose. But the people, though they did not join the Americans, yet were found immovable in their purpose to stand neuter. The British administration next tried to engage the Indians in their cause. But, though agents were dispersed among them with large presents to the chiefs, the greatest part replied, that they did not understand the nature of the quarrel, nor could they distinguish whether those who dwelt in America or on the other side of the ocean were in fault: but they were surprised to see Englishmen ask their assistance against one another; and advised them to be reconciled, and not to think of shedding the blood of their brethren. To the representations of congress they paid more respect. These set forth, that the English on the other side of the ocean had taken up arms to enslave not only their countrymen in America, but the Indians also; and, if the latter should enable them to overcome the colonists, they themselves would soon be reduced to a state of slavery also. By arguments of this kind most of the savages were engaged to remain neuter; and thus the colonists were freed from a dangerous enemy. On this occasion the congress thought proper to hold a solemn conference with the different tribes of Indians. The speech made by them on the occasion is curious, but too long to

be fully inserted. The following is a specimen of the European mode of addressing these people:

"Brothers, Sachems, and Warriors!

"We, the delegates from the Twelve United Provinces, now sitting in general congress at Philadelphia, send their talk to you our brothers.

"Brothers and Friends, now attend!

"When our fathers crossed the great water, and came over to this land, the king of England gave them a talk, assuring them that they and their children should be his children; and that if they would leave their native country, and make settlements, and live here, and buy and sell, and trade with their brethren beyond the water, they should still keep hold of the same covenant-chain, and enjoy peace; and it was covenanted, that the fields, houses, goods, and possessions, which our fathers should acquire, should remain to them as their own, and be their children's for ever, and at their sole disposal.

"Brothers and Friends, open a kind ear!

"We will now tell you of the quarrel betwixt the counsellors of king George and the inhabitants and colonies of America.

"Many of his counsellors have persuaded him to break the covenant-chain, and not to send us any more good talks. They have prevailed upon him to enter into a covenant against us; and have torn asunder, and cast behind their back, the good old covenant which their ancestors and ours entered into, and took strong hold of. They now tell us they will put their hands into our pocket without asking, as though it were their own; and at their pleasure they will take from us our charters, or written civil constitution, which we love as our lives; also our plantations, our houses, and goods, whenever they please, without asking our leave. They tell us, that our vessels may go to that or this island in the sea, but to this or that particular island we shall not trade any more; and, in case of our non-compliance with these new orders, they shut up our harbours.

"Brothers, we live on the same ground with you; the same island is our common birth-place. We desire to sit down under the same tree of peace with you; let us water its roots, and cherish the growth, till the large leaves and flourishing branches shall extend to the setting sun, and reach the skies. If any thing disagreeable should ever fall out between us, the Twelve United Colonies, and you, the Six Nations, to wound our peace, let us immediately seek measures for healing the breach. From the present situation of our affairs, we judge it expedient to kindle up a small fire at Albany, where we may hear each other's voice, and disclose our minds fully to one another."

The other remarkable transactions of this congress were the ultimate refusal of the conciliatory proposal made by Lord North, of which such sanguine expectations had been formed by the English ministry; and appointing a generalissimo to command their armies, which were now very numerous. The person chosen for this purpose was Geo. Washington: a man so universally beloved, that he was raised to such an high station by the unanimous voice of congress: and his subsequent conduct shewed him every way worthy of it. Horatio Gates and Charles Lee, two English officers of considerable reputation, were also chosen; the former an adjutant-general, the second a major-general. Artemus Ward, Philip Schuyler, and Israel Putnam, were likewise nominated major-generals. Seth Pomeroy, Richard Montgomery, David Wooster, William Heath, Joseph Spencer, John Thomas, John Sullivan, and Nathaniel Green, were chosen brigadier-generals at the same time.

The success which had hitherto attended the Americans in all their measures, now emboldened them to think not only of defending themselves, but likewise of acting offensively against Great Britain. The conquest of Canada appeared an object within their reach, and one that would be attended with many advantages; and, as an invasion of that province was already facilitated by the taking of

Crown Point and Ticonderago, it was resolved if possible to penetrate that way into Canada, and reduce Quebec during the winter, before the fleets and armies, which they were well assured would sail thither from Britain, should arrive. By order of congress, therefore, 3000 men were put under the command of generals Montgomery and Schuyler, with orders to proceed to lake Champlain, from whence they were to be conveyed in flat-bottomed boats to the mouth of the river Sorel, a branch of the great river St. Lawrence, and on which is situated a fort of the same name with the river. On the other hand, they were opposed by general Carleton, governor of Canada; an officer of great activity and experience in war; who, with a very few troops, had hitherto been able to keep in awe the disaffected people of Canada, notwithstanding all the representations of the colonists. He had now augmented his army by a considerable number of Indians, and promised even in his present situation to make a formidable resistance.

As soon as general Montgomery arrived at Crown Point, he received information that several armed vessels were stationed at St. John's, a strong fort on the Sorel, with a view to prevent his crossing the lake; on which he took possession of an island that commands the mouth of the Sorel, and by which he could prevent them from entering the lake. In conjunction with general Schuyler, he next proceeded to St. John's: but, finding that place too strong, he landed on a part of the country considerably distant, and full of woods and swamps. From thence, however, they were driven by a party of Indians whom general Carleton had employed.

The provincial army was now obliged to retreat to the island of which they at first took possession; where general Schuyler being taken ill, Montgomery was left to command alone. His first step was to gain over the Indians whom general Carleton had employed, and this he in a great measure accomplished; after which he determined to lay siege to St. John's. In this he was facilitated by the reduction of Chamblee, a small fort in the neighbourhood, where he found a large supply of powder. An attempt was made by general Carleton to relieve the place; for which purpose he with great pains collected about 1000 Canadians, while Colonel Maclean proposed to raise a regiment of the Highlanders who had emigrated from their own country to America. But, while general Carleton was on his march with these new levies, he was attacked by a superior force of provincials, and utterly defeated; which being made known to another body of Canadians who had joined colonel Maclean, they abandoned him without striking a blow, and he was obliged to retreat to Quebec.

The defeat of general Carleton was a sufficient recompence to the Americans for that of colonel Ethan Allen, which had happened a little before. The success which had attended this gentleman against Crown Point and Ticonderago had emboldened him to make a similar attempt on Montreal; but, being attacked by the militia of the place, supported by a detachment of regulars, he was entirely defeated, and taken prisoner.

General Carleton's defeat, and the desertion of Maclean's forces, induced the garrison of St. John's to surrender themselves prisoners of war; and they were treated with great humanity. They were in number 500 regulars and 200 Canadians, among whom were many French nobles. General Montgomery next took measures to prevent the British shipping from passing down the river from Montreal to Quebec. This he accomplished so effectually, that the whole were taken. The town itself was obliged to surrender at discretion; and it was with the utmost difficulty that general Carleton escaped in an open boat by the favour of a dark night.

No obstacle now remained to prevent the Americans from making their way to the capital, except what arose from the nature of the country; and these were very considerable. Nothing, however, could damp the ardour of the provincials. Notwithstanding it was now the middle

of November, and the depth of winter was at hand, colonel Arnold formed a design of penetrating through woods, morasses, and the most frightful solitudes, from New England to Canada by a nearer way than that which Montgomery had chosen; and this he accomplished in spite of every difficulty, to the astonishment of all who saw or heard of the attempt. This desperate march, however, cannot be looked upon as conducive to any good purpose. A third part of his men under another colonel had abandoned him by the way, under pretence of want of provisions; the total want of artillery rendered his presence insignificant before a place strongly fortified; and the smallness of his army rendered it even doubtful whether he could have taken the town by surprise. The Canadians indeed were amazed at the exploit, and their inclination to revolt from Britain was somewhat augmented; but none of them as yet took up arms in behalf of America. The consternation into which the town of Quebec was thrown, proved detrimental rather than otherwise to the expedition; as it doubled the vigilance and activity of the inhabitants to prevent any surprise; and the appearance of common danger united all parties, who, before the arrival of Arnold, were contending most violently with one another. He was therefore obliged to content himself with blocking up the avenues to the town, in order to distress the garrison for want of provisions; and even this he was unable to do effectually, by reason of the small number of his men. The matter was not much mended by the arrival of general Montgomery. The force he had with him, even when united to that of Arnold, was too insignificant to attempt the reduction of a place so strongly fortified, especially with the assistance only of a few mortars and field-pieces. After the siege had continued through the month of December, general Montgomery, conscious that he could accomplish his end no other way than by surprise, resolved to make an attempt on the last day of the year 1775. The method he took at this time was perhaps the best that human wisdom could devise. He advanced by break of day, in the midst of an heavy fall of snow, which covered his men from the sight of the enemy. Two real attacks were made by himself and colonel Arnold, at the same time that two feigned attacks were made on two other places, thus to distract the garrison, and make them divide their forces. One of the real attacks was made by the people of New York, and the other by those of New England under Arnold. Their hopes of surprising the place, however, were defeated by the signal for the attack being through some mistake given too soon. General Montgomery himself had the most dangerous place, being obliged to pass between the river and some high rocks on which the Upper Town stands; so that he was forced to make what haste he could to close with the enemy. His fate, however, was now decided. Having forced the first barrier, a violent discharge of musquetry and grape-shot from the second killed him, his principal officers, and the most of the party he commanded; on which those who remained immediately retreated. Colonel Arnold in the mean time made a desperate attack on the Lower Town, and carried one of the barriers after an obstinate resistance for an hour; but in the action he himself received a wound, which obliged him to withdraw. The attack, however, was continued by the officers whom he had left, and another barrier forced: but the garrison, now perceiving that nothing was to be feared except from that quarter, collected their whole force against it; and, after a desperate engagement of three hours, overpowered the provincials, and obliged them to surrender.

In this action the valour of the provincial troops could not be exceeded. Yet such a terrible disaster left no hope remaining of the accomplishment of their purpose, as Arnold could now scarcely number 800 effective men under his command. He did not, however, abandon the province, or even remove to a greater distance than three miles from Quebec; and here he still found means to annoy the garrison very considerably by intercepting their provisions.

VOL. I. No. 28.

The Canadians, notwithstanding the bad success of the American arms, still continued friendly; and thus he was enabled to sustain the hardships of a winter encampment in that most severe climate. The congress, far from passing any censure on him for his misfortune, created him a brigadier-general.

While hostilities were thus carried on with vigour in the north, the flame of contention was gradually extending itself in the south. Lord Dunmore, the governor of Virginia, was involved in disputes similar to those which had taken place in other colonies. These had proceeded so far, that the assembly was dissolved; which in this province was attended with a consequence unknown to the rest. As Virginia contained a great number of slaves, it was necessary that a militia should be constantly embodied to keep them in awe. During the dissolution of the assembly the militia-laws expired; and the people, after complaining of the danger they were in from the negroes, formed a convention, which enacted that each county should raise a quota for the defence of the province. Dunmore, on this, removed the powder from Williamsburg; which created such discontents, that an immediate quarrel would probably have ensued, had not the merchants of the town undertaken to obtain satisfaction for the injury supposed to be done to the community. This tranquillity, however, was soon interrupted; the people, alarmed by a report that an armed party were on their way from the man of war where the powder had been deposited, assembled in arms, and determined to oppose by force any farther removals. In some of the conferences which passed at this time, the governor let fall some unguarded expressions, such as threatening them with setting up the royal standard, proclaiming liberty to the negroes, destroying the town of Williamsburg, &c. which were afterwards made public, and exaggerated in such a manner as greatly to increase the public ferment.

In this state of confusion the governor thought it necessary to fortify his palace with artillery, and procure a party of marines to guard it. Lord North's conciliatory proposal arriving also about the same time, he used his utmost endeavours to cause the people to comply with it. The arguments he used were such as must do him honour; and, had not matters already gone to such a pitch of distraction, it is highly probable that some attention would have been paid to them. "The view (he said) in which the colonies ought to behold this conciliatory proposal, was no more than an earnest admonition from Great Britain to relieve her wants: that the utmost condescendence had been used in the mode of application; no determinate sum having been fixed, as it was thought most worthy of British generosity to take what they thought could be conveniently spared, and likewise to leave the mode of raising it to themselves, &c." But the clamour and dissatisfaction were now so universal, that nothing else could be attended to. The governor had called an assembly for the purpose of laying this conciliatory proposal before them; but it had been little attended to. The assembly began their session by enquiries into the state of the magazine. It had been broken into by some of the townsmen; for which reason spring-guns had been placed there by the governor, which discharged themselves upon the offenders at their entrance: these circumstances, with others of a similar kind, raised such a violent uproar, that, as soon as the preliminary business of the session was over, the governor retired on-board a man of war, informing the assembly that he durst no longer trust himself on shore. This produced a long course of disputation, which ended in a positive refusal of the governor to trust himself again in Williamsburg, even to give his assent to the bills, which could not be passed without it, and though the assembly offered to bind themselves for his personal safety. In his turn he requested them to meet him on-board the man of war where he then was; but this proposal was rejected, and all further correspondence containing the least appearance of friendship was discontinued.

5X

Lord

Lord Dunmore, thus deprived of his government, attempted to reduce by force those whom he could no longer govern. Some of the most strenuous adherents to the British cause, whom their zeal had rendered obnoxious at home, now repaired to him. He was also joined by numbers of black slaves. With these, and the assistance of the British shipping, he was for some time enabled to carry on a kind of predatory war, sufficient to hurt and exasperate, but not to subdue. After some inconsiderable attempts on land, proclaiming liberty to the slaves, and setting up the royal standard, he took up his residence at Norfolk, a maritime town of some consequence, where the people were better affected to Britain than in most other places. A considerable force, however, was collected against him; and the natural impetuosity of his temper prompting him to act against them with more courage than caution, he was entirely defeated, and obliged to retire to his shipping, which was now crowded by the number of those who had incurred the resentment of the provincials.

In the mean time a scheme of the utmost magnitude and importance was formed by one Mr. Conolly, a Pennsylvanian, of an intrepid and aspiring disposition, and attached to the cause of Britain. The first step of this plan was to enter into a league with the Ohio Indians. This he communicated to lord Dunmore, and it received his approbation: upon which Conolly set out, and actually succeeded in his design. On his return, he was dispatched to general Gage, from whom he received a colonel's commission, and set out in order to accomplish the remainder of his scheme. The plan in general was, that he should return to the Ohio, where, by the assistance of the British and Indians in these parts, he was to penetrate through the back settlements into Virginia, and join lord Dunmore at Alexandria: but, by an accident very naturally to be expected, he was discovered, taken prisoner, and thrown into a dungeon.

After the retreat of lord Dunmore from Norfolk, that place was taken possession of by the provincials, who treated the loyalists that had remained there with great cruelty; at the same time that they greatly distressed those on-board lord Dunmore's fleet, by refusing to supply them with any necessities. Nor was this all: the vicinity of the shipping was so great, as to afford the riflemen an opportunity of aiming at the people on-board, and exercising the cruel occupation of killing them, in which they did not fail every day to employ themselves. These proceedings at last drew a remonstrance from his lordship; in which he insisted, that the fleet should be furnished with necessities, and that the soldiers should desist from the cruel diversion above-mentioned; but, both these requests being denied, a resolution was taken to set fire to the town. After giving the inhabitants a proper warning, a party landed, under cover of a man of war, and set fire to that part which lay nearest the shore; but the flames were observed, at the same time, to break forth in every other quarter, and the whole town was reduced to ashes. This universal destruction, by which a loss of more than 300,000*l.* was incurred, is said to have been occasioned by order of the congress itself, that the loyalists might find no refuge there for the future.

In the southern colonies of Carolina, the governors were expelled, and obliged to take refuge on-board the men of war, as lord Dunmore had been: among others, Mr. Martin, governor of North Carolina, was expelled, on a charge of attempting to raise the back-settlers, consisting chiefly of Scots Highlanders, against the colony. Having secured themselves against any attempts from these enemies, they proceeded to regulate their internal concerns in the same manner as the rest of the colonies; and, by the end of the year 1775, Britain beheld the whole of America united against her in the most determined opposition. Her vast possessions of that tract of land, since known by the name of the *Thirteen United States*, were now reduced to the single town of Boston; in which her forces were besieged by an enemy with whom they were apparently

not able to cope, and by whom they must of course expect in a very short time to be expelled. The situation of the inhabitants of Boston, indeed, was peculiarly unhappy. After having failed in their attempts to leave the town, general Gage had consented to allow them to retire with their effects; but afterwards, for what reason does not well appear, he refused to fulfil his promise. When he resigned his place to general Howe, in October 1775, the latter, apprehensive that they might give intelligence of the situation of the British troops, strictly prohibited every person from leaving the place, under pain of military execution. Thus matters continued till the month of March, 1776, when the town was evacuated.

On the second of that month, general Washington opened a battery on the west side of the town, from whence it was bombarded with a heavy fire of cannon at the same time; and three days after, it was attacked by another battery from the eastern shore. This terrible attack continued for fourteen days without intermission; when general Howe, finding the place no longer tenable, determined if possible to drive the enemy from their works. Preparations were therefore made for a most vigorous attack on a hill called Dorchester Neck, which the Americans had fortified in such a manner as would in all probability have rendered the enterprise next to desperate. No difficulties, however, were sufficient to daunt the spirit of the general; and every thing was in readiness, when a sudden storm prevented this intended exertion of British valour. Next day, upon a more close inspection of the works they were to attack, it was thought advisable to desist from the enterprise altogether. The fortifications were very strong, and extremely well provided with artillery; and, besides other implements of destruction, upwards of 100 hogheads of stones were provided to roll down upon the enemy as they came up; which, as the ascent was extremely steep, must have done prodigious execution.

Nothing, therefore, now remained, but to think of a retreat; and even this was attended with the utmost difficulty and danger. The Americans, knowing that it was in the power of the British general to reduce the town to ashes, which could not have been repaired in many years, did not think proper to give the least molestation; and, for the space of a fortnight, the troops were employed in the evacuation of the place, from whence they carried along with them 2000 of the inhabitants, who durst not stay on account of their attachment to the British cause. From Boston they sailed to Halifax; but all their vigilance could not prevent a number of valuable ships from falling into the hands of the enemy. A considerable quantity of cannon and ammunition had also been left at Bunker's Hill and Boston Neck; and, in the town, an immense variety of goods, principally woollen and linen, of which the provincials stood very much in need. The estates of those who fled to Halifax were confiscated; as also those who were attached to government, and had remained in the town. As an attack was expected as soon as the British forces should arrive, every method was employed to render the fortifications, already very strong, impregnable. For this purpose some foreign engineers were employed, who had before arrived at Boston; and so eager were people of all ranks to accomplish this business, that every able-bodied man in the place, without distinction of rank, set apart two days in the week, to complete it the sooner.

The Americans, exasperated to the utmost by the proceedings of parliament, now formally renounced all connection with Britain, and declared themselves independent. This celebrated declaration was published on the fourth of July, 1776. Previous to this, a circular letter had been sent through each colony, stating the reasons for it; and such was the animosity now every where prevailing against Great Britain, that it met with universal approbation, except in the province of Maryland alone. It was not long, however, before the people of that colony, finding themselves left in a very dangerous minority, thought proper to accede to the measures of the rest. The manifesto it-

self was much in the usual style, stating a long list of grievances, for which redress had been often applied in vain; and, for these reasons, they determined on a final separation; to hold the people of Britain, as the rest of mankind, "enemies in war, in peace friends."

After thus publicly throwing off all allegiance and hope of reconciliation, the colonists soon found that an exertion of all their strength was required in order to support their pretensions. Their arms, indeed, had not, during this season, been attended with success in Canada. Reinforcements had been promised to general Arnold, who still continued the blockade of Quebec; but they did not arrive in time to second his operations. Being sensible, however, that he must either desist from the enterprise, or finish it successfully, he recommenced in form; attempting to burn the shipping, and even to storm the town itself. They were unsuccessful, however; by reason of the smallness of their number, though they succeeded so far as to burn a number of houses in the suburbs; and the garrison were obliged to pull down the remainder, in order to prevent the fire from spreading.

As the provincials, though unable to reduce the town, kept the garrison in continual alarms, and in a very disagreeable situation, some of the nobility collected themselves into a body, under the command of one Mr. Beaujeu, in order to relieve their capital; but they were met on their march by the provincials, and so entirely defeated, that they were never afterwards able to attempt any thing. The Americans, however, had but little reason to plume themselves on this success. Their want of artillery at last convinced them, that it was impracticable in their situation to reduce a place so strongly fortified; the small-pox at the same time made its appearance in their camp, and carried off great numbers; intimidating the rest to such a degree, that they deserted in crowds. To add to their misfortunes, the British reinforcements unexpectedly appeared, and the ships made their way through the ice with such celerity, that the one part of their army was separated from the other; and general Carleton, sailing out as soon as the reinforcement was landed, obliged them to fly with the utmost precipitation, leaving behind them all their cannon and military stores; at the same time that their shipping was entirely captured by vessels sent up the river for that purpose. General Carleton now gave a signal instance of his humanity: being well apprised that many of the provincials had not been able to accompany the rest in their retreat, and that they were concealed in woods, &c. in a very deplorable situation, he generously issued a proclamation, ordering proper persons to seek them out, and give them relief at the public expence; at the same time, lest, through fear of being made prisoners, they should refuse these offers of humanity, he promised, that, as soon as their situation enabled them, they should be at liberty to depart to their respective homes.

The British general, now freed from any danger of an attack, was soon enabled to act offensively against the provincials, by the arrival of the forces destined for that purpose from Britain. By these, he was put at the head of 12,000 regular troops, among whom were those of Brunswick. With this force he instantly set out to the Three Rivers, where he expected that Arnold would have made a stand; but he had fled to Sorel, a place 150 miles distant from Quebec, where he was at last met by the reinforcements ordered by congress. Here, though the preceding events were by no means calculated to inspire much military ardour, a very daring enterprise was undertaken; and this was, to surprise the British troops posted under generals Frazer and Nesbit; of whom the former commanded those on land, the latter such as were on-board the transports, and were but a little way distant. The enterprise was very hazardous, both on account of the strength of the parties against whom they were to act, and as the main body of the British forces were advanced within fifty miles of the place; besides that, a number of small vessels and transports with troops lay between them and the

Three Rivers. Two thousand chosen men, under general Thomson, engaged in this enterprise. Their success was by no means answerable to their spirit and valour. Though they passed the shipping without being observed, general Frazer had notice of their landing; and, thus being prepared to receive them, they were soon thrown into disorder, at the same time that general Nesbit, having landed his forces, prepared to attack them in the rear. On this occasion some field-pieces did prodigious execution, and a retreat was found to be unavoidable. General Nesbit had got between them and their boats; so that they were obliged to take a circuit through a deep swamp, while they were vigorously pursued by both parties at the same time, who marched for some miles on each side of the swamp, till at last the miserable provincials were sheltered from further danger by a wood at the end of the swamp. General Thomson was taken, with 200 of his men.

By this disaster the provincials lost all hopes of accomplishing any thing in Canada. They demolished their works, and carried off their artillery with the utmost expedition. They were pursued by general Burgoyne; against whom it was expected that they would have collected all their force, and made a resolute stand. But they were for the present too much dispirited by misfortunes to make any further exertions of valour. On the 18th of June the British general arrived at Fort St. John's, which he found abandoned and burnt. Chamblee had shared the same fate, as well as all the vessels that were not capable of being dragged up against the current of the river. It was thought they would have made some resistance at Nut Island, the entrance to Lake Champlain; but this also they had abandoned, and retreated across the lake to Crown Point, whither they could not be immediately followed. Thus was the province of Canada entirely evacuated by the Americans; whose loss in their retreat from Quebec was not calculated at less than 1000 men, of whom 400 fell at once into the hands of the enemy at a place called the Cedars, about fifty miles above Montreal. General Sullivan, however, who conducted this retreat after the affair of general Thomson, was acknowledged to have had great merit in what he did, and received the thanks of the congress accordingly.

This bad success in the north was somewhat compensated by what happened in the southern colonies. We have formerly taken notice that Mr. Martin, governor of North Carolina, had been obliged to leave his province and take refuge on-board of a man of war. Notwithstanding this, he did not despair of reducing it again to obedience. For this purpose he applied to the Regulators, a daring set of banditti, who lived in a kind of independent state; and, though considered by government as rebels, yet had never been molested, on account of their numbers and known skill in the use of fire-arms. To the chiefs of these people commissions were sent, in order to raise some regiments; and colonel Macdonald, a brave and enterprising officer, was appointed to command them. In the month of February he erected the king's standard, issued proclamations, &c. and collected some forces, expecting to be soon joined by a body of regular troops, who were known to be shipped from Great Britain to act against the southern colonies. The Americans, sensible of their danger, dispatched immediately what forces they had to act against the royalists, at the same time that they diligently exerted themselves to support these with suitable reinforcements. Their present force was commanded by general Moore, whose numbers were inferior to Macdonald; for which reason the latter summoned him to join the king's standard, under pain of being treated as a rebel. But Moore, being well provided with cannon, and conscious that nothing could be attempted against him, returned the compliment, by acquainting colonel Macdonald, that if he and his party would lay down their arms, and subscribe an oath of fidelity to congress, they should be treated as friends; but, if they persisted in an undertaking for which it was evident they had not sufficient strength, they could not but expect

the severest treatment. In a few days, general Moore found himself at the head of 8000 men, by reason of the continual supplies which daily arrived from all parts. The royal party amounted only to 2000, and they were destitute of artillery, which prevented them from attacking the enemy while they had the advantage of numbers. They were now, therefore, obliged to have recourse to a desperate exertion of personal valour; by dint of which, they effected a retreat for eighty miles, to Moore's Creek, within sixteen miles of Wilmington. Could they have gained this place, they expected to have been joined by governor Martin and general Clinton, who had lately arrived with a considerable reinforcement. But Moore, with his army, pursued them so close, that they were obliged to attempt the passage of the creek itself, though a considerable body of the enemy, under the command of colonel Coswell, in fortifications well planted with cannon, was posted on the other side. On attempting the creek, it was found not to be fordable. They were obliged, therefore, to cross over a wooden bridge, which the provincials had not time to destroy entirely. They had, however, by pulling up part of the planks, and greasing the remainder in order to render them slippery, made the passage so difficult, that the royalists could not attempt it. In this situation they were, on the 27th of February, attacked by Moore, with his superior army, and totally defeated; with the loss of their general, and most of their leaders, as well as the best and bravest of their men.

Thus was the power of the provincials established in North Carolina. Nor were they less successful in the province of Virginia; where lord Dunmore, having long continued an useless predatory war, was at last driven from every creek and road in the province. The people he had on-board were distressed to the highest degree, by confinement in small vessels. The heat of the season, and the numbers crowded together, produced a pestilential fever, which made a great havoc, especially among the blacks. At last, finding themselves in the utmost hazard of perishing by famine as well as disease, they set fire to the least valuable of their vessels, reserving only about fifty for themselves, in which they bade adieu to Virginia, some sailing to Florida, some to Bermuda, and the rest to the West Indies.

In South Carolina, the provincials had a more formidable enemy to deal with. A squadron, whose object was the reduction of Charlestown, had been fitted out in December, 1775; but, by reason of unfavourable weather, did not reach Cape Fear, in North Carolina, till the month of May, 1776; and here it met with further obstacles till the end of the month. Thus the Americans, always noted for their alertness in raising fortifications, had time to strengthen those of Charlestown in such a manner as rendered it extremely difficult to be attacked. The British squadron consisted of two 50-gun ships, four of 30 guns, two of 20, an armed schooner, and bomb-ketch, under the command of Sir Peter Parker. The land-forces were commanded by lord Cornwallis, with generals Clinton and Vaughan. As they had yet no intelligence of the evacuation of Boston, general Howe dispatched a vessel to Cape Fear with some instructions; but it was too late; and, in the beginning of June, the squadron anchored off Charlestown-bar. Here they met with some difficulty in crossing, being obliged to take out the guns from the two large ships, which were, notwithstanding, several times in danger of sticking fast. The next obstacle was a strong fort on Sullivan's island, six miles east from Charlestown; which, though not completely finished, was very strong. The British generals resolved, without hesitation, to attack it; but, though an attack was easy from the sea, it was very difficult to obtain a co-operation with the land-forces. This was attempted, by landing them on Long Island, adjacent to Sullivan's Island on the east, from which it is separated by a very narrow creek, said not to be above two feet deep at low water. Opposite to this ford, the provincials had posted a strong body of troops,

with cannon and intrenchments; while general Lee was posted on the main land, with a bridge of boats betwixt that and Sullivan's Island, so that he could at pleasure send reinforcements to the troops in the fort on Sullivan's Island. On the part of the British, so many delays occurred, that it was the 28th of June before they were in readiness to make an attack; and, by this time, the provincials had abundantly provided for their reception. On the morning of that day, the bomb-ketch began to throw shells into fort Sullivan; and, about mid-day, the two 50-gun ships and 30-gun frigates came up and began a severe fire. Three other frigates were ordered to take their station between Charlestown and the fort, in order to enfilade the batteries, and cut off the communication with the main land; but, through the ignorance of the pilots, they all stuck fast; and, though two of them were disentangled, they were found to be totally unfit for service: the third was burnt, that she might not fall into the hands of the enemy. The attack was therefore confined to the five armed ships and bomb-ketch, between whom and the fort a dreadful fire ensued. The Bristol suffered excessively. The springs on her cable being shot away, she was entirely exposed to the enemy's fire. As the enemy poured in great quantities of red-hot balls, she was twice in flames. The captain, (Mr. Morris,) after receiving five wounds, was obliged to go below, in order to have his arm amputated. After undergoing this operation, he bravely returned to his place, where he received another wound, but still refused to quit his station; at last he received a red-hot ball in his belly, which instantly put an end to his life. Of all the officers and seamen who stood on the quarter-deck of this vessel, not one escaped without a wound, excepting Sir Peter Parker alone; whose intrepidity and presence of mind on this occasion was very remarkable. The engagement lasted till darkness put an end to it. Little damage was done by the British, as the works of the enemy lay so low, that most of the shot flew over; and the fortifications, being composed of palm-trees mixed with earth, were extremely well calculated to resist the impression of cannon. During the height of the attack, the provincial batteries remained for some time silent, so that it was concluded that they had been abandoned; but this was found to proceed only from want of powder; for, as soon as a supply of this article was obtained, the firing was resumed as briskly as ever. During the whole of this desperate engagement, it was impossible for the land-forces to give the least assistance to the fleet. The enemy's works were found to be much stronger than they had been imagined, and the depth of water effectually prevented them from making any attempt. In this unsuccessful attack, the killed and wounded, on the part of the British, amounted to about 200. The Bristol and Experiment were so much damaged, that it was thought they could not have been got over the bar; however, this was at last accomplished, by a very great exertion of naval skill, to the surprise of the provincials, who had expected to make them both prizes. On the American side the loss was very considerable; as most of their guns were dismounted; and reinforcements had poured into the fort during the whole time of the action.

This year also, the Americans, having so frequently made trial of their valour by land, became desirous of trying it by sea, and of forming a navy that might in some measure be able to protect their trade, and do essential hurt to the enemy. In the beginning of March, commodore Hopkins was dispatched with five frigates to the Bahama Islands, where he made himself master of the ordnance and military stores; but the gunpowder, which had been the principal object, was removed. On his return he captured several vessels; but was foiled in his attempt on the Glasgow frigate, which found means to escape, notwithstanding the efforts of his whole squadron.

The time was now come, when the fortitude and patience of the Americans were to undergo a severe trial. Hitherto they had been, on the whole, successful in their operations.

operations: but now they were doomed to experience misfortune, misery, and disgrace; the enemy over-running their country, and their own armies not able to face them in the field. The province of New York, as being the most central colony, and most accessible by sea, was pitched upon for the object of the main attack. The force sent against it consisted of six ships of the line, thirty frigates, besides other armed vessels, and a vast number of transports. The fleet was commanded by lord Howe, and the land-forces by his brother, general Howe, who was now at Halifax. The latter, however, a considerable time before his brother arrived, had set sail from Halifax, and lay before New York, but without attempting to commence hostilities until he should be joined by his brother. The Americans had fortified New York, and the adjacent islands, in an extraordinary manner. General Howe landed his troops on Staten Island, where he was soon joined by a number of the inhabitants. About the middle of July, lord Howe arrived with the grand armament; and, being one of the commissioners appointed to receive the submission of the colonists, he published a circular letter to this purpose, to the several governors who had lately been expelled from their provinces, desiring them to make the extent of his commission, and the powers he was invested with by parliament, as public as possible. Here, however, congress saved him trouble, by ordering his letter and declaration to be published in all the newspapers, that every one, as they said, might see the insidiousness of the British ministry, and that they had nothing to trust to besides the exertion of their own valour.

Lord Howe next sent a letter to general Washington; but, as it was directed "To George Washington, Esq." the general refused to receive it, as not being directed in the style suitable to his station. To obviate this objection, adjutant-general Paterson was sent with another letter, directed "To George Washington, &c. &c." But, though a very polite reception was given to the bearer, general Washington utterly refused the letter; nor could any explanation of the adjutant induce him to open it. The only interesting part of the conversation, of which lord Howe was one. The adjutant told him, that these powers were very extensive; that the commissioners were determined to exert themselves to the utmost, in order to bring about a reconciliation; and that he hoped the general would consider this visit as a step towards it. General Washington replied, that it did not appear that these powers consisted in any thing else than granting pardons; and, as America had committed no offence, she asked no forgiveness, and was only defending her unquestionable rights.

The decision of every thing being now by consent of both parties left to the sword, no time was lost, but hostilities commenced as soon as the British troops could be collected. This, however, was not done before the month of August; when they landed on Long Island, opposite to the shore of Staten Island. General Putnam, with a large body of troops, lay encamped and strongly fortified on a peninsula on the opposite shore, with a range of hills between the armies, the principal pass of which was near a place called *Flat-bush*. Here the centre of the British army, consisting of Hessians, took post; the left wing, under general Grant, lying near the shore; and the right, consisting of the greater part of the British forces, lay under lords Percy, Cornwallis, and general Clinton. Putnam had ordered the passes to be secured by large detachments, which was executed as to those at hand; but one of the greatest importance, which lay at a distance, was entirely neglected. This gave an opportunity to a large body of troops under lord Percy and Clinton to pass the mountains and attack the Americans in the rear, while they were engaged with the Hessians in front. Through this piece of negligence their defeat became inevitable. Those who were engaged with the Hessians first perceived their mistake, and began a retreat towards their camp; but the passage was intercepted by the British troops, who

drove them back into the woods. Here they were met by the Hessians; and thus were they for many hours slaughtered between two fires, no way of escape remaining but by breaking through the British troops, and thus regaining their camp. In this attempt many perished; and the right wing, engaged with general Grant, shared the same fate. The victory was complete; and the Americans lost on this fatal day (August 27th) between three and four thousand men, of whom 2000 were killed in the battle. Among these a regiment, consisting of young gentlemen of fortune and family in Maryland, was almost entirely cut in pieces, and of the survivors not one escaped without a wound. The ardour of the British troops was so great, that they could scarcely be restrained from attacking the lines of the provincials; but for this there was now no occasion, as it was certain they could not be defended. Of the British only sixty-one were killed in this engagement, and 257 wounded. Eleven hundred of the enemy, among whom were three generals, were taken prisoners. As none of the American commanders thought it proper to risk another attack, it was resolved to abandon their camp as soon as possible. Accordingly, on the night of the 29th of August, the whole of the continental troops were ferried over with the utmost secrecy and silence; so that in the morning the British had nothing to do but take possession of the camp and artillery which they had abandoned.

This victory, though complete, was very far from being so decisive as the conquerors imagined. Lord Howe, supposing that it would be sufficient to intimidate the congress into some terms, sent general Sullivan, who had been taken prisoner in the late action, to congress, with a message, importing, that though he could not consistently treat with them as a legal assembly, yet he would be very glad to confer with any of the members in their private capacity; setting forth at the same time the nature and extent of his powers as commissioner. But the congress was not as yet sufficiently humbled to derogate in the least from the dignity of character they had assumed. They replied, that the congress of the free and independent states of America could not consistently send any of its members in another capacity than that which they had publicly assumed; but, as they were extremely desirous of restoring peace to their country upon equitable conditions, they would appoint a committee of their body to wait upon him, and learn what proposals he had to make.

This produced a new conference. The committee appointed by congress was composed of Dr. Franklin, Mr. Adams, and Mr. Rutledge. They were very politely received by his lordship; but the conference proved as fruitless as before independency had been declared, and the final answer of the deputies was, that they were extremely willing to enter into any treaty with Great Britain that conduce to the good of both nations, but that they would not treat in any other character than that of independent states. This positive declaration instantly put an end to all hopes of reconciliation; and it was resolved to prosecute the war with the utmost vigour. Lord Howe, after publishing a manifesto, in which he declared the refusal of congress, and that he himself was willing to confer with all well-disposed persons about the means of restoring public tranquillity, set about the most proper methods for reducing the city of New York. Here the provincial troops were posted, and from a great number of batteries kept continually annoying the British shipping. The East River lay between them, of about 1200 yards in breadth, which the British troops were extremely desirous of passing. At last the ships having, after an incessant cannonade of several days, silenced the most troublesome batteries, a body of troops was sent up the river to a bay, about three miles distant, where the fortifications were less strong than in other places. Here having driven off the provincials by the cannon of the fleet, they marched directly towards the city; but the enemy, finding that they should now be attacked on all sides, abandoned the city, and retired to the

north of the island, where their principal force was collected. In their passage thither they skirmished with the British, but carefully avoided a general engagement; and it was observed that they did not behave with that ardour and impetuous valour which had hitherto marked their character.

The British and provincial armies were not now above two miles distant from each other: the former lay encamped from shore to shore for an extent of two miles, being the breadth of the island, which though fifteen miles long, exceeds not two in any part in breadth. The provincials, who lay directly opposite, had strengthened their camp with many fortifications; at the same time, being masters of all the passes and defiles between the two camps, they were enabled to defend themselves against an army much more numerous than their own; and they had also strongly fortified a pass called *King's Bridge*, whence they could secure a passage to the continent in case of any misfortune. Here general Washington, in order to inure the provincials to actual service, and at the same time to annoy the enemy as much as possible, employed his troops in continual skirmishes; by which it was observed that they soon recovered their spirits, and behaved with their usual boldness.

As the situation of the two armies was now highly inconvenient for the British generals, it was resolved to make such movements as might oblige general Washington to relinquish his strong situation. The possession of New York had been less beneficial than was expected. It had been concerted among the provincials, that the city should be burnt at the time of evacuation; but, as they were forced to depart with precipitation, they were prevented from putting the scheme in execution. In a few days, however, it was attempted by some who had been left behind for that purpose. Taking advantage of a high wind and dry weather, the town was set on fire in several places at once, by means of combustibles placed for that purpose; and, notwithstanding the most active exertions of the soldiery and sailors, a fourth part of the city was consumed.

On this occasion the British were irritated to the highest degree; and many persons, said to be incendiaries, were without mercy thrown into the flames. It was determined to force the provincial army to a greater distance, that they might have it less in their power, by any emissaries, to engage others in a similar attempt. For this purpose, general Howe having left lord Percy with sufficient force to garrison New York, he embarked his army in flat-bottom boats, by which they were conveyed through the dangerous passage called *Hull Gate*, and landed near the town of West Chester, lying on the continent towards Connecticut. Here having received a supply of men and provisions, they moved to New Rochelle, situated on the sound which separates Long Island from the continent. After this, receiving still fresh reinforcements, they made such movements as threatened to distress the provincials very much, by cutting off their convoys of provisions from Connecticut, and thus force them to an engagement. This, general Washington determined at all events to avoid. He therefore extended his forces into a long line opposite to the way in which the enemy marched, keeping the *Bruna*, a river of considerable magnitude, between the two armies, with the North River on his rear. Here again the provincials continued for some time to annoy and skirmish with the Royal army, until at last, by some other manoeuvres, the British general found means to attack them advantageously at a place called the *White Plains*, and drove them from some of their posts. The victory on this occasion was much less complete than the former; however, it obliged the provincials once more to shift their ground, and to retreat further up the country. General Howe pursued for some time; but, at last, finding all his endeavours vain to bring the Americans to a pitched battle, he determined to give over such an useless chase, and employ himself in reducing the forts which the provincials still retained in the neighbourhood of New York. In this he

met with the most complete success. The Americans, on the approach of the king's forces, retreated from King's Bridge into Fort Mifflin; and this, as well as Fort Mifflin, which lay in the neighbourhood, was quickly reduced, though the garrison made their escape. Thus the Jerseys were laid entirely open to the incursions of the British troops; and so fully were these provinces taken possession of by the royal army, that its winter quarters extended from New Brunswick to the river Delaware. Had any number of boats been at hand, it is probable that Philadelphia would now have fallen into their hands. All these, however, had been carefully removed by the Americans. In lieu of this enterprise, Sir Henry Clinton undertook an expedition to Rhode Island, and became master of it without losing a man. His expedition was also attended with this further advantage, that the American fleet under commodore Hopkins was obliged to sail as far as possible up the river Providence, and thus remained entirely useless.

The same ill success attended the Americans in other parts. After their expulsion from Canada, they had crossed the lake-Champlain, and taken up their quarters at Crown Point, as already mentioned. Here they remained for some time in safety, as the British had no vessels on the lake, and consequently general Burgoyne could not pursue them. To remedy this deficiency, there was no possible method, but either to construct vessels on the spot, or take to pieces some vessels already constructed, and drag them up the river into the lake. This was effected in no longer a space than three months; and the British general, after incredible toil and difficulty, saw himself in possession of a great number of vessels, by which means he was enabled to pursue his enemies, and attack them in his turn. The labour undergone at this time by the sea and land forces, must indeed have been prodigious; since there were conveyed over land, and dragged up the rapids of St. Lawrence, no fewer than 30 large long-boats, 400 bateaux, besides a vast number of flat-bottomed boats, and a gondola of thirty tons. The intent of the expedition was to push forward before winter to Albany, where the army would take up its winter quarters, and next spring effect a junction with that under general Howe, when it was supposed that the united force and skill of these two commanders would speedily put a termination to the war.

By reason of the difficulties with which the equipment of this fleet had been attended, it was the beginning of October before the expedition could be undertaken. It was now, however, by every judge, allowed to be completely able to answer the purpose for which it was intended. It consisted of one large vessel with three masts, carrying 18 twelve-pounders; two schooners, the one carrying 14, the other 12, six-pounders; a large flat-bottomed radeau with 6 twenty-four and 6 twelve pounders; and a gondola with 8 nine-pounders. Besides these were twenty vessels of a smaller size, called *gun-boats*, carrying each a piece of brass ordnance from nine to twenty-four pounders, or howitzers. Several long-boats were fitted out in the same manner; and, besides all these, there was a vast number of boats and tenders of various sizes, to be used as transports for the troops and baggage. It was manned by a number of select seamen, and the guns were to be served by a detachment from the corps of artillery; the officers and soldiers for this expedition were also chosen out of the whole army.

To oppose this formidable armament the Americans had only an inconsiderable force, commanded by general Arnold, who, after engaging part of the British fleet for a whole day, took advantage of the darkness of the night to set sail without being perceived, and next morning was out of sight; but he was so closely pursued by the British, that on the second day after he was overtaken, and forced to a second engagement. In this he behaved with great gallantry; but, his force being very inferior to that of the enemy, he was obliged to run his ships ashore and set them on fire; but a few escaped to Lake George. The garrison of Crown Point, having destroyed or carried off every thing of value, retired to Ticonderoga.

Thus,

Thus the affairs of the Americans seemed every where going to wreck: even those who had been most sanguine in their cause began to waver. The time, also, for which the soldiers had enlisted themselves, was now expired; and the bad success of the preceding campaign had been so very discouraging, that no person was willing to engage himself during the continuance of a war, of which the event seemed to be so doubtful. In consequence of this, general Washington found his army daily decreasing in strength; so that from 30,000, of whom it consisted when general Howe landed on Staten Island, scarcely a tenth part could now be mustered. To assist the chief commander as much as possible, general Lee had collected a body of forces in the north; but on his way southward, having imprudently taken up his lodging at some distance from his troops, information was given to colonel Harcourt, who happened at that time to be in the neighbourhood, and Lee was made prisoner. The loss of this general was much regretted, the more especially as he was of superior quality to any prisoner in the possession of the colonists. Six field-officers were offered in exchange for him, but refused; and the congress was highly irritated at its being reported that he was to be treated as a deserter, having been a half-pay officer in the British service at the commencement of the war. In consequence of this they issued a proclamation, threatening to retaliate on the prisoners in their possession whatever punishment should be inflicted on any of those taken by the British; and especially, that their conduct should be regulated by the treatment of general Lee.

In the mean time, they proceeded with the most indefatigable diligence to recruit their army, and bound their soldiers to serve for a term of three years, or during the continuance of the war. The army designed for the ensuing campaign, was to consist of eighty-eight battalions; of which, each province was to contribute its quota; and twenty dollars were offered as a bounty to each soldier, besides an allotment of lands at the end of the war. In this allotment it was stipulated, that each soldier should have 100 acres; an ensign, 150; a lieutenant, 200; a captain, 300; a major, 400; a lieutenant-colonel, 450; and a colonel, 500. No lands were promised to those who enlisted only for three years. All officers or soldiers disabled through wounds received in the service, were to enjoy half-pay during life. To defray the expence, congress borrowed five millions of dollars at five per cent. for payment of which the United States became surety. At the same time, in order to animate the people to vigorous exertions, a declaration was published, in which they set forth the necessity there was for taking proper methods to ensure success in their cause: they endeavoured to palliate, as much as possible, the misfortunes which had already happened; and represented the true cause of the present distress to be the short term of enlistment.

This declaration, together with the imminent danger of Philadelphia, determined the Americans to exert themselves to the utmost, in order to reinforce general Washington's army; and they soon received farther encouragement, by an exploit of that general against the Hessians. As the royal army extended in different cantonments for a considerable length, general Washington, perceiving the imminent danger to which Philadelphia was exposed, resolved to make some attempt on those divisions of the enemy which lay nearest that city. These happened to be the Hessians, who lay in three divisions. On the 25th of December, he set out with an intent to surprise that body of the enemy which lay at Trenton. His army was divided into three battalions, one of which he ordered to cross the Delaware at Trenton Ferry, a little below the town; the second at a distance below, at a place called Borden-town, where the second division of Hessians was placed; while he himself with the third, directing his course to a ferry some miles above Trenton, intended to have passed it at midnight, and attack the Hessians at break of day. But, by reason of various impediments, it was eight in the

morning before he could reach the place of his destination. The enemy did not perceive his approach till they were suddenly attacked. Colonel Ralle, who commanded them, did all that could be expected from a brave and experienced officer; but every thing was in such confusion, that no efforts of valour or skill could now avail them. The colonel himself was mortally wounded, his troops were entirely broken, their artillery seized, and about 1000 taken prisoners.

This action, though seemingly of no very decisive nature, was sufficient, at that time, to turn the fortune of war in favour of America. It tended greatly to lessen the fear which the provincials had of the Hessians, at the same time that it equally abated the confidence which the British had till now put in them. Reinforcements came in to general Washington's army from all quarters; so that he was soon in a condition to leave Philadelphia, and take up his quarters at Trenton. Emboldened by his success, he determined to make an attempt on a division of the British forces stationed at Maidenhead, a town situated half-way between Trenton and Prince-town. This consisted of three regiments, under the command of colonel Mawhood, an officer of great merit. The troops were surprised on their march; but, though they were separately surrounded and attacked by a force vastly superior, they charged the enemy so resolutely with their bayonets, that they effected a retreat. These attempts of the Americans, however, with the hostile disposition of the people, shewed the impossibility of maintaining posts so far advanced in the enemy's country; so that it was resolved to retreat towards Brunswick, in order to prevent it, with the troops and magazines it contained, from falling into the hands of the provincials. General Washington omitted no opportunity of recovering what had been lost; and, by dividing his army into small parties, which could be reunited on a few hours warning, he in a manner entirely covered the face of the country, and repossessed himself of all the important places.

Thus ended the campaign of 1776, with scarce any real advantage other than the acquisition of the city of New York, and of a few fortresses in its neighbourhood; where the troops were constrained to act with as much circumspection as if they had been besieged by a victorious army, instead of being themselves the conquerors.

The army at New York began, in 1777, to exercise a kind of predatory war, by sending out parties to destroy magazines, make incursions, and take or destroy such forts as lay on the banks of rivers, to which their great command of shipping gave them access. In this they were generally successful; the provincial magazines at Peek's Hill, a place about fifty miles distant from New York, were destroyed, the town of Dunbury, in Connecticut, burnt, and that of Ridgefield, in the same province, was taken possession of. In returning from the last expedition, the British were greatly harried by the enemy under generals Arnold, Wooster, and Sullivan; but they made good their retreat in spite of all opposition, with the loss of only 170 killed and wounded. On the American side the loss was much greater, general Wooster was killed, and Arnold in the most imminent danger. On the other hand, the Americans destroyed the stores at Sag Harbor, in Long Island, and made prisoners of all who defended the place. As this method of making war could answer but little purpose, and favoured more of the barbarous incursions of savages than of a war carried on by a civilized people, it was resolved to make an attempt on Philadelphia. At first it was thought that this could be done through the Jerseys; but general Washington had received such large reinforcements, and posted himself so strongly, that it was found to be impracticable. Many stratagems were used to draw him from this strong situation, but without success; so that it was found necessary to make the attempt on Philadelphia by sea. While the preparations for this expedition were going forward, the Americans found means to make amends for the capture of general Lee by that of general

general Prescott, who was seized in his quarters with his *aid-de-camp*, in much the same manner as general Lee had been. This was exceedingly mortifying to the general himself, as he had not long before set a price upon general Arnold, by offering a sum of money to any one that apprehended him; which the latter answered, by setting a lower price upon general Prescott.

The month of July was far advanced before the preparations for the expedition against Philadelphia were completed; and it was the 23^d before the fleet was able to sail from Sandy Hook. The force employed in this expedition consisted of thirty-six battalions of British and Hessians, a regiment of light horse, and a body of loyalists raised at New York. The remainder of these, with seventeen battalions, and another body of light horse, were stationed at New York, under Sir Henry Clinton. Seven battalions were stationed at Rhode Island. After a week's sailing, they arrived at the mouth of the Delaware; when they received certain intelligence, that the navigation of the river was so effectually obstructed, that no possibility of forcing a passage remained. Upon this, it was resolved to proceed farther southward, to Chesapeake Bay, in Maryland, from whence the distance to Philadelphia was not very great, and where the provincial army would find less advantage, from the nature of the country, than in the Jerseys. On the news of their arrival in Chesapeake, general Washington left the Jerseys, and hastened to the relief of Philadelphia; and, in the beginning of September, met the royal army at Brandy-wine Creek, about mid-day, between the head of the Elk and Philadelphia. Here he adhered to his former method of skirmishing and harassing the royal army on its march; but, as this proved insufficient to stop its progress, he retired to that side of the creek next to Philadelphia, with an intent to dispute the passage. This brought on a general engagement, on the 11th of September, in which the Americans were defeated; and it was only through the approach of night that they were saved from being entirely destroyed. On this occasion, the provincials lost about 1000 in killed and wounded, besides 400 taken prisoners.

The loss of this battle proved also the loss of Philadelphia. General Washington retired towards Lancaster, an inland town at a considerable distance. Here the British general took such measures as must have forced the provincials to a second engagement, but a violent rain, which lasted a day and a night, prevented his design. General Washington, though he could not prevent the loss of Philadelphia, still adhered to his original plan of distressing the royal party, by laying ambushes, and cutting off detached parties: but in this he was less successful than formerly; and one of his own detachments, which lay in ambush in a wood, were themselves surprised and entirely defeated, with the loss of 300 killed and wounded, besides a great number taken, and all their arms and baggage.

General Howe, now perceiving that the Americans would not risk another battle, even for the sake of their capital, took peaceable possession of it on the 26th of September. His first care was then to cut off, by means of strong batteries, the communication between the upper and lower parts of the river: which was executed, notwithstanding the opposition of some American armed vessels; one of which, carrying 36 guns, was taken. His next task was to open a communication with it by sea; and this was a work of no small difficulty. A vast number of batteries and forts had been erected, and immense machines, formed like *chevaux de frize*, from whence they took their name, sunk in the river to prevent its navigation. As the fleet was sent round to the mouth of the river, in order to co-operate with the army, this work, however difficult, was accomplished; nor did the provincials give much opposition, well knowing that all places of this kind were now untenable. General Washington, however, took the advantage of the royal army being divided, to attack the camp of the principal division of it, that lay at German-town, in the neighbourhood of Phila-

delphia. In this he met with very little success; for, though he reached the place of destination by three o'clock in the morning, the patrols had time to call the troops to arms. The Americans made a very resolute attack; but they were received with such bravery, that they were compelled to abandon the attempt, and retreat in great disorder; with the advantage, however, of carrying off their cannon, though pursued for a considerable way, after having 300 killed, 600 wounded, and upwards of 400 taken prisoners, among whom were fifty-four officers. On the British side, the loss amounted to 430 wounded and prisoners, and 70 killed; among which were general Agnew and colonel Bird, with some other excellent officers.

There still remained two strong forts on the Delaware to be reduced. These were Mud Island and Red Bank. The various obstructions which the Americans had thrown in the way rendered it necessary to bring up the *Augusta*, a ship of the line, and the *Merlin* frigate, to the attack of Mud Island; but, during the heat of the action, both were grounded. Upon this, the Americans sent down four fire-ships, and directed the whole fire from their galleys against them. The former were rendered ineffectual by the courage and skill of the British seamen; but, during the engagement, both the *Augusta* and *Merlin* took fire, and were burnt to ashes, and the other ships obliged to withdraw. The enemy, encouraged by this unsuccessful attempt, proceeded to throw new obstructions in the way; but the British general having found means to convey a number of cannon, and to erect batteries within a gun-shot of the fort, by land, and bringing up three ships of the line which mounted heavy cannon, the garrison, after making a vigorous defence for one day, perceiving that preparations were making for a general assault on the next, abandoned the place in the night. Those who defended Red Bank followed their example, and abandoned it on the approach of lord Cornwallis. A great number of the American shipping, finding themselves entirely destitute of any protection, sailed up the river in the night-time. Seventeen remained, whose retreat was intercepted by a frigate and some armed vessels; on which the Americans ran them ashore and burnt them, to prevent their falling into the enemy's hands.

Thus the campaign of 1777, in Pennsylvania, concluded successfully on the part of the British. In the north, however, matters wore a different aspect. The expedition in that quarter had been projected by the British ministry, as the most effectual method that could be taken to crush the colonies at once. The four provinces of New England had originally begun the confederacy against Britain, and they were still considered as the most active in the continuation of it; and it was thought, that any impression made upon them would contribute in an effectual manner to the reduction of the rest. For this purpose, an army of 4000 chosen British troops, and 3000 Germans, were put under the command of general Burgoyne: general Carleton was directed to use his interest with the Indians to persuade them to assist in this expedition; and the province of Quebec was to furnish large parties to join in the same. The officers who commanded under general Burgoyne were, general Philips of the artillery, generals Fraser, Powell, and Hamilton; with the German officers, generals Reidesel and Specht. To aid the principal expedition, another was projected on the Mohawk river, under colonel St. Leger, who was to be assisted by Sir John Johnson, son to the famous Sir William Johnson, who had so greatly distinguished himself in the war of 1755.

On the 21st of June, 1777, the army encamped on the western side of the Lake Champlain; where, being joined by a considerable body of Indians, general Burgoyne made a speech, in which he exhorted these new allies to lay aside their ferocious and barbarous manner of making war; to kill only such as opposed them in arms; and to spare prisoners, with such women and children as should fall into their hands. After issuing a proclamation, in which the force of Britain, and that which he commanded, was set forth

forth in very ostentatious terms, the campaign opened with the siege of Ticonderoga. The place was very strong, and garrisoned by 6000 men, under general Sinclair; nevertheless, the works were so extensive, that even this number was scarce sufficient to defend them. They had, therefore, omitted to fortify a rugged eminence, called Sugar Hill, the top of which overlooked and effectually commanded the whole works; vainly imagining, that the difficulty of the ascent would be sufficient to prevent the enemy from taking possession of it. On the approach of the first division of the army, the provincials abandoned and set fire to their outworks; and so expeditious were the British troops, that by the 5th of July every post was secured which was judged necessary for investing it completely. A road was soon after made to the very summit of that eminence, which the Americans had with such confidence supposed could not be ascended; and so much were they now disheartened, that they instantly abandoned the fort entirely, taking the road to Skenesborough, a place to the south of Lake George; while their baggage, with what artillery and military stores they could carry off, were sent to the same place by water. But the British generals were determined not to let them pass so easily. Both were pursued, and both overtaken. Their armed vessels consisted only of five galleys; two of which were taken, and three blown up; on which they set fire to their boats and fortifications at Skenesborough. On this occasion, the provincials lost 200 boats, 130 pieces of cannon, with all their provisions and baggage. Their land-forces under colonel Francis made a brave defence against general Frazer: and, being greatly superior in number, had almost overpowered him, when general Reidefel, with a large body of Germans, came to his assistance. The enemy were now overpowered in their turn; and, their commander being killed, they fled on all sides with great precipitation. In this action 200 Americans were killed, as many taken prisoners, and above 600 wounded, many of whom perished in the woods for want of assistance.

During the engagement, general Sinclair was at Castleton, about six miles from the place; but, instead of going forward to Fort Anne, the next place of strength, he repaired to the woods which lie between that fortress and New England. General Burgoyne detached colonel Hill, with the ninth regiment, to intercept such as should attempt to retreat towards Fort Anne. On his way he met with a body of the enemy, said to be six times as numerous as his own; who, after an engagement of three hours, were obliged to retire with great loss. After so many disasters, despairing of being able to make any stand at Fort Anne, they set fire to it, and retired to Fort Edward. In all these engagements, the loss of killed and wounded in the royal army did not exceed two hundred men.

General Burgoyne was now obliged to suspend his operations for some time, and wait at Skenesborough for the arrival of his tents, provisions, &c. He therefore employed this interval in making roads through the country about St. Anne, and in clearing a passage for his troops to proceed against the enemy. This was attended with incredible toil; but all obstacles were surmounted with equal patience and resolution by the army. In short, after undergoing the utmost difficulties that could be undergone, and making every exertion that man could make, he arrived with his army before Fort Edward about the end of July. Here general Schuyler had been for some time endeavouring to recruit the shattered American forces, and had been joined by general Sinclair with the remains of his army; the garrison of Fort George also, situated on the lake of that name, had evacuated the place, and retired to Fort Edward. However, on the approach of the royal army, they retired thence also, and formed their head-quarters at Saratoga. Notwithstanding the great successes of the British general, the Americans shewed not the least disposition to submit, but seemed only to consider how they might make the most effectual resistance. For this purpose, the militia were every where raised and draughted to join the

army at Saratoga; and such numbers of volunteers were daily added, that they soon began to recover from the terror into which they had been thrown. That they might have a commander whose abilities could be relied on, general Arnold was appointed, who repaired to Saratoga with a considerable train of artillery; but, receiving intelligence that colonel St. Leger was proceeding with great rapidity in his expedition on the Mohawk River, he removed to Stillwater, a place about half-way between Saratoga and the junction of the Mohawk and Hudson's River. The colonel, in the mean time, had advanced as far as Fort Stanwix; the siege of which he pressed with great vigour. On the 6th of August, understanding that a supply of provisions, escorted by eight or nine hundred men, was on the way to the fort, he dispatched Sir John Johnson with a strong detachment to intercept it. This he did so effectually, that, besides intercepting the provisions, 400 of its guard were slain, 200 taken, and the rest escaped with great difficulty. The garrison, however, were not to be intimidated by this disaster, nor by the threats or representations of St. Leger: on the contrary, they made several successful sallies, under colonel Willet, the second in command; and this gentleman, in company with another, even ventured out of the fort; and, eluding the vigilance of the enemy, passed through them, in order to hasten the march of general Arnold to their assistance.

Thus the affairs of colonel St. Leger seemed to be in no very favourable situation, notwithstanding his late success, and they were soon totally ruined by the desertion of the Indians. They had been alarmed by the report of general Arnold's advancing with 2000 men to the relief of the fort; and, while the colonel was attempting to give them encouragement, another report was spread, that general Burgoyne had been defeated with great slaughter, and was now flying before the provincials. On this, he was obliged to retreat, with the loss of the tents, and some of the artillery and military stores.

General Burgoyne, in the mean time, notwithstanding the difficulties he had already sustained, found that he must still encounter more. The roads he had made with so much labour and pains, were destroyed, either by the wetness of the season, or by the enemy; so that the provisions he brought from Fort George could not arrive at his camp without prodigious toil. On hearing of the siege of Fort Stanwix by colonel St. Leger, he determined to move forward, in hopes of inclosing the enemy betwixt his own army and that of St. Leger, or of obtaining the command of all the country between Fort Stanwix and Albany; or, at any rate, a junction with colonel St. Leger would be effected, which could not but be attended with the most happy consequences. The only difficulty was, the want of provisions; and this it was proposed to remedy by reducing the provincial magazines at Bennington. For this purpose, colonel Baume, a German officer of great bravery, was chosen, with a body of 500 men. The place was about twenty miles from Hudson's River; and, to support colonel Baume's party, the whole army marched up the river's bank, and encamped almost opposite to Saratoga, with the river betwixt it and that place. An advanced party was posted at Batten Kill, between the camp and Bennington, in order to support colonel Baume. In their way, the British seized a large supply of cattle and provisions, which were immediately sent to the camp; but the badness of the roads retarded their march so much, that intelligence of their design was sent to Bennington. Understanding now that the American force was greatly superior to his own, the colonel acquainted the general, who immediately dispatched colonel Breyman with a party to his assistance; but, through the same causes that had retarded the march of colonel Baume, this assistance came too late. General Starke, in the mean time, who commanded at Bennington, determined to attack the two parties separately; and, for this purpose, advanced against colonel Baume, whom he surrounded on all sides, and attacked with the utmost violence. The troops defended themselves

themselves with great valour, but were to a man either killed or taken. Colonel Breyman, after a desperate engagement, had the good luck to effect a retreat through the darkness of the night, which otherwise he could not have done, as his men had expended all their ammunition.

General Burgoyne, disappointed in his attempt on Bennington, applied himself with indefatigable diligence to procure provisions from Fort George; and, having amassed a sufficient quantity to last for a month, he threw a bridge of boats over the river Hudson, which he crossed about the middle of September, encamping on the hills and plains near Saratoga. As soon as he approached the provincial army, encamped at Stillwater under general Gates, he determined to make an attack; for which purpose he put himself at the head of the central division of his army, having general Frazer and colonel Breyman on the right, with generals Reidesel and Philips on the left. In this position he advanced towards the enemy on the 19th of September. But the Americans did not now wait to be attacked: on the contrary, they attacked the central division with the greatest ardour; and it was not until general Philips with the artillery came up, that they could be repulsed. On this occasion, though the British troops lost only 330 in killed and wounded, and the enemy no less than 1500, the former were very much alarmed at the obstinate resolution shewn by the Americans. This did not, however, prevent the British from advancing towards the enemy, and posting themselves the next day within cannon-shot of their lines. But their allies the Indians began to desert in great numbers; and at the same time the general was in the highest degree mortified by having no intelligence of any assistance from Sir Henry Clinton, as had been stipulated. He now received a letter from him, by which he was informed that Sir Henry intended to make a diversion on the North River in his favour. This afforded but little comfort: however, he returned an answer by several trusty persons whom he dispatched different ways, stating his present distressed situation, and mentioning that the provisions and other necessities he had would only enable him to hold out till the 12th of October.

In the mean time the Americans, in order to cut off the retreat of the British army, undertook an expedition against Ticonderoga; but were obliged to abandon the enterprise after having surprised all the out-posts, and taken a great number of boats with some armed vessels, and a number of prisoners. The army under general Burgoyne now laboured under the greatest distresses; so that in the beginning of October he was obliged to diminish the soldiers' allowance. On the 7th of that month he determined to move towards the enemy. For this purpose he sent a body of 1500 men to reconnoitre their left wing; intending, if possible, to break through it in order to effect a retreat. This detachment had not proceeded far, when a dreadful attack was made upon the left wing of the British army, which was with great difficulty preserved by a reinforcement brought up by general Frazer, who was killed in the action. After the troops had with great difficulty regained their camp, it was furiously assaulted by general Arnold; who, notwithstanding all opposition, would have forced the entrenchments, had he not received a dangerous wound, which obliged him to retire. Thus the attack failed on the left, but on the right the camp of the German reserve was forced, colonel Breyman killed, and his countrymen defeated, with the loss of all their artillery and baggage.

This was by far the heaviest loss the British army had sustained since the action at Bunker's Hill. The list of killed and wounded amounted to near 1200, exclusive of the Germans; but the greatest misfortune was, that the enemy had now an opening on the right and rear of the British forces, so that the army was threatened with entire destruction. This obliged general Burgoyne once more to shift his position, that the enemy might also be obliged to alter theirs. This was accomplished on the night of the 7th, without any loss, and all the next day he continued to

offer the enemy battle; but they were now too well assured of obtaining a complete victory, by cutting off all supplies from the British, to risk another engagement. Wherefore they advanced on the right side, in order to inclose him entirely; which obliged the general to direct a retreat towards Saratoga. But the enemy had stationed a great force on the ford at Hudson's River, so that the only possibility of retreat was by securing a passage to lake George; and, to effect this, a body of workmen were detached, with a strong guard, to repair the roads and bridges that led to Fort Edward. As soon as they were gone, the enemy seemed to menace an attack; which rendered it necessary to recal the guard, and the workmen, being of course left exposed, could not proceed. The boats, which conveyed provisions down Hudson's River, were now exposed to the continual fire of the American marksmen, who also took many of them; so that it became necessary to convey the provisions over land. In this extreme danger it was resolved to march by night to Fort Edward, forcing the passages at the fords either above or below the place; and, in order to effect this the more easily, it was resolved that the soldiers should carry their provisions on their backs, leaving behind their baggage and every other incumbrance. But, before this could be executed, intelligence was received that the enemy had raised strong entrenchments opposite to these fords, well provided with cannon, and that they had likewise taken possession of the rising ground between Fort George and Fort Edward, which in like manner was provided with cannon.

All this time the American army was increasing by the continual arrival of militia and volunteers from all parts. Their parties extended all along the opposite bank of Hudson's River, and some had even passed it in order to watch the least movement of the British army. The whole force under general Gates was computed at upwards of 16,000 men, while the army under general Burgoyne did not amount to 6000; and every part of the camp was penetrated by the grape and rifle shot of the enemy, besides discharges from their artillery, which were almost incessant. In this state of extreme distress and danger, the army continued with the greatest constancy and perseverance till the evening of the 13th of October, when, an inventory of provisions being taken, it was found that no more remained than what were sufficient to serve for three days; and, a council of war being called, it was unanimously determined that there was no method now remaining but to treat with the enemy. In consequence of this, a negotiation was opened the next day, which speedily terminated in a capitulation of the whole British army; the principal article of which was, that the troops were to have a free passage to Britain, on condition of not serving against America during the war. On this occasion, general Gates ordered his army to keep within their camp, while the British soldiers went to a place appointed for them to lay down their arms, that the latter might not have the additional mortification of being made spectacles of, so melancholy an event. The number of those who surrendered at Saratoga amounted to 5750, according to the American accounts; the list of sick and wounded left in the camp when the army retreated to Saratoga, to 528; and the number of those lost by other accidents since the taking of Ticonderoga, to near 3000. But in the evidence afterwards adduced before the house of commons by general Burgoyne, it appeared that the number of effective men in the British army at the time it surrendered, amounted only to 3499; whilst the number of the American army, according to general Gates's return, was 18,624. Thirty-five brass field-pieces, 7000 stand of arms, clothing for an equal number of soldiers, with the tents, military-chest, &c. likewise fell into the hands of the Americans.

Sir Henry Clinton, in the mean time, had failed up the North River, and destroyed the two forts called Montgomery and Clinton, with Fort Constitution, and another place called Continental Village, where were barracks for 2000 men. Seventy large cannon were carried away, be-

sides

sides a number of smaller artillery, and a great quantity of stores and ammunition; a large boom and chain reaching across the river from Fort Montgomery to a point of land called St. Anthony's Nose, which cost no less than 70,000*l.* sterling, were partly destroyed and partly carried away, as was also another boom of little less value at Fort Constitution. Another attack was made by Sir James Wallace, with some frigates, and a body of land-forces under general Vaughan. The place which now suffered was named Esopus: the fortifications were destroyed, and the town itself reduced to ashes, as that called Continental Village had been before. But these successes, of whatever importance they might be, were now disregarded by both parties. They served only to irritate the Americans, flushed with their success; and they were utterly insufficient to raise the spirits of the British, who were now thrown into the utmost dismay.

On the 16th of March, 1778, lord North acquainted the house of commons, that a paper had been laid before the king by the French ambassador, intimating the conclusion of an alliance between the court of France and the United States of America. The preliminaries of this treaty had been concluded in the end of the year 1777, and a copy of them sent to congress, in order to counteract any proposals that might be made in the mean time by the British ministry. On February 6, 1778, the articles were signed, to the great satisfaction of the French nation.

The notification of such a treaty as this could not but be looked upon as a declaration of war. On its being announced to the house, every one agreed in an address to his majesty, promising to stand by him to the utmost in the present emergency; but it was warmly contended by the members in opposition, that the present ministry ought to be removed on account of their numberless blunders and miscarriages in every instance. Many were of opinion, that the only way to extricate the nation from its trouble was to acknowledge the independency of America at once, and thus we might still do with a good grace what must inevitably be done at last, after expending much more blood and treasure than had yet been lavished in this unhappy contest. The ministerial party, however, entertained different ideas. Instigated by zeal for the national honour, it was determined at once to resent the arrogance of France, and prosecute hostilities against America with more vigour than ever, should the terms now offered them be rejected.

The Americans, in the mean time, assiduously employed their agents at the courts of Spain, Vienna, Prussia, and Tuscany, in order, if possible, to conclude alliances with them, or at least to procure an acknowledgment of their independency. As it had been reported that Britain intended to apply for assistance to Russia, the American commissioners were enjoined to use their utmost influence with the German princes to prevent such auxiliaries from marching through their territories, and to endeavour to procure the recall of the German troops already sent to America. To France they offered a cession of such West-India islands as should be taken by the united strength of France and America; and, should Britain by their joint endeavours be dispossessed of Newfoundland, Cape Breton, and Nova Scotia, these territories should be divided betwixt the two nations, and Great Britain be totally excluded from the fishery. The proposals to the Spanish court were, that, in case they should think proper to espouse their quarrel, the American States should assist in reducing Pensacola under the dominion of Spain, provided their subjects were allowed the free navigation of the river Mississippi, and the use of the harbour of Pensacola; and they further offered, that, if agreeable to Spain, they would declare war against Portugal, should that power expel the American ships from its ports.

In the mean time, the troops under general Burgoyne were preparing to embark for Britain, according to the convention at Saratoga; but, to their utter surprise, congress positively refused to allow them to depart, under pretence that some sinister designs were harboured on the

part of Britain, and that they only wanted an opportunity to join the other troops at Philadelphia or New York.

The season for action was now approaching; and congress was indefatigable in its preparations for a new campaign, which it was confidently said would be the last. Among other methods taken for this purpose, it was recommended to all the young gentlemen of the colonies to form themselves into bodies of cavalry to serve at their own expence during the war. General Washington, at the same time, in order to remove all incumbrances from his army, lightened the baggage as much as possible, by substituting sacks and portmanteaus in place of chests and boxes, and using pack-horses instead of waggons. On the other hand, the British army, expecting to be speedily reinforced by 20,000 men, thought of nothing but concluding the war according to their wishes before the end of the campaign. It was with the utmost concern, as well as indignation, therefore, that they received the news of lord North's conciliatory bill. It was universally looked upon as a national disgrace; and some even tore the cockades from their hats, and trampled them under their feet as a token of their indignation. By the colonists it was received with indifference. The British commissioners endeavoured to make it as public as possible; and the congress, as formerly, ordered it to be printed in all the newspapers. On this occasion governor Tryon inclosed several copies of the bill to general Washington in a letter, entreating that he would allow them to be circulated; to which that general returned for answer a copy of a newspaper in which the bill was printed, together with the resolutions of congress upon it. These were, That whoever presumed to make a separate agreement with Britain should be deemed a public enemy; that the United States could not with any propriety keep correspondence with the commissioners until their independence was acknowledged, and the British fleets and armies removed from America. At the same time, the colonies were warned not to suffer themselves to be deceived into security by any offers that might be made; but to use their utmost endeavours to send their quotas with all diligence into the field. The individuals with whom the commissioners conversed on the subject of the conciliatory bill, generally returned for answer, that the day of reconciliation was past; and that the haughtiness of Britain had extinguished all filial regard in the breasts of the Americans.

About this time also Mr. Silas Deane arrived from France with two copies of the treaty of commerce and alliance to be signed by congress. Advances of the most agreeable nature were also received from various parts, representing in the most favourable light the dispositions of the European powers; all of whom, it was said, wished to see the independence of America settled upon the most firm and permanent basis. Considering the situation of matters with the colonists at this time, therefore, it is no wonder that the commissioners found themselves unable to accomplish the errand on which they came. Their proposals were utterly rejected, themselves treated as spies, and all intercourse with them interdicted.

But, before any final answer could be obtained from congress, Sir Henry Clinton had taken the resolution of evacuating Philadelphia. Accordingly, on the 10th of June, after having made all necessary preparations, the army marched out of the city, and crossed the Delaware before noon with all its baggage and other incumbrances. General Washington, apprised of this design, had dispatched expresses into the Jerseys with orders to collect all the forces that could be assembled, to obstruct the march of the enemy. After various movements on both sides, Sir Henry Clinton, with the royal army, arrived on the 27th of June at a place called Freehold; where, judging that the enemy would attack him, he encamped in a very strong situation. Here general Washington determined to make an attack as soon as the army had again begun its march. The night was spent in making the necessary preparations, and general Lee with his division was ordered to be ready by day-break. But Sir Henry Clinton, justly apprehending that

that the chief object of the enemy was the baggage, committed it to the care of general Knyphausen, whom he ordered to set out early in the morning, while he followed with the rest of the army. The attack was accordingly made; but the British general had taken such care to arrange his troops properly, and so effectually supported his forces when engaged with the Americans, that the latter not only made no impression, but were with difficulty preserved from a total defeat, by the arrival of general Washington with the whole army. The British troops effected their retreat with the loss of 300 men, of whom many died through fatigue. In this action general Lee was charged by general Washington with disobedience and misconduct in retreating before the British army. He was tried by a court-martial, and sentenced to a temporary suspension from his command. After they had arrived at Sandy Hook, a bridge of boats was by lord Howe's directions thrown over the channel which separated the island from the main land, and the troops were conveyed on-board the fleet; after which they failed to New York. After sending some light detachments to watch the enemy's motions, general Washington marched towards the North River, where a great force had been collected to join him, and where it was now expected that some capital operations would take place.

In the mean time, France had set about her preparations for the assistance of the Americans. On the 14th of April count D'Estaing sailed from Toulon with a strong squadron of ships of the line and frigates, and arrived on the coast of Virginia in the beginning of July, while the British fleet was employed in conveying the forces from Sandy Hook to New York. It consisted of one ship of 90 guns, one of 80, six of 74, and four of 64, besides several large frigates; and, exclusive of its complement of sailors, had 6000 marines and soldiers on-board. To oppose this the British had only six ships of 64 guns, three of 50, and two of 40, with some frigates and sloops. Notwithstanding this inferiority, however, the British admiral posted himself to advantageously, and shewed such superior courage and skill, that D'Estaing did not think proper to attack him. He therefore remained at anchor four miles off Sandy Hook till the 22d of July, without effecting any thing more than the capture of some vessels, which, through ignorance of his arrival, fell into his hands.

The next attempt of the French admiral was, in conjunction with the Americans, on Rhode Island. It was proposed that D'Estaing, with the 6000 troops he brought with him, should make a descent on the southern part of the island, while a body of the Americans should take possession of the north; at the same time the French squadron was to enter the harbour of Newport, and take or destroy all the British shipping. On the 8th of August the French admiral entered the harbour as was proposed, but found himself unable to effect any thing material. Lord Howe instantly set sail for Rhode Island; and D'Estaing, confiding in his superiority, came out of the harbour to meet him. A violent storm parted the two fleets, and did so much damage that they were both rendered unfit for action. The French suffered most; and several of their ships, being afterwards attacked singly by the British, very narrowly escaped being taken. On the 20th of August D'Estaing returned to Newport in a very shattered condition; and, not thinking himself safe there, failed two days after for Boston. General Sullivan had landed in the mean time on the northern part of Rhode Island with 10,000 men. On the 17th of August they began their operations by erecting batteries, and making their approaches to the British lines. But general Pigot, who commanded in Newport, had taken such effectual care to secure himself on the land-side, that without the assistance of a marine force it was altogether impossible to attack him with any probability of success. The conduct of D'Estaing, therefore, who had abandoned them when master of the harbour, gave the greatest disgust to the people of New England, and Sullivan began to think of a retreat. On perceiving his intentions, the garrison sallied out upon him with so

much vigour, that it was not without difficulty that he effected his retreat. He had not been long gone when Sir Henry Clinton arrived with a body of 4000 men; which, had it arrived sooner, would have enabled the British commander to have gained a decisive advantage over him, as well as to have destroyed the town of Providence, which, by its vicinity to Rhode Island, and the enterprises which were continually projected and carried on in that place, kept the inhabitants of Rhode Island in continual alarm.

The first British expedition was to Buzzard's Bay, in the neighbourhood of Rhode Island. Here they destroyed a great number of privateers and merchantmen, magazines, with storehouses, &c. whence proceeding to a fertile and populous island called Martha's Vineyard, they carried off 10,000 sheep and 300 black cattle. Another expedition took place up the North River, under lord Cornwallis and general Knyphausen; the principal event of which was the destruction of a regiment of American cavalry, known by the name of Washington's light-horse. A third expedition was directed to Little Egg Harbour, in New Jersey, a place noted for privateers, the destruction of which was its principal intention. It was conducted by captains Ferguson and Collins, and ended in the destruction of the enemy's vessels, as well as of the place itself. At the same time part of another body of American troops, called Pulaski's legion, was surprised, and a great number of them put to the sword.

The Americans had in the beginning of the year projected the conquest of West Florida; and captain Willing, with a party of resolute men, had made a successful incursion into the country. This awakened the attention of the British to the southern colonies, and an expedition against them was resolved on. Georgia was the place of destination; and the more effectually to ensure success, colonel Campbell, with a sufficient force, under convoy of some ships of war, commanded by commodore Hyde Parker, embarked at New York, while general Prevost, who commanded in East Florida, was directed to set out with all the forces he could collect. The armament from New York arrived off the coast of Georgia in December; and, though the enemy were strongly posted in an advantageous situation near the shore, the British troops made good their landing, and advanced towards Savannah the capital of the province. That same day they defeated the provincials who opposed them; and took possession of the town with such celerity, that the Americans had not time to execute a resolution they had taken of setting it on fire. In ten days the whole province of Georgia was reduced, Sunbury alone excepted; and this was also brought under subjection by general Prevost in his march northward. Every proper method was taken to secure the tranquillity of the country; and rewards were offered for apprehending committee and assembly men, or such as they judged most inimical to the British interest. On the arrival of general Prevost, the command of the troops devolved on him as the senior officer; and the conquest of Carolina was next projected. That country contained a great number of friends to government, who now eagerly embraced the opportunity of declaring themselves; many of the inhabitants of Georgia had joined the royal standard; and there was not in the province any provincial forces capable of opposing the efforts of the regular and well-disciplined troops. On the news of general Prevost's approach, the loyalists assembled, imagining themselves able to stand their ground until their allies should arrive; but in this they were disappointed. The Americans attacked and defeated them, with the loss of half their number. The remainder retreated into Georgia; and, after undergoing many hardships, at last effected a junction with the British forces.

In the mean time, general Lincoln, with a considerable reinforcement of American troops, had encamped within twenty miles of the town of Savannah; and another strong party had posted themselves at a place called Briar's Creek, farther up the river of the same name. Thus the extent of the British government was likely to be circumscribed within

within very narrow bounds. General Prevost therefore determined to dislodge the party at Briar's Creek: and the latter, trusting to their strong situation, and being remiss in their guard, suffered themselves to be surprised on the 30th of March, 1779; when they were utterly routed, with the loss of 400 killed and taken, besides a great number drowned in the river or the swamps. The whole artillery, stores, baggage, and almost all the arms, of this unfortunate party were taken, so that they could no more make any stand; and thus a communication was opened with those places in Carolina where the royalists chiefly resided.

The victory at Briar's Creek proved of considerable service to the British cause. Great numbers of the loyalists joined the army, and considerably increased its force. Hence general Prevost was enabled to stretch his posts farther up the river, and to guard all the principal passes: so that general Lincoln was reduced to a state of inaction; and at last moved off towards Augusta, in order to protect the provincial assembly, which was obliged to sit in that place, the capital being in the hands of the British. Lincoln had no sooner quitted his post, than it was judged proper by the British general to put in execution the grand scheme which had been meditated against Carolina. Many difficulties indeed lay in his way. The river Savannah was so swelled by excessive rains, that it seemed impassable; the opposite shore was so full of swamps and marshes, that no army could march over it without the greatest difficulty; and, to render the passage still more difficult, general Moultrie was left with a considerable body of troops to oppose the enemy's attempts. Yet, in spite of every opposition, the constancy and perseverance of the British forces prevailed. General Moultrie was defeated, and obliged to retire towards Charlestown; and the victorious army, after having waded through the marshes for some time, arrived in an open country, through which they pursued their march with great rapidity towards the capital; while general Lincoln remained in a state of security at Augusta, vainly imagining that the obstacles he had left in the way could not be surmounted.

Intelligence of the danger to which Charlestown was exposed, roused the American general from his lethargy. A chosen body of infantry, mounted on horseback for the greater expedition, was dispatched before him; while Lincoln himself followed with all the forces he could collect. General Moultrie too, with the troops he had brought from the Savannah, and some others he had collected since his retreat from thence, had taken possession of all the avenues leading to Charlestown, and prepared for a vigorous defence. But all opposition proved ineffectual. The Americans were defeated in every encounter; and, retreating continually, allowed the British army to come within cannon-shot of Charlestown on the 12th of May. The town was now summoned to surrender; and the inhabitants would gladly have agreed to observe a neutrality during the rest of the war, and would also have engaged for the rest of the province. But, these terms not being accepted, they made preparations for a vigorous defence. It was not in the power of the British commander at this time to make an attack with any prospect of success. His artillery was not of sufficient weight; there were no ships to support him by sea; and general Lincoln, advancing rapidly with a superior army, threatened to inclose him between his own forces and the town; so that, should he fail in his first attempt, certain destruction would be the consequence. For these reasons he withdrew his army from before the town, and took possession of two islands called St. James's and St. John's, lying to the southward; where, having waited some time, he was reinforced by the arrival of two frigates. With these he determined to make himself master of Port Royal, an island possessed of an excellent harbour and many other natural advantages, from its situation also commanding the sea-coast from Charlestown to Savannah River. The American general, however, did not allow this to be accomplished without opposition. Perceiving that his oppo-

nent had occupied an advantageous post on St. John's island, preparatory to his enterprise against Port Royal, he attempted, on the 20th of June, to dislodge him from it; but, after an obstinate attack, the provincials were, as usual, obliged to retire with considerable loss. On this occasion the success of the British was in a great measure owing to an armed float; which galled the right flank of the enemy so effectually, that they could direct their efforts only against the strongest part of the lines, which proved impregnable. This disappointment was instantly followed by the loss of Port Royal, which general Prevost took possession of, and put his troops into proper stations, waiting for the arrival of such further reinforcements as were necessary for the intended attack on Charlestown.

In the mean time, count D'Estaing, who put into Boston harbour to refit, had used his utmost efforts to ingratiate himself with the inhabitants of that city. Zealous also in the cause of his master, he had published a proclamation to be dispersed through Canada, inviting the people to return to their original friendship with France, and declaring that all who renounced their allegiance to Great Britain should certainly find a protector in the French king. All his endeavours, however, proved insufficient to produce any revolution, or even to form a party of any consequence among the Canadians.

As soon as the French admiral had refitted his fleet, he took the opportunity, while that of admiral Byron had been shattered by a storm, of sailing to the West Indies. During his operations there, the Americans having represented his conduct as totally unserviceable to them, he received orders from Europe to assist the colonies with all possible speed. He therefore directed his course towards Georgia, with a design to recover that province, and to put it, as well as South Carolina, in such a posture of defence as would effectually secure them from any future attack. This seemed to be an easy matter, from the little force with which he knew he should be opposed; and the next object in contemplation was the destruction of the British fleet and army at New York. Full of these hopes, the French commander arrived off the coast of Georgia with a fleet of twenty-two sail of the line and ten frigates. His arrival was so little expected, that several vessels laden with provisions and military stores fell into his hands: the Experiment also, a vessel of 50 guns, commanded by Sir James Wallace, was taken after a stout resistance. On the continent, the British troops were divided. General Prevost, with one part, remained at Savannah; but the main force was under colonel Maitland at Port Royal. On the first appearance of the French fleet, an express was dispatched to colonel Maitland: but it was intercepted by the enemy; so that, before he could set out to join the commander in chief, the Americans had secured most of the passes by land, while the French fleet effectually blocked up the passage by sea. Yet by taking advantage of creeks and inlets, and marching over land, he arrived just in time to relieve Savannah.

D'Estaing allowed general Prevost twenty-four hours to deliberate whether he would capitulate or not. This time the general employed in making the best preparations he could for a defence; and at this critical juncture colonel Maitland arrived. D'Estaing's summons was now rejected; and, as the superiority of the enemy was by no means so much out of proportion, there was every probability of success on the part of the British. The garrison consisted of 3000 men, of approved valour and experience; and, having the advantage of a strong fortification and excellent engineers, the fire of the allies made so little impression, that D'Estaing resolved to bombard the town, and a battery of nine mortars was erected for the purpose. This produced a request from general Prevost, that the women and children might be allowed to retire to a place of safety. But the allied commanders had the inhumanity to refuse compliance; and resolved upon a general assault. This was accordingly attempted on the 9th of October: but the assailants were every where repulsed with such slaugh-

ter, that 1200 were killed and wounded; among the former was count Polaski, and among the latter D'Estaing himself. This disaster entirely overthrew the sanguine hopes of the Americans and French; mutual reproaches and animosities took place, and, after waiting eight days, both parties prepared to retreat; the French to their shipping, and the Americans into Carolina.

While the allies were thus unsuccessfully employed in the southern colonies, their antagonists were no less assiduous in distressing them in the northern parts. Sir George Collier was sent with a fleet, carrying general Matthews, with a body of land-forces, into the province of Virginia. Their first attempt was on the town of Portsmouth; where, though the enemy had destroyed some ships of great value, the British troops arrived in time to save a great number of others. On this occasion about 120 vessels of different sizes were burnt, and twenty carried off; and an immense quantity of provisions designed for the use of general Washington's army was either taken or destroyed, together with a great variety of naval and military stores.

The success with which this expedition was attended, soon gave encouragement to another. The Americans had for some time been employed in erecting two strong forts on the river; the one at Verplanks Neck on the east, and the other at Stoney Point on the west side. These when completed would have been of the utmost service to the Americans, by commanding the principal pass, called the King's Ferry, between the northern and southern colonies. At present, however, they were not in a condition to make any effectual defence; and it was determined to attack them before the works should be completed. The force employed on this occasion was divided into two battalions; one of which directed its course against Verplanks, and the other against Stoney Point. The former was commanded by general Vaughan, the latter by general Patton, while the shipping was under the direction of Sir George Collier. General Vaughan met with no resistance, the enemy abandoning their works, and setting fire to every thing they could not carry off. At Stoney Point, however, a vigorous defence was made, though the garrison was at last obliged to capitulate. To secure the possession of this last, which was the more important of the two, general Clinton removed from his former situation, and encamped in such a manner that Washington could not give any assistance. The Americans, in turn, revenged themselves by distressing, with their numerous privateers, the trade to New York.

This occasioned an expedition to Connecticut, where these privateers were chiefly built and harboured. The command was given to governor Tryon and general Garth. Under convoy of a considerable number of armed vessels they landed at Newhaven, where they demolished the batteries that had been erected to oppose them, and destroyed the shipping and naval stores; but they spared the town itself, as the inhabitants had abstained from firing out of their houses upon the troops. From Newhaven they marched to Fairfield, where they proceeded as before, and reduced the town to ashes. Norwalk was next attacked, which in like manner was burnt; as was also Greenfield, a small sea-port in the neighbourhood. These successes proved very alarming as well as detrimental to the Americans; so that general Washington determined at all events to drive the enemy from Stoney Point. For this purpose he sent general Wayne with a detachment of chosen men, directing them to attempt the recovery of it by surprise. On this occasion the Americans shewed a spirit and resolution exceeding any thing they had performed during the course of the war. Though the fortifications of this place were very strong, they attacked the British with bayonets, after passing through a heavy fire of musquetry and grape-shot; and, in spite of all opposition, obliged the surviving part of the garrison, amounting to 500 men, to surrender prisoners of war. Though the Americans did not retain Stoney Point, the success they had met with emboldened them to make a similar attempt on Paulus Hook, a fortified

post on the Jersey side, opposite to New York; but they were obliged to retreat, after they had made themselves masters of one or two posts.

An expedition of greater importance was now projected on the part of the Americans. This was against a post on the river Penobscot, on the borders of Nova Scotia, of which the British had lately taken possession, and where they had begun to erect a fort, which threatened great inconvenience to the colonists. The armament destined against it was so soon got in readiness, that colonel MacLane, the commanding officer at Penobscot, found himself obliged to drop the execution of part of his scheme; and, instead of a regular fort, to content himself with putting the works already constructed in as good a posture of defence as possible. The Americans could not effect a landing without much difficulty; and, as soon as this was done, they erected several batteries, and kept up a brisk fire for the space of a fortnight. They now proposed to carry the fort by a general assault; but before this could be effected, they perceived Sir George Collier, with a British fleet, coming to its relief. On this, they instantly re-embarked their artillery and military stores, and sailed up the river, as far as possible, in order to avoid him. They were so closely pursued, however, that not a single vessel could escape; so that the whole fleet, consisting of nineteen armed vessels and twenty-four transports, was destroyed. The soldiers and sailors were obliged to wander through immense deserts, where they suffered much for want of provisions; and, to add to their calamities, a quarrel arose between the soldiers and seamen concerning the cause of their disaster, which ended in a violent fray, wherein a great number were killed.

Thus, the arms of America and France being almost every where unsuccessful, the independency of the former seemed yet to be in danger, notwithstanding the assistance of so powerful an ally, when further encouragement was given by the accession of Spain to the confederacy against Britain, in the month of June, 1779. The first effect of this appeared in the invasion of West Florida by the Spaniards, in September following. As the country was in no state of defence, the enemy easily made themselves masters of it, almost without opposition. Their next enterprise was against the Bay of Honduras, where the British logwood-cutters were settled. These, finding themselves too weak to resist, applied to the governor of Jamaica for relief; who sent them a supply of men, ammunition, and military stores, under captain Dalrymple. Before the arrival of this detachment, the principal settlement in those parts, called St. George's Key, had been taken by the Spaniards, and retaken by the British. In his way, captain Dalrymple fell in with a squadron from admiral Parker, in search of some register ships richly laden; but which, retreating into the harbour of Omoa, were too strongly protected by the fort to be attacked with safety. A project was then formed, in conjunction with the people of Honduras, to reduce this fort. The design was to surprise it; but, the Spaniards having discovered them, they were obliged to fight. Victory quickly declared for the British; but the fortifications were so strong, that the artillery made no impression. It was then determined to try the success of an escalade; and this was executed with so much spirit, that the Spaniards stood astonished, without making any resistance, and, in spite of all the efforts of the officers, threw down their arms and surrendered. The spoil was immense, being valued at three millions of dollars. The Spaniards chiefly lamented the loss of 250 quintals of quicksilver; a commodity indispensably necessary in the working of their gold and silver mines, so that they offered to ransom it at any price; but this was refused, as well as the ransom of the fort, though the governor offered 300,000 dollars for it. A small garrison was left for the defence of the place; but it was soon after attacked by a superior force, and retaken.

We must now take a view of the transactions in the southern colonies; to which the war, in the year 1780, was

was so effectually transferred, that the operations there became at last decisive. The success of general Prevost, in advancing to the very capital of South Carolina, has been already stated, together with the obstacles which prevented him from becoming master of it at that time. Towards the end of 1779, Sir Henry Clinton set sail from New York with a considerable body of troops, intended for the attack of Charlestown, in a fleet of ships of war and transports, under the command of vice-admiral Arbuthnot. They had a very tedious voyage; the weather was uncommonly bad; several of the transports were lost; and an ordnance-ship foundered at sea. Having arrived at Savannah, where they endeavoured to repair the damages, they proceeded, on the 10th of February, 1780, to North Edisto, the place of debarkation which had been previously appointed. They had a favourable passage thither; and, though it required time to have the bar explored and the channel marked, the transports all entered the harbour the next day; and the army took possession of John's Island without opposition. Preparations were then made for passing the Squadron over Charlestown-bar, where the high-water spring-tides were only nineteen feet deep; but no opportunity offered of going into the harbour till the 20th of March, when it was effected without any accident, though the American galleys continually attempted to prevent the English boats from founding the channel. The British troops had previously removed from John's to James's Island; and, on the 29th of the same month, they effected their landing on Charlestown Neck. On the 1st of April they broke ground within 800 yards of the American works; and, by the 8th, the besiegers guns were mounted for action.

As soon as the army began to open their batteries against the town, admiral Arbuthnot embraced the first opportunity of passing Sullivan's Island, upon which there was a strong fort, the chief defence of the harbour. He weighed on the 9th, with the Roebuck, Richmond, and Romulus, Blonde, Virginia, Raleigh, and Sandwich armed ship, the Renown bringing up the rear; and, passing through a severe fire, anchored in about two hours under James's Island, with the loss of twenty-seven seamen killed and wounded. The Richmond's fore-top-mast was shot away, and the ships in general sustained damage in their masts and rigging, though not materially in their hulls. But the *Acetus* transport, having on-board some naval stores, grounded within gun-shot of Sullivan's Island, and received so much damage, that she was obliged to be abandoned and burnt.

On the 10th, Sir Henry Clinton and admiral Arbuthnot summoned the town to surrender; but major-general Lincoln, who commanded in Charlestown, returned them an answer, declaring it to be his intention to defend the place. The batteries were now opened against the town; and from their effect the fire of the American advanced works considerably abated. It appears, that the number of troops under the command of Lincoln, were by far too few for defending works of such extent as those of Charlestown; and, that many of these were men little accustomed to military service, and very ill provided with clothes and other necessaries. Lincoln had been for some time expecting reinforcements and supplies from Virginia, and other places; but they came in very slowly. Earl Cornwallis and lieutenant-colonel Tarleton were extremely active in intercepting these reinforcements. They totally defeated a considerable body of cavalry and militia, which was proceeding to the relief of the town; and made themselves masters of some posts, which gave them the command of the country, by which means great supplies of provisions fell into their hands. Such was the state of things, and Fort Sullivan had also been taken by the king's troops, when general Clinton again summoned the town to surrender; an offer being made, that the lives and property of the inhabitants should be preserved to them. Articles of capitulation were then agreed upon, and the town surrendered on the 4th of May, 1780. A large quantity of ordnance,

arms, and ammunition, was found in Charlestown; and, according to Sir Henry Clinton's account, the number of prisoners amounted to 5618 men, exclusively of near a thousand sailors in arms; but, according to general Lincoln's account, transmitted to the congress, the whole number of continental troops taken prisoners amounted to no more than 2487. The remainder, therefore, included in general Clinton's account, must have consisted of militia and inhabitants of the town. Several American frigates were also taken or destroyed in the harbour.

While Sir Henry Clinton was employed in his voyage to Charlestown, and in the siege of that place, the garrison at New York were not free from apprehensions for their own safety. An intense frost, accompanied with great falls of snow, began about the middle of December, 1779, and shut up the navigation of the port of New York from the sea, within a few days after the departure of admiral Arbuthnot and general Clinton. The severity of the weather increased to so great a degree, that towards the middle of January all communications with New York by water were entirely cut off; and as many new ones opened by the ice. The inhabitants could scarcely be said to be in an insular state. Horses with heavy carriages could go over the ice into the Jerseys, from one island to another. The passage in the North River, even in the widest part, from New York to Paulus Hook, which was 2000 yards, was, about the 19th of January, passable for the heaviest cannon: an event which had been unknown in the memory of man. Provisions were soon after transported upon sledges, and a detachment of cavalry marched upon the ice from New York to Staten Island, which was a distance of eleven miles.

The city of New York being thus circumstanced, was much exposed to the continental troops; and it was strongly reported, that general Washington was meditating an attack upon it with his whole force. Some time before this, major-general Pattison, commandant at New York, having received an address from many of the inhabitants, offering to put themselves in military array, he thought the present a favourable opportunity of trying the sincerity of their professions. Accordingly, he issued a proclamation, calling upon all the male inhabitants from sixteen to sixty to take up arms. The requisition was so readily complied with, that, in a few days, forty companies from the six wards of the city were enrolled, officered, and under arms, to the number of 2600. Other volunteer companies were also formed; and the city was put into a strong posture of defence. No attack, however, was made upon New York, whatever design might originally have been meditated: but an attempt was made upon Staten Island, where there were about 1800 men, under the command of brigadier-general Sterling. General Washington, whose army was halted at Morris-town, sent a detachment of 2700 men, with six pieces of cannon, two mortars, and some horses, commanded by lord Sterling, who arrived at Staten Island early in the morning of the 15th of January. The advanced posts of the British troops retired upon the approach of the Americans, who formed the line, and made some movements in the course of the day; but they withdrew in the night, and carried off with them about 200 head of cattle. Immediately on the arrival of the Americans on Staten Island, lieutenant-general Knyphausen had embarked 600 men to attempt a passage, and to support general Sterling; but the floating ice compelled them to return. After Charlestown had surrendered, general Clinton issued two proclamations, and circulated a hand-bill amongst the inhabitants of South Carolina, to induce them to return to their allegiance, and to be ready to join the king's troops. These proclamations appear to have produced some effect, though they probably operated chiefly upon those who were before not much inclined to the cause of American independence. Two hundred and ten of the inhabitants of Charlestown signed an address to general Clinton and admiral Arbuthnot, soliciting to be re-admitted to the character and condition of British subjects; declaring their disapprobation of the doctrine of American inde.

independence, and expressing their regret, that, after the repeal of those statutes which gave rise to the troubles in America, the overtures of his majesty's commissioners had not been regarded by the congress.

At this time the people of America were involved in great difficulties by the depreciation of their paper-currency. At the time when the colonies engaged in war with Great Britain, they had no regular civil government established among them of sufficient energy to enforce the collection of taxes, or to provide funds for the redemption of such bills of credit as their necessities obliged them to issue. In consequence of this, their bills increased in quantity far beyond the sum necessary for the purpose of a circulating medium: and, as they wanted at the same time specific funds to rest on for their redemption, they saw their paper-currency daily sink in value. The depreciation continued, by a kind of gradual progression, from the year 1777 to the year 1780; so that, at the latter period, the continental dollars were passed, by common consent, in most parts of America, at the rate of at least thirty-nine fortieths below their nominal value. The impossibility of keeping up the credit of the currency to any fixed standard, occasioned great and almost insurmountable embarrassments in ascertaining the value of property, or carrying on trade with any sufficient certainty. Those who sold, and those who bought, were left without a rule whereon to form a judgment of their profit or their loss: and every species of commerce or exchange, whether foreign or domestic, was exposed to numberless and increasing difficulties. The consequences of the depreciation of the paper-currency, were also felt with peculiar severity by such of the Americans as were engaged in their military services, and greatly augmented by their other hardships. The requisitions made by the congress to the several colonies for supplies, were also far from always being complied with: and their troops were not unfrequently in want of the most common necessities; which naturally occasioned complaints and discontent among them. Some of these difficulties, resulting from their circumstances and situation, perhaps no wisdom could have prevented: but they seem to have arisen in part from the congress not being sufficiently acquainted with the principles of finance, and from a defect of system in the departments of their government. The cause of the Americans appears also to have suffered by their depending too much on temporary enlistments. But the congress endeavoured, towards the close of the year 1780, to put their army upon a more permanent footing, and to give all the satisfaction to their officers and soldiers which their circumstances would permit. They appointed a committee for arranging their finances, and made some new regulations respecting their war-office and treasury-board, and other public departments.

Notwithstanding the disadvantages under which they laboured, the Americans seemed to entertain no doubts but that they should be able to maintain their independency. The 4th of July was celebrated this year at Philadelphia, as the anniversary of American independence. A commencement for conferring degrees in the arts was held the same day, in the hall of the university there; at which the president and members of the congress attended, and other persons in public offices. The chevalier de la Lucerne, minister plenipotentiary from the French king to the United States, was also present on the occasion. A charge was publicly addressed by the provost of the university to the students; in which he said, that he could not but congratulate them "on that auspicious day, which, amidst the confusions and desolations of war, beheld learning beginning to revive; and animated them with the pleasing prospect of seeing the sacred lamp of science burning with a still brighter flame, and scattering its invigorating rays over the unexplored deserts of that extensive continent; until the whole world should be involved in the united blaze of knowledge, liberty, and religion. When he stretched his views forward," he said, "and surveyed the

rising glories of America, the enriching consequences of their determined struggle for liberty, the extensive fields of intellectual improvement and useful invention, in science and arts, in agriculture and commerce, in religion and government, through which the unfettered mind would range, with increasing delight, in quest of the undiscovered treasure which yet lay concealed in the animal, vegetable, and mineral, kingdoms of that new world; or in the other fertile sources of knowledge with which it abounded. His heart swelled with the pleasing prospect, that the sons of that institution would distinguish themselves, in the different walks of life, by their literary contributions to the embellishment and increase of human happiness.

On the 10th of July, M. Ternay, with a fleet consisting of seven ships of the line, besides frigates, and a large body of French troops, commanded by the count de Rochambeau, arrived at Rhode Island; and the following day 6000 men were landed. A committee from the general assembly of Rhode Island was appointed to congratulate the French general upon his arrival: whereupon he returned an answer, in which he informed them, that the king his master had sent him to the assistance of his good and faithful allies the United States of America. At present, he said, he only brought over the vanguard of a much greater force destined for their aid; and the king had ordered him to assure them, that his whole power should be exerted for their support. He added, that the French troops were under the strictest discipline; and, acting under the orders of general Washington, would live with the Americans as their brethren.

A scheme was soon after formed, of making a combined attack with English ships and troops, under the command of Sir Henry Clinton and admiral Arbuthnot, against the French fleet and troops at Rhode Island. Accordingly a considerable part of the troops at New York were embarked for that purpose. General Washington, having received information of this, passed the North River by a very rapid movement, and, with an army increased to 12,000 men, proceeded with celerity towards King's Bridge, in order to attack New York; but, learning that the British general had changed his intentions, and disembarked his troops on the 31st of the month, general Washington recrossed the river, and returned to his former station. Sir Henry Clinton and the admiral had agreed to relinquish their design of attacking the French and Americans at Rhode Island as impracticable.

An unsuccessful attempt was also made about this time in the Jerseys by general Knyphausen, with 7000 British troops under his command, to surprise the advanced posts of general Washington's army. They proceeded rapidly towards Springfield, meeting little opposition till they came to the bridge there, which was very gallantly defended by 170 of the continental troops, for fifteen minutes, against the British army: but they were at length obliged to give up so unequal a contest, with the loss of thirty-seven men. After securing this pass, the British troops marched into the place, and set fire to most of the houses. They also committed some other depredations in the Jerseys; but were obliged to return about the beginning of July, without effecting any thing material.

In South Carolina the royal arms were attended with more success. Earl Cornwallis, who commanded the British troops, obtained a very signal victory over general Gates, on the 16th of August. The action began at break of day, in a situation very advantageous for the British troops, but very unfavourable to the Americans. The latter were much more numerous; but the ground on which both armies stood was narrowed by swamps on the right and left, so that the Americans could not avail themselves of their superior numbers. There seems to have been a want of generalship in Gates, in suffering himself to be surprised in so disadvantageous a position: but this circumstance was partly the effect of accident; for both armies set out with a design of attacking each other precisely at the same time, at ten the preceding evening, and met

met together before day-light at the place where the action happened. The attack was made by the British troops with great vigour, and in a few minutes the action was general along the whole line. It was at this time a dead calm, with a little haziness in the air, which prevented the smoke from rising, and occasioned so thick a darkness, that it was difficult to see the effect of a very heavy and well-supported fire on both sides. The British troops either kept up a constant fire, or made use of bayonets, as opportunities offered: and, after an obstinate resistance during three quarters of an hour, threw the Americans into total confusion, and forced them to give way in all quarters. The continental troops appear to have behaved well, but the militia were soon broken, and left the regulars to oppose the whole force of the British troops. General Gates did all in his power to rally the militia, but without effect: the continentals retreated in some order; but the rout of the militia was so great, that the British cavalry are said to have continued the pursuit of them to the distance of twenty-two miles from the place where the action happened. The loss of the Americans was very considerable: about 1000 prisoners were taken, and more said to have been killed and wounded, but the number is not very accurately ascertained. Seven pieces of brass cannon, a number of colours, and all the ammunition-waggons of the Americans, were taken. Of the British troops, the killed and wounded amounted to 213. Among the prisoners was major-general baron de Kalb, a Prussian officer in the American service, who was mortally wounded, having exhibited great gallantry in the action, and received eleven wounds. The British troops by which this great victory was achieved did not much exceed 2000, while the American army is said to have amounted to 6000; of which, however, the greatest part was militia.

Lieutenant-colonel Tarleton, who had greatly distinguished himself in this action, was detached the following day, with some cavalry and light infantry, amounting to about 350 men, to attack a corps of Americans under general Sumpter. He executed this service with great activity and military address. He procured good information of Sumpter's movements; and by force and concealed marches came up with and surprised him in the middle of the day on the 18th, near the Catawba fords. He totally destroyed or dispersed his detachment, which consisted of 700 men, killing 150 on the spot, and taking two pieces of brass cannon, 300 prisoners, and forty-four waggons.

Not long after these events, major-general Arnold, who had engaged so ardently in the cause of America, and who had exhibited so much bravery in the support of it, became an apostate. Major André, adjutant-general to the British army, was a principal agent in this transaction: or, if the overture of joining the king's troops came first from Arnold, this gentleman was the person employed to concert the affair with him. More must have been originally comprehended in the scheme than the mere desertion of the American cause by Arnold: but, whatever designs had been formed for promoting the views of the British government, they were frustrated by the apprehending of major André. He was taken in disguise, after having assumed a false name, on the 23d of September, by three American soldiers; to whom he offered considerable rewards if they would have suffered him to escape, but without effect. Several papers written by Arnold were found upon him; and, when Arnold had learned that major André was seized, he found means to get on-board a barge, and to escape to one of the king's ships. General Washington referred the case of major André to the examination and decision of a board of general officers, consisting of major-general Green, major-general lord Sterling, major-general the marquis de la Fayette, major-general the baron de Stenben, two other major-generals, and eight brigadier-generals. Major André was examined before them, and the particulars of his case enquired into; and they reported to the American commander in chief, that Mr. André came on shore from the *Vulture*

floop of war in the night, on an interview with general Arnold, in a private and secret manner; that he changed his dress within the American lines; and, under a feigned name, and in a disguised habit, passed the American works at Stoney Point and Verplanks Point on the evening of the 22d of September; that he was taken on the morning of the 23d at Tarry-town, being then on his way for New York: and that, when taken, he had in his possession several papers which contained intelligence for the enemy. They therefore determined, that he ought to be considered as a spy from the enemy; and that, agreeable to the law and usage of nations, he ought to suffer death. Sir Henry Clinton, lieutenant-general Robertson, and the late American general Arnold, all wrote pressing letters to general Washington on the occasion, to prevent the decision of the board of general officers from being put in force; but their applications were ineffectual. Major André was hanged at Tappan, in the province of New York, on the 2d of October. He met his fate with great firmness; but appeared somewhat hurt that he was not allowed a more military death, for which he had solicited. He was a gentleman of very amiable qualities, had a taste for literature and the fine arts, and possessed many accomplishments. His death, therefore, was regretted even by his enemies; and the severity of the determination concerning him was much exclaimed against in Great Britain. It was, however, generally acknowledged by impartial persons, that there was nothing in the execution of this unfortunate gentleman but what was perfectly consonant to the rules of war.

Arnold was now made a brigadier-general in the king's service, and published an address to the inhabitants of America, dated from New York, October 7, in which he endeavoured to justify his desertion of their cause. He said, that, when he first engaged in it, he conceived the rights of his country to be in danger, and that duty and honour called him to her defence. A redress of grievances was his only aim and object; and therefore he acquiesced unwillingly in the declaration of independence, because he thought it precipitate. But what now induced him to desert their cause was the disgust he had conceived at the French alliance, and at the refusal of congress to comply with the last terms offered by Great Britain, which he thought equal to all their expectations and their wants.

After the defeat of general Gates by earl Cornwallis, that nobleman exerted himself to the utmost in extending the progress of the British arms, and with considerable effect. But one enterprise, which was conducted by major Ferguson, proved unsuccessful. That officer had taken abundant pains to discipline some of the Tory militia, as they were termed; and with a party of these, and some British troops, amounting in the whole to about 1400 men, made incursions into the country. But on the 7th of October he was attacked by a superior number of Americans, at a place called King's Mountain, and totally defeated. One hundred and fifty were killed in the action, and 810 made prisoners, of which 150 were wounded. Fifteen hundred stand of arms also fell into the hands of the Americans, whose loss was inconsiderable.

On the 3d of September, the *Mercury*, a congress packet, was taken by the *Vestal*, captain Keppel, near Newfoundland. On board this packet was Mr. Laurens, late president of the congress, who was bound on an embassy to Holland. He had thrown his papers overboard, but great part of them were recovered without having received much damage. He was brought to London, and examined before the privy-council; in consequence of which he was committed close prisoner to the Tower on the 6th of October, on a charge of high treason. His papers were delivered to the ministry, and contributed to facilitate a rupture with Holland, as among them was found the sketch of a treaty of amity and commerce between the republic of Holland and the United States of America.

At the beginning of the year 1781, an affair happened in America, from which expectations were formed by Sir

Henry Clinton, that some considerable advantage might be derived to the royal cause. The long continuance of the war, and the difficulties under which the congress laboured, had prevented their troops from being properly supplied with necessaries and conveniences. In consequence of this, on January the 1st, the American troops that were huddled at Morris-town, and who formed what was called the *Pennsylvania line*, turned out, being in number about 1300, and declared, that they would serve no longer, unless their grievances were redressed, as they had not received their pay, or been furnished with the necessary clothing or provisions. It is said that they were somewhat inflamed with liquor, in consequence of rum having been distributed to them more liberally than usual, New-year's Day being considered as a kind of festival. A riot ensued, in which an officer was killed, and four wounded; five or six of the insurgents were also wounded. They then collected the artillery, stores, provisions, and waggons, and marched out of the camp. They passed by the quarters of general Wayne, who sent a message to them, requesting them to desist, or the consequences would prove fatal. They refused, and proceeded on their march till the evening, when they took post on an advantageous piece of ground, and elected officers from among themselves. On the second, they marched to Middlebrook, and on the third to Prince-town, where they fixed their quarters. On that day a flag of truce was sent to them from the officers of the American camp, with a message, desiring to know what were their intentions. Some of them answered, that they had already served longer than the time for which they were enlisted, and would serve no longer; and others, that they would not return, unless their grievances were redressed. But at the same time they repeatedly, and in the strongest terms, denied being influenced by the least diffidence to the American cause, or having any intentions of deserting to the enemy.

Intelligence of this transaction was soon conveyed to New York. A large body of British troops were immediately ordered to hold themselves in readiness to move on the shortest notice, it being hoped that the American volunteers might be induced to join the royal army. Messengers were also sent to them from general Clinton, acquainting them that they should directly be taken under the protection of the British government; that they should have a free pardon for all former offences; and that the pay due to them from the congress should be faithfully paid them, without any expectation of military service, unless it should be voluntary, upon condition of their laying down their arms and returning to their allegiance. It was also recommended to them to move beyond the South River; and they were assured, that a body of British troops should be ready to protect them whenever they desired it. These propositions were rejected with disdain; and they even delivered up two of Sir Henry Clinton's messengers to the congress. Joseph Reed, Esq. president of the state of Pennsylvania, afterwards repaired to them at Prince-town, and an accommodation took place: such of them as had served out their full term were permitted to return to their homes, and others again joined the American army, upon receiving satisfactory assurances that their grievances should be redressed.

Earl Cornwallis now made vigorous preparations to penetrate into North Carolina. On the 11th of January his lordship's army was in motion; but was somewhat delayed by an attempt made by the Americans, under general Morgan, to make themselves masters of the valuable district of Ninety-six. To prevent this, lord Cornwallis detached lieutenant-colonel Tarleton, with 300 cavalry, 300 light infantry, the 7th regiment, the first battalion of the 71st regiment, and two 3-pounders, to oppose the progress of Morgan, not doubting but that he would be able to perform this service effectually. The British troops came up with the Americans on the 17th of January. They were drawn up in an open wood, and, having been lately joined by some militia, were more numerous than the British;

but the latter were so much better disciplined, that they had the utmost confidence of obtaining a speedy victory. The attack was begun by the first line of infantry, consisting of the 7th regiment and a corps of light infantry, with a troop of cavalry placed on each flank. The first battalion of the 71st and the remainder of the cavalry formed the reserve. The American line soon gave way, and their militia quitted the field; upon which the royal troops, supposing the victory already gained, engaged with ardour in the pursuit, and were thereby thrown into some disorder. General Morgan's corps, who were supposed to have been routed, immediately faced about, and began a heavy fire upon the king's troops, which occasioned the utmost confusion amongst them; and they were at length totally defeated by the Americans. Four hundred of the British infantry were either killed, wounded, or taken prisoners: the loss of the cavalry was much less considerable; but the two 3-pounders fell into the hands of the Americans, together with the colours of the 7th regiment. Lieutenant-colonel Tarleton gallantly made another effort; having assembled about fifty of his cavalry, with which he charged and repulsed colonel Washington's horse, retook his baggage, and killed the Americans who were appointed to guard it. He then retreated to Hamilton's Ford, near the mouth of Bullock's Creek, carrying with him part of baggage, and destroying the remainder.

This defeat was a severe stroke to lord Cornwallis, as the loss of his light infantry was a great disadvantage to him. The day after that event, he employed in collecting the remains of Tarleton's corps, and in endeavouring to form a junction with general Leslie, who had been ordered to march towards him with some British troops from Wynneshorough. Considerable exertions were then made by part of the army, without baggage, to retake the prisoners in the hands of the Americans, and to intercept general Morgan's corps on its retreat to the Catawba. But that officer had made forced marches up the country, and crossed the Catawba the evening before a great rain, which swelled the river to such a degree, as to prevent the royal army from crossing for several days; by which time the British prisoners were got quite out of reach.

On the first of February, the king's troops crossed the Catawba at M'Cowan's Ford, where general Davidson, with a party of the American militia, was ordered to oppose their passage; but, that officer being killed by the first discharge, the royal troops made good their landing, and the militia retreated. When lord Cornwallis arrived at Hillsborough, he erected the king's standard, and invited, by proclamation, all loyal subjects to repair to it, and to stand forth and take an active part in assisting his lordship to restore order and government. He had been taught to believe that the king's friends were numerous in that part of the country: but the event did not confirm the truth of the representations that had been made. The royalists were but few in number, and some of them too timid to join the king's standard. There were, indeed, about 200 who were proceeding to Hillsborough, under colonel Pyle, in order to avow their attachment to the royal cause; but they were met accidentally, and surrounded, by a detachment from the American army, by whom a number of them are said to have been killed when they were begging for quarter, without making the least resistance. Meanwhile general Greene was marching with great expedition to form a junction with another corps of American troops, in order to put a stop to the progress of lord Cornwallis.

In other places considerable advantages were obtained by the royal arms. On the 4th of January, some ships of war with a number of transports, on-board which was a large body of troops under the command of general Arnold, arrived at Westover, about 140 miles from the Capes of Virginia, where the troops immediately landed and marched to Richmond; which they reached without opposition, the provincials having retreated on their approach. Lieutenant-colonel Simcoe marched from hence with a detachment of the British troops to Westham, where he destroyed

destroyed one of the finest foundries for cannon in America, and a large quantity of stores and ammunition. General Arnold, on his arrival at Richmond, found large quantities of salt, rum, sail-cloth, tobacco, and other merchandise; and that part which was public property he destroyed. The British troops afterwards attacked and dispersed some small parties of the Americans, took some stores, and a few pieces of cannon; and, on the 20th of the same month, marched into Portsmouth. On the 23th, captain Barclay, with several ships of war, and a body of troops under the command of major Craig, arrived in Cape Fear river. The troops landed about nine miles from Wilmington, and, on the 28th, entered that town. It was understood, that their having possession of that town, and being masters of Cape Fear river, would be productive of very beneficial effects to lord Cornwallis's army.

General Greene, having effected a junction, about the 10th of March, with a continental regiment, and two large bodies of militia, resolved to attack the British troops under lord Cornwallis. The American army marched from the High Rock Ford on the 12th of the month, and on the 14th arrived at Guildford. Lord Cornwallis, from the information he had received of the motions of the American general, concluded what were his designs. As they approached more nearly to each other, a few skirmishes ensued between some advanced parties, in which the king's troops had the advantage. On the morning of the 15th, lord Cornwallis marched at day-break to meet the Americans, or to attack them in their camp. About four miles from Guildford, the advanced guard of the British army, commanded by lieutenant-colonel Tarleton, fell in with a corps of the Americans, consisting of lieutenant-colonel Lee's legion, which he defeated.

The greater part of the country in which the action happened is a wilderness, with a few cleared fields interspersed. The American army, which was superior to the British in point of numbers, was posted on a rising ground. It was drawn up in three lines: the front line was composed of the North Carolina militia, under the command of generals Butler and Eaton; the second line was of Virginian militia, commanded by generals Stephens and Lawton, forming two brigades; the third line, consisting of two brigades, one of Virginia and one of Maryland continental troops, was commanded by general Huger and colonel Williams. Lieutenant-colonel Washington, with the dragoons of the first and third regiments, a detachment of light infantry, composed of continental troops, and a regiment of riflemen, under colonel Lynch, formed a corps of observation for the security of their right flank. Lieutenant-colonel Lee, with his legion, a detachment of light infantry, and a corps of riflemen under colonel Campbell, formed a corps of observation for the security of their left flank. The attack was made by lord Cornwallis, in the following order: on the right, the regiment of Bose and the 71st regiment, led by major-general Leslie, and supported by the first battalion of guards; on the left, the 23d and 33d regiments, led by lieutenant-colonel Webster, and supported by the grenadiers and second battalion of guards, commanded by general O'Hara; the Yagers and light infantry of the guards remained in a wood, on the left of the guns, and the cavalry in the road, ready to act as circumstances might require.

About half an hour after one in the afternoon, the action commenced by a cannonade, which lasted about twenty minutes; when the British troops advanced in three columns and attacked the North Carolina brigade with great vigour, and soon obliged part of these troops, who behaved very ill, to quit the field: but the Virginia militia kept up a heavy fire for a long time, till, being beaten back, the action became general every where. The American corps, under colonels Washington and Lee, did considerable execution. Lieutenant-colonel Tarleton had directions to keep his cavalry compact, and not to charge without positive orders, excepting to protect any of the corps from the most evident danger of being defeated.

The excessive thickness of the woods rendered the British bayonets of little use, and enabled the broken corps of Americans to make frequent stands with an irregular fire. The second battalion of the guards first gained the clear ground near Guildford court-house, and found a corps of continental infantry, superior in number, formed in an open field on the left of the road. Desirous of signalizing themselves, they immediately attacked and soon defeated them, taking two six-pounders; but, as they pursued the Americans into the wood with too much ardour, they were thrown into confusion, and instantly charged and driven back into the field by lieutenant-colonel Washington's dragoons, with the loss of the six-pounders they had taken. But the American cavalry were in turn repulsed, and the two six-pounders again fell into the hands of the British troops. The spirited exertions of general O'Hara and lieutenant-colonel Tarleton, contributed to bring the action to a termination. The British troops having at length broken the second Maryland regiment, and turned the left flank of the Americans, got into the rear of the Virginia brigade, and appeared to be gaining their right, which would have encircled the whole of the continental troops, when general Greene thought it prudent to retreat. Many of the American militia dispersed in the woods; but the continental troops fell back in good order to the Reedy Fork River, and crossed at the ford, about three miles from the field of action. When they had collected their stragglers, they retreated to the iron-works, ten miles distant from Guildford, where they encamped. They lost their artillery, and two waggons laden with ammunition. It was a hard-fought battle, and lasted an hour and an half. Of the British troops, the loss, as stated by lord Cornwallis, was 532 killed, wounded, and missing. General Greene, in his account of the action transmitted to the congress, stated the loss of the continental troops to be 329 killed, wounded, and missing; but he made no estimate of the loss of the militia. Lieutenant-colonel Stuart was killed in the action; and lieutenant-colonel Webster, and captains Schutz, Maynard, and Goodriche, died of their wounds. General O'Hara, general Howard, and lieutenant-colonel Tarleton, were also wounded. Of the Americans, the principal officer killed was major Anderson, of the Maryland line; and generals Stephens and Huger were wounded.

The British troops underwent great hardships in the course of this campaign; and in a letter from lord Cornwallis to lord George Germaine, dated March 17th, he observed, that "the soldiers had been two days without bread." His lordship quitted Guildford three days after the battle; and, on the 7th of April, arrived at Wilmington. General Greene, notwithstanding his late defeat, endeavoured to make some fresh attempts against the king's forces in South Carolina. Lord Rawdon had been appointed to defend the post of Camden, with about 800 British; and, on the 19th of April, general Greene appeared before that place with a large body of continentals and militia. He found it impossible to storm the town with any prospect of success; and therefore endeavoured to take such a position as should induce the British troops to sally forth from their works. He posted the Americans about a mile from the town, on an eminence which was covered with woods, and flanked on the left by an impassable swamp. On the morning of the 25th, lord Rawdon marched out of Camden, and with great gallantry attacked general Greene in his camp. The Americans made a vigorous resistance, but were at last compelled to give way, and the pursuit is said to have been continued three miles. The loss of the English was about 100 killed and wounded. Upwards of 100 of the Americans were taken prisoners; and, according to the account published by general Greene, they had 126 killed and wounded.

Notwithstanding the advantage which lord Rawdon had obtained, he soon found it necessary to quit his post; and the Americans made themselves masters of several other posts that were occupied by the king's troops, and the garisons were made prisoners of war. These were afterwards

wards exchanged under a cartel which took place between lord Cornwallis and general Greene, for the release of all prisoners in the southern district. After this, general Greene laid siege to Ninety-six, which was the most commanding and important of all the posts in the back-settlements; and, on the 19th of June, he attempted to storm the garrison, but was repulsed by the British troops, with the loss of 75 killed and 150 wounded. General Greene then raised the siege, and retired behind the Saluda, to a strong situation within sixteen miles of Ninety-six.

On the 18th of April, a large body of British troops, under the command of general Philips and general Arnold, embarked at Portsmouth, in Virginia, on an expedition for the purpose of destroying some of the American stores. A party of light-infantry were sent ten miles up the Chickahomany; where they destroyed several armed ships, sundry warehouses, and the American ship-yards. At Peterburgh, they destroyed 4000 hogheads of tobacco, one ship, and a number of small vessels on the stocks and in the river. At Chesterfield, they burnt a range of barracks for 2000 men, and 300 barrels of flour. At a place called Osborn's, they made themselves masters of several vessels loaded with cordage and flour, and destroyed 2000 hogheads of tobacco, and sundry vessels were sunk and burnt. At Warwick, they burnt 500 barrels of flour, some mills belonging to colonel Carey, a large range of public rope-walks and store-houses, tan and bark houses full of hides and bark, and great quantities of tobacco. A like destruction of stores and goods was made in other parts of Virginia.

Lord Cornwallis, after his victory over general Greene, at Guildford, proceeded, as we have seen, to Wilmington; and, on the 20th of May, his lordship arrived at Peterburgh, in Virginia, where he joined the British troops that had been under the command of general Philips and general Arnold. Before this junction, he had encountered considerable inconveniences from the difficulty of procuring provisions and forage; so that, in a letter to Sir Henry Clinton, he informed him, that his cavalry wanted every thing; and his infantry every thing but shoes. He added, that he had experienced the distresses of marching hundreds of miles in a country chiefly hostile, without one active or useful friend, without intelligence, and without communication with any part of the country.

On the 26th of June, about six miles from Williamsburgh, lieutenant-colonel Simcoe, and 350 of the queen's rangers, with eighty mounted yagers, were attacked by a much superior body of the Americans; but whom they repulsed with great gallantry and with equal success, making four officers and twenty private men prisoners. The loss of the Americans in this action is said to have been upwards of 120, and that of the British troops not more than forty. On the 6th of July, another action happened near the Green Springs, in Virginia, between a reconnoitring party of the Americans, under general Wayne, amounting to about 800, and a large part of the British army, under lord Cornwallis; in which, the Americans had 127 killed and wounded; and the loss of the royal troops is supposed to have been considerably greater. It was an action in which no small degree of military skill and courage was exhibited by the Americans. In a variety of skirmishes, the marquis la Fayette very much distinguished himself, and displayed the utmost ardour in the American cause.

Notwithstanding the signal advantages lord Cornwallis had obtained, his situation in Virginia began to be very critical; and the rather, because he did not receive those reinforcements from Sir Henry Clinton which he conceived to be necessary for the success of his operations. Indeed, the commander in chief was prevented from sending those reinforcements, by his fears respecting New York, against which he entertained apprehensions that general Washington intended to make a formidable attack. In fact, the American general appears to have taken much pains, and to have employed great finesse, to lead Sir

Henry Clinton into this imagination. Letters, expressive of this intention, fell into the hands of Sir Henry, which were manifestly written to be intercepted, with a view to amuse and deceive the British general. The project was successful; and, by a variety of manoeuvres, in which he completely out-generalled the British commander, he increased his apprehensions about New York, and prevented him from sending proper assistance to lord Cornwallis. Having thus kept Sir Henry Clinton in perpetual alarm, general Washington suddenly quitted his camp at White Plains, crossed the Delaware, and marched towards Virginia, with a design to attack lord Cornwallis. Sir Henry Clinton now received information, that the count de Grasse, with a large French fleet, was expected every moment in the Chesapeak, to co-operate with general Washington. He therefore endeavoured to communicate this information to lord Cornwallis; and also sent him assurances, that he would either reinforce him by every possible means, or make the best diversion he could in his favour. In the mean time, lord Cornwallis had taken possession of the posts of York-town and Gloucester, in Virginia, where he fortified himself in the best manner he could.

On the 28th of August, Sir Samuel Hood, with a squadron from the West Indies, joined the fleet under admiral Graves, before New York. It was then necessary, on account of the situation of lord Cornwallis, that they should immediately proceed to the Chesapeak; but much time appears to have been lost, though admiral Hood was extremely anxious that no delay might be made. They arrived in the Chesapeak on the 5th of September, with nineteen ships of the line; where they found the count de Grasse, who had come to an anchor, on the 30th of August, with twenty-four ships of the line. The French admiral had previously landed a large body of troops, which had marched to join the American army under general Washington. The British and French fleets came to an action on the same day in which the former arrived in the Chesapeak. On-board the British fleet, ninety were killed and 246 wounded; some of the ships were greatly damaged in the engagement, and the Terrible, a 74-gun ship, was so much shattered, that it was afterwards found necessary to set her on fire. That this action was not favourable to the English, was manifest from the event: the fleets continued in sight of each other for five days successively, and sometimes were very near; but at length, the French all anchored within the Cape, so as to block up the passage. Admiral Graves then called a council of war, in which it was resolved, that the fleet should return to New York, that the ships might be put into the best state for the service: and thus were the French left masters of the Chesapeak.

Before the news of this engagement had reached New York, a council of war had been held, in which it was resolved, that 5000 men should be embarked on-board the king's ships, in order to proceed to the assistance of lord Cornwallis. But, when it was known that the French were absolute masters of the navigation of the Chesapeak, it was thought inexpedient to send off that reinforcement. In another council of war, it was resolved, that as lord Cornwallis had provisions to last him to the end of October, it was advisable to wait for more favourable accounts from admiral Graves, or for the arrival of admiral Digby, who was expected with three ships of the line.

In the mean time, the most effectual measures were taken by general Washington, for surrounding the army under lord Cornwallis. A large body of French troops, under the command of the count de Rochambeau, with a considerable train of artillery, assisted in the enterprise. The Americans amounted to near 8000 continentals, and 5000 militia. General Washington was commander in chief of the combined forces of America and France. On the 29th of September, the investment of York-town was complete, and the British army were quite blocked up. The day following, Sir Henry Clinton wrote a letter to lord Cornwallis, containing assurances that he would do every thing

thing in his power to relieve him. A duplicate of this letter was sent to his lordship by major Cochran, on the 3d of October. That gentleman, who was a very gallant officer, went in a vessel to the Capes, and made his way to lord Cornwallis, undiscovered, through the whole French fleet, in an open boat. He got to York-town on the 10th of the month; and, soon after his arrival, had his head carried off by a cannon-ball.

After the return of admiral Graves to New York, a council of war was held, in which it was resolved, that a large body of troops should be embarked on-board the king's ships, as soon as they were refitted; and, that the exertions of both fleet and army should be made, in order to form a junction with lord Cornwallis. Sir Henry Clinton himself embarked on-board the fleet, with upwards of 7000 troops, on the 18th; they arrived off Cape Charles, at the entrance of the Chesapeake, on the 24th, where they received the mortifying intelligence, that lord Cornwallis had been obliged to capitulate five days before.

It was on the 19th of October, that lord Cornwallis surrendered himself and his whole army prisoners of war, to the combined armies of America and France. He made a defence suitable to the character he had before acquired for courage and military skill; but was compelled to submit to untoward circumstances and superior numbers. It was agreed by the articles of capitulation, that the British troops were to be prisoners to the United States of America, and the seamen to the French king, to whose officers also the British vessels found at York-town and Gloucester were to be delivered up. The British prisoners amounted to more than 6000; but many of them, at the time of surrender, were incapable of duty. A considerable number of cannon, and a large quantity of military stores, fell into the hands of the Americans on this occasion.

As no rational expectation now remained of a subjugation of the colonies, the military operations that succeeded in America were of little consequence. On the 5th of May, 1782, Sir Guy Carleton arrived at New York, being appointed to the command of the British troops in America, in the room of Sir Henry Clinton. Two days after his arrival, he wrote to general Washington, acquainting him, that admiral Digby was joined with himself in a commission to treat of peace with the people of America; transmitting to him, at the same time, some papers, tending to manifest the pacific disposition of the government and people of Britain towards those of America. He also desired a passport for Mr. Morgan, who was appointed to transmit a similar letter of compliment to the congress. General Washington declined signing any passport till he had taken the opinion of congress upon that measure; and by them he was directed to refuse any passport for such a purpose. However, another letter was sent to general Washington, dated the 2d of August, and signed by Sir Guy Carleton and rear-admiral Digby, in which they informed him, that they were acquainted by authority, that negotiations for a general peace had already commenced at Paris; that Mr. Grenville was invested with full powers to treat with all the parties at war, and was then at Paris in the execution of his commission. They farther informed him, that his majesty, in order to remove all obstacles to that peace which he so ardently wished to restore, had commanded his ministers to acknowledge the independency of the thirteen provinces the first instance, instead of making it the condition of a general treaty. But some jealousies were still entertained, that it was the design of the British court either to disunite them, or to bring them to treat of a peace separately from their ally the king of France: they therefore resolved, that any man, or body of men, who should presume to make any separate or partial convention or agreement with the king of Great Britain, or with any commissioner or commissioners under the crown of Great Britain, ought to be considered and treated as open and avowed enemies of the United States of America; and also that those States could not with propriety hold any conference or treaty with any com-

missioners on the part of Great Britain, unless they should, as a preliminary, thereto, either withdraw their fleets and armies; or else, in positive or express terms, acknowledge the independency of the said States. They likewise resolved, that any propositions which might be made by the court of Great Britain, in any manner tending to violate the treaty subsisting between them and the king of France, ought to be treated with every mark of indignity and contempt.

The most satisfactory assurances, however, on the part of the British chiefs, having been laid before congress, an immediate cessation of hostilities took place; and, on the 30th of November following, the provisional articles of peace and reconciliation between England and America was signed at Paris, by which Great Britain solemnly acknowledged the independency and sovereignty of the United States. These articles were ratified by a definitive treaty, September 3, 1783. This peace was negotiated on the part of Great Britain by Mr. Oswald, and the definitive treaty was signed by Mr. Hartley; and on the part of the United States by John Adams, and John Jay, Esqrs. and Dr. Benjamin Franklin. Holland acknowledged the independency of the United States of America on the 19th day of April, 1782; Sweden, February 5, 1783; Denmark, the 25th of February; Spain in March, and Russia in July, 1783.

Thus ended that long and arduous conflict, in which Great Britain expended near an hundred millions of money, with an hundred thousand lives, and won nothing; and in which America patiently endured every distress; lost an infinite number of lives, and much treasure; but eventually delivered herself from a foreign dominion, and gained a name among the nations of the earth.

ESTABLISHMENT of the UNITED STATES.

By the definitive treaty of peace between the king of Great Britain and the United States of America, the boundaries of these states are fixed to extend on the north from Nova Scotia, across the four great lakes Ontario, Erie, Huron, and Superior, assigning to the states the southern half of each, and in the latter the islands Royal and Phillippeaux; lake Michigan they possess entire: though these lakes have ever been considered as making a part of Canada, and no new regulation of limits has excluded them. This boundary is farther extended through the centre of the Lake of the Woods to its most western point. It may be supposed that a want of acquaintance with the geography of the country has caused it to be added "from thence on a due west course to the river Mississippi," for, if the boundary is carried due west, it will reach the Pacific Ocean, about one degree of latitude south of Nootka Sound. The line, in order to touch the Mississippi, should have been carried from the western side of the Lake of the Woods due south. In consequence of this inaccuracy, no boundary is settled throughout a space of near three degrees of latitude; it being resumed along the middle of the river Mississippi to thirty-one degrees north latitude, where that river begins to divide West Florida from Louisiana. The American States are bounded on the south by the two Floridas. They possess all the eastern coast from the mouth of the river St. Croix, in the bay of Fundy, to St. Mary's River, which divides Georgia from East Florida, and all islands within twenty leagues of any part of the shores.

The states with whom the king of Great Britain concluded this treaty were, New Hampshire, Massachusetts Bay, Rhode Island with Providence Plantation, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia.

These states, in their fullest extent, comprise eighteen degrees of latitude, and thirty-three degrees of longitude; they are described as being 1250 miles in length, and 1000 in breadth: reaching from thirty-one degrees to forty-nine degrees north latitude, and from fifty-one degrees to

eighty-four degrees west longitude from Greenwich; but, as the Americans have fixed their meridian at the city of Philadelphia, the extent in longitude from that city is, from nine degrees east to twenty-four degrees west.

Although the longitudinal extent is laid down to be nearly double to the latitudinal, yet the limits are so intersected on the northward, that toward the north-west coast it lies in forty-five degrees, except a small district of land, which reaches to almost forty-seven degrees; but, in the interior country, on lake Erie, the boundary is on forty-two degrees: its greatest extent is on the coast, toward the north-east, where only it is forty-nine degrees. Its longitudinal extent, from New England on the east, to a little below Nootka Sound on the west, comprehends the whole continental breadth, from the Atlantic to the Pacific Ocean; and it is only in that part that its breadth is 1040 miles.

Mr. Hutchins, late geographer to the United States, computed that the surface contained within the boundaries so described, is one million of square miles, which comprehends 640 millions of acres; and he computes that of these, fifty-one millions are water, or about $\frac{2}{5}$ parts of the whole: so that the land within the United States amounts to 589 millions of acres; about three-fifths of which is comprised within the States which now compose the union; the remaining 220 millions of acres, which lie west of the northern and middle States, and north-west of of the river Ohio, and extend to the river Mississippi, together with an extensive territory south of the Ohio, originally ceded to the United States, by North Carolina, South Carolina, and Georgia, forms what is usually denominated "the western territory."

The face of the country belonging to the United States, is happily variegated with plains and mountains, hills and vallies. Some parts are rocky, particularly New England, the north parts of New York, and New Jersey, and a broad space, including the several ridges of the long range of mountains which run fourth-westward through Pennsylvania, Virginia, North Carolina, and part of Georgia, dividing the waters which flow into the Atlantic from those which fall into the Mississippi.

In this extent of country are to be found every species of soil that the earth affords; and in one part or other are produced all the various kinds of fruits, grain, pulse, and hortulane plants and roots, which are found in Europe, and have been thence transplanted to America; and besides these, a great variety of native vegetable productions.

The American States are composed of almost all nations, languages, characters, and religions, which Europe can furnish; the greater part, however, are descended from the English; and all may, perhaps with propriety, be denominated Federal Americans.

The English language is universally spoken in the States, and in it business is transacted, and the records are kept. It is spoken with great purity, and pronounced with propriety, in New England, by persons of education; and, excepting some few corruptions in pronunciation, by all ranks of people. In the middle and southern States, where they have had a great influx of foreigners, the language, in many instances, is corrupted in pronunciation. Attempts are making, however, to introduce an uniformity of pronunciation, throughout the provinces; which, for political, as well as other, reasons, it is hoped will completely succeed. Intermingled with the Americans, are the Dutch, Scotch, Irish, French, Germans, Swedes, and Jews; all these, except the Scotch and Irish, retain in a greater or less degree their native language, in which they perform their public worship, converse, or transact their business with each other.

The origin of the present system of government in America, had its rise from a general congress, which, as we have seen, was first held at Philadelphia, in September, 1774, and was composed of delegates chosen by the houses of representatives of each of the twelve old colonies, Georgia alone being unrepresented in that assembly; but it afterward acceded, and the number of members then

amounted to fifty-four, and a president; two years after, the number was reduced to forty-eight. In this assembly each colony had no more than a single voice, whether its deputation was more or less numerous; so that a contrariety of opinion among the deputies from any particular colony, if the majority were in favour of the measure, did not occasion a dissenting voice in the congress; the sense of any colony could not be taken if its deputies were equally divided in their opinions; which was likely frequently to occur, as seven of the colonies sent either two or four deputies; the other five were represented by three, five, seven, or nine.

In the year 1776 congress, by a solemn act, renounced allegiance to the king of Great Britain, and declared the American colonies to be Independent States. In March, 1781, articles of confederation were ratified; and the style of the confederation was settled to be, "United States of America." The particular articles agreed upon by this compact need not here be spoken of, as in a convention of all the states, which was held at New York, where general Washington presided, a new constitution was agreed upon, from which the delegates from Rhode Island alone dissented. It consisted of seven articles, which were transmitted to congress for their approbation, which having received, in the year 1789, general Washington was chosen president of the congress thus formed.

This new system of republican government retains much of the spirit of the English constitution; and those two essential securities to individuals in their persons and their property, the habeas corpus act and trial by jury, are retained. It unites the American States in a much closer confederation than the Helvetic union brought the Swiss Cantons, or even than the compact entered into by the Seven United Provinces of the Netherlands placed the Dutch. Indeed, in many important points, it is such a form of government as the world had not before seen. The most effectual measures seem to have been taken to remove what was formerly a fruitful source of animosity and dissension among the colonies, the undefined bounds of their respective territories, as every state has now renounced all right of deciding upon their claims, and has agreed that they shall be laid before congress, and decided upon by that assembly as a court of judicature. In this new form of government the several independent states may be said to have delegated to congress all the functions of government, except retaining their interior constitution, but deprived of the power of levying duties on merchandize, of equipping ships of war, of making foreign alliances, or waging war; for, as the preamble to the new constitution expresses it, in the federal government of these states, "it is impossible to secure all right of independent sovereignty to each, and yet provide for the interest and safety of all."

The president of the congress, the senate, and representatives, form a legislative body somewhat similar to the king, lords, and commons, of Great Britain, in that every act of congress must have a majority of votes in the two houses, and receive the assent of the president, before it can pass into a law; but the American constitution differs in many particulars: the president of the congress has not a power absolutely to negative any bill; he can only refuse his assent, and at the same time is required to assign the reasons on which he founds his refusal; the business is then to undergo a fresh discussion in both houses, and the bill must be passed by two-thirds of the members of each house, which then constitutes it a law without the concurrence of the president.

No specific portion of property, whether real or personal, is required to be possessed as a qualification either for a representative, a senator, the vice-president, or the president. Nor is any one excluded on account of the religious principles which he professes, whatever they may be; so that Jews or Roman Catholics are as eligible as any other citizens. The house of representatives are chosen every two years, by the people of the several states. The only legal requisites in a candidate are his having attained

to twenty-five years of age; having been seven years a citizen of the United States; and, at the time of his election, an inhabitant of the state by which he is chosen; the holding of any place of honour, trust, or emolument, is an absolute disqualification. In this representation there is no distinction of knights, citizens, and burgeses; it not being made out of counties, cities, and borough-towns; for the exclusive rights and peculiar privileges of corporations are entirely unknown here. The design of the new constitution is, that the number of representatives in congress shall not exceed one representative for every 30,000, but that each state shall have at least one representative. An enumeration or census of inhabitants was made soon after the first meeting of the new congress, and a fresh enumeration is to be taken within every subsequent term of ten years.

In the year 1790, a census was made of all the inhabitants; when they were classed as follows:

Free white males, from sixteen years of age and upward	- - -	807,094
Free white males under sixteen	- - -	794,900
Free white females, without discrimination of age	- - -	1,541,263
All other free persons, of either sex, and all ages	- - -	59,150

The salaries paid to the great officers who conduct the affairs of government are,—The president of the congress, and commander in chief of the military and naval forces, 25,000 dollars, (5,300l. sterling.) Vice-president, and president of the senate, 5,000 dollars, (1,060l.) The speaker of the house of representatives, twelve dollars per diem during his attendance, (2l. 11s.) The members of the senate and house of representatives, six dollars (1l. 5s. 6d.) for every day's attendance; as well as for every twenty miles travelling to and from the seat of government. The secretary of the senate and clerk of the house of representatives, each 1,500 dollars, (320l.) The chief justice of the supreme court, 4000 dollars, (850l.) The four associated justices, 3,500 dollars each.

The estimated amount of foreign debt, on the 4th of August, 1790, when an act was passed to make provision for the debts incurred by the war, appeared to be 11,710,378 dollars, or 2,488,455l. sterling; the estimated amount of the domestic debt, with the arrears of interest to the 31st

of December, 1790, as reported to the house of representatives by their secretary, was,

Liquidated,	- - -	40,414,085
Unliquidated,	- - -	2,000,000
Dollars,	- - -	<u>42,414,085</u>

Or 9,012,992l. sterling. To discharge which, a subscription was opened for a loan, on the 30th of September, 1793, and nearly a sufficient sum was subscribed; the amount being 39,635,248 dollars.

The American States in their house of commons are not represented by above one-third of the number by which the people of Great Britain are represented in their house, calculating upon the supposed population of each country. The senate of the United States, which may be considered as the upper house of parliament, is composed of two senators from each state, chosen, not from the people at large, but from the legislature thereof. No one can be chosen a senator who has not attained to thirty years of age, who has not been nine years a citizen, and is not a resident in the state where he is chosen: he cannot hold any place of honour, trust, or profit. These senators, when assembled, are divided into three classes; those in the first class vacate their seats at the expiration of the second year; those of the second class, at the end of the fourth year; and of the third class, at the expiration of the sixth year.

The president of the United States, in whom is vested the executive power, and who must not be under thirty-five years of age, is chosen by the nomination of each state, who for this purpose names two, and the person upon whom the largest number of suffrages falls obtains this distinguished rank, which is held for four years. In like manner the vice-president is to be elected, and for the same term. The latter is president of the senate. The president, vice-president, senate, and representatives, are paid for their services at a rate settled by law, and out of the treasury of the United States.

As the first regulation, by which each State had only one vote in congress, is abolished, and the majority of voices among the representatives now carry a question, the weight of interest which the largest colonies possess in that house may be considered as greatly predominating over the smaller states, who send only one or two representatives each; but, as the senate is composed of two delegates from every state, and no bill can pass into a law without the concurrence of that house, the interest of each state is equally maintained there. The executive powers of the president are likewise subject to the advice and controul of the senate, by which participation of power each state has an equal opportunity of being informed of the secret measures which are pursuing by government, and an equal power of enforcing or checking them.

That both the legislative and executive branches of government, over more than three millions of people, should be placed, when first formed, in the hands of only ninety-three persons, might be considered as dangerous to the pure principles of a republican constitution, by tending to cause it to degenerate into an aristocracy; but the most effectual precautions seem to have been taken to repress the spirit of ambition, and the views of aggrandisement inherent in human nature, by every individual being chosen for a short term, from his being inhibited from enjoying any kind of post, or receiving, without permission, any kind of present.

The president, by virtue of his office, is commander in chief of the army and navy, and of the militia of the several states, when called into the actual service of the union. He has power to grant reprieves and pardons for offences against the United States, except in cases of impeachment. With the advice and consent of the senate, he has the power to make treaties, but the concurrence of two-thirds of the senators present is necessary to render such an act valid. He nominates, and, with the advice and consent of the senate, appoints, ambassadors, consuls, judges of the supreme court, and all other officers of the United States, not otherwise appointed by the constitution.

He

He may, on extraordinary occasions, convene both houses, or either of them; and, in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper. He receives ambassadors; and other public ministers, and is empowered to take care that the laws be faithfully executed.

The congress has the power to impose and collect taxes, duties, imposts, and excises, to pay the debts, and provide for the common defence and general welfare, of the community; but all duties, imposts, and excises, are to be uniform throughout the United States. To borrow money on the public credit. To regulate commerce with foreign nations, also among the several states, and with the Indian tribes. To coin money, to regulate the value thereof, and of foreign coin; and to fix the standard of weights and measures. To constitute tribunals inferior to the supreme court. To declare war, grant letters of mark and reprisal. To raise and support armies; but no appropriation of money to that use can be for a longer term than two years. To provide and maintain a navy. To provide for, call forth, arm, and discipline, the militia: each state to appoint the officers of their militia, and to possess the authority of training them, according to the discipline prescribed by congress. All bills for raising a revenue to originate in the house of representatives. The privilege of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, the public safety may require it. No money shall be drawn from the treasury but in consequence of appropriations made by law, and a regular statement and account of the receipts and expenditure of all public money shall be published from time to time. No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of the congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state. Each particular state is, by this confederation, debarred from entering into any treaty, alliance, or confederation, coin money, emit bills of credit, make any thing but gold and silver coin a tender in payment of debts, or grant any title of nobility. No state shall, without the consent of the congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection-laws; whilst the nett produce of such duties shall be for the use of the general treasury, and subject to the revision and controul of congress.

On surveying the nature of the government thus established in the United States, it will appear, that the genuine spirit of the British constitution has been much diffused through that of America. The code of laws which this new state will adopt, is likely to partake no less of the principles of the principles of British jurisprudence, but it is to be hoped that it will be as much simplified, and divested of legal chicane and circuitry, as is consistent with the judicial preservation of freedom. It is highly gratifying to an Englishman, when viewing these interesting events, to reflect, that not only the constitution and laws of his country will be thus perpetuated over a continent, which in future ages must be immensely populous, but that his language will be preserved there so long as the world shall endure. In the late war, whilst the French officers served in America, many of them were solicitous to become acquainted with the language spoken in the country, and it was at that time no small mortification to the Americans to consider it as the language of their invaders: it became therefore common among them to call the English language "the American," and to say to such foreigners as spoke it, "you speak American well." The marquis de Chastellux says, that they carried their aversion to the language so far as seriously to propose introducing another language, which should be taught in schools, and made use of in all public acts; but these resentful feelings have happily subsided.

The third congress was assembled in December 1793, when the illustrious George Washington was re-chosen

president; nor was there another man in any degree qualified like him to fill that dignified and important station; yet it is much to be apprehended that such a re-election at the commencement of the constitution, may furnish a precedent which, in future times, will prove very injurious to its original purity, as well as essential principle. Experience has fully proved, that elective offices, if not carefully guarded, are liable to be converted into tenures for life, and it may be deemed a discussion of much nicety, as well as importance, whether it had not been more advisable for the states to have lost the ostensible services of that great man for the four succeeding years, rather than by reinstating him to lay a foundation for a destructive innovation in future times; and such a sacrifice of present advantage to futurity, would have utterly frustrated all attempts of ambitious men hereafter to gain the presidency for life.

The three national objects of the government in the United States, are the encouragement of agriculture, commerce, and manufactures. The richness of the soil, which amply rewards the industrious husbandman; the temperature of the climate, which admits of steady labour; the cheapness of land, which tempts the foreigner from his native home; renders agriculture the great leading interest of America. This furnishes outward cargoes, not only for all their own ships, but for those also which foreign nations send to their ports; or, in other words, it pays for all their importations; it supplies a great part of the clothing of the inhabitants, and food for them and their cattle. What is consumed at home, including the materials for manufacturing, is four or five times the value of what is exported.

The number of people employed in agriculture, is at least three parts in four of the inhabitants of the United States; some say more. It follows of course that they form the body of the militia, who are the bulwark of the nation. The value of their property occupied by agriculture, is many times greater than the property employed in every other way. The settlement of waste lands, the sub-division of farms, and the numerous improvements in husbandry, annually increase the pre-eminence of the agricultural interest. The resources they derive from it, are at all times certain and indispensably necessary: besides, the rural life promotes health, by its active nature; and morality, by keeping the people from the luxuries and vices of populous towns. In short, agriculture is the spring of their commerce, and the parent of manufactures.

Yet the vast extent of sea-coast, which spreads before the confederated states; the number of excellent harbours and sea-port towns they possess; the numerous creeks and immense bays, which indent the coast; and the rivers, lakes, and canals, which peninsulate the whole country; give the United States superior advantages for trade. Their commerce, including their exports, imports, shipping, manufactures, and fisheries, may properly be considered as forming one interest. This has been considered as the great object, and the most important interest, of the New England States.

The consumption of fish, oil, whale-bone, and other articles obtained through the fisheries, in the towns and counties that are convenient for navigation, has become much greater than is generally supposed. It is computed that no less than 3000 barrels of mackarel, salmon, and pickled cod-fish, are vended annually in the city of Philadelphia; add to them the dried fish, oil, spermaceti candles, whale-bone, &c. and it will be found that a fleet of sloops and schooners are employed in the business.

The quantity of furs, deer and elk skins, annually imported from the northern parts of America to England, is prodigious. In 1784, the amount of sales for furs was more than 245,000*l*. It has not equalled this sum every year since, but has seldom varied more than from ten to twenty thousand pounds, and this often on the favourable side. When we consider the number of animals destroyed to furnish such extensive products, the mind feels itself

lost in contemplating the vast tract of country that could afford an habitation for them.

Manufactures, in the United States, are as yet in their infancy; the country abounds, however, with the raw materials for almost every purpose useful to mankind. Iron is found in various parts of the continent, in great abundance, and of almost every quality; and manufactures of edged tools, implements of husbandry, fire-arms and military weapons, spikes, nails, &c. are carried on to a considerable extent. The latter articles are manufactured chiefly by water-mills, the finishing of which employs a great number of boys, whose early habits of industry are of importance to the community, to the present support of their families, and to their own future comfort. It is no less curious than true, that in certain parts of the United States, the making of nails is an occasional family manufacture.

Coppersmiths and brass-founders, particularly the former, are numerous in the United States. The material is a natural production of the country. In many parts of the States mines of copper have been actually wrought. Lead also abounds in great plenty, and requires little to unfold it to an extent more than sufficient for every domestic occasion. A prolific mine of it has long been open in the south-western parts of Virginia; and, under a public administration, during the late war, yielded a considerable supply for military use. This is now in the hands of individuals, who not only carry it on with spirit, but have established extensive works at Richmond, in the same state.

As an important instrument of manufactures, fossil coal may, without impropriety, be mentioned among the subjects of the present remarks. There are several coal-mines in Virginia now worked; and appearances of their existence are familiar in several of the other states. As an article of household fuel it is an interesting production; and its importance to navigation, as a boundless source of traffic coastwise, is signally exemplified in Great Britain.

There is scarcely any manufacture of greater importance to the United States, than that of skins. The direct and very happy influence it has upon agriculture, by promoting the raising and growth of cattle of different kinds, is a very material consideration. Tanneries are now carried on as a regular business in many of the states, and they constitute in some places a valuable item of incidental family manufacture. Cabinet wares, and household furniture, likewise constitute an extensive branch of their domestic trade.

Manufactures of the several species of grain have made considerable progress in the United States; and are entitled to peculiar attention, not only because they are most of them so intimately connected with the subsistence of the people, but because they enlarge the demand for the most precious products of the soil. Breweries are now carried on very successfully; and, in order to discourage the use of spirituous liquors, a low duty has been imposed upon them; which, however, has been the means of introducing the excise-laws into America.

Manufactures of flax, hemp, and cotton, have already made considerable progress in the United States. Cotton works, not long since established at Beverly, in Massachusetts; at Providence, in the state of Rhode Island; and at New York; seem to have overcome the first obstacles to success: producing corduroys, velvets, fustians, jeans, and other similar articles, of a quality which will bear a comparison with the like articles from Manchester. Some essays are also making in the printing and staining of cotton goods; and there are several small establishments of this kind lately set on foot, that bid fair to grow into the first importance. A promising essay towards the fabrication of cloths, kerseymeres, and other woollen goods, is likewise going on at Hertford, in Connecticut. Specimens of the different kinds which we have seen, evince that these fabrics have already attained a considerable degree

of perfection. Household manufactures of woollen articles are carried on, in different parts of the United States, to a very interesting extent; and many thousands of families spin and make up their own clothing. Hats of wool, and of wool mixed with fur, are made in large quantities; and constitute a very productive manufacture, rapidly extending over the whole North American continent.

The production of silk is attended with great facility in most parts of the United States; but flourishes most in Connecticut, where silk stockings, handkerchiefs, ribbons, buttons, &c. are now made in tolerable quantities. A manufactory of lace has also been established at Ipswich, in the state of Massachusetts, which bids fair to answer every purpose of the proprietor.

Different manufactures of glass are now on foot in the United States. The sands and stones called *targa*, which include flinty and crystalline substances, and the salts of various plants, particularly kali or kelp, constitute the essential ingredients, and are every where to be found in North America. An extraordinary abundance of fuel, which is always at hand, gives great advantage to the undertaking. Considerable progress has been likewise made in the manufacture of gunpowder; and the encouragement given to it by the government, bids fair to make it an extensive article of commerce.

Manufactures of paper are among those which are arrived at the greatest maturity in America, and are most adequate to a national supply. That of paper hanging is also a branch in which respectable progress has been made. Refined sugars and chocolate are among the number of extensive and prosperous domestic manufactures; and that of maple sugar particularly, has of late become an interesting object of national attention. It is made from the sap or juice of the *ACER*, or maple-tree, which grows spontaneously in North America; and yields, by an easy process, great quantities of sugar, in every respect equal to that which is imported from the West-India islands. The manufacture of wines is also growing into respectability among the United States. Successful experiments have been made by some French settlers on the river Ohio, which evince the practicability of producing home-made wines of excellent quality; and, as grapes are the spontaneous production of the country, and, by culture, might be raised in any quantity, in great perfection, this manufacture bids fair to diminish, and in time, perhaps, wholly to preclude, foreign importation. It is further a pleasure to remark, that public improvements of every kind, in the United States of America, appear to go hand in hand with the extension of their commerce, and the growth of their manufactures. In the space only of three years, from the end of 1790 to the end of 1793, more public funds and private capitals have been applied to the improvement of roads and rivers, and the cutting of canals, than have been expended from the first settlement of the colonies up to that time.

The naval and military establishments of the United States are wisely kept upon a narrow footing. To aim at such a navy as the principal maritime powers of Europe possess, would be a useless waste of their revenue. As they have no possessions to protect abroad, nor any ambitious view of extending their dominions, it is deemed sufficient that ships enough be kept to repel any hostile attempt of those nations of Europe that are weak on the sea; because circumstances exist, which render even the stronger ones weak as to them. Providence has placed the richest and most defenceless European possessions at their door, and obliged its most valuable commerce to pass by their shores. To protect either of these, a small part only of any European navy would ever be detached across the Atlantic; and the dangers to which the elements expose them there, have been too often fatally experienced by the principal potentates of Europe. Hence a small naval force will at all times be sufficient to cope with such detachments, as well as to protect the American territory, and annoy the commerce of their enemies. Their mili-

tary strength lies chiefly in a well-disciplined militia. Five thousand regular troops were, however, in 1794, enlisted for the term of three years; and, on account of the present posture of affairs, it was proposed to encrease the number to 15,000; but, after mature deliberation, the house of representatives refused to comply, rather chusing, in case of a war, to trust to the energy and exertions of their militia, than risk the introduction of a standing army.

With respect to religion, we find a vast number of different sects dispersed over the United States; yet the spirit of toleration prevails among them to the fullest extent. In the New England provinces, the presbyterians and independents are most numerous; but, in Connecticut, the form of worship and ecclesiastical government of the church of England prevail. More to the southward the Quakers are extremely numerous, and the Moravians are increasing and flourishing greatly. Methodism likewise spreads very wide; but it has been said by an extensive observer of the present prevailing manners in these States, that the prevalent religion of the principal inhabitants of America, and particularly to the southward, is pure *deism*; called by the name of *philosophy* in Europe. A spirit which has contributed in no small degree to the revolution, and produced their unfettered constitutions of freedom and toleration.

When the independence of the American States was acknowledged by the British government, it became necessary that the clergy who adhered to the discipline of the church of England should obtain ordination, and that all ecclesiastical affairs should be transacted without crossing the Atlantic, and applying to an English bishop. At length an act of parliament was passed in Great Britain, authorising the metropolitan to consecrate American bishops. These now ordain priests and deacons for the service of the church of England there, but have no revenues annexed to their sees, and are no otherwise distinguished from the body of the clergy, than by pre-eminence of rank. In short, religion, in the United States, is placed on its proper basis. Without the feeble and unwarranted aid of the civil power, it is left to be supported by its own internal evidence, by the lives and manners of its professors, and by the almighty care of its Divine Author.

AMERICAN NIGHT-SHADE, *f.* in botany. See PHYTOLOACCA.

AMERICAN EARTH-NUT, *f.* in botany. See ARACHIS.

AMERICUS VESPUTIUS, a Florentine gentleman, from whom America improperly derived its name. The merchants of Seville, having obtained permission to attempt discoveries as private adventurers, sent out four ships in 1499, under the command of Alonzo de Ojeda (who had accompanied Columbus in his second voyage), assisted by Americus Vesputius, who was known to be deeply skilled in the science of navigation. This fleet touched on that part of the western continent already discovered by Columbus, whose track Ojeda followed; and Americus, who was a man of much address, as well as possessed of considerable literary talents, by publishing the first voyages on the subject, and other artful means, gave his name to the New World, in prejudice to the illustrious Genoese. The imposture, though long detected, has been sanctified by time; and hence the fourth division of the globe, so long unknown to the inhabitants of Europe, Asia, and Africa, continues to be distinguished by the name of AMERICA.

AMERIM'NUM, *f.* [*αμνημονον*, Gr. any thing void of care, or in a state of security; from the careless flow of the branches.] In botany, a genus of the diadelphica decandria class, ranking in the natural order of papilionaceæ or leguminosæ. The generic characters are—Calyx: perianthium one-leaved, tube bell-shaped, five-toothed; teeth sharp. Corolla: papilionaceous; standard with an oblong claw, roundish, heart-shaped, expanding, convex; wings lanceolate, shorter than the standard; keel short. Stamina: filaments ten, conjoined; antheræ roundish. Pistillum: germ pedicelled, oblong, compressed-leafy, varicose, with lateral veins, within woody, not gaping; cells

disposed longitudinally within. Seeds: solitary, kidney-shaped, thicker at the base, appendicled at the tip.—*Essential Character.* Calyx two-lipped; legume compressed-leafy, two-valved, gaping; seeds few, solitary.

Species. 1. *Amerimum Brownei*: unarmed; leaves petioled, alternate, subcordate-ovate; racemes compound, axillary and lateral. This shrub rises commonly to the height of about ten feet, and supports itself upon other shrubs. It divides into long round branches, covered with a blackish bark, and sub-dividing into a great number of alternate twigs. Leaves quite entire, sharp, shining, two or three inches in length. The common peduncles sustain about ten flowers; which are small, white, and have a very sweet scent: they come out in great abundance after the rainy season. The standard of the corolla after fecundation becomes erect, whereas before it spread out wide. Native of Carthage, Jamaica, and Domingo.

2. *Amerimum ebenus*, or prickly amerimum or Jamaica ebony: spiny; leaves subsessile aggregate obovate-oblong, peduncles two-flowered. The second sort is very common in Jamaica, and several other places in the West Indies, where the wood is cut, and sent to England under the title of ebony, though it is not the true ebony, which is a native of the eastern country, and is a plant of a very different genus. The wood of this American ebony being of a fine greenish brown colour, and polishing very well, is much coveted by the instrument-makers; and is of a very hard durable nature. Dr. Browne adds, that the small dimensions of this shrubby tree render it fit only for few purposes, the trunk seldom exceeding three or four inches in diameter: but that the slender branches, being very tough and flexible, are frequently used for riding switches, and generally kept at all the wharfs about Kingston, to scourge the refractory slaves. This tree has a pretty thick stem which rises twelve or fourteen feet high, covered with a rugged brown bark, and divides into many spreading branches, which grow almost horizontal, and are armed with short brown crooked spines. The leaves are small, stiff, and wedge-shaped, coming out in clusters, and sit close to the branches. The flowers come out upon slender foot-stalks from the side of the branches singly; they are of a bright yellow colour, and are succeeded by compressed moon-shaped pods, which inclose one kidney-shaped seed.

Propagation and Culture. The second sort is propagated by seeds, which must be procured from the countries of its natural growth, for the plants do not produce seeds in this climate. These seeds should be sown in pots filled with light fresh earth early in the spring, and plunged into a good hot-bed of tanner's bark, or placed in tan under pots, as their covers are very hard. In about six weeks the plants will appear, when they must be carefully treated, being very tender while young; they must have fresh air admitted to them every day when the weather is warm, and should be frequently refreshed with water when the earth in the pots appears dry. In about five or six weeks after the plants appear they will be fit to transplant, when they should be carefully shaken out of the pots and separated, planting each into a small pot filled with light rich earth, and then plunged into the hot-bed again, being careful to shade them from the sun every day until they have taken root; after which time they must be treated in the same manner as other very tender exotic plants, by giving them air every day in warm weather, and watering them once in two or three days gently, and, when the nights are cold, to cover the glasses. In this hot-bed the plants may remain till autumn, when they must be removed into the stove, and plunged into the bark-bed. Those of them whose roots have filled the pots, should be carefully shifted into pots one size larger before they are plunged; but, as these plants are not of quick growth while young, they do not require to be often shifted out of the pots. During the winter season these plants must be kept warm, especially the first year, and must have but little water, and in cold weather it must be given to them in small

small quantities; and, if their leaves should contract filth, they must be washed with a sponge to clean them, otherwise the plants will not thrive. As these plants are very tender when young, they will not live in the open air in this country, even in the warmest part of the year; therefore they must be constantly kept in the stove, and should be kept plugged in the bark-bed, observing in the summer season, when the weather is warm, to admit a large share of fresh air to the plants; but, when they have obtained strength, they may be exposed for three months in a warm situation in the summer.

AM'ERSFORT, a considerable town of the Netherlands, in the province of Utrecht. It carries on a manufacture of dimity and bombazines, and is seated in a fertile country, on the river Ems, twelve miles east of Utrecht. Lat. 52. 14. N. lon. 5. 22. E.

AM'ERSHAM, [*Agmundesham*, from *ac* in oak, *mund* a fence or mound, and *ham*, Sax. a village, q. d. a village fenced from the violence of the winds with a row of oaks; or from *Agmundas*, the builder of it.] A borough-town in Buckinghamshire, twenty-six miles from London. It has a market on Tuesday, and a fair on Whit-Monday for cattle, as also a statute-fair on the 19th of September. The chief manufactures are lace, which is considerably large, chiefly black lace; the facking manufacture, which is but small; and a manufactory for white cotton goods, by a machinery of the newest construction. This town lies in a vale between woody hills, near the river Colne, and has a free-school, founded in the reign of queen Elizabeth, and four alms-houses. Amersham consists of a long street, in the road from Uxbridge to Buckingham, divided about the middle by a shorter cross-street; in the intersection of which stands the church. The living is said to be the best in England. The town sends two members to parliament, and its town-hall, or market-house, is the handsomest in the county. Lat. 51. 47. N. lon. 0. 15. W.

A'MERY, or A'MERICK, [*earice*, Sax. always rich.] A proper name of men.

A'MES (William), a learned divine, famous for his controversial writings, was born in 1576, and educated at Christ's college, in Cambridge. In the reign of James I. he left the kingdom, on account of his being unwilling to conform to the rules of the church; and retired to the Hague, where he was invited to accept of the divinity-chair in the university of Franeker, in Friesland, which he filled with admirable abilities for above twelve years; during which his fame was so great, that many came from remote nations to be educated under him. His controversial writings, which compose the greatest part of his works, are chiefly against Bellarmine and the Arminians. He also wrote, *A fresh Suit against the Ceremonies; Lectures on Psalmos Davidis; Medulla Theologiæ*; and several pieces relative to the sciences. He died of an asthma at Rotterdam, in November 1633.

AMES ACE, *f.* [a corruption of the word *ambs ace*, which appears, from very old authorities, to have been early softened by omitting the *b.*] Two aces on two dice:

But then my study was to cog the dice,
And dext'rously to throw the lucky sice:
To shun *ames ace*, that swept my stakes away;
And watch the box, for fear they should convey
False bones, and put upon me in the play. *Dryden.*

AMESS', *f.* [corrupted from *amice*.] A priest's vestment.

AMESTRA'TA, a town of Sicily; now *Mistretta*, in the Val di Demona, on the river Halesus. It was a very strong fort of the Carthaginians, besieged in vain by the Romans for seven months with considerable loss; at length, after another siege, taken and raised.

AMETHO'DICAL, *adj.* [from *a* and *method*.] Out of method; without method; irregular.

A'METHYST, *f.* [*αμεθυστος*, Gr. of *α* priv. and *μεθυσω*, to make drunk.] A transparent gem of a purple colour, which seems composed of a strong blue and a deep red; and, according as either of these prevails, affording diffe-

rent tinges of purple, sometimes approaching to violet, and sometimes even fading to a pale rose-colour. Though the amethyst is generally of a purple colour, it is nevertheless sometimes found naturally colourless, and may at any time be easily made so by putting it into the fire; in which pellucid or colourless state, it so resembles the diamond, that its want of hardness seems the only way of distinguishing it. Some derive the name *amethyst* from its colour, which resembles wine mixed with water; whilst others, with more probability, think it got its name from its supposèd virtue of preventing drunkenness; an opinion which, however imaginary, prevailed to that degree among the ancients, that it was usual for great drinkers to wear it about their necks. Be this as it will, the amethyst is scarcely inferior to any of the gems in the beauty of its colour; and in its purest state is of the same hardness, and at least of equal value, with the ruby and sapphire. It is found of various sizes, from the bigness of a small vetch to an inch and a half in diameter, and often much more than that in length. Its shape is extremely various, sometimes roundish, sometimes oblong, and at others flattened, at least on one side; but its most common appearance is in crystalliform figure, consisting of a thick column, composed of four plants, and terminated by a flat and short pyramid, of the same number of sides; or else, of a thinner and longer hexangular column; and sometimes of a long pyramid, without any column. It makes the gayest figure in the last of these states, but is hardest and most valuable in the roundish and pebble-like form. The amethyst is found in Persia, Arabia, Armenia, and the East and West Indies, and in several parts of Europe.

Counterfeit or factitious AMETHYSTS. Spars and crystals tinged red and yellow, &c. are sold for amethysts. The false ones come from Germany, are tinged by vapours in the mines, and contain some lead. Amethysts may likewise be counterfeited by glass, to which the proper colour or stain is given. There were fine ones made in France about the year 1690, which may even impose on connoisseurs, unless the stone be taken out of the collet. The method of giving this colour to glass is directed as follows: Take crystal frit, made with the most perfect and fine tarso; then prepare a mixture of manganese in powder, one pound; and zaffar prepared, one ounce and a half. Mix these powders well together; and add to every pound of the frit an ounce of this powder. Let it be put into the pots with the frit, not into the already-made metal. When the whole has stood long enough in fusion to be perfectly pure, work it into vessels, and they will resemble the colour of the amethyst.

AMETHYST, in heraldry, a term for the purple colour in the coat of a nobleman, in use with those who blazon with precious stones, instead of metals and colours. This, in a gentleman's escutcheon, is called *purple*; and in those of sovereign princes, *mercury*.

AMETHYSTEA, *f.* [from the *amethystine* colour of the flowers.] In botany, a genus of the diandria monogynia class, in the natural order of verticillatæ. The generic characters are—Calyx: perianthium one-leaved, tube bell-shaped, angular, semiquinquefid, subequal, acuminate, permanent. Corolla: one-petalled, ringent, little longer than the calyx; border five-parted, subequal; upper lip erect, rounded, concave, two-parted, gaping; lower three-parted, the sides rounded, erect, shorter; the middle quite entire, concave, the length of the upper lip. Stamina: filaments filiform, approximating, under the upper lip, and longer than it; antheræ simple, roundish. Pistillum: germ quadrifid; style size of the stamens; stigmas two, acute. Pericarpium: none, but the calyx becomes more bell-shaped and spreading. Seeds: four, shorter than the calyx, obtuse, angular within.—*Essential Character.* Corolla quinquefid; the lower division more spreading. Stamina approximated. Calyx subcampanulate. Seeds four, gibbous.

There is only one species, called *amethystea cærulea*. It is an annual plant with an upright stalk, which rises

about a foot high; toward the top it puts out two or three small lateral branches, with small trifid leaves, fawed on their edges, of a very dark green colour; at the extremity of the branches the flowers are produced in small umbels; they are of a fine blue colour, as are also the upper part of the branches, and the leaves immediately under the umbel; so that, although the flowers are small, yet from their colour, with that of the upper part of the stalks, the plants make a pretty appearance, during their continuance in flower. If the seeds of this plant are sown in the autumn, or are permitted to scatter, the plants will come up early the following spring, and these will flower the beginning of June; but those which are sown in the spring will not flower till July; and, in dry seasons, the seeds will remain in the ground a whole year, so that the best time for sowing them is in the autumn. This plant is a native of the mountains of Siberia, from whence the seeds were sent to the imperial gardens at Petersburg, where the plants flourished and perfected their seeds, part of which were sent to Mr. Miller by Dr. Ammann, which grew in 1759 in the Chelsea garden, where the plants annually produce seeds.

When the plants come up, they will require no other care but to keep them clean from weeds, and, where they are too close, to thin them; for they do not thrive when transplanted, therefore the seeds should be sown where they are to remain.

AMETHYSTINE, *adj.* Resembling an amethyst in colour.

AMHAR, or **AMHARA**, a province of Abyssinia, said to extend forty leagues from east to west. It is considered as the most noble in the whole empire, both on account of its being the usual residence of the Abyssinian monarchs, and having a particular dialect different from all the rest, which, by reason of the emperors being brought up in this province, is become the language of the court and of the politer people. Here is the famed rock Ambageshen, where the young monarchs were formerly confined.

AMHERST (Lord). This gentleman, who has spent a long and active life in the service of his country, was major-general and commander of the land-forces in the expedition against Louisbourg in the year 1758. The land-forces amounted to about 14,000 men, including some light troops, fitted out for the peculiar service of the country. The fleet arrived at Halifax, in Nova Scotia, on the 9th day of May, failed from thence on the 28th of the same month, and, on the 2d day of June, appeared before Louisbourg. For six days they remained on the coast without being able to effect a landing, owing to the prodigious surf which swelled all along the shore, so that no boat could possibly live near it. The French, not trusting to this obstacle, had drawn intrenchments in every part where it might be possible to land, supported them with batteries in convenient places, and lined them with a numerous infantry. At length the surf, though violent at first, was observed to be somewhat abated, and the admiral and general did not lose a moment to avail themselves of this first opportunity of landing: they made all their dispositions for it with the highest judgment. The frigates were ordered to rake the enemy on the right and left, whilst the troops were disposed for landing in three divisions. That on the left was destined to the real attack. The divisions in the centre and to the right were meant only as feints, to draw the enemy's attention to all parts, and to distract their defence. The landing being effected, the centre division of the army moved forward, and was followed by the third division on the right; so that, in the course of that day, the whole British army made good their landing with inconsiderable loss. The interval of calm weather, which had befriended the operation thus far, was of very short continuance; it was succeeded by tempests, which continued several days, and caused a prodigious surf, which rendered it impossible to land the artillery and ammunition necessary to begin the siege. But the excellent conduct of general Amherst, by degrees,

overcame all the difficulties of the weather, which was extremely unfavourable, as well as those of the ground, which was rugged in some places, and boggy in others. At the same time the garrison defended the place with great resolution. Nor were the French destitute of means of defence, for in the harbour they had five sail of the line, each of which could bring a broadside to bear on the English troops as they advanced. It was therefore necessary to secure a point, called the light-house battery, which in some measure commanded the harbour. The possession of this spot greatly accelerated the reduction of the place; for, on the 25th day of June the island battery, which had been a great annoyance to the besiegers, was effectually silenced. Still, however, the advances were very gradual, for the ships in the harbour yet continued to fire with considerable effect. Fortunately, on the 21st day of July, one of the ships blew up, and spread its flames to the two next adjoining, whereby they were presently consumed to the water's edge. This was a decisive advantage gained. The approaches were now brought near the covered way, and it was expected that a lodgement would soon be made in it; the fire from the besieged grew less. By this time the fortifications had suffered great injury, and a considerable part of the town was reduced to ashes; so that the garrison soon after became prisoners of war, and amounted, with the irregulars and seamen, to 5637 men.

According to the plan laid down in England, for the reduction of Quebec and Montreal, we find general Amherst in motion, with some of his troops, as early as the first of May, 1759. He arrived at Albany on the 12th, and set out for Fort Edward on the 3d of June; the regular regiments being posted on the road to bring up the provisions in the batteaux; and all precautions were used to prevent a surprise. But, not to mention the difficulty of bringing up the batteaux, &c. for transporting the army, such was the behaviour of some individuals in that part of the world, without whose concurrence nothing could be done effectually, that general Amherst's progress was greatly obstructed: the impediments he met with protracted the time till the summer was far advanced before he could get his forces across Lake George. They landed on the 21st of July, and reached the field where their countrymen had fallen with so great a slaughter, and were obliged to retreat, before Ticonderoga, in the preceding year; but which hitherto-impregnable post, the enemy judging from the precaution and wise dispositions, and bold advances into their lines, with bayonets fixed, made by the approaching besiegers, that it would be impossible for them to maintain their post; and that their retreat from place to place, within the centre of operations, to cover Quebec, would do effectual service, and be much more eligible than to risk the hazard of being made prisoners of war; they did all that time would permit to dismantle their fortifications, and then retreated to Crown Point.

This acquisition, without a blow, put general Amherst into possession of a post, that effectually covered the frontiers of New York, and afforded him a safe retreat in case of necessity. For which reason he ordered the fortifications to be immediately restored, and allotted a strong garrison to protect it after his departure. During his stay at Ticonderoga, he levelled the trenches and batteries, and filled up the road he had made from lake Champlain to the Saw-mill river, for carrying on the siege, repaired the works of the fort, sent 500 men to Fort George for provisions, &c. and not only ordered brig-boats, built by his direction, to be finished with all expedition; but the French boats, which they sunk before they retreated, to be fished up, that he might have a superior force of sloops to the enemy on the lake. He forwarded every thing as fast as possible, that he might get possession of Crown Point without loss of time. While the general was thus necessarily employed, he continually detached scouting parties to reconnoitre, and to look from the mountains into Crown Point itself, and to watch the motions of a corps of the enemy.

enemy, which encamped on the eastern part of the lake. Whether diffident of their own strength, or directed to withdraw from their strong holds, by order of M. Montcalm, which, in case of a siege, he was in no condition to relieve; and his present circumstances required all his collective strength in the field; the scouts, on the 1st of August, brought an account, that the enemy had abandoned Crown Point also. The weather was so bad that made it impracticable to move with his whole army until the 4th. But he dispatched 200 rangers through the woods, to seize the possession of so easy a conquest. On the 4th, weather permitting, and the boats being brought over the carrying-place, the troops began to embark at two in the morning, and were all got over the lake, landed, and posted, before night; some being encamped, and others laid on their arms. Next day the general, considering the importance of this situation, which entirely secured all his majesty's dominions behind it, from the inroads of the enemy, and from the seeping parties that had infested the whole country, and that it would give peace and quiet to all the settlers from thence to New York to have a respectable fort built on that spot; he immediately ordered the ground to be traced out, and the fort to be begun with all possible expedition. Here general Amherst received intelligence, that the flying enemy had retired to the Isle Aux Noix, standing at the other end of lake Champlain, at about five leagues from St. John's: that their numbers were augmented, by other parties called in, to 3500 effective men, regulars, marines, and Canadians, encamped under the command of M. de Burlemaque, and provided with a numerous and well-regulated artillery; and that the enemy had got a squadron of four large vessels on the lake, mounted with cannon, and manned with piquets from different regiments, under the command of experienced naval officers. A strength, which, if to be encountered and defeated by general Amherst, was sufficient to retard his advancing to the assistance of the besiegers of Quebec, before the approach of the winter would oblige him to fall back, to prevent his army's suffering by the inclemency of the weather. But such was his zeal for the service of his country, that, regardless of any thing but to fulfil his instructions, he ordered a sloop to carry sixteen guns, and a radeau (of eighty-four feet long and twenty broad) to carry six 24-pounders, to be built with the utmost expedition; and with these, and with a brigantine and a sloop, which arrived on the 11th of October, the general embarked to attack Burlemaque on the Island Aux Noix; but a storm soon after compelled him to give up all further thoughts of forcing a way to the river St. Lawrence in quest of the British fleet, and to seek shelter once more in the bay, from whence he had sailed just before: where he debarked, and marched with his army back to Crown Point; without being able to get any certain intelligence of the situation and operations of the fleet and army before Quebec. He arrived at Crown Point on the 21st of October, where he completed his intended fortresses, and three small out-forts; opened communications between Ticonderoga and the governments of New Hampshire and Massachusetts; and disposed his troops in winter quarters, after such a manner, as to prevent any inroads by the enemy.

General Amherst resumed his operations as soon as the season in 1760 would permit. But before he could reach Oswego (on the 9th of July) two French vessels had crossed the lake, and appeared off that fort. Being informed of this, the general ordered the *Mondega*, carrying four 9-pounders, fourteen 6-pounders, and 100 seamen; and the *Mohawk*, carrying sixteen 6-pounders and ninety seamen; to sail in quest of them, and if possible to cut them off from their harbour. General Amherst, during his stay at this fort, employed his time in every useful expedient to improve the troops and to forward his intended operations against the enemy. For it was the 9th of August before Schuyler's regiment arrived. The whole army was ordered to embark at day-break next morning;

but, the batteaux being not quite completed, the general embarked with the regulars; and left general Gage to bring up the provincials and the rear; who failed next morning, and joined general Amherst on the 14th. This navigation was attended with several difficulties, from its own nature and the want of sufficient pilots; which greatly retarded the armed vessels. On the 16th the general had intelligence of the enemy's two vessels, which had escaped the vigilance of those sent in quest of them on the 14th of July. An Oswegatchie Indian informed him that one of the French vessels was a-ground at the fort, and so much damaged that he could not get off; and that the other lay off Galette. At this juncture the armed vessels could not be found, having got out of the right channel: wherefore the general fitted his row-galleys to attack the vessel. This account also hastened his attack of the enemy's post at Isle Royale. As this post was deprived of any assistance from their ships, he resolved to proceed, without halting, down the river Swegatchie for that purpose; and reached the Point de Baril with the advanced guard very late in the day of the 16th. They could see the French vessel a-ground; but, as it was a calm, there was no reaching of her that night: but she was taken the next day; on which day also, the general took possession of Swegatchie, and encamped there, while he detached two engineers, with parties, to view the coasts and situation of the islands near l'Isle Royale; whose report, next day, being favourable, general Amherst, though the weather was excessive bad, was determined to seize the first moment to invest the place. He set off with a proper force, and three row-galleys, taking also some light field-pieces; rowed down the north shore, passed the fort, and took possession of the islands and coasts below it. At eleven at night the place was completely invested. Isle Gallot and l'Abbé Piquets Island were found abandoned; the enemy having left them in a great hurry; for the scalps they had taken on the Mohawk river, with tools and utensils of various kinds, two swivels, some barrels of pitch, and a quantity of iron, were left behind. The Indians whom the general had with him, on finding the scalps, burnt the chapel, and all the houses. On the 19th, at day-break, the general viewed the islands, with colonel Williamson and lieutenant-colonel Eyre, and fixed the batteries, one on each of the two islands nearest the fort; and one on a point of land on the south shore. Detachments were immediately made to open ground. The enemy kept a front fire at the vessels: but the general ordered his vessels to avoid firing, rather than keep it up, and spent the 19th in preparing fascines, and every necessary for carrying on the siege. Which preparations were so well conducted, that all the batteries began to play on the 23d, and did so much execution, that the enemy drew in their guns, and tried to put them under cover. General Amherst also made a disposition for storming the fort, after some time firing: but he was obliged, for the present, to put it off; his vessels not complying with his orders so well as he could have wished. But, the enemy not able to keep to their guns, and many of their guns being dismounted and disabled, the garrison beat a parley in the afternoon, which ended in a capitulation; by which his majesty was put into possession of a fort and post, that entirely commanded lake Ontario, and effectually covered the Mohawk river, and all that part of his majesty's dominions, from the inroads and barbarities of the savages.

Having repaired the fort, mended the batteaux, fitted out the vessels, and made such other preparations as were judged essentially necessary for the passage of the army down the river, the general proceeded for Montreal, the place of his destination, on the 31st, and arrived at the Isle au Chat, a passage of about twenty-four miles, where he encamped that night; and next day arrived at John's Point, fourteen miles lower, being interrupted and delayed by the parties of the enemy that lined, and fired upon the batteaux from the shore, as they passed the Long Saut; and by the rapids and broken waves, which filled

many of the batteaux with water, and drowned a corporal and three men of the royal highlanders. On the 2d, this armament rowed twenty-four miles down lake St. Francis, arrived at Point au Beaudet; encamped and hauled in their boats under the shelter of coves, before night; when there arose a very violent storm of rain and wind, which continued all next day. But the army embarked again soon after day-break on the 4th, and arrived that night at Isle Perrott, with the loss of eighty-four men drowned, twenty-nine batteaux of regiments, seventeen of artillery, some artillery and stores, seventeen whale-boats, and one row-galley, occasioned by the rapids. The regulars encamped upon this island, about two miles from the river. But the greatest part of the artillery, and the provincials, encamped on the river side, it being too late for them to proceed to the head-quarters. The islanders abandoned their houses, and fled into the woods, at the approach of the English. But next day, being invited to come in by some of their own people, who were taken and dispatched to them, with assurances of protection, upon their submission and good behaviour; they returned to their habitations, took the oath of allegiance to his Britannic majesty, and, being suffered to keep possession of their houses, they seemed as much surprised with their treatment as they were happy in it. It was the 6th before the boats could be repaired: when, soon after day-break, the whole army embarked, and the boats rowed in four columns by the right, it being intended to land on the left, at La Chine, on the Island of Montreal, which lay at the distance of three leagues only from this place of embarkation: and, the weather proving favourable, they arrived at the place of destination soon in the day, and landed without any other opposition than a few random shot from flying parties, that ran into Montreal, breaking down a bridge between the English camp and the town. General Amherst, determined to make the most of the day, marched on towards the city, repaired the bridge, and, after a march of two leagues, formed the troops on a plain before Montreal; having left the New York troops, and two Connecticut regiments at la Chine, to protect the boats. The army, thus encamped, lay all night on their arms, and got up two 12-pounders, five 6-pounders, and five 3-pounders of light artillery. In this situation general Amherst, next morning, received a letter from the marquis de Vaudreuil; which was brought by two officers, and referred his excellency to colonel Bougainville for particulars: and this conference produced a cessation of arms till twelve o'clock. The colonel brought proposals for a capitulation from the French governor, and they were returned by general Amherst, with such alterations and amendments as he thought proper. But the French commanders shuffled so long about particular articles, that it was next morning before the capitulation could be completed and signed. By this capitulation, not only Montreal, but all Canada, an immense country, was surrendered to the king of Great Britain. Accordingly the British troops took immediate possession of all the fortresses in that province, and the French garrisons were engaged not to serve against Great Britain during the war.

The minds of the English people had been, for some time, agitated and filled with very disagreeable ideas, by the surprise of Newfoundland. The French, apprised of the weak state of that important island, which had been totally neglected, landed in the bay of Bulls, on the 24th of June, 1762. They seized upon the small settlement in the bay, and on the 27th obliged the garrison of St. John's, consisting only of sixty-three men, to surrender prisoners of war, with promise to secure them in their persons and effects. But they destroyed every thing that belonged to the fishery; by which they only injured private property, and ruined many individuals. Having done all the mischief in their power, they set about repairing the fortifications of the town; because they intended to hold the place. When the news of this loss reached England, it

is impossible to describe the indignation with which the people were exasperated against the ministry. It is true, government ordered a squadron and some forces to be got ready for the recovery of the place: but those orders were so delayed, that Newfoundland must have remained in the hands of France at the commencement of the treaty of peace, to our great disadvantage, had not general Amherst, of his own accord, detached a sufficient force to drive them away. He sent his brother, colonel Amherst, before he received any orders from Europe; with a body of troops to join lord Colville, who was stationed with one ship of the line and one frigate only, at Halifax. This junction was happily effected on the 11th of September, and on the 18th the place was re-taken by the British; and we are certainly indebted to the general for the firm possession of this most ancient and important settlement in North America.

Sir Jeffery Amherst was created lord Amherst of Holmesdale on the 20th of May, 1776; and, on the 16th of September, 1788, was made lord Amherst of Montreal, and a general in the army; his lordship is also colonel of the 2d regiment of life-guards, and of the 2d regiment of foot, governor of Guernsey, and a knight of the Bath.

AM'HURST (Nicholas), an English poet and political writer, was born at Marden in Kent, and entered of St. John's college, Oxford; from whence he was expelled for irregularity of conduct and libertine principles. Retaining great resentment against the university on this account, he abused its learning and discipline, in a poem published in 1724, called *Oculus Britannicæ*, and in a book entitled *Terræ Filius*. He published, *A Miscellany of Poems, sacred and profane*; and, *The Convocation*, a poem in five cantos, which was a satire on the bishop of Bangor's antagonists. But he is best known for the share he had in the political paper called *The Craftsman*; though, after having been the drudge of his party for near twenty years, he was as much forgot in the famous compromise of 1742 as if he had never been born; and, when he died in that year of a broken heart, was indebted to the charity of his bookseller for a grave.

AMIALE, *adj.* [*aimable*, Fr. *amabile*, It. *amabile*, Sp. of *amabilis*, Lat. from *amo*, to love.] Lovely; pleasing.—That which is good in the actions of men, doth not only delight as profitable, but as *amiable* also. *Hooker*.—Pretending love; shewing love.—Lay *amiable* siege to the honesty of this Ford's wife; use your art of wooing. *Shakespeare*.

AMIALENESS, *f.* The quality of being amiable; loveliness; power of raising love.—As soon as the natural gaiety and *amiableness* of the young man wears off, they have nothing left to commend them, but lie by among the lumber and refuse of the species. *Addison*.

AMIABLY, *adv.* In an amiable manner; in such a manner as to excite love.

AMIAN'THUS, or EARTH-FLAX, *f.* [*ἀμραντος*, Gr.] In natural history, a fibrous, flexible, elastic, mineral, substance, consisting of short, abrupt, and interwoven, filaments. It is found in Germany, in the strata of iron ore, sometimes forming veins of an inch in diameter. Its fibres are so flexible that cloth has been made of them, and the shorter filaments that separate in the washing of the stone may be made into paper in the common manner. *Anianthus* is classed by Mr. Kirwan in the muriatic genus of earths, because it contains about a fifth part of magnesia. Its other constituents are, flint, mild calcareous earth, barytes, clay, and a very small proportion of iron. It is fusible *per se* in a strong heat, and also with the common fluxes. It differs from asbestos in containing some ponderous earth.

AMICABLE, *adj.* [*amicabilis*, Lat.] Friendly; kind. It is commonly used of more than one; as, They live in an *amicable* manner; but we seldom say, An *amicable* action, or, An *amicable* man, though it be so used in this passage:

AMIA, AND AMMANNIA.

The three-finned Amia, and the Ammannia-octandria.

J. Pass sculp.

O grace serene! oh virtue heav'nly fair,
Divine oblivion of low-thoughted care!
Fresh blooming hope, gay daughter of the sky!
And faith, our early immortality!
Enter each mild, each *amicable*, guest;
Receive and wrap me in eternal rest.

Pope.

AMICABLE BENCHES, in Roman antiquity, were, according to Pitiſcus, lower and leſs honourable ſeats allotted for the *judices pedanei*, or inferior judges, who, upon being admitted of the emperor's council, were dignified by him with the title *amici*.

AMICABLE NUMBERS, denote pairs of numbers, of which each of them is mutually equal to the ſum of all the aliquot parts of the other. So the firſt or leaſt pair of amicable numbers are 220 and 284; all the aliquot parts of which, with their ſums, are as follow, viz.

of 220, they are 1, 2, 4, 5, 10, 11, 20, 22, 44, 55,
110, their ſum - - - - - 284;

of 284, they are 1, 2, 4, 71, 142, and their ſum is 220.

The ſecond pair of amicable numbers are 17296 and 18416, which have alſo the ſame property as above.

And the third pair of amicable numbers are 9363584 and 9437056.

Theſe three pairs of amicable numbers were found out by P. Schooten, ſect. 9 of his *Exercitationes Mathematicæ*, who I believe firſt gave the name of *amicable* to ſuch numbers, though ſuch properties of numbers it ſeems had before been treated of by Rudolphus, Deſcartes, and others. To find the firſt pair, Schooten puts $4x$ and $4yz$, or a^2x and a^2yz for the two numbers where $a=2$; then making each of theſe equal to the ſum of the aliquot parts of the other, gives two equations, from which are found the values of x and z , and conſequently, aſſuming a proper value for y , the two amicable numbers themſelves $4x$ and $4yz$. In like manner for the other pairs of ſuch numbers; in which he finds it neceſſary to aſſume $16x$ and $16yz$, or a^4x and a^4yz for the ſecond pair, and $128x$ and $128yz$, or a^7x and a^7yz for the third pair. Schooten then gives this practical rule, from Deſcartes, for finding amicable numbers, viz. Aſſume the number 2, or ſome power of the number 2, ſuch that if unity, or 1, be ſubtracted from each of theſe three following quantities, viz.

From 3 times the aſſumed number,

Alſo from 6 times the aſſumed number,

And from 18 times the ſquare of the aſſumed number, the three remainders may be all prime numbers; then, the laſt prime number being multiplied by double the aſſumed number, the product will be one of the amicable numbers ſought, and the ſum of its aliquot parts will be the other.

That is, if a be put = the number 2, and n ſome integer number, ſuch that $3a^n - 1$, and $6a^n - 1$, and $18a^{2n} - 1$, be all three prime numbers; then is $18a^{2n} - 1 \times 2a^n$ one of the amicable numbers; and the ſum of its aliquot parts is the other.

AMICABLENESS, *f.* The quality of being amicable; friendlineſs; good-will.

AMICABLY, *adv.* In an amicable manner; in a friendly way; with good-will and concord:

They ſee

Through the dun miſt, in blooming beauty freſh,

Two lovely youths, that *amicably* walkt

O'er verdant meads, and pleas'd, perhaps, revolv'd

Anna's late conqueſts.

Philips.

A'MICE, *f.* [*amicus*, Lat. *amicus*, Fr.] The firſt or undermoſt part of a prieſt's habit, over which he wears the alb:

Thus paſſ'd the night ſo foul, till morning fair

Came forth with pilgrim ſteps in *amice* grey.

Milton.

On ſome a prieſt, ſuccinct in *amice* white,
Attends.

Pope.

A'MICUS CU'RIAE, in law. If a judge is doubtful or miſtaken in matter of law, a ſtander-by may inform the court as *amicus curiæ*. 2 Co. Inſt. 178.

AMIDA, a god worſhipped by the Japanefe, who has

many temples erected to him in the iſland of Japan, of which the principal is at Jedo. The Japanefe have ſuch a confidence in their idol Amida, that they hope to attain eternal felicity by the frequent invocation of his name. One of the figures of this idol is repreſented at Rome.

AMIDA, a principal city of Meſopotamia; ſituated on a high mountain, on the borders of Aſſyria, on the Tigris, where it receives the Nymphius. It was taken from the Romans, in the time of the emperor Conſtans, by Sapore king of Perſia. The ſiege is ſaid to have coſt him 30,000 men; however, he reduced it to ſuch ruin, that the emperor afterwards wept over it. According to Ammianus Marcellinus, the city was raiſed; the chief officers were crucified; and the reſt, with the foldiers and inhabitants, either put to the ſword or carried into captivity. The inhabitants of Niſibis, however, being obliged to leave their own city by Jovian's treaty with the Perſians, ſoon reſtored Amida to its former ſtrength; but it was again taken by Cavades in 501, but was reſtored to the Romans in 503. On the declenſion of the Roman power, it fell again into the hands of the Perſians; but was taken from them by the Saracens in 899. It is now in the poſſeſſion of the Turks. Here are above 20,000 Chriſtians, who are better treated by the Turks than in other places. A great trade is carried on in this city, of red Turkey leather, and cotton cloth of the ſame colour. The Arabian name of Amida is *Diarbekir*, and the Turkiſh one *Kara-Amid*. Lat. 36. 58. N. lon. 39. 0. E.

AMIDST, or AMID, *prep.* [from *a* and *mid*, or *midſt*.] In the midſt; equally diſtant from either extremity. Mingled with; ſurrounded by; in the ambit of another thing. Amongſt; conjoined with:

What though no real voice nor found

Amid their radiant orbs be found?

In reaſon's ear they all rejoice,

And utter forth a glorious voice,

For ever ſinging, as they ſhine,

"The hand that made us is divine."

Addiſon.

A'MIENS, a large handſome city of France, in the department of Somme, and late province of Picardy. It is a place of great antiquity; being mentioned by Cæſar as a town that had made a vigorous reſiſtance againſt the Romans, and where he convened a general aſſembly of the Gauls after having made himſelf maſter of it. The emperors Antoninus and Marcus Aurelius enlarged it; and Conſtantine, Conſtans, Julian, and ſeveral others, reſided here a conſiderable time. The river Somme enters A-miens by three different channels, over which are as many bridges; and theſe channels, after waſhing the town in ſeveral places, unite at the other end by the bridge of St. Michael. The houſes are well built; the ſtreets ſpacious, embellished with handſome ſquares and good buildings; and the number of inhabitants between forty and fifty thouſand. The cathedral is one of the largeſt and moſt magnificent churches in France; adorned with handſome paintings, fine pillars, chapels, and tombs; particularly the nave is greatly admired. Amiens was taken by the Spaniards, in 1597, by the following ſtratagem: foldiers, diſguiſed like peaſants, conducted a cart laden with nuts, and let a bag of them fall juſt as the gate was opened. While the guard was buſy in gathering up the nuts, the Spaniards entered and became maſters of the town. It was retaken by Henry IV. who built a citadel here.

Here are manufactures of linen and woollen cloth, which employ in the city and adjacent country 30,000 people. It is on the road from Calais to Paris, twenty miles S. E. of Abbeville, and 75 N. of Paris. Lat. 49. 54. N. long. 2. 28. E.

AMILCAR, the name of ſeveral Carthaginian captains. The moſt celebrated of them is Amilcar Barca, the father of Hannibal, who during five years infeſted the coaſt of Italy; when the Romans ſending out their whole naval ſtrength, defeated him near Trapani, 242 years before Chriſt; and this put an end to the firſt Punic war. Amilcar began the ſecond, and landed in Spain, where he ſubdued

subdued the most warlike nations; but, as he was preparing for an expedition against Italy, he was killed in battle, 278 years before the Christian era. He left three sons, whom he had educated, as he said, like three lions, to tear Rome in pieces; and made Hannibal, his eldest son, swear an eternal enmity against the Romans.

AMILICTI, *f.* in the Chaldaic theology, denote a kind of intellectual powers or persons in the divine hierarchy. The amilicti are represented as three in number; and constitute one of the triad, in the third order of the hierarchy.

AMIMO'NE, a daughter of Danaus, changed into a fountain which is near Argos, and flows into the lake Lerna. *Ovid.*

AMIN'ADAB, אֱמִינָדָב, Heb. a free or willing people;] the father of Naassan.

AMIRAN'TE, in the Spanish polity, a great officer of state, answering to our lord high-admiral.

AMISS, *adv.* [from *a*, which, in this form of composition, often signifies *according to*, and *miss*, the English particle, which shews any thing, like the Greek *παρά*, to be wrong, as, to *miscount* to count erroneously; to *misdo*, to commit a crime: *amiss* therefore signifies *not right*, or *out of order*.] Faulty; criminal. Faultily; criminally:

O've powers that search

The heart of man, and weigh his inmost thoughts,
If I have done *amiss*; impute it not! *Addison.*

In an ill sense. Wrong; improper; unfit.—Methinks, though a man had all science, and all principles, yet it might not be *amiss* to have some conscience. *Tillotson.*—Wrong; not according to the perfection of the thing, whatever it be. Reproachful; irreverent. Impaired in health; as, I was somewhat *amiss* yesterday, but am well to-day. *Amis* is marked as an adverb, though it cannot always be adverbially rendered; because it always follows the substantive to which it relates, contrary to the nature of adjectives in English; and, though we say the action was *amiss*, we never say an *amiss* action. *Amis* is used by Shakespeare as a noun substantive:

To my sick soul, as sin's true nature is,
Each toy seems prologue to some great *amiss*. *Shakespeare.*

AMIS'SION, *f.* [*amissio*, Lat.] Loss.

AMISUS, the chief city of the ancient kingdom of Pontus. It was built by the Milesians, and peopled partly by them and partly by a colony from Athens. It was at first a free city, like the other Greek cities in Asia; but afterwards subdued by Pharnaces king of Pontus, who made it his metropolis. It was taken by Lucullus in the Mithridatic war, who restored it to its ancient liberty.

TO AMIT', *v. a.* [*amitto*, Lat.] To lose; a word little in use.—Ice is water congealed by the frigidity of the air, whereby it acquireth no new form, but rather a consistence or determination of its fluidity, and *amitteth* not its essence, but condition of fluidity. *Brown.*

AMITER'NUM, a town of the Sabines, in Italy, now extinct. The ruins are to be seen on the level ridge of a mountain, near St. Vittorino.

AMIT'TERE LEGUM TERRÆ, *f.* in law, a phrase importing the loss of liberty of swearing in any court: the punishment of a champion overcome or yielding it battle, of jurors found guilty in a writ of attain, and of a person outlawed.

AMIZO'DAR, a king of part of Lycia, had a wife called Chimera, whose two brothers were called the Lion and the Dragon, because they murdered all those that fell into their hands.

AMITY, *f.* [*amitié*, Fr. *amicitia*, Lat.] Friendship, whether public between nations, opposed to war; or among the people, opposed to discord; or between private persons.—The prophet David did think, that the very meeting of men together, and their accompanying one another to the house of God, should make the bond of their love insoluble, and tie them in a league of inviolable *amity*.

Hooker.—The monarchy of Great Britain was in league and *amity* with all the world. *Sir John Davis.*

AM'KAS, *f.* a name given to a spacious saloon in the palace of the Great Mogul, where he gives audience to his subjects, and where he appears on solemn festivals with extraordinary magnificence. His throne is supported by six large steps of massy gold, set with rubies, emeralds, and diamonds, estimated at 60,000,000*l.*

AM'MA, *f.* [some derive it of *αμω*, Gr. to connect or join together.] A tying, knitting; a band. With surgeons, a truss for ruptures.

AM'MAN, or **AMMANT**, *f.* in the German and Belgic policy, a judge who has the cognizance of civil causes. It is also used among the French for a public notary, or officer, who draws up instruments and deeds.

AMMAN'NIA, *f.* [from John Ammann, professor of botany at Petersburg.] In botany, a genus of the tetrandria monogynia class, ranking in the natural order of calycanthemæ. The generic characters are—Calyx: Perianthium bell-shaped, oblong, erect, with eight streaks, and folds, quadrangular, eight-toothed; teeth alternate bent in, permanent. Corolla: none, or four-petalled; petals vertically ovate, spreading, inserted into the calyx. Stamina: filaments bristly, the length of the calyx, into which they are inserted: antheræ twin. Pistillum: germin sub-ovate, large, superior; style simple, very short; stigma headed. Pericarpium: a roundish, four-celled, capsule, (berry, *g.*) covered with the calyx. Seeds: numerous, small. The petals are often deficient, but sometimes occur in the same species.—*Essential Character.* Corolla, four-petalled, inserted into the calyx. Calyx, one-leaved, plaited, eight-toothed, inferior. Capsule, four-celled.

Species. 1. *Ammannia latifolia*, or broad-leaved *Ammannia*: leaves half-stem-clasping, stalk square, branches erect. Root annual. It grows about a foot and an half high, with an upright square stalk, and long narrow leaves in form of a triangle; these grow the whole length of the stem; they are of a pale green, and the consistence of purslane leaves; the stalks are also succulent, and of the same colour with those of that plant. The flowers come out in whorls, at the joints where the leaves adhere, in clusters. This grows naturally in moist places in Jamaica, from whence Dr. Houston (about 1731) sent the seeds to England, which succeeded at Chelsea, and have thence been distributed to most of the botanic gardens in Europe.

2. *Ammannia ramosior*, or branching *Ammannia*: leaves half-stem-clasping, stalk square, branches very spreading. This is an annual plant, growing naturally in Virginia and Carolina. It rises about a foot high, with red succulent stalks, putting out side-branches, which are opposite, round and simple. The flowers are produced single from the axils on the lower part of the branches, but toward the top they are in clusters; they have little beauty, and therefore are only preserved in botanic gardens for the sake of variety.

3. *Ammannia baccifera*, or berry-bearing *ammannia*: leaves sub-petiolate, capsules larger than the calyx, and coloured. This is a tender low plant, erect, without branches. It is a native of China, and is now naturalized in Italy. Having but little beauty, it is rarely preserved in gardens.

4. *Ammannia octandra*, or eight-stamened *ammannia*: flowers petaloid, and eight stamened. Found by Koenig in the East Indies.

5. *Ammannia pinnatifida*, or pinnatifid-leaved *ammannia*: stalks procumbent, rooting, compressed, leaves linear, pinnatifid. Found by Sonnerat in the isle of Java.

6. *Ammannia debillis*, or cluster-flowered *ammannia*: leaves lanceolate attenuated at the base, stem branching, flowers in bundles from the axils, capsules two-celled. Annual. Native of the East Indies. Introduced in 1778, by Sir Joseph Banks, bart. It flowers in July and August.

7. *Ammannia sanguinolenta*: leaves half-stem-clasping, cordate at the base, flowers subpeduncled, eight-stamened, petal-bearing. Native of Jamaica and Domingo.

1. *Amomum roseum*, or Indian Ginger. 2. The Sand Eel.

Propagation and Culture. The first and third must be raised from seeds on a hot-bed in the spring, and afterwards removed to another hot-bed to bring them forward. When the plants have acquired strength, they should be transplanted into pots filled with rich light earth, and placed under a frame, observing to shade them till they have taken fresh root; then they should be placed in a glass case or stove to ripen their seeds, for the plants are too tender to thrive in the open air in this country, unless the summer should prove very warm. The second sort, however, will perfect its seeds in the open air, if the plants be raised on a hot-bed in the spring, and planted in a warm border. The other species are stove-plants.

AMMI, f. [from *αμμος*, sand.] In botany, a genus of the pentandria digynia class, ranking in the natural order of umbellales or umbelliferae. The generic characters are—Calyx: universal umbel manifold, frequently of fifty rays; partial short, crowded; universal involucre of many linear, pinnatifid, acute, leaflets, scarcely the length of the umbel; partial many-leaved; leaflets linear, acute, simple, shorter than its umbellet. Proper perianthium scarcely apparent. Corolla: universal uniform, all the floscules fertile; proper of five inflex, heart-shaped petals, of unequal size in the ray; almost in the middle of the disk. Stamina: filaments capillary; anthers roundish. Pistillum: germ inferior; styles reflex; stigmas obtuse. Pericarpium: none. Fruit roundish, smooth, small, streaked, bipartite. Seeds: two, convex and streaked on one side; flat on the other.—*Essential Character.* Involucre, pinnatifid. Corolla, radiate; all hermaphrodite. Fruit, smooth.

Species. 1. *Ammi majus*, or common bishop's weed: lower leaves pinnate; lanceolate, serrate; upper ones multifid, linear. The first sort is annual, and grows in vineyards and fields in the southern parts of Europe, and in the east.

2. *Ammi copticum*: leaves super-decompound, linear; seeds muricate. Found in Egypt by Forskahl. Annual.

3. *Ammi glaucifolium*, or perennial bishop's-weed: subdivisions of all the leaves lanceolate. This has the appearance of being only a variety of the first species. It is annual, as that is. The stem is from one to two feet high, hard, smooth, scarcely grooved, with several upright branches at top, each supported by a small sessile leaf. It is a native of the south of France. Miller describes it as a perennial plant, which is preserved in botanic gardens for variety; but, having little beauty, is rarely admitted into other gardens.

Propagation and Culture. This plant is propagated by seeds, which should be sown in autumn in the place where they are to remain: and in the spring, the ground should be hoed to cut up the weeds, and also to thin the plants in the same manner as is practised for carrots, leaving them four or five inches asunder: or, if the ground is good where they grow, they must be left at least six inches, for they will grow large and cover the ground: after this they will require no farther care, but to keep them clean from weeds. In June they will flower, and their seeds will ripen in August, which should be gathered as they ripen, otherwise they will soon scatter. These seeds are used in medicine, and may be had in plenty with this management; for this plant will grow in any situation that is open, but thrives best on light sandy land. When the seeds are sown in the spring they seldom come up the same year; and, if they should, those plants will be weak, and produce few seeds.

AMMI, f. in botany. See *BUNYUM*, *CICUTA*, *SESELLI*, *SISON*, and *STUM*.

AMMIANUS (Marcellinus), a Grecian soldier, was born at Antioch, and flourished under Constantius and the preceding emperors as late as Theodosius. He served under Julian in the east; and wrote in Latin an interesting history, from the reign of Nerva to the death of Valens, in thirty-one books; of which only eighteen remain. Though a Pagan, he speaks with candour and moderation of the Christian religion. He died about the year 390.

The best edition of his history is that of Gronovius, in 1693.

AMMIRATO (Scipio), an eminent Italian historian, born at Lecca in Naples in 1531. After travelling over great part of Italy, he was engaged by the great duke of Tuscany to write The History of Florence; for which he was presented to a canonry in the cathedral there. He wrote other works while in this station; and died in 1600.

AMMISHAD'DAI, [אֲמִישַׁדַּי Heb. i. e. the people of the Almighty.] A prince of the tribe of Dan.

AMMOCHOSIA, f. A remedy for drying the body, by covering it with hot sand, or salt, which is preferable.

AMMOCHRY'SOS, [from *αμμος*, sand, and *χρυσος*, gold.] A name given to a stone very common in Germany, and seeming to be composed of a golden sand. It is of a yellow gold-like colour, and its particles are very glossy, being all fragments of a coloured talc. It is usually so soft as to be easily rubbed to a powder, and is used only as sand to strew over writing. The Germans call it *katzengold*. There is another kind of it less common, but much more beautiful, consisting of the same sort of glossy spangles, but of a bright red colour, like vermilion.

AMMO'DYTES, or **SAND EEL**, in ichthyology, a genus of fishes belonging to the order of apodes. This fish resembles an eel, and seldom exceeds a foot in length. The head of the ammodytes is compressed, and narrower than the body; the upper jaw is larger than the under; the body is cylindrical, with scales hardly perceptible. There is but one species of the ammodytes, viz. the tobianus, or lancee, a native of Europe. This fish gathers itself into a circle, and pierces the sand with its head in the centre. It is found in most of our sandy shores during the summer months. They are commonly used as baits for other fish, but they are also very delicate eating. These fish are found in the stomach of the porpoise; an argument that the last roots up the sand with its nose, as hogs do the ground.

AMMOIDES, f. in botany. See *SESELLI*.

AMMON, [אֲמֹן Heb. i. e. the son of my people.] the son of Lot. He was the father of the Ammonites, and dwelt to the east of the Dead Sea, in the mountains of Gilead.

AMMON, anciently a city of Marmarica. Arian calls it a place, not a city, in which stood the temple of Jupiter Ammon, round which there was nothing but sandy wastes. Diodorus Siculus says, That the district where the temple stood, though surrounded with deserts, was watered by dews which fell no where else in all that country. It was agreeably adorned with fruitful trees and springs, and full of villages. In the middle stood the acropolis or citadel, encompassed with a triple wall; the first and inmost of which contained the palace; the others the apartments of the women, the relations and children, as also the temple of the god, and the sacred fountain for lustrations. Without the acropolis stood, at no great distance, another temple of Ammon, shaded by a number of tall trees: near which there was a fountain, called that of the sun, or *Solis Fons*, because subject to extraordinary changes according to the time of the day; morning and evening warm, at noon cold, at midnight extremely hot. Here a kind of fossil salt was said to be dug out of the earth in large oblong pieces, as transparent as chrysal. It was said to be a present worthy of kings, and used by the Egyptians in their sacrifices. From this our sal ammoniac is thought by some to have taken its name.

AMMON, or **HAMMON**, in heathen mythology the name of the Egyptian Jupiter, worshipped under the figure of a ram. Bacchus having subdued Asia, and passing with his army through the deserts of Africa, was in great want of water: Jupiter, his father, assuming the shape of a ram, led him to a fountain, where he refreshed himself and his army; in gratitude for which favour, Bacchus built there a temple to Jupiter, under the title of *Ammon*, from the Greek *αμμος*, which signifies *sand*, alluding to the sandy desert where it was built. In this temple was an

oracle of great note, which Alexander the Great consulted, and which lasted till the time of Theodosius. Hammon, the god of the Egyptians, was the same with the Jupiter of the Greeks. He is thought to be the same with Ham, who peopled Africa, and was the father of Mizraim, the founder of the Egyptians.

AMMON (Andreas), a Latin poet, born at Lucca in Italy, was sent by pope Leo X. to England in the characters of prothonotary of the apostolic see and collector-general of this kingdom. Being a man of singular genius and learning, he soon became acquainted with the principal literati of those times; particularly with Erasmus, Colet, Grocin, and others, for the sake of whose company he resided some time at Oxford. The advice which Erasmus gives him, in regard to pushing his fortune, has a good deal of humour in it, and was certainly intended as a satire on the artful methods then practised by the selfish and ambitious clergy. "In the first place," says he, "throw off all sense of shame; thrust yourself into every one's business, and elbow out whomsoever you can; neither love nor hate any one; measure every thing by your own advantage; let this be the scope and drift of all your actions. Give nothing but what is to be returned with usury, and be complaisant to every body." Ammon was Latin secretary to Henry VIII. In 1512 he was made canon and prebendary of St. Stephen's, Westminster. He was likewise prebendary of Wells; and in 1514 was presented to the rectory of Dychial in that diocese. About the same time, by the king's special recommendation, he was also made prebendary of Salisbury. He died in the year 1517, and was buried in St. Stephen's chapel, Westminster. His works are, *Epistolæ ad Erasmus*; *Scotici conflictus historia*; *Bucolicæ vel eclogæ*, Basil 1546, 8vo. *De rebus nihil*; *Panegyricus quidam*; *Varii generis epigrammata*; *Pœmata diversa*.

AMMONIAC, *f.* [called also *armoniacum*, but improperly; *hammoniæ lacryma*; *assac*; *azac*; and in English, *gum ammoniac*. Ammon took its name from *αμμε*, the sands, but the gum and the *sal ammoniac*, from the country called *Ammonia*.] It is a concrete gummi-resinous juice, produced in the East Indies, whence it is brought in masses, consisting of little lumps, which inwardly are very white, but outwardly yellowish or brownish; its whitest parts become yellow on being exposed to the air. From what plant it is obtained, we know not certainly; but, according to Dioscorides, it is from a shrub called *agafyllis*. It has been supposed to be an exudation from a species of *ferula*. It hath a strong sinell, somewhat like that of galbanum, but not so ungrateful, a nauseous sweetish taste mixed with a bitterness. Such pieces as are white, clear, free from foreign matter, dry, and large, should be preferred for internal use. Thrown on live coals, it burns away in flames: it is soluble both in water and vinegar into a kind of milk; but the resinous part, which is nearly one half of the whole, subsides on standing: spirit of wine dissolves near one half of it, taking up all its active parts.

Dr. Dedier says, $\mathfrak{ss}$ i. of this gum, afforded by distillation of phlegm $\mathfrak{z}$ vi. volatile spirit $\mathfrak{z}$ ij. a volatile foetid oil $\mathfrak{z}$ vi. and the remainder was a caput mortuum. But other skilful chemists have failed to obtain any oil from it by this process. Water is very slightly impregnated with it by distillation. This drug is an excellent deobstruent in hysterics, when caused by retarded menses, and in other abdominal obstructions: dissolved in the acet. scillæ, it is a powerful expectorant, for vinegar greatly exalts its virtue in this particular: in old-standing cholicky symptoms, proceeding from viscid matter in the intestines, it produces very happy effects: it is on a par with the *assa foetida* for virtues of the same kind as the *assa foetida* possesseth, though it is less nauseous and less antispasmodic; but its principal virtues are attributed to its expectorant powers in asthma, and difficult breathing: it gently moves the belly, and, externally applied, it has been recommended for resolving indurated tumours, though the theory of this seems to many very doubtful.

The foetid gums agree in their effects with oily aromatics, but have also acrid poignant salts conjoined, and so more forcibly raise, stimulate, and promote secretions; But the gum ammoniac is peculiar, as its oil, which is but little, is not aromatic, but inodorous, and it is not so heating and rarefying as the others are; but it hath the same acid salts; therefore, it may be used in fevers with turgid blood, and in robust habits, having so excellent a stimulus, without the power of rarefaction. Of this sort, among plants, are the viscus and dracontium, among roots the arum and scilla, and most of the vegetable emetics. The dose may be from gr. x. to $\mathfrak{z}$ $\mathfrak{ss}$. three times a day. Dissolved in water it is called *lac ammon*, ammoniacal milk. $\mathfrak{R}$ Gum ammon. opt. $\mathfrak{z}$ ij. aq. distillatæ $\mathfrak{ss}$ m. P. L. 1788. Thus administered, it is more active than in pills; the dose may be two large spoonfuls three or four times in twenty-four hours. It varies only from the old formula, by having the distilled water substituted for that of penny-royal.

SAL AMMONIAC, f. [*ammonia muricata*, called also *cyreniacus sal*, *ammoniac salt*, and *armoniac*; but improperly.] Many writers speak of the natural and artificial. The natural sort spoken of by the ancients, according to Dioscorides, is only the sal gem, and is reckoned by them among the alimentary salts; but many others say that it was made from the urine of camels, and was deposited in the sands near the temple of Jupiter Ammon. We have no evidence of native sal ammoniac of this sort being found. Tournefort observes, that out of the simple native salts other compounded salts are naturally produced, viz. the essential salts which naturally are concreted from the juices of plants, among which are natural ammoniacal salts.

The artificial is the only sort known and used in the shops. It is a neutral sort, composed of a volatile alkaline salt, and the acid of sea-salt; hence the term *ammonia muricata*; this is the only genuine sort, though it may be made with the vitriolic or with the nitrous acid. The different sorts formed of the different mineral acids, are thus distinguished; by dropping oil of vitriol on that made with the acid of sea-salt, white fumes immediately arise; red fumes from that made of the nitrous acid; and no effect follows from that made with the oil of vitriol.

Sal ammoniac is brought to us generally in round cakes, convex on one side, and concave on the other, from the shape of the vessels into which they are sublimed. When these cakes are broken, the salt appears of a needled texture, or composed of stræ, running transversely and parallel to one another; the internal part is generally pure, and of an almost transparent whiteness; the outside for the most part is foul, and of a yellowish green or black hue. In England, this salt is obtained from burnt cow's dung; urinous salt, joined with an acid, produceth ammoniacal salt; it is obtainable from every species of soots by sublimation or solution. At Newcastle, it is made from the bittern, which remains after making common salt, and old urine; from 100 pounds weight of the bitter cathartic salt, and three hogheads of urine, fifty-six pounds of sal ammoniac is obtained. In Egypt it is made from the burnt dung of quadrupeds that feed only on vegetables: this dung is collected in the first four months in the year, when the cattle feed on spring grass, which is a sort of clover: at other seasons, and when the cattle eat other sort of food, it is unfit for this purpose. As to the camel, its excrements are not preferable to those of any other of their cattle which feed on grass, nor is their urine ever used, though so commonly declared by writers on this subject. Mr. Hasselquist says, that the salt-workers in Egypt pretend, that the excrements from men, goats, and sheep, are preferable to all others; and he farther tells us, that March and April are the only times in which they make this salt. See the account in his voyages.

The ammoniac salt hath many and useful properties. It is soluble in water, and spirit of wine, and in the air alone. It renders water extremely cold while continuing to dissolve into it. The crude salt, when dissolved in water,

ter, and mixed with a vitriolic acid, effervesces violently and produces a sense of cold; the volatile salt treated in the same manner effervesces likewise, but produces heat. After solution in water, it shoots into crystals, which resemble feathers, or into long shining spicula. Mixed with a fixed alkaline salt, and then sublimed, it affords a dry volatile salt; but, mixed with quick-lime, its volatile parts are only to be obtained in a liquid form. When unmixed with other matters, it may be sublimed with a considerable degree of heat, without suffering the least change in its nature or properties; but, if the fire is hastily raised during its sublimation, it remarkably volatilizes many kinds of bodies, if mixed with it. On account of its sea-salt, it turns acidum nitrosum dilutum into aqua regia. Crude ammoniac salt does not curdle milk, nor alter the colour of an infusion of roses. Rubbed with quick-lime, or with a fixed alkaline salt, it emits an urinous smell. Dissolved in lime-water, then a little hydrag. mur. being added, the mixture becomes of a yellow colour.

In folding, tinning, and casting shot, the crude salt is much used. It becomes volatile in a heat somewhat greater than that of boiling water.

As a medicine, its effects are to be ranked among the most valuable of its tribe. Boerhaave says, that it preserves all animal substances from putrefaction; that its brine penetrates their most inward parts; that it is the noblest aperient, attenuant, resolvent, errhine, sternutatory, diaphoretic, sudorific, and diuretic. When used externally as a discutient, or detensive, it is mixed with some proper fomentation in the proportion of 3 vi. or 3 i. to ℥ ij. of the liquid. It is more pungent to the taste than common salt, but is less antiseptic; it passes off more freely through the pores than common salt, but does not move the belly so freely. It is perfectly neutral; attenuates viscid juices; promotes a discharge through the skin, or by urine, according as the patient is kept warmer or cooler, or according to the peculiar circumstances of the constitution; in larger doses, as 3 ij. it opens the belly, and in yet larger it proves emetic; it is an excellent febrifuge, and peculiarly assidant to the bark; in many instances where the bark and emetics failed in agues, the crude salt given to ʒ i. every four hours, with an infusion of camomile flowers, for some days; then every six, and at least every eight, hours, hath succeeded; it is used both as an antiseptic and a repellent in gargles; when the throat is inflamed, or otherwise requires such remedies, it powerfully dissolves viscid mucus in the mouth and fauces; in violent hypochondriac cases, it hath been of singular efficacy by a daily use of it in doses just within what are required to render the bowels lax; after taking it six, eight, and twelve, months, the cold bath hath completed the cure. From 3 i. to 3 ij. dissolved in 3 viij. of any simple water, is a good substitute for the common saline mixture, and may be given, as to quantity and time, in the same manner. Great as are the powers attributed to this medicine, they are some of them much doubted by practitioners of eminence, particularly by Dr. Cullen. He does not admit of its resolving powers by attenuating or dissolving the fluids; but, like other saline matters, in passing by the excretions, they may be suited to promote them. In being coupled with the Peruvian bark, it may be of some use as a diaphoretic; but he doubts, that, in obviating the consequences apprehended from the use of the bark, it can be of any service; nor does he allow that, externally applied, it has the power of discussing tumors, otherwise than by giving a moderate stimulus to the vessels on the surface; not by entering the pores, and by that means attenuating the viscid fluids. However, there are some compositions in which this is a principal ingredient, and upon which surgeons have much dependence. Mr. Justamond strongly recommends the following in the cure of the milk-breast. *R. ammoniæ muriatæ 3 j. fss. roris marini ℥ j. m.* Linen rags should be dipped into this, and kept continually on the part affected. As a discutient

this lotion is much employed. *R. ammoniæ muriatæ 3 i. fss. aceti. fss. Vinoli rectificati. ana ℥ i. m.*

AMMONIACAL, *adj.* [from *ammoniac*.] Having the properties of ammoniac salt.—Human blood calcined, yields no fixed salt; nor is it a sal ammoniac; for that remains immutable after repeated distillations; and distillation destroys the *ammoniacal* quality of animal salts, and turns them alkaline; so that it is a salt neither quite fixed, nor quite volatile, nor quite acid, nor quite alkaline, nor quite *ammoniacal*; but soft and benign, approaching nearest to the nature of sal ammoniac. *Arbuthnot.*

AMMONITÆ *f.* in natural history. See CORNU AMMONIS.

AMMONITES, a people descended from Ammon the son of Lot. The Ammonites destroyed those giants which they called Zamzuminis, Deut. ii. 19-21, and seized upon their country. God forbade Moses to attack the Ammonites; because he did not intend to give their lands unto the Hebrews. Before the Israelites entered the land of Canaan, the Amorites had by conquest got great part of the countries belonging to the Ammonites and Moabites. This Moses retook from the Amorites, and divided between the tribes of Gad and Reuben. In the time of Jephtha, the Ammonites declared war against the Israelites, under pretence that they had detained great part of the country which had formerly been theirs before the Amorites possessed it. Jephtha declared, that as this was an acquisition which the Israelites had made in a just war, and what they had taken from the Amorites, who had long enjoyed it by right of conquest, he was under no obligation to restore it. The Ammonites were not satisfied with this reason; wherefore Jephtha gave them battle and defeated them. The Ammonites and Moabites generally united whenever there was any design set on foot of attacking the Israelites. After the death of Othniel, the Ammonites and Amalekites joined with Eglon king of Moab to oppress the Hebrews; whom they subdued, and governed for the space of eighteen years, till they were delivered by Ehud the son of Gera, who slew Eglon king of Moab. Some time after this, the Ammonites made war against the Israelites, and greatly distressed them. But these were at last delivered by the hands of Jephtha; who having attacked the Ammonites, made a very great slaughter among them. In the beginning of Saul's reign, 1 Sam. xi. Naash king of the Ammonites having sat down before Jabbeth-gilead, reduced the inhabitants to the extremity of demanding a capitulation. Naash answered, that he would capitulate with them on no other conditions than their submitting to have every one his right eye plucked out, that so they might be made a reproach to Israel: but Saul, coming seasonably to the relief of Jabbeth, delivered the city and people from the barbarity of the king of the Ammonites. After the tribes of Reuben, Gad, and the half-tribe of Manasseh, were carried into captivity by Tiglath-pileser in the year 3264, the Ammonites and Moabites took possession of the cities belonging to these tribes. Jeremiah reproaches them for it. The ambassadors of the Ammonites were some of those to whom this prophet, chap. xxvii. 2-4. presented the cup of the Lord's fury, and directed to make bonds and yokes for themselves; exhorting them to submit themselves to Nebuchadnezzar, and threatening them, if they did not, with captivity and slavery. Ezekiel denounces their entire destruction; and tells them that God would give them up to the people of the east, who should set their palaces in their country, so that there should be no more mention of the Ammonites among the nations. It is believed that these misfortunes happened to the Ammonites in the fifth year after the taking of Jerusalem, when Nebuchadnezzar made war against all the people that dwelt upon the confines of Judea, in the year of the world 3420. During the persecutions of Antiochus Epiphanes, Josephus informs, that the Ammonites shewed their hatred to the Jews, and exercised great cruelties against such of them as lived about their

their country. Justin Martyr says, that in his time there were still many Animonites remaining; but Origen assures us, that, when he was living, they were known only under the general name of Arabians. Thus was the prediction of Ezekiel, xxv. 10. accomplished; who said, that the Ammonites should be destroyed in such a manner as not to be remembered among the nations.

AMMONITIS, a country of Arabia Petraea, anciently occupied by the children of Ammon, whence the appellation. Its limits, partly to the west and partly to the north, were, the river Jabbok, whose course is no where determined; though Josephus says, that it runs between Rabbath-Ammon, or Philadelphia, and Gerasa, and falls into the Jordan.

AMMONIUS, surnamed SACCAS, was born in Alexandria, and flourished about the beginning of the third century. He was one of the most celebrated philosophers of his age; and, adopting with alterations the Eclectic philosophy, laid the foundations of that sect which was distinguished by the name of the *New Platonics*. This learned man was born of Christian parents, and educated in their religion; the external profession of which, it is said, he never deserted. As his genius was vast and comprehensive, so were his projects bold and singular: for he attempted a general coalition of all sects, whether philosophical or religious, by framing a system of doctrines which he imagined calculated to unite them all, the Christians not excepted, in the most perfect harmony. In pursuance of this design, he maintained, that the great principles of all philosophical and religious truths were to be found equally in all sects; that they differed from each other only in their method of expressing them, and in some opinions of little or no importance; and that, by a proper interpretation of their respective sentiments, they might easily be united into one body. Accordingly, all the Gentile religions, and even the Christian, were to be illustrated and explained by the principles of this universal philosophy. In conformity to this plan, he insisted, that all the religious systems of all nations should be restored to their original purity, and reduced to their primitive standard, viz. the ancient philosophy of the East, preserved uncorrupted by Plato: and he affirmed, that this project was agreeable to the intentions of our Saviour; whose sole view in descending upon earth was to set bounds to the reigning superstition, to remove the errors that had blended themselves with the religions of all nations, but not to abolish the ancient theology from which they were derived. In order to reconcile the popular religions, and particularly the Christian, with this new system, he made the whole history of the heathen gods an allegory; maintaining that they were only celestial ministers, intitled to an inferior kind of worship. This system, so plausible in its first rise, but so comprehensive and complying in its progress, has been the source of innumerable errors and corruptions in the Christian church. At its first establishment, it is said to have had the approbation of Athenagoras Pantenus, and Clemens the Alexandrian, and of all who had the care of the public school belonging to the Christians at Alexandria. It was afterwards adopted by Longinus, the celebrated author of the treatise on the Sublime, Plotinus, Hieronimus, Origen, Porphyry, Jamblichus the disciple of Porphyry, Sopater, Edisus, Eustathius, Maximus of Ephesus, Priscus, Chrysanthius the master of Julian, Julian the apostate, Hieroclis, Proclus, and many others, both Pagans and Christians.

AMMONIUS, surnamed LITHOTOME, a celebrated surgeon of Alexandria; so called from his inventing the operation of extracting the stone from the bladder.

AMMUNITION, *f.* [supposed by some to come from *amonitio*, which, in the barbarous ages, seems to have signified supply of provision; but it surely may be more reasonably derived from *munitio*, fortification; *chofes à munitions*, things for the fortresses.] A general name for all warlike provisions; but more particularly powder, ball, &c. Ammunition, arms, utensils of war, gun-powder, im-

ported without licence from his majesty, are, by the laws of England, forfeited, and triple the value. And again, such licence obtained, except for furnishing his majesty's public stores, is to be void, and the offender to incur a premunire, and to be disabled to hold any office from the crown.

AMMUNITION BREAD, SHOES, &c. such as are served out to the soldiers of an army or garrison.

AM'NESTY, *f.* [*amnestie*, Fr. *amnesia*, Lat. of *αμνηστια*, Gr.] An act of oblivion; an act by which crimes against the government, to a certain time, are so obliterated, that they can never be brought into charge.

AMNI'COLIST, *f.* [*amnicola*, Lat.] Inhabiting near a river.

AMNI'GENOUS, *f.* [*amnigenus*, Lat.] Bred in or near a river.

AMNION, or AMNIOS, *f.* [Martinus thinks it is derived from, or hath its name in allusion to, *αμνιον*, a vessel.] The internal membrane which surrounds the fœtus. It is a fine, thin, transparent, membrane, soft but tough, smooth on its inside, but rough on the outer. Dr. Hunter says, that it runs over the internal surface of the placenta, and that this membrane, which seems not vascular in the human subject, makes the external covering of the navel-string, to which it is most firmly united; and that, viewed in a microscope, it appears to have blood-vessels, but they are lymphatics. However the existence of the allantois may be disputed in the human subject, the amnion is found in all animals both viviparous and oviparous.

AM'NON, [אַמְנוֹן, Heb. i. e. true; also an artificer or schoolmaster.] The first-born son of king David.

AMOEBÆ'UM, *f.* in ancient poetry, a kind of poem representing a dispute between two persons, who are made to answer each other alternately: such are the third and seventh of Virgil's eclogues.

AMO'L, a town of Asia, in the country of the Ussacks, seated on the river Gihon. Lat. 39. 20. N. lon. 64. 30. E.

AMO'MUM, *f.* [*άμύμον*, Gr. from the Arabic.] In botany, ranks in the natural order of scitamineæ. The generic characters are—Calyx: perianthium one-leaved, cylindraceous, unequally trifid. Corolla: monopetalous, funnel-shaped; tube cylindraceous; border three-parted, parts oblong, spreading. Nectary two-leaved or two-lipped; lower lip inserted under the upper segment of the corolla, spreading, almost erect, entire or three-lobed. Stamina: filament none, except the upper lip of the nectary, smaller than the lower and opposite to it, acuminate or three-lobed at the tip; along the middle or at the end of which grows longitudinally a large oblong anthera, germinate, or divided by a longitudinal furrow into two, which are one-valved. Pistillum: germ inferior, oblong; style filiform, drawn through the future of the anthera; stigma turbinate, obtuse, ciliate. Pericarpium: capsule fleshy, ovate, three-cornered, three-celled, three-valved. Seeds several, covered with a sort of berried aril. The inflorescence is in a spike on a distinct scape.—*Essential Character.* Calyx: trifid, unequal, cylindrical. Corolla: three-parted, unequal, spreading. Nectary two-lipped, almost erect.

Species. 1. Amomum zinziber, or narrow-leaved ginger: scape middle-sized, spike ovate, leaves linear-lanceolate. It is a native of the East Indies, and other countries of Asia; and is largely cultivated both there and in the West Indies. The dried roots furnish a considerable export from our West-India islands. These roots, it is well known, are of great use both in the kitchen and in medicine; and, preserved green as a sweetmeat, are preferable to every other sort. It flowers with us in September. The root of ginger appears to be much less liable to heat the constitution, than might be expected from the penetrating warmth and pungency of its taste. It gives out the whole of its virtue to rectified spirit, and great part of it to water. The spirituous tincture inspissated yields a fiery extract, sinelling moderately of the ginger. A syrup made from an infusion of three or four ounces of

the root in three pints of boiling water, is kept in the shops. The cases in which ginger is more immediately serviceable, are flatulent cholics, debility and laxity of the system, and in torpid and phlegmatic constitutions, to excite a brisker action of the vessels. The manner of preparing it for use, in the West Indies, is as follows. When the stalks are wholly withered, the roots are fit to take up; which is generally done in January and February. Being picked and cleared, they are gradually scalded in boiling water: after this they are spread, and exposed to the sun till the whole is sufficiently cured; they are then divided into parcels of about one hundred weight each, and put into bags for the market; this is called black ginger. The white ginger is never scalded, but every root is picked, washed, and scraped, separately, and then dried in the sun and air. To preserve this root in syrup, it is dug when the shoots do not exceed five or six inches in height. Being picked and washed, they are scalded till tender; then put into cold water, and scraped and peeled gradually: this operation may last three or four days, during which time the roots are constantly kept in water, frequently shifted. They are then put into jars, and covered with a thin syrup, which, after two or three days, is shifted, and a richer put on; this is sometimes again removed, and even a fourth put on; but it seldom requires more than three syrups. The shifted syrups are diluted, and fermented into a small pleasant liquor, called cool drink.

2. *Amomum zerumbet*, or broad-leaved ginger, or zerumbet: scape naked, spike oblong, obtuse. This is a native of the East Indies, Cochinchina, &c. Also in Otaheite and the other Society isles. With us it flowers from September to November; when the stalks perish, in the same manner as the true ginger. This is used externally in the East, in cataplasms and fomentations; but not as spice or medicine internally: though Garcias affirms, that it makes a better preserve with sugar than the other.

3. *Amomum sylvestre*, or great wild ginger: scape naked, spike elongate with oblong ventricose bractes, leaves broad-lanceolate. This differs in nothing from the preceding, only the stalk rises eight or nine feet high, having much larger leaves; and, instead of the flowers and fruits being on the end of the same stalk, they are on another about three feet high, immediately springing from the root. It is a native of Jamaica, where it is frequent enough in the woods. Browne says, that its common height is five or six feet, and that the flower-stalks seldom rise above one or two feet from the ground. The root is warm, and stimulates very gently; it may be properly administered as a stomachic and alexipharmic.

4. *Amomum mioga*, or Japanese ginger: scape very short, capsule ovate, leaves ensiform acute. It is a native of Japan, where it flowers in September.

5. *Amomum cardamomum*, or cardamom: scape very simple and short, bractes alternate, loose. The cardamom has thick fleshy roots, which in the spring send forth many green reed-like stalks, and rise to the height of seven or eight feet, garnished with very long narrow leaves, set alternately, closely embracing them at the base. The stalks decay entirely in autumn, and new ones arise from the roots in the spring; but it has not produced any flowers as yet in England, though the roots thrive and increase greatly where they are properly managed. Cardamom is an object of considerable commerce in Malabar. The Indians themselves make great use of it; they mix the seeds with their betel, thinking that it facilitates digestion. The lesser cardamom, which in all probability will prove to be a different species from this, affords an elegant and useful aromatic; very warm, yet not fiery, or subject, like pepper, to produce immoderate heat. The seeds, which are the part used in medicine, give out their warmth to watery as well as to spirituous menstrua, but much more powerfully to the latter. The tincture of cardamoms is occasionally made use of as a pleasant warm cordial, as well as for flavouring other medicines.

6. *Amomum villosum*: scape short reclining, bractes

linear, fruit villose. Native of the mountains of Cochinchina. The seeds are in great request among the Chinese merchants, being much used in medicine in China.

7. *Amomum medium*: spike cauline, branched; fruit oblong, streaked, valveless. Native of China, in the province Yunnan, to the west of Canton. The seeds are used in agues, for culinary purposes, and to increase the strength of any odours whatever.

8. *Amomum globosum*: spike cauline, branched; fruit globose with an even surface. Native of the mountains of China and Cochinchina; and used medicinally in both countries, in disorders of the bowels, &c.

9. *Amomum hirsutum*: spike cauline, simple, reclining; fruit roundish hirsute. Native of Cochinchina, in woods.

10. *Amomum granum paradisi*, or grains of paradise: scape branching, very short. As yet we know very little about this plant. It is a native of Guinea, and of the islands of Ceylon and Madagascar.

11. *Amomum galanga*, or galangale: spike cauline, erect; spathe subtriflorous; capsule three-cornered, ovate, smooth. It is a native of China and Cochinchina, and is cultivated in both countries. The root and seeds are both used there medicinally. The root, as imported to us, has no very grateful smell, and an unpleasant, bitterish, hot, taste. It was formerly in common use as a warm stomachic bitter, and generally made an ingredient in bitter infusions; but it is now almost wholly laid aside, on account of its unpleasant flavour. The spirituous extract is excessively fiery; and the watery extract is very hot and pungent. The essential oil has little smell, and no great pungency. The pungent matter, therefore, seems to be of the same nature with that of pepper; residing, not in the volatile oil, but in a more fixed matter. In the East, they use the fresh root in preserving fish and meat, and to flavour the spirit which they draw from rice and sugar. For this purpose, they bruise it grossly, and make it up into balls, with an equal quantity of rice. These balls are hung up for a long time in a chimney, that they may imbibe the foot. A quantity of this substance is broken into the liquor prepared by boiling for making spirit, and is left in it all night; the next day the liquor is found in a state of fermentation, and is put into the still; and they procure a spirit from this mixture, not inferior to that which is drawn from the coco palm, and probably much more wholesome. The same root is usually given in the shops for galangale and for zedoary.

12. *Amomum arboreum*: stem arboreous, fruit calycine. This is a tree about ten feet in height, with many twisted spreading branches. It has scarcely any taste or smell, and its use is unknown. The wood is very light, and not even fit for the fire. Native of the island of Sumatra, in a wood, on the eastern coast.

Propagation and Culture. All these sorts are tender, and require a warm stove to preserve them in this country. They are easily propagated by parting their roots; the best time for doing this is in the spring, before they put out new shoots; for they should not be transplanted in summer, when they are in full vigour, nor do they succeed so well when they are removed in autumn; because they remain long after in an inactive state; and, during that time, if wet comes to the roots, it often causes them to rot. When the roots are parted, they should not be divided into small pieces, especially if they are designed to have flowers; for, until the roots have spread to the side of the pots, they rarely put out flower-stems, for which reason they should not be planted in very large pots. These plants thrive best in a rich light earth, such as may be found in the kitchen-garden; with this the pots should be filled within two inches of the top, then the roots should be placed in the middle of the pots, observing that their crowns are upwards, and the pots filled up with the same rich earth; after this, the pots should be plunged into a hot-bed of tanner's bark, and must be sparingly watered, until their stalks appear above ground, when they will require a greater share of moisture, especially

during the warm summer months; but in autumn the waterings must not be often, nor in great plenty; and, during the winter, when the roots are inactive, very little water should be given them. The pots with these roots should constantly remain plunged in a tan-bed; for if they are taken out, and placed on shelves in the stove, their fibres frequently shrink, which occasions their roots to decay. With this management these plants have multiplied greatly, and the common ginger has produced roots weighing five or six ounces, but the others have been near a pound weight. In the West Indies the ginger thrives best in a rich cool soil; in a more clayey soil the root shrinks less in scalding. The land laid out for the culture of it is first well cleared and hoed, then slightly trenched, and planted in March or April; it flowers about September. When the stalks are wholly withered, the roots are fit to take up, which is generally done in January and February. See ALPINIA, COSTUS, and SISON.

AMOMUM CURCUMA. See CURCUMA.

AMOMUM PLINII, or AMORIS POMUM. See SOLANUM.

AMO'NG, or AMO'NGST, *prep.* [*among, gemang, Sax.*] Mingled with; placed with other persons or things on every side.—*Amongst* strawberries sow here and there some borage-seed, and you shall find the strawberries under those leaves far more large than their fellows. *Bacon*.—Conjoined with others, so as to make part of the number.—I have then, as you see, observed the failings of many great wits *amongst* the moderns, who have attempted to write an epic poem. *Dryden*.

AMON'TONS (William), an ingenious French experimental philosopher, was born in Normandy, the 31st of August, 1663. While at the grammar-school, he by sickness contracted a deafness that almost excluded him from the conversation of mankind. In this situation, he applied himself to the study of geometry and mechanics; with which he was so delighted, that it is said he refused to try any remedy for his disorder, either because he deemed it incurable, or because it increased his attention to his studies. Among other objects of his study, were the arts of drawing, of land-surveying, and of building; and, shortly after, he acquired some knowledge of those more sublime laws by which the universe is regulated. He studied with great care the nature of barometers and thermometers; and wrote his treatise of "Observations and Experiments concerning a new Hour-glass, and concerning Barometers, Thermometers, and Hygroscopes;" and also some pieces in the Journal des Savans. In 1687, he presented a new hygroscope to the Academy of Sciences, which was much approved. He found out a method of conveying intelligence to a great distance in a short space of time: this was by making signals from one person to another, placed at as great distances from each other as they could see the signals by means of telescopes, and which is the foundation and origin of our present telegraphs. When the Royal Academy was new regulated, in 1699, Amontons was chosen a member of it, as an eleve under the third astronomer; and he read there his "New Theory of Friction," in which he happily cleared up an important object in mechanics. In fact, he had a particular genius for making experiments; his notions were just and delicate; and he knew how to prevent the inconveniencies of his new inventions, and had a wonderful skill in executing them. He died the 11th of October, 1705, being only forty-two years of age.

AMORÆ'ANS, a sect or order of gemaric doctors, or commentators on the Jerusalem Talmud. The Amoræans succeeded the Mischnic doctors. They subsisted 250 years, and were succeeded by the Seburæans.

AMOR'GOS, or AMURGUS, now Morgo, not far from Naxos to the east, one of the European Sporades; the country of Simonides, the iambic poet. To this island criminals were banished. It was famous for a fine flax, called *emorgis*.

AM'ORIST, *f.* An innamorato; a gallant; a man professing love.—Female beauties are as fickle in their faces as their minds; though casualties should spare them, age brings in a necessity of decay; leaving doaters upon red and white perplexed by uncertainty both of the continuance of their mistresses's kindness, and her beauty, both of which are necessary to the *amorist's* joys and quiet. *Boyle*.

AM'ORITES, a people descended from Amorrihæus; according to the Septuagint and Vulgate; Emoræus, according to other expositors; Hæmori, according to the Hebrew; or Emorite, according to our version of the bible; who was the fourth son of Canaan, Gen. x. 16. The Amorites first of all peopled the mountains lying to the west of the Dead Sea. They had likewise establishments to the east of the same sea, between the brooks of Jabbok and Arnon. Moses made a conquest of this country from their kings Sihon and Og, in the year of the world 2553. The prophet Amos (ii. 9.), speaking of the gigantic stature and valour of the Amorites, compares their height with that of cedars, and their strength with that of an oak. The name Amorite is often taken in Scripture for all Canaanites in general. The lands which the Amorites possessed on this side Jordan, were given to the tribe of Judah; and those which they had enjoyed beyond this river, were distributed between the tribes of Reuben and Gad.

AMO'RIMUM, a town of Phrygia Major, near the river Sangarius, on the borders of Galatia. It was taken from the Romans by the Saracens in 668, but soon after retaken by the Romans. A war breaking out again between these two nations in 837, the Roman emperor Theophylus destroyed Sozopetra, the birth-place of the khalif Al' Motafem, notwithstanding his earnest entreaties to him to spare it. This so enraged the khalif, that he ordered every soldier in his army to engrave upon his shield the word *Amorium*, the birth-place of Theophylus, which he resolved at all events to destroy. After a siege of fifty-five days, it was betrayed into his hands by one of the inhabitants, who had abjured the Christian religion. The khalif, exasperated at the loss he had sustained during the siege, put most of the men to the sword, carried the women and children into captivity, and levelled the city with the ground. His forces being distressed for want of water on their return home, the Christian prisoners rose upon some of them, and murdered them; upon which the khalif put 6000 of the prisoners to death. According to the eastern historians, 30,000 of the inhabitants of Amorium were slain, and as many carried into captivity.

AMORO'SO, *f.* [Ital.] A man enamoured.

A'MOROUS, *adj.* [*amoroso, Ital.*] In love; enamoured; with the particle of before the thing loved; in *Shakespeare, on*.—Sure my brother is *amorous on* Hero, and hath withdrawn her father to break with him about it.—Naturally inclined to love; disposed to fondness; fond.—Apes, as soon as they have brought forth their young, keep their eyes fastened on them, and are never weary of admiring their beauty; so *amorous* is nature of whatsoever the produces. *Dryden*.—Relating or belonging to love:

And into all things from her air inspir'd
The spirit of love, and *amorous* delight.

Milton.

A'MOROUSLY, *adv.* Fondly; lovingly.

A'MOROUSNESS, *f.* The quality of being amorous; fondness; lovingness; love.—Lindamor has wit, and *amorousness* enough to make him find it more easy to defend fair ladies than to defend himself against them. *Boyle*.

AMOR'PHA, *f.* [from *a priv.* and *μορφη, form.*] In botany, a genus of the diadelphia decandria class, of the natural order of papilionacæ, or leguminosæ. The generic characters are—Calyx: perianthium one-leaved, tubulous, cylindrical, turbinate; mouth erect, five-toothed, obtuse, the two upper-teeth larger than the others; permanent. Corolla: of one ovate concave petal, scarcely larger than the calyx, erect, inserted into the calyx, between the two larger and upper teeth, and placed at the upper side of it. Stamina: filaments very slightly united

at the base, erect, unequal in length, longer than the corolla: anthera simple. Pistillum: germ roundish; style subulate, the length of the stamens; stigma simple. Pericarpium: legume lunulate, reflex, larger than the calyx, compressed, more reflex at the tip, one-celled, tubercled. Seeds two, oblong-kidney-shaped. — *Essential Character.* Standard of the corolla ovate, concave.

There is but one species, which is named *amorphia fruticosa*, or bastard indigo. It rises with many irregular stems, to the height of twelve or fourteen feet, with very long winged leaves, in shape like those of the common acacia. At the extremity of the same year's shoots, the flowers are produced in long slender spikes, they are small and of a deep purple colour; make their appearance the beginning of July; and the seeds do not ripen in England. This shrub grows naturally in Carolina, where formerly the inhabitants made a coarse sort of indigo from the young shoots, which occasioned their giving it the name of bastard indigo. The seeds were sent to England, by Mr. Mark Catesby, in 1724, from which many plants were raised in the gardens near London; these were of quick growth, and many of them produced flowers in three years. It is become very common in all gardens and nurseries. Thunberg observed it in the great island of Nipon belonging to Japan.

It is generally propagated by seeds, which are annually sent to England from different parts of America, for it is found in many of the northern colonies there; they usually arrive in February, and should be sown as soon as possible, in a light soil. It may also be propagated by laying down the young branches, which in one year will make good roots, and may then be taken off, and planted either in the nursery or in the places where they are designed to remain. If they are put into a nursery, they should not remain there more than one year; for, as the plants make large shoots, they do not remove well when they have remained long in a place: they must have a sheltered situation, otherwise their branches will be broken by the winds. As these shoots are large and soft, their upper parts are generally killed by frost in winter; but they put out shoots again in plenty, below the dead part, the spring following.

AMOR'PHOUS, *adj.* [of *amorphus*, Lat. *αμορφος*, Gr. of a priv. and *μορφη*, form.] Without form or shape; ill-shaped.

AMOR'T, *adv.* [*à la mort*, Fr.] In the state of the dead; dejected; depressed; spiritless.—How fares my Kate? what, sweeting, all *amort*? *Shakespeare.*

AMORTIZA'TION, or AMO'RTIZEMENT, *f.* [*amortissement*, *amortissable*, Fr.] The right or act of transferring lands to mortmain; that is, to some community, that never is to cease.—Every one of the religious orders was confirmed by one pope or other; and they made an especial provision for them, after the laws of *amortization* were devised and put in use by princes. *Ayliffe.*

To AMOR'TIZE, *v. a.* [*amortir*, Fr.] To alien lands or tenements to any corporation, guild, or fraternity, and their successors; which cannot be done without licence of the king, and the lord of the manor. *Blount.*

AMOS, [אָמֹס Heb. i. e. burden, or burdening.] The fourth of the small prophets, who in his youth had been a herdman in Tekoa, was sent to the king of Bashan, that is, to the people of Samaria, to bring them back to repentance, and an amendment of their lives; whence it is thought probable, that he was born within the territories of Israel, and only retired to Tekoa on his being driven from Bethel by Amaziah, the priest of the golden calves at Bethel. The prophet, being thus retired to Tekoa, in the kingdom of Judah, continued to prophesy. He boldly remonstrates against the crying sins that prevailed among the Israelites, as idolatry, oppression, wantonness, and obstinacy. He likewise reproves those of Judah, for their sensuality and injustice. He terrifies them both with frequent threatenings, and pronounces, that their sins will at last end in the ruin of Judah and Israel. Amos

was chosen to the prophetic office in the time of Uzziah, king of Judah, and Jeroboam, the son of Joash, king of Israel, two years before the earthquake, which happened in the twenty-fourth or twenty-fifth year of Uzziah, according to the rabbins and most of the modern commentators. He foretold the misfortunes which the kingdom of Israel should fall into after the death of Jeroboam II. who was then living. He foretold the death of Zeechariah, the invasion of the lands belonging to Israel by Phul and Tiglath-Pileser, kings of Assyria; and he speaks of the captivity of the ten tribes, and their return.

AMOS, [אָמֹס Heb. i. e. stout or strong.] The father of the prophet Isaiah.

To AMO'VE, *v. a.* [*amoveo*, Lat.] To remove from a post or station: a juridical sense. To remove; to move; to alter: a sense now out of use.

To AMO'UNT, *v. n.* [*monter*, Fr.] To rise to in the accumulative quantity; to compose in the whole; with the particle *to*. It is used of several sums in quantities added together.—Let us compute a little more particularly how much this will *amount to*, or how many oceans of water would be necessary to compose this great ocean rolling in the air, without bounds or banks. *Burnet.*—It is used, figuratively, of the consequence rising from any thing taken altogether.—The errors of young men are the ruin of business; but the errors of aged men *amount but to* this, that more might have been done, or sooner. *Bacon.*

AMO'UNT, *f.* The sum total; the result of several sums or quantities accumulated:

And now, ye lying vanities of life,
Where are you now, and what is your *amount*?
Vexation, disappointment, and remorse. *Thomson.*

AMO'UR, *f.* [*amour*, Fr. *amor*, Lat.] An affair of gallantry; an intrigue: generally used of vicious love. The *ou* sounds like *oo* in *poor*.—No man is of so general and diffusive a lust, as to prosecute his *amours* all the world over; and, let it burn never so outrageously, yet the impure flame will either die of itself, or consume the body that harbours it. *South.*

AMOUR'IST, *f.* [*un amoureux*, Fr.] An amorous person, one apt to be in love. Now spelt AMORIST.

A'MOY, an island in the province of Fokien, in China, where the English had a factory; but they have abandoned it on account of the impositions of the inhabitants. Lat. 24. 30. lon. 136. 0. It has a fine port, that will contain many thousand vessels.

AMP'ANA, *f.* in botany. See BORASSUS.

AMP'ELIS, the CHATTERER, *f.* in ornithology, a genus of birds belonging to the order passeris; the distinguishing characters of which are—bill straight, convex: upper mandible longer, somewhat bent inwards, and notched on both sides: nostrils beset with bristles: tongue sharp, cartilaginous, bifid. There are eleven species, one of which inhabits Europe, and the remaining ten the hotter parts of America. They are as follow:

1. *Ampelis teresa*, or blue-breasted, being of a beautiful azure, its back black, and its belly yellowish white.
2. *Garrulus Bohemicus*, or Bohemian, from often migrating there; having the back of its head erected, the secondary wing quills membranous, coloured at the tip.
3. *Ampelis carunculata*, or carunculated; having a pendulous, expandible, and moveable, caruncle at the base of the bill.
4. The *pompadora*, of a beautiful purple colour; the nearest coverts of its wings are sword-shaped, elongated, boat-shaped, and stiff.
5. The *cayana*, or purple-throated; being of a bright blue colour, with its neck violet below.
6. The *carnifex*, having its head and breast red; the stripe at its eyes, the tips of the quills of the wings, and its tail, black.
7. The *maynana*, or silken, from the softness of its plumage, which is a bright blue, with purple neck.
8. The *variegata*, or variegated; its colour is cinereous, and to its throat are attached two lance-shaped caruncles.
9. The

9. The cuprea, or coppery; being of a fine bronze colour, and found in Surinam.

10. The phœnicea, or red-winged, which migrates into Africa.

11. The chrifata, or crested ampelis of America.

Aristotle, lib. ix. 16. has named this bird *γναφάλης*, which signifies a sort of matrafs or pillow, alluding to its silky feathers. Aldrovandus calls it *ampelis*, or vine-bird, because it generally feeds upon grapes; *αμπελος* denoting a vine. Some have reckoned it improperly the *merops* of Aristotle, which is the *bee-eater*; others have taken it for the *avis incendiaria* of the ancients, or the bird of the Hercynian forest, mentioned by Pliny; though its feathers do not cast fire at night, as alleged of that bird, unless this was a metaphorical allusion to the colour of the chattering's eyes, and the red pallets or tears on its wings.

We cannot well assign the cause that determines these birds to leave their ordinary residence, to roam into distant climes; particularly, as their migration is only occasional, happening once in three or four years; when, as Gesner informs us, their numerous host often darkens the sky. But whatever be the countries in which these birds choose to enjoy the sweets of existence, and transmit them to new generations, it is certain that they are not sedentary, but make their excursions far and wide, tenacious of the utmost scope of liberty. They sometimes appear in the north of England, in Scotland, France, Italy, and Spain; and were once superstitiously considered as the presages of plague, pestilence, and war. It is even recorded, that in the year 1551, when these birds made their customary tour of Italy, they spread in vast flocks through Modena, Placentia, and every other part, except Ferrara, as if they had a presentiment of the tremendous earthquake which was then about to happen, and which dispersed or destroyed even the feathered race of that ill-fated country. It is said they penetrate far into the arctic regions, which is confirmed by count Strahlenberg, who saw them in Tartary. They are gregarious, and feed on the berries of the mountain ash, of privet, bramble, juniper, and laurel; also upon almonds, apples, and figs; but the fruit of the vine appears to be their choicest food. They are killed for table throughout all the regions where they migrate, and are esteemed a delicious bird.

The representation given in the annexed plate, was drawn from the real crested chattering of America, which is a very elegant species of the ampelis. The bill is short, a little arched on the top of the upper mandible, and of a dusky colour. Round the base of the upper mandible are small black feathers, which form a bar reaching beyond the eyes, which are of a beautiful red, and shine with uncommon lustre. It hath long feathers on the crown of the head, which it can raise into a crest, or let fall at pleasure. The head and neck are of a reddish brown or bay colour, the breast inclines to white; the belly and thighs are of a pale yellow; the covert feathers beneath the tail are whitish; the back is of a rich brown colour; the rump and covert feathers on the upper side of the tail, and wings, are of a light ash-colour; the three innermost quills on each wing next the back, have their inner webs white to the tips; seven of the middle quills in each wing have small oblong flat pallets or horny substances hanging to their tips, of the colour and gloss of the finest red sealing-wax; the tips of the tail feathers are of a fine golden yellow; and the legs, feet, and claws, are black. In short, the plumage of the ampelis is perfectly elegant when the bird is at rest; but when it expands its wings, and spreads its tail, and erects its crest, in the act of flying, its appearance is charming. The hens of this species are not so bright-coloured as the cocks, and they want the red pallets or drops near the tips of their wing feathers.

AMPELIS, *f.* in botany. See VITIS.

AMPELITES, *f.* a solid, dry, hard, opaque, black, fossil, coal, not fusible, but easily inflammable, and burning with a bright vivid white flame, with much smoke, and a bituminous or pitchy smell. In the north of Eng-

land it is called cannel coal, perhaps by corruption, instead of candle coal, as it is used to supply the place of candles in poor families. An alum ore found in Burgundy, and consisting of clay, pirites, and bitumen, is also distinguished by this name. There is a large quarry of it near Alençon, in France. It is dug in many parts of England, but the finest is in Lancashire and Cheshire. It is capable of a very high and elegant polish; and, in the countries where it is produced, is turned into a vast number of toys, as snuff-boxes, and the like, which bear all the nicety of turning, and are made to pass for jet. Husbandmen smear their vines with it, as it kills the vermin which infests them: It is likewise used for dyeing of hair black. In medicine, it is reputed good in colics, against worms, and of being in general an emollient and discutient; but the present practice takes no notice of it.

AMPELOPRA'SUM, *f.* in botany. See ALLIUM.

AMPELU'SIA, a promontory of Mauritania Tingitana, called Cottes by the natives, which is of the same signification with a town of the same name not far from the river Lixus, near the Straits of Gibraltar; now Cape Spartel. Lat. 36. 0. lon. 6. 30. W.

AM'PER, *f.* [*ampre*, Sax.] A tumour, with inflammation; bile: a word said, by Skinner, to be much in use in Essex; but, perhaps, not found in books.

AMPHARIS'TEROS, *adj.* it is the reverse of ambidexter; that is, not having a proper use of either hand. Figuratively, it signifies unlucky, unfortunate.

AMPHEME'RINOS, *f.* it is the continued fever of Linnæus and Vogel, from *αμφι*, a Greek preposition, signifying a revolution, and *εμερα*, a day; a quotidian intermittent. It is by some considered a remittent fever, and properly put in contradistinction to the febris quotidiana, which is an intermittent, and is defined a kind of remittent fever, whose paroxysms return every day of a similar nature, though it is rarely observed to be regular. Sauvages enumerates no less than twenty-four species. See Sauvages' Nosolog. Meth. 4to. vol. ii. p. 322.

AMPHE'RES, *f.* in antiquity, a kind of vessels, wherein the rowers plied two oars at the same time, one with the right hand and another with the left.

AMPHIARA'US, in pagan mythology, a celebrated prophet, who possessed part of the kingdom of Argos. He was believed to excel in divining by dreams, and is said to be the first who divined by fire. Amphiaras knowing, by the spirit of prophecy, that he should lose his life in the war against Thebes, hid himself, in order to avoid engaging in that expedition: but his wife Eriphyle, being prevailed upon by a present, discovered the place in which he had concealed himself; so that he was obliged to accompany the other princes who marched against Thebes. This proved fatal to him; for, the earth being rent asunder by an earthquake, both he and his chariot were swallowed up in the opening. Amphiaras, after his death, was ranked among the gods; temples were dedicated to him; and his oracle, as well as the sports instituted to his honour, were very famous.

AMPHIARTHRO'SIS, *f.* in anatomy, a mixed sort of articulation; partaking of the diarthrosis and the synarthrosis; it resembles the first in being moveable, and the latter in its connection. The species which compose it have not a particular cartilage belonging to each of them, as in the diarthrosis, but they are both united to a common cartilage, which being more or less pliable, allows them certain degrees of flexibility, though they cannot slide upon each other; such is the connection of the first rib with the sternum, and of the bodies of the vertebrae with each other.

AMPHI'BIA, *f.* in zoology, the name of Linnæus's third class of animals; including all those which live partly in water and partly on land. This class he subdivides into four orders, viz. The amphibia reptiles; the amphibia serpentes; the amphibia nantes; and the amphibia meantes. It has been a question, whether the animals commonly called *amphibious* live most in the water or

AMPELIS.

The Crested Chatterer of America.

London Published as the Act directs, July 2. 1796. by J. H. Fisher.

1. The Pompadour Chatterer. 2. The Purple-throated Chatterer.

or on land. If we consider the words *αμφι* (*utrinque*, both ways), and *βίος* (*vita*, life), from which the term *amphibious* is derived; we should understand, that animals having this title are capable of living as well by land, or in the air, as by water; or of dwelling in either constantly; but it will be difficult to find any animal that can fulfil this definition, by being equally qualified for either. Dr. Parsons, therefore, from considering their economy respectively, divides them into two orders, viz. 1. Such as enjoy their chief functions by land, but occasionally go into the water. 2. Such as chiefly inhabit the water, but occasionally go ashore. What he advances on this subject is curious, and well illustrates the nature of them.

Of the first order, he particularly considers the phocæ; and endeavours to shew, that none of them can live entirely in the water; but that their chief enjoyment of the functions of life is on shore. These animals, he observes, are really quadrupeds; but, as their chief food is fish, they are under a necessity of going out to sea to hunt their prey, and to great distances from shore; taking care that, however great the distance, rocks or small islands are at hand, as resting-places when they are tired, or when their bodies become too much macerated in the water; and they return to the places of their usual resort to sleep, copulate, and bring forth their young, for the following reasons, viz. It is well known, that the only essential difference (as to the general structure of the heart) between amphibious and land animals, or such as never go into the water, is, that in the former the oval hole remains always open. Now, in such as are without this hole, if they were to be immersed in water for but a little time, respiration would cease, and the animal must die; because a great part of the mass of blood passes from the heart by the pulmonary artery through the lungs, and by the pulmonary veins returns to the heart, while the aorta is carrying the greater part of the mass to the head and extremities, &c.

Now, the blood passes through the lungs in a continual uninterrupted stream, while respiration is gentle and moderate; but, when it is violent, then the circulation is interrupted, for inspiration and expiration are now carried to their extent; and, in this state, the blood cannot pass through the lungs, either during the total inspiration or total expiration of the air in breathing: for, in the former case, the inflation compresses the returning veins; and, in the latter, by the collapse of the lungs, these veins are interrupted also; so that it is only between these two violent actions that the blood can pass: and hence it is, that the lives of animals are shortened, and their health impaired, when they are subject to frequent violent respiration; and thus it is, that when animals have once breathed, they must continue to respire ever after, for life is at an end when that ceases.

There are three necessary and principal uses of respiration in all land-animals, and in those kinds that are counted amphibious. The first is, that of promoting the circulation of all the blood through the whole body and extremities. In real fishes, the force of the heart is alone capable of sending the blood to every part, as they are not furnished with limbs or extremities; but, in the others mentioned, being all furnished with extremities, respiration is an assistant force to the arteries in sending blood to the extremities; which, being so remote from the heart, have need of such assistance, otherwise the circulation would be very languid in these parts: thus we see, that, in persons subject to asthmatic complaints, the circulation grows languid, the legs grow cold and cedematous, and other parts suffer by the defect of respiration. A second use of breathing is, that, in inspiration, the variety of particles, of different qualities, which float always in the air, might be drawn into the lungs, to be insinuated into the mass of blood, being highly necessary to temperate and cool the agitated mass, and to contribute refined pabulum to the finer parts of it, which, meeting with the daily supply of chyle, serves to assimilate and more inti-

mately mix the mass, and render its constitution the fitter for supporting the life of the animal. Therefore it is, that valetudinarians, by changing foul or unwholesome air for a fine, good, open, air, often recover from lingering diseases. A third principal use of respiration is, to promote the exhibition of voice in animals; which all those who live on the land do, according to their specific natures.

From these considerations it appears, that the phocæ of every kind are under an absolute necessity of making the land their principal residence. But there is another very convincing argument why they reside on shore the greater part of their time; namely, that the flesh of these creatures is analogous to that of other land-animals; and therefore, by over long maceration, added to the fatigue of chasing their prey, they would suffer such a relaxation as would destroy them. It is well known, that animals which have lain long under water, are reduced to a very lax and even putrid state; and the phoca must bask in the air on shore: for, while the solids are at rest, they acquire their former degree of tension, and the vigour of the animal is restored; and, while he has an uninterrupted placid respiration, his blood is refreshed by the new supply of air, and he is rendered fit for his next cruise: for action waits the most exalted fluids of the body, more or less, according to its duration and violence; and the restorative rest must continue longer or shorter, according to the quantity of the previous fatigue.

We shall next examine by what power these animals are capable of remaining longer under water than land-animals. All these have the oval hole open between the right and left auricles of the heart; and, in many, the canalis arteriosus also: and, while the phoca remains under water, which he may continue an hour or two, more or less, his respiration is stopped; and the blood, not finding the passage through the pulmonary artery free, rushes through the hole from the right to the left auricle, and partly through the arterial canal, being a short passage to the aorta, and thence to every part of the body, maintaining the circulation: but, upon rising to come ashore, the blood finds its passage again through the lungs the moment he respire. Thus the fœtus in utero, during its confinement, having the lungs compressed, and consequently the pulmonary arteries and veins impervious, has the circulation of the blood carried on through the oval hole and the arterial canal. Now, so far, the phoca in the water, and the fœtus in utero, are analogous; but they differ in other material circumstances. One is, that the fœtus, having never respired, remains sufficiently nourished by the maternal blood circulating through him, and continues to grow till the time of his birth, without any want of respiration during nine months confinement: the phoca, having respired the moment of his birth, cannot live very long without it, for the reasons given before; and this hole and canal would be closed in them, as it is in land-animals, if the dam did not, soon after the birth of the cub, carry him so very frequently into the water to teach him; by which practice these passages are kept open during life, otherwise they would not be capable of attaining the food designed for them by Providence. Now, as all fœtuses have these passages open, if a whelp of a true water-spaniel were, immediately after its birth, served as the phoca does her cubs, and immersed in water, to stop respiration for a little time every day, it is probable that the hole and canal would be kept open, and the dog be made capable of remaining as long under water as the phoca.

Frogs, how capable soever of remaining in the water, yet cannot avoid living on land, for they respire; and, if a frog be thrown into a river, he makes to the shore as fast as he can. The lizard kind, such as may be called water-lizards, are all obliged to come to land, to deposit their eggs, to rest, and to sleep. Even the crocodiles, who dwell much in rivers, sleep and lay their eggs on shore, and, while in the water, are compelled to rise to the surface to breathe; yet, from the texture of their scaly covering, they are capable of remaining in the water longer

by far than any species of the phoca, whose skin is analogous to that of a horse or cow. The hippopotamus, who wades into the lakes or rivers, is a quadruped, and remains under the water a considerable time; yet his chief residence is upon land, and he must come on-shore for respiration. The testudo, or sea-tortoise, though he goes out to sea, and is often found far from land; yet, being a respiring animal, cannot remain long under water. He has indeed a power of rendering himself specifically heavier or lighter than water, and therefore can let himself down to avoid an enemy or a storm: yet he is under a necessity of rising frequently to breathe; and his most usual situation, while at sea, is upon the surface of the water, feeding upon the various substances that float in great abundance every where about him; these animals sleep securely upon the surface, but not under water; and can remain longer at sea than any other of this class, except the crocodile; because, like him, his covering is not in danger of being too much macerated; yet they must both go on-shore to copulate and lay their eggs.

The consideration of these is sufficient to inform us of the nature of the first order of the class of amphibious animals; let us now see what is to be said of those which chiefly inhabit the waters, but occasionally go on-shore. These are but of two kinds: the eels and water serpents, or snakes of every kind. It is their form that qualifies them for loco-motion on land, and they know their way back to the water at will; for, by their structure, they have a strong peristaltic motion, by which they can go forward at a pretty good rate: whereas all other kinds of fish, whether vertical or horizontal, are incapable of a voluntary loco-motion on shore; and therefore, as soon as such fish are brought out of the water, after having floundered awhile, they lie motionless, and soon die. The reason is, that fish in general have, instead of lungs, gills, or branchiæ: and as, in land-animals, the lungs have a large portion of the mass of blood circulating through them, which must be stopped if the air has not a free ingress and egress into and from them; so, in fish, there is a great number of blood-vessels that pass through the branchiæ, and a great portion of their blood circulates through them, which must in like manner be totally stopped, if the branchiæ are not perpetually wet with water. So that, as the air is to the lungs in land-animals a constant assistant to the circulation, so is the water to the branchiæ of those of the rivers and seas: for, when these are out of the water, the branchiæ very soon grow crisp and dry, the blood-vessels are shrunk, and the blood is obstructed in its passage; so, when the former are immersed in water, or otherwise prevented from having respiration, the circulation ceases, and the animal dies. Again, as land-animals would be destroyed by too much maceration in water; so fishes would, on the other hand, be ruined by too much exsiccation: the latter being, from their general structure and constitution, made fit to bear, and live in, the water; the former, by their constitution and form, to breathe and dwell in the air. But it may be asked, why eels and water-snakes are capable of living longer in the air than the other kinds of fish? This is answered, by considering the providential care of the great Creator for these and every one of his creatures; for, since they were capable of loco-motion by their form, which they need not be if they were never to go on shore, it seemed necessary that they should be rendered capable of living a considerable time on shore, otherwise their loco-motion would be in vain. This is provided for in a most convenient manner: for this order of fishes have their branchiæ well covered from the external drying air; they are also furnished with a slimy mucus, which hinders them from becoming crisp and dry for many hours; and their very skins always emit a mucous liquor, which keeps them supple and moist for a long time: whereas the branchiæ of other kinds of fish are much exposed to the air, and want the slimy matter to keep them moist. Now, if any of these, when brought out of the water, were laid in a vessel without water, they might be

preserved alive a considerable time, by only keeping the gills and surface of the skin constantly wet, even without any water to swim in.

It has been advanced, that man may, by art, be rendered amphibious, and able to live under water as well as frogs. As the fœtus lives *in utero* without air, and the circulation is there continued by means of the foramen ovale; by preserving the passage open, and the other parts *in statu quo*, after the birth, the same faculty would still continue. Now, the foramen, it is alleged, would be preserved in its open state, were people accustomed, from their infancy, to hold their breath a considerable time once a day, that the blood might be forced to resume its pristine passage, and prevent its drying up, as it usually does. This conjecture seems, in some measure, supported by the practice of divers, who are taught from their childhood to hold their breath, and keep long under water, by which means the ancient channel is kept open. A Calabrian monk, at Madrid, laid claim to this amphibious capacity; making an offer to the king of Spain, to continue twice twenty-four hours under water, without ever coming up to take breath. Kircher gives an account of a Sicilian, named the *fish Colas*, who, by a long habitude from his youth, had so accustomed himself to live in water, that his nature seemed to be quite altered; and he lived rather after the manner of a fish than a man.

AMPHIBIOUS, *adj.* [*amphibie*, Fr. *anfibi*, It. *amphibio*, Sp. *amphibius*, Lat. of *αμφιβιός*, of *αμφι*, both sides, and *βιος*, life, Gr.] That which partakes of two natures, so as to live in two elements; as, in air and water:

A creature of *amphibious* nature,

On land a beast, a fish in water.

Hudibras.

Of a mixed nature, in allusion to animals that live in air and water:

Traulus of *amphibious* breed,

Motley fruit of mongrel seed;

By the dam from lordlings sprung,

By the fire exhal'd from dung.

Swift.

AMPHIBIOUSNESS, *f.* The quality of being able to live in different elements.

AMPHIBLESTROIDES, *f.* [*αμφιβλεστροειδης*, of *αμφιβλεστρον*, a net, Gr.] The retina, or net-like coat of the eye.

AMPHIBOLOGICAL, *adj.* Doubtful.

AMPHIBOLOGICALLY, *adv.* Doubtfully; with a doubtful meaning.

AMPHIBOLOGY, *f.* [*amphibologie*, Fr. *amphibologia*, Lat. of *αμφιβολογια*, of *αμφι*, about, and *βαλλω*, to cast, or throw, Gr.] Discourse of uncertain meaning. It is distinguished from *equivocation*, which means the double signification of a single word; as, *noli regem occidere timere bonum est*, is *amphibology*; *captare lepores*, meaning, by *lepores*, either hares or jests, is *equivocation*.—In defining obvious appearances, we are to use what is most plain and easy; that the mind be not misled by *amphibologies* into fallacious deductions. *Glanville.*

AMPHIBOLOUS, *adj.* [*αμφι* and *βαλλω*, Gr.] Tossed from one to another; striking each way.—Never was there so *amphibolous* a quarrel, both parties declaring themselves for the king, and making use of his name in all their remonstrances, to justify their actions. *Howell.*

AMPHIBRACHYS, *f.* [*αμφι* and *βραχυς*, short, Gr.] In ancient poetry, the name of a foot consisting of three syllables, whereof that in the middle is long, and the other two short; such is the word “*ābīrē*.”

AMPHIBRANCHIA, *f.* [from *αμφι*, about, and *βραγχια*, the gills of a fish; some say, *βραγχια*, the fauces, and some say the jaws.] The fauces or parts about the tonsils.

AMPHICOME, *f.* A kind of figured stone, of a round shape, but rugged, and beset with eminences, celebrated on account of its use in divination. The word is originally

AMPHISBÆNA.

Idle delin.

Pige sculp.

The Fuliginosa and Alba Serpents.

London Published as the Act directs, 23rd August 1796, by J. Wilkes.

nally Greek, ἀμφικροίαι, *utrinque comata*, or "hairy on all sides." This stone is also called *erotylos*, ἐρωτυλός, *amatoria*, probably on account of its supposed power of creating love. The amphirome is mentioned by Democritus and Pliny, though little known among the moderns.

AMPHICTYONS, *f.* [Some suppose the word ἀμφικτιόνες to be formed of ἀμφί, about, and κτείνω or κτείνειν, Gr. in regard the inhabitants of the country round about met here in council; others, with more probability, from Amphictyon, son of Deucalion, whom they suppose to have been the founder of this assembly; though others will have Acrisius, king of the Argives, to have been the first who gave a form and laws to it.] In Grecian antiquity, an assembly composed of deputies from the different states of Greece; and resembling, in some measure, the diet of the German empire. Authors give different accounts of the number of the Amphyctions, as well as of the states that were entitled to have their representatives in this council. They decided all public differences and disputes between any of the cities of Greece; but, before they entered on business, they jointly sacrificed an ox cut into small pieces, as a symbol of their union. Their determinations were received with the greatest veneration, and even held sacred and inviolable. The stated terms of their meeting were in spring and autumn; the spring was called *Εαρινή Πύλαια*, that in autumn *Μετοπωρινή*. On extraordinary occasions, however, they met at any time of the year, or even continued sitting all the year round. Philip of Macedon usurped the right of presiding in the assembly of the Amphictions, and of first consulting the oracle which was called *Προμαντεία*.

AMPHIDAMAS, the son of Busiris, king of Egypt, was offered to Hercules on the same altar that his father had sacrificed all strangers that he could get into his possession.

AMPHIDROMIA, *f.* [ἀμφιδρόμα, of ἀμφί, about, and δρόμος, Gr. a course.] A festival observed in Athens by private families, upon the fifth day after the birth of a child, it being the custom for the sponsors to run round the fire with the infant in their arms; and then, having delivered it to the nurse, they were entertained with feasting and dancing.

AMPHIDRYON, *f.* in ecclesiastical writers, denotes the veil or curtain which was drawn before the door of the bema in ancient churches.

AMPHILOCHIA, the territory of the city of Argos in Acarnania. A town also of Spain, in Gallacia, built by Teucer, and denominated from Amphilochus one of his companions; now *Orense*. Lat. 42. 36. lon. 8. 20. W.

AMPHILOCHIUS, bishop of Iconium, in the fourth century, was the friend of St. Gregory Nazianzen and St. Basil. He assisted at the first general council of Constantinople in 381; presided at the council of Sidæ; and was a strenuous opposer of the Arians. He died in 394; and his works were published in Greek and Latin at Paris 1644, by Francis Combefis.

AMPHILOCHUS, son of Amphiarus and Eriphyle, was a celebrated diviner. He had an altar erected to him at Athens, and an oracle at Mallus, in Cilicia, which city was founded by him and Mopsus. The answers of this oracle were given by dreams; the party enquiring used to pass a night in the temple, and that night's dream was the answer.

AMPHILOGY, *f.* [ἀμφί and λόγος, Gr.] Equivocation; ambiguity.

AMPHIMACER, *f.* [ἀμφί and μακρός, Gr.] In ancient poetry, a foot consisting of three syllables, whereof the first and last are long, and that in the middle short; such is the word "castitas."

AMPHIMEDON, the son of Melantheus, one of the lovers of Penelope, who was slain by her son Telemachus.

AMPHINOME, the name of one of the fifty Nereides, according to Homer.

AMPHION, a son of Jupiter, by Antiope daughter

of Nycteus, who had married Lycus, and had been repudiated by him when he married Dirce. Amphion was born at the same birth as Zethus, on mount Cythron, where Antiope had fled to avoid the resentment of Dirce. He made such uncommon progress in music, that he is said to have built the walls of Thebes by the harmony of his lyre. He and Zethus united to avenge the wrongs of their mother; they besieged and took Thebes, put Lycus to death, and tied Dirce to the tail of a wild bull, who dragged her till she expired. A son of Jafus king of Orchomenos, by Persephone daughter of Minus. He married Niobe, by whom he had many children, but all of them and himself were destroyed, for her insolence to Latona, except Chloris, who became the wife of Neleus.

AMPHIPOLES, in antiquity, the principal magistrates of Syracuse. They were established by Timoleon in the 109th Olympiad, after the expulsion of the tyrant Dionysius. They governed Syracuse for the space of 300 years: and Diodorus Siculus says, that they subsisted in his time.

AMPHIPOLIS, an ancient decayed city of Macedon, an Athenian colony, on the Strymon, but on which side is not certain. Also a town of Syria, on the Euphrates, said to have been built by Seleucus, and called by the Syrians *Turmeda*; supposed to have been only renewed and adorned by Seleucus, because long famous before his time.

AMPHIPILI, *f.* in Grecian antiquity, soldiers who, in war, used two horses without saddles, and were dexterous enough to leap from one to the other.

AMPHIPROREÆ, *f.* in the naval affairs of the ancients, vessels with a prow at each end. They were used chiefly in rapid rivers and narrow channels, where it was not easy to tack about.

AMPHIPROSOTYLE, *f.* [ἀμφίπροστυλός, Gr.] A term in architecture, used of those temples, in ancient times, which had four columns or pillars in the front, and the same number behind.

AMPHISBÆNA, *f.* [ἀμφισβæνα, of ἀμφί and βæνω, Gr. to go.] A genus of serpents belonging to the order of amphibia serpentes, so called from the notion of its having two heads, because the head and tail are nearly of the same dimensions and appearance, and because it moves with either end foremost. The head of the amphisbæna is small, smooth, and blunt; the nostrils are very small; the eyes are minute and blackish; and the mouth is furnished with a great number of small teeth. The body is cylindrical, and divided into about 200 annular convex segments, like those of a worm; and it has a number of longitudinal streaks on each side, which intersect each other in the form of small crosses. The anus is a transverse slit; and the last ring, or segment, of the belly has eight small papillæ, forming a transverse line before the anus; the tail, and all the space below the anus, is short, consisting of thirty annular segments, and is thick and blunt at the point. The colour of the whole animal is beautifully variegated, being adorned with yellow, green, black, and cochineal. We know as yet but of two species, viz.

1. The fuliginosa, which answers exactly to the above description, and is found in Libya, and in different parts of America, in the hotter regions of which they grow to a large size.

2. The alba, which is of a silvery white, a little tinted with a beautiful green, that only appears in the shades occasioned by the folds of its body in moving along, is a native of the East and West Indies, as well as of America, and it is generally found in the ant-hillocks. The bite of the amphisbæna is reckoned to be mortal by many authors; but, as it is not furnished with dog-fangs, (the usual instrument of conveying the poison of serpents,) later writers esteem it not to be poisonous. They feed upon ants and earth-worms, but particularly the latter. The figures represented in the annexed plate are taken from the drawings of madam Merian, preserved in the British Museum. The broken egg shews a young serpent just emerging from the shell, as drawn from the life by the above celebrated naturalist.

AMPHISBÆNA AQUATICA, a name given by authors to that long and slender insect commonly called the *sta aquatic*, and *vermisetarius*. It has the name *amphisbæna*, from its going backwards or forwards with equal ease and celerity. The usual size is four or five inches long, and the thickness of a large hair. Two or three of these worms are generally to be found in the body of the common black beetle. When put into water they will live a considerable time, and swim nimbly about; but often put up their heads as if endeavouring to escape; and sometimes fastening themselves by the mouth to the sides of the vessel, and drawing their whole bodies after them. These creatures are not only found in water, but buried in earth, and sometimes on leaves of trees, in gardens and hedges.

AMPHIS'CH, *f.* [*αμφισχιος*, of *αμφι*, on both sides, and *σχια*, Gr. shadows.] A name applied to the people who inhabit the torrid zone. The *amphiseii* have their shadows one part of the year towards the north, and the other towards the south, according to the sun's place in the ecliptic. They are also called *Asii*.

AMPHIS'MILA, *f.* [from *αμφι*, on both sides, and *μιλη*, Gr. an incision knife.] A dissecting knife with an edge on each side.

AMPHIS'SA, anciently the capital of the Loeri Oxolæ, fifteen miles to the west of Delphi, and so named, because surrounded on all sides by mountains. Hence *Amphissei*, the inhabitants; who plundered the temple at Delphi. Also a town of Magna Græcia, at the mouth of the Sagra, on the coast of the farther Calabria, situated between Locri and Caulonia; now called *Rocella*.

AM'PHITANE, *f.* [*αμφιτανη*, Gr.] Among ancient naturalists, a stone said to attract gold as the loadstone does iron. Pliny says it was found in that part of the Indies where the native gold lay so near the surface of the earth as to be turned up in small masses among the earth of ant-hills; and describes it to have been of a square figure, and of the colour and brightness of gold. The description plainly points out a well-known fossil, called by Dr. Hill *pyriticubum*: this is common in the mines of most parts of the world; but its power of attracting gold is fabulous.

AMPHITHE'ATRE, *f.* [*amphitheatrum*, Lat. of *αμφιθεατρον*, of *αμφι*, about, and *θεατρον*, Gr. to behold.] In antiquity, a spacious edifice, built either round or oval, with a number of rising seats, upon which the people used to behold the combats of gladiators, of wild beasts; and other sports. Amphitheatres were at first only of wood; and it was not till the reign of Augustus, that Statilius Taurus built one, for the first time, of stone. The lowest part was of an oval figure, and called *arena*, because, for the conveniency of the combatants, it was usually strewn with sand; and round the arena were vaults styled *caveæ*, in which were confined the wild beasts appointed for the shows. Above the caveæ was erected a large circular peristyle, or podium, adorned with columns. This was the place of the emperors, senators, and other persons of distinction. The rows of benches were above the podium. Their figure was circular; and they were entered by avenues, at the end of which were gates called *vomitoria*. Their theatre was built in form of a semicircle, only exceeding a just semicircle by one-fourth part of the diameter; and the amphitheatre was nothing else but a double theatre, or two theatres joined together: so that the longest diameter of the amphitheatre was to the shortest as one and a half to one.

There are amphitheatres still standing at Rome, at Pola, at Nismes, &c. The amphitheatre of Vespasian, called the *Coliseum*, and that at Verona in Italy, are the most celebrated now remaining of all antiquity. Remains of amphitheatres are shown also at Arles, Bourdeaux, &c. The amphitheatre at Polla, an ancient republic of Ithria, is very entire: it consists of two orders of Tuscan pillars, one over the other. The lower have pedestals, which is extraordinary; this order having scarcely ever more than bases to support them. The amphitheatre of Vespasian

is computed to have been capable of holding 87,000 spectators. That of Verona is the best preserved: for, though most of the great and best stones of the outside are picked out, yet the great vault, on which the rows of the seats are laid, is entire; the rows also, which are forty-four in number, are entire. Every row is a foot and a half high, and as much in breadth; so that a man fits conveniently in them; and, allowing for a seat a foot and a half, the whole will hold 23,000 persons. Pliny mentions an amphitheatre built by Curio, which turned on large iron pivots; so that of the same amphitheatre two several theatres were occasionally made, whereon different entertainments were sometimes presented at the same time. Mr. Brydone mentions an amphitheatre at Syracuse, the theatre of which is so entire, that the *gradini* for seats still remain; but it is small in comparison of the others.

AMPHITHEATRE, in gardening, certain dispositions of trees and shrubs on the sides of hilly places, which, if the hill or rising be naturally of a circular figure, always have the best effect. They are to be formed of evergreens; such as hollies, phillæreas, larnistines, bays, and such plants, observing to plant the shortest growing trees in the front, and those which will be the tallest behind, such as pines, firs, cedars of Lebanon, &c.

AMPHITRI'TE, [*αμφιτριτη*, Gr. from *circumferendo*, Lat.] The daughter of Oceanus and Tethys, with whom Neptune fell in love; but she, desirous to continue a virgin, fled from him and hid herself; whereupon he sent two dolphins, who found her by mount Atlas, and persuaded her to marry Neptune; and, having conveyed her to him in a car, in the form of a shell, he on her begat Triton. She is sometimes called Salacia, and is often taken for the sea itself by the poets.

AMPHI'TRYON, the son of Alcæus, and grandson of Perseus, married to his cousin Alcmena. During the war with the Thebans, Alcmena became pregnant of Hercules by Jupiter, who, to deceive Alcmena, had assumed the shape of her husband. When Amphitryon returned from the war, he killed his father-in-law, Electryon, king of Mycenæ, by accident, for which he was obliged to fly and retire to Thebes with Alcmena.

AMPHO'RA, *f.* in antiquity, a liquid measure among the Greeks and Romans. The Roman amphora contained forty-eight sextaries, equal to about seven gallons one pint English wine-measure; and the Grecian or Attic amphora contained one-third more. **AMPHORA** was also a dry measure used by the Romans, and contained about three bushels. **AMPHORA**, among the Venetians, is the largest measure used for liquids, containing about sixteen quarts.

AMPHORA'RIVM VINUM, in antiquity, denotes that which is drawn or poured into *amphora* or pitchers; by way of distinction from *vinum doliare*, or cask wine. The Romans had a method of keeping wine in amphoræ for many years to ripen, by fastening the lids tight down with pitch or gypsum, and placing them either in a situation where smoke came, or under ground.

AM'PHOTIDES, *f.* a kind of armour or covering for the ears, worn by the ancient pugilists, to prevent their adversaries from laying hold of that part.

AMPHRY'SIUS, a river of Thessaly, running by the foot of mount Othrys, from south to north, into the Enipeus at Thebes of Thessaly; where Apollo fed the herds of king Admetus. Another Amphryus in Phrygia, rendering women barren, according to Pliny; hence the epithet *Amphrysiacus*. Also a town of Phocis, at the foot of mount Parnassus, encompassed with a double wall by the Thebans, in the war with Philip king of Macedon.

AM'PLE, *adj.* [*amplus*, Lat.] Large; wide; extended:

Heav'n descends

In universal bounty, shedding herbs,
And fruits, and flowers, on nature's ample lap. *Thomson.*

Great in bulk. Unlimited; without restriction. Liberal; large; without parsimony.—If we speak of strict justice,

AMPHITRITE.

Four curious and rare Species of Amphitrite.

J. Pass sculpt.

justice, God could no way have been bound to requite man's labours in so large and ample manner as human felicity doth import; in as much as the dignity of this exceedeth so far the other's value. *Hooker*.—Magnificent; splendid. Diffusive; not contracted; as, An ample narrative, that is, not an epitome.

AMPLENESS, *f.* The quality of being ample; largeness; splendour.—Impossible it is for a person of my condition to produce any thing in proportion either to the *ampleness* of the body you represent, or of the places you bear. *South*.

AMPLEPU'IS, a town in the department of Rhone and Loire. It is celebrated for its wines, and is sixteen miles east of Rouanne.

To AMPLIATE, *v. a.* [*amplio*, Lat.] To enlarge; to make greater; to extend.—He shall look upon it, not to traduce or extenuate, but to explain and dilucidate, to add and *ampliate*. *Brown*.

AMPLIATION, *f.* Enlargement; exaggeration; extension. Diffuseness.—The obscurity of the subject, and the prejudice and prepossession of most readers, may plead excuse for any *ampliations* or repetitions that may be found, whilst I labour to express myself plain and full. *Holder*.

On a medal of the emperor Antoninus Pius, we find the title *Ampliator civium* given him, on account of his having extended the *jus civitatis*, or right of citizenship, to many states and people before excluded from that privilege. In effect, it is generally supposed to have been this prince that made the famous constitution, whereby all the subjects of the empire were made citizens of Rome.

AMPLIATION, in Roman antiquity, was the deferring to pass sentence in certain causes. This the judge did, by pronouncing the word *amplius*; or by writing the letters N. L. for *non liquet*; thereby signifying, that, as the cause was not clear, it would be necessary to bring further evidence.

To AMPLIFICATE, *v. a.* [*amplifico*, Lat.] To enlarge; to spread out; to amplify.

AMPLIFICATION, *f.* [*amplification*, Fr. *amplificatio*, Lat.] Enlargement; extension.

AMPLIFICATION, in rhetoric, part of a discourse or speech, wherein a crime is aggravated, a praise or commendation heightened, or a narration enlarged, by an enumeration of circumstances; so as to excite the proper emotions in the souls of the auditors. Such is the passage in Virgil, where, instead of saying merely that Turnus died, he amplifies the circumstances of his death:

—*Ast illi solvuntur frigore membra,
Vitaque cum genitu fugit indignata sub umbras.*

The masters of eloquence make amplification to be the soul of discourse. See ORATORY.

AMPLIFIER, *f.* One that enlarges any thing; one that exaggerates; one that represents any thing with a large display of the best circumstances; it being usually taken in a good sense.

To AMPLIFY, *v. a.* [*amplifier*, Fr.] To enlarge; to increase any material substance, or object of sense. To enlarge, or extend any thing incorporeal. To exaggerate any thing; to enlarge it by the manner of representation. To improve by new additions.—I feel age advancing, and my health is insufficient to increase and *amplify* these remarks, to confirm and improve these rules, and to illuminate the several pages. *Watts*.

To AMPLIFY, *v. n.* To speak largely in many words; to lay one's self out in diffusion. It is used frequently with the particle *on*.—When you affect to *amplify on* the former branches of a discourse, you will often lay a necessity upon yourself of contracting the latter, and prevent yourself in the most important part of your design. *Watts*.—To form large or pompous representations.—Homer *amplifies*, not invents; and, as there was really a people called Cyclopeans, so they might be men of great stature, or giants. *Pope*.

AMPLITUDE, *f.* [*amplitude*, Fr. *amplitudo*, Lat.] Extent.—Whatever I look upon, within the *amplitude* of heaven and earth, is evidence of human ignorance. *Glanville*.

—Largeness; greatness.—Men should learn how severe a thing the true inquisition of nature is, and accustom themselves, by the light of particulars, to enlarge their minds to the *amplitude* of the world, and not reduce the world to the narrowness of their minds. *Bacon*.—Capacity; extent of intellectual faculties. Splendour; grandeur; dignity. Copiousness; abundance.—In the great frame of kingdoms and commonwealths, it is in the power of princes, or estates, to add *amplitude* and greatness to their kingdoms. *Bacon*.

AMPLITUDE, in astronomy, is an arch of the horizon, intercepted between the true east or west point, and the centre of the sun or a star at its rising or setting: so that the amplitude is of two kinds; *ortive* or eastern, and *occiduous* or western. Each of these amplitudes is also either northern or southern, according as the point of rising or setting is in the northern or southern part of the horizon: and the complement of the amplitude, or the arch of distance of the point of rising or setting, from the north or south point of the horizon, is the azimuth. The amplitude is of use in navigation, to find the variation of the compass or magnetic needle. And the rule to find it is this: As the cosine of the latitude is to radius, so is the sine of the sun's or star's declination to the sine of the amplitude. So in the latitude of London, viz. $51^{\circ} 31'$, when the sun's declination is $23^{\circ} 28'$; then

Cos. $51^{\circ} 31'$ the lat.	-	-	-	9.7939907
Sin. $23^{\circ} 28'$ the decl.	-	-	-	+9.6001181

Sin. $39^{\circ} 47'$ the ampl.	-	-	-	9.8061274

That is, the sun rises or sets $39^{\circ} 47'$ from the east or west point to the north or south, according as the declination is north or south.

Magnetical AMPLITUDE, is an arch of the horizon, contained between the sun or star, at the rising or setting, and the magnetical east or west point of the horizon, pointed out by the magnetical compass, or the amplitude or azimuth compass. And the difference between this magnetical amplitude, so observed, and the true amplitude, as computed in the last article, is the variation of the compass. So if, for instance, the magnetical amplitude be observed, by the compass, to be $61^{\circ} 47'$, at the time when it is computed to be $39^{\circ} 47'$;

then the difference - - - $22^{\circ} 0'$ is the variation west.

AMPLIVAGOUS, *adj.* [*amplivagus*, Lat.] That wanders wide, or far and near; that stretches out far, having a large scope.

AMPLY, *adv.* [*amplè*, Lat.] Largely; liberally. At large; without reserve:

At return

Of him so lately promis'd to thy aid,
The woman's seed, obscurely then foretold,
Now *amplier* known, thy Saviour and thy Lord. *Milton*.

At large; copiously; with a diffusive detail.—Some parts of a poem require to be *amplly* written, and with all the force and elegance of words; others must be cast into shadows; that is, passed over in silence, or but faintly touched. *Dryden*.

AMPSA'GA, a river of ancient Numidia.

AMPSAN'CTI VALLIS, or AMPSANCTI LACUS, a cave or lake in the heart of the Hirpini, or Principato Ultra, near the city Tricento. It is now called *Mossitta*, from Mephitis, the goddess of stench, who had a temple there. The Mossitta is thus described by Mr. Swinburn: "We were led into a narrow valley, extending a considerable way to the south-west, and pressed in on both sides by high ridges thickly covered with copses of oak. The bottom of the dell is bare and arid: in the lowest part, and close under one of the hills, is an oval pond of muddy ash-coloured water, not above fifty feet in diameter: it boils up in several places with great force in irregular fits, which are always preceded by a hissing sound. The water was several times spouted up as high as our heads in a diagonal direction, a whirl-pool being formed round the tube, like a basin,

to receive it as it fell. A large body of vapour is continually thrown out with a loud rumbling noise. The stones on the rising ground that hangs over the pool are quite yellow, being stained with the fumes of sulphur and sal ammoniac. A most nauseous smell rising with the steam obliged us to watch the wind, and keep clear of it, to avoid suffocation. The water is quite insipid both as to taste and smell; the clay at the edges is white, and carried into Puglia to rub upon scabby sheep, on which account the lake is farmed out at 100 ducats a year.

AMPT'HILL, Bedfordshire, is a small neat regular well-built town, delightfully situated between two hills; it has two principal streets, crossing each other nearly at right angles. It has a good market on Thursday, and two fairs, the 4th of May and 30th of November; also a statute sessions, for hiring servants, generally a few days before Old Michaelmas. Here is a school endowed for teaching thirteen poor children, and an hospital, with good allowance for ten poor men, founded by Mr. Stone.

Ampt'hill Park, the seat of the right honourable earl of Upper Ossory, is a small distance from the town. Here was the residence of the injured princess Catharine of Aragon, during the period in which her divorce from Henry VIII. was in agitation; to whose memory, in 1774, the earl of Upper Ossory, in the site of the castle, erected a Gothic column, designed by the late Mr. Effex of Cambridge, to perpetuate the memory of this ill-fated queen, with an inscription.

AMPUL'LA, in antiquity, a round big-bellied vessel which the ancients used in their baths, to contain oil for anointing their bodies. Also a cup for drinking out of.

AMPULLA, among ecclesiastical writers, denotes one of the sacred vessels used at the altars. Ampullæ were also used for holding the oil used in chrismation, consecration, coronation, &c. Among the ornaments of churches we find frequent mention made of ampuls or vials. In the inventory of the cathedral of Lincoln we meet with ampuls of crystal, variously enriched with silver feet and covers; one containing a tooth of St. Christopher, another a tooth of St. Cecily, another a bone of the head of St. John the Baptist.

Knights of St. AMPULLA, belong to an order instituted by Clovis I. king of France; at the coronation they bear up the canopy under which the ampulla is carried in procession.

AMPU'RA, a province of the kingdom of Peru, before its conquest by the Spaniards. Here the inhabitants worshipped two lofty mountains from a principle of gratitude, because of the descent of the water from them by which their lands were fertilized. It is said to have been conquered by Virachoca the eighth inca.

To AMPUTATE, *v. a.* [*amputo*, Lat.] To cut off a limb: a word used in chirurgery.

AMPUTATION, *f.* [*amputatio*, Lat.] In surgery, the cutting off a limb, or other part from the body. See **SURGERY**.

AM'RAM, [אֶרְאִי of אֶרְאִי a people, and רַם high, Heb. i. e. an high people.] the father of Moses.

AMRAPHEL, [אַמְרַפֶּל of אֶרֶץ he hath spoke, and נַפְלָה destruction, Heb. i. e. a speaking destruction.] the king of Shinar, or Babylonia, confederated with Cherdorlaomer, king of the Elamites, and two other kings, to make war against the kings of Pentapolis; that is to say, of Sodom, Gomorrah, and the three neighbouring cities. The kings who were in league with Amraphel worsted those of Pentapolis, plundered their city, and carried off abundance of captives, among whom was Lot, Abraham's nephew: but Abraham pursued them, re-took Lot, and recovered all.

AM'RAS. See **AMBRAS**.

AM'SANCTI. See **AMPSANCTI**.

AMSDORFIANS, in church history, a sect of Protestants in the sixteenth century, who took their name from Amsdorf their leader. They maintained, that good works were not only unprofitable, but were obstacles to salvation.

AMSONIA, *f.* in botany. See **TABERNÆMONTANA**.

AMSTERDAM, the capital city of the province of Holland and of the United Netherlands, is seated on the river Amstel and an arm of the sea called the *Wye*. In 1204, it was nothing but a small castle which its lords made a retreat for fishermen, who at first lived in huts covered with thatch: but it soon became considerable, though, till the year 1490, it was surrounded with nothing but a weak palisado. The walls were then built with brick, to defend it from the incursions of the inhabitants of Utrecht, with whom the Hollanders were often quarrelling; but some time after it was almost totally reduced to ashes. In 1512, it was besieged by the people of Guelderland; who, not being able to take it, set fire to the ships in the harbour. In 1525, an Anabaptist leader, with 600 of his followers, got into the city in the night-time, attacked the town-house, and defeated those that made any resistance; but, when day appeared, the citizens fell upon them on all sides, and forced them to retire into the town-house, where most of them were cut to pieces. About ten years after, there was another tumult raised by a parcel of fanatics, consisting of men and women, who ran about the streets stark naked, and had a design of making themselves masters of the town-house: Their shrieks and cries soon alarmed the inhabitants, who gave them the chastisement they deserved. Amsterdam was one of the last cities that embraced the reformed religion. It was besieged by the Hollanders in 1578, and submitted after a siege of ten months. One article of the capitulation was, a free exercise of the Roman Catholic religion: but this was not observed by the Protestants; for they soon drove the ecclesiastics, monks, and nuns, out of the city, broke the images, and demolished the altars. After this time it became the general rendezvous of all nations and of every sect; and to the good sense and candour of the Dutch, in thus making it an asylum for all professions of religion, when persecution prevailed in other parts, we may attribute the grandeur and opulence it now enjoys. The inhabitants were often obliged to enlarge the bounds of their city, and in 1675 it was increased to its present extent. It was surrounded with a brick wall, and a large ditch eighty feet broad full of running water. The walls were fortified with twenty-six bastions, on each of which there is now a windmill. There are eight gates towards the land, and one towards the water.

Amsterdam, being seated on a marshy soil, is built on piles of wood; for which reason no coaches are allowed, except to great men and physicians, who pay a tax for that privilege; and all kinds of goods are drawn on sledges. It stands so low, that they would be exposed to inundations, if they did not secure themselves by dykes and sluices. The finest streets are, the Keyfar's Graft, or Emperor's Canal; the Heer Graft, or Lord's Canal; the Cingel; and the street of Haerlem. The principal canal is remarkable for its houses, which are magnificent structures of an equal height. Here are three prodigious sluices, and a great number of canals, which cross the city in many parts, and render the streets clean and pleasant. The canals are deep, their sides are lined with hewn stone, and they have many stone-bridges over different parts of them. The finest is that called the *Ammarack*, which is formed by the waters of the Amstel, into which the tide comes up, and on the sides of which are two large quays. This canal has several bridges. The principal is that next the sea, called *Pont Neuf*, or the "New Bridge:" it is 600 feet long, and seventy broad, with iron balustrades on each side; it has thirty-six arches, of which eleven are very high, and eight are shut up to inclose the yachts. From this bridge there is a most charming prospect of the city, harbour, and sea. The harbour, though difficult of access on account of the shoals, is one of the largest and finest in Europe, and is always filled with a multitude of ships and vessels, which look like a forest, or rather a floating city. The streets in general are well paved, and the houses built of brick or stone. Towards the sides of the haven, the city is inclosed with great poles driven into the

the ground, which are joined by large beams placed horizontally. There are openings to let the ships in and out, which are shut every night at the ringing of a bell. Amsterdam is computed to be half as big as London, next to which it is the most commercial city in the world. There are people here of almost every nation and religion in Europe. There are eleven churches for the Dutch of the established or Calvinistical religion, with two French and one High Dutch. The English have also three churches, one for the Presbyterians, a second for those of the church of England, and a third for the Brownists. All these churches or congregations make up only one-third part of the inhabitants. The Roman Catholics, who have twenty-seven houses or chapels for their worship, form another third part; and the other third part is made up of Jews, Lutherans, Arminians, Anabaptists, &c. The Jews, who are very considerable in this place, have two synagogues; one of which, namely the Portuguese, is the largest in Europe.

The most remarkable of the religious buildings is the new church dedicated to St. Catharine. It was begun in the year 1408, others say 1414; and was 100 years in building. The foundation of a steeple is laid before this church, which was designed to be very high. The piles on which it was to be erected are 100 feet square and 6334 in number, and those very large; nevertheless it was thought that these vast piles, or rather the ground, were not able to support the prodigious weight they intended to lay upon it; for which reason the steeple remains unfinished. The pulpit is a master-piece of the kind, where the four evangelists and many other curious pieces of sculpture are represented. The glass-windows are adorned with paintings, among which the emperor Maximilian is presenting an imperial crown to the burgomasters of Amsterdam for the crest of the arms of the city. The organ is very large, and reckoned one of the best in the world. It has a set of pipes that counterfeit a chorus of voices, and has fifty-two whole stops besides half stops, with two rows of keys for the feet, and three rows of keys for the hands. Those who hear it play for the first time imagine they hear a human voice. The grate dividing the chancel from the body of the church is all of Corinthian brass. The branches of candlesticks are the richest in the Seven Provinces. There is a very fine marble monument erected to admiral Ruyter, who was killed at Messina.

The public buildings of a civil nature are very magnificent. The *stadt-houfe* was founded in 1648. It is built upon 14,000 wooden piles; and its front is 232 feet long, its sides 255 feet, and its height to the roof 116. There is a marble pediment in the front, whereon a woman is carved in relievo, holding the arms of the city; she is seated in a chair, supported by two lions, with an olive-branch in her right hand; on each side are four Naiads, who present her with a crown of palm and laurel, and two other marine goddesses present her with different sorts of fruit; besides, there is Neptune with his trident, accompanied with Tritons, a sea-unicorn, and a sea-horse. On the top stands three statues in bronze, representing Justice, Strength, and Plenty. On the top of the structure is a round tower, fifty feet above the roof, adorned with statues, and an harmonious chime of bells, the biggest of which weighs about 7000 pounds, and the next 6000. They are made to play different tunes every month. On the floor of the great hall are two globes, the celestial and terrestrial, which are twenty-two feet in diameter and sixty-nine in circumference. They are made of black and white marble, and are inlaid with jasper and copper. While this *stadt-houfe* was building, the old one was set on fire, and consumed with all the archives and registers. Under the *stadt-houfe* is a prodigious vault, wherein is kept the bank of Amsterdam, which is said to be inexhaustibly rich, and is under excellent regulations. Sir William Temple, in his time, supposed it to contain the greatest treasure, either real or imaginary, in the known world. Mr. Anderson supposes that the cash, bullion, and

pawned jewels, in this bank amount to thirty-six millions sterling. The bourse, or exchange, where the merchants assemble, is all of free-stone, and built upon 2000 wooden piles. Its length is about 250 feet, and its breadth 140. The galleries are supported by twenty-six marble columns, upon each of which are the names of the people that are to meet there. They are all numbered; and there is a place fixed for every merchandize under some one of these numbers. On the right hand of the gate is a superb stair-case which leads to the galleries; on one side of which there are several shops, and on the other a place to sell clothes. It is not unlike the royal exchange in London. The admiralty-office is in a house which formerly belonged to the prince of Orange. The arsenal for their men of war is in the harbour. This is a very handsome building, 200 feet long and twenty-two feet broad. Near this edifice is the dock, or yard where they build their men of war, and which is plentifully supplied with every necessary for the construction of ships.

The East-India company occupy a large building divided into several offices or apartments. In the new part of this city they have a magazine or palace, which may properly be called an *arsenal*. The ground on which this building stands is 2000 feet, and square every way, reckoning the moats or burgwall about it. In this arsenal they build the ships belonging to the India chamber of Amsterdam; for which purpose they have all sorts of workhouses here for the artificers that serve the company.

The academy called the *Illustrious School*, is likewise a very fine building. It was formerly a convent belonging to the nuns of St. Agnes. Here they teach Latin, the oriental languages, theology, philosophy, history, &c. Besides these there are several hospitals, or houses for orphans, for poor widows; for sick persons, and for mad people; all which are regulated with great prudence. There are two suburbs to this city; one at the gate of the regulars; and the other reaches to Overtown, a village a little way from Amsterdam, where boats which come from Leyden are rolled over land upon wooden rollers. Here is likewise an hospital for those that are infected with the plague; which was built in the year 1639, and has 360 windows.

This city is governed by a senate or council, which consists of thirty-six persons, called a *vroedschap*, who enjoy their places for life; and when any of them dies, the remainder choose another in his stead. This senate elects deputies to be sent to the States of Holland, and appoints the chief magistrates of the city, called *burgomasters* or *echevins*, who are like our aldermen. The number is twelve; out of which four are chosen every year to execute the office, and are called *burgomasters-regent*. Three of these are discharged every year, to make room for three others. One of the four is kept in to inform the new ones of the state of affairs, and also presides the three first months in the year, and the others three months each; so that, when they are in this office, they may be compared to the lord-mayor of the city of London. These alterations and appointments are made by their own body. They dispose of all inferior offices which become vacant during their regency. They have likewise the direction of all public works, which regard the safety, tranquillity, and embellishment, of the place. The keys of the famous bank of this city are in the hands of these magistrates.

The college consists of new burgomasters or echevins, who are judges in all criminal affairs, without appeal; but in civil causes they may appeal to the council of the province. There are two treasurers, a bailiff, and a pensionary. The bailiff continues in his office three years; and searches after criminals, takes care to prosecute them, and sees their sentence executed. The city of Amsterdam contributes to the public income above 30,000 livres per day, besides the excise of beer, flesh, and corn; which in all amounts to above 1,600,000l. a year. This is more than is paid by all the rest of the provinces put together; and yet Amsterdam bears but the fifth rank in the assembly

bly of the states of Holland, with this distinction, that, whereas other cities send two members, this sends four.

The militia of Amsterdam is very considerable. They have sixty companies, each of which has from 200 to 300 men. Jews and Anabaptists are excluded from this service, not being admitted to bear arms: but they are obliged to contribute to the maintenance of the city-guard, which consists of 1400 soldiers; as also to the night-watch, who patrol about the streets, and proclaim the hour. Besides these, there are trumpeters on every church steeple, who sound every half hour; and, if there happens a fire, they ring the fire-bell, and shew where it is. The inhabitants have excellent contrivances to extinguish it speedily.

The trade of Amsterdam is prodigious: for almost the whole business of the East-India company centres in this city, which besides carries on a commerce with all the rest of the world, inasmuch that it may be called the magazine or storehouse of Europe. They import a vast deal of corn from the Baltic, not so much for present consumption, as to lay up against times of scarcity. The richest spices are entirely in the hands of the East-India company, who furnish all Europe therewith. They have vast quantities of military stores, with which they supply several nations; which is owing to their engrossing most of the iron works on the Rhine and other great rivers that run into Holland. Notwithstanding all these advantages, and the neatness and cleanliness that is every where observed within doors, Amsterdam labours under two very great inconveniences; bad air, and the want of fresh wholesome water, which obliges the inhabitants to preserve their rain-water in reservoirs. It is situated 65 miles north of Antwerp, 175 east by north of London, 240 north by east of Paris, and 560 north-west of Vienna. Lat. $52^{\circ}23'$ lon. $4^{\circ}50'$ E.

AMSTERDAM, is also the name of an island in the South Sea, said to have been discovered by Tasman a Dutch navigator. It was visited by captain Cook in his late voyages. Its greatest extent from east to west is about twenty-one miles, and from north to south about thirteen. It is broad at the east end, and runs taper towards the west, where it turns and runs to a point due north. It is about six leagues to the west of Middleburgh. The shore is surrounded by a coral rock, and its most elevated parts are not above six or eight yards above the level of the sea. Lat. 21.11 S. lon. 175.0 W. It is wholly laid out in plantations in which are cultivated some of the richest productions of nature. Here are bread-fruit, cocoa-nut, plantains, bananas, shaddock, yams, and some other roots, sugar-canes, and a fruit like the nectarine called by the natives *fighega*. There did not appear an inch of waste ground: the roads occupied no more space than was absolutely necessary: the fences did not take up above four inches each; and even these were not wholly lost, for in many grew some useful trees or plants: it was every where the same, change of place altered not the scene: nature, assisted by art, no where appeared with more splendour than on this island. Casuarinas, pandangs, and wild sago-palms, appear here with their various tints of green, and barringtonia as big as the loftiest oaks.

Both men and women are of the common size of Europeans, and their colour is that of a lightish copper; they are well-shaped, have regular features, are active, brisk, and lively. They have fine eyes, and in general good teeth, even to an advanced age. The women are the merriest creatures imaginable, and incessant talkers. In general, they appear to be modest; although there was no want of those of a different stamp. Among the natives, who swam about the ship very vociferously, were a considerable number of women, who wanted in the water like amphibious creatures, and were easily persuaded to come on-board perfectly naked; but none of them ventured to stay after sunset, but returned to the shore to pass the night, like the greater part of the inhabitants, under the shade of the wild woods which lined the coast. There they lighted great fires, and were heard conversing almost the whole night. The hair of both sexes in general is

black, but especially that of the women; both sexes wear it short, except a single lock on the top of the head, and a small quantity on each side. The dress of both sexes consists of a piece of cloth or matting wrapped round the waist, and hanging down below the knees. From the waist upwards they are generally naked, and it seems to be a custom to anoint these parts every morning. The practice of tattooing, or puncturing the skin, likewise prevails. The men are tattooed from the middle of the thigh to above the hips; the women have it only on their arms and fingers, and on those parts but very slightly. Their ornaments are amulets, necklaces, and bracelets, the bone, shells, and beads of mother-of-pearl, tortoise-shell, &c. which are worn by men as well as women. They have also a curious apron, made of the cocoa-nut shell; and composed of a number of small pieces sewed together in such a manner as to form stars, half-moons, little squares, &c. it is studded with beads and shells, and covered with red feathers, so as to have a pleasing effect. They make the same kind of cloth, and of the same materials, as at Otaheite, though they have not such a variety, nor do they make any so fine; but, as they have a method of glazing it, it is more durable, and will resist rain for some time, which the other cloth would not. Their colours are black, brown, yellow, purple, and red; all made from vegetables. They make various sorts of matting, some of a very fine texture, which is generally used for cloathing; and the thick and stronger sort serves to sleep upon, and to make sails for their canoes. Among other useful utensils, they have various sorts of baskets, made of the twisted fibres of cocoa-nuts. These are not only durable, but beautiful, being generally composed of different colours, and studded with beads made of shells or bones. They have many little nicknacks among them, which shews that they neither want taste to design, nor skill to execute whatever they take in hand.

AMULET, *f.* [amulette, Fr. *amuletum*, or *amuletum*, quod *malum amolitur*, Lat.] a charm, or preservative against mischief, witchcraft, or disease. These the Latins called *amuleta*, probably from *amovere*, "to remove, or take away." They also called them *præbia*, or *præbra*, from *prohibere*, "to guard, or defend." The Greeks call them *apotropaia*, *phylacteria*, *amyteria*, *alexiteria*, and *alexipharmaca*, because they imagined that these remedies could defend them, not only against such diseases as proceed from natural causes, but also against the power of other enchantments. Amulets were made of stone, metals, simples, animals, and in a word of every thing that imagination suggested. Sometimes they consisted of words, characters, and sentences, ranged in a particular order and engraved upon wood, &c. and worn about the neck, or some other part of the body. At other times they were neither written nor engraved; but prepared with many superstitious ceremonies, great regard being usually paid to the influence of the stars. The Arabians have given to this species of amulet the name of *talisman*. All nations have been fond of amulets: the Jews were extremely superstitious in the use of them, to drive away diseases; and the Misna forbids them, unless received from an improved man who had cured at least three persons before by the same means.

Amulets are now much fallen from the repute they were anciently in; yet the great Mr. Boyle alleges them as an instance of the increase of external effluvia into the habit, in order to shew the great porosity of the human body. He adds, that he is persuaded some of these external medicines do answer; for that he himself, having once been subject to bleed at the nose, and reduced to use several remedies to check it, found the moss of a dead man's skull, though only applied so as to touch the skin till the moss was warm thereby, the most effectual of any. The same Mr. Boyle shews how the effluvia, even of cold amulets, may, in tract of time, pervade the pores of a living animal; by supposing an agreement between the pores of the skin and the figure of the corpufcles. Bellini has demonstrated the possibility of the thing in his last propositions

tions *De Febribus*; and the like is done by Dr. Wainwright, Dr. Keill, &c.

AMULIUS, king of Alba, was son of Procas, and younger brother to Numitor. He dispossessed his brother of the crown, and even put to death his son Lausus, and consecrated his daughter Ilia a vestal virgin, to prevent her ever becoming a mother. Notwithstanding these precautions, Ilia became pregnant by the god Mars, and brought forth Romulus and Remus, who afterwards put Anulus to death, and restored the crown to their grandfather.

AM'URAT, or AM'URATH I. the fourth emperor of the Turks, and one of the greatest princes of the Ottoman empire, succeeded Solymán in 1360. He took from the Greeks Gallipoli, Thrace, and Adrianople, which last he chose for the place of his residence. He defeated the prince of Bulgaria, conquered Misnia, chastised his rebellious bashaws, and is said to have gained thirty-six battles. This prince, in order to form a body of devoted troops that might serve as the immediate guards of his person and dignity, appointed his officers to seize annually, as the imperial property, the fifth part of the Christian youth taken in war. These, after being instructed in the Mahometan religion, inured to obedience by severe discipline, and trained to warlike exercises, were formed into a body distinguished by the name of *Janissaries*, or "new soldiers." Every sentiment which enthusiasm can inspire, every mark of distinction that the favour of the prince could confer, were employed in order to animate this body with martial ardour, and with a consciousness of its own pre-eminence. The janissaries soon became the chief strength and pride of the Ottoman armies, and were distinguished above all the troops whose duty it was to attend on the person of the sultan. At length the death of Lazarus, despot of Servia, who had endeavoured in vain to stop the progress of Amurat's arms, touched Milo, one of his servants, in so sensible a manner, that, in revenge, he stabbed the sultan in the midst of his troops, and killed him upon the spot, A. D. 1389, after he had reigned twenty-three years.

AMURAT II. the tenth emperor of the Turks, was the eldest son of Mahomet I. and succeeded his father in 1421. He besieged Constantinople and Belgrade without success; but he took Thessalonica from the Venetians, and compelled the prince of Bosnia and John Castriot prince of Albany to pay him tribute. He obliged the latter to send his three sons as hostages; among whom was George, celebrated in history by the name of *Scanderbeg*. John Hunniades defeated Amurat's troops, and obliged him to make peace with the Christian princes, in 1442. These princes afterwards breaking the peace, Amurat defeated them in the famous battle of Varna, November 10, 1444, which proved so fatal to the Christians, and in which Ladislaus king of Hungary was killed. He afterwards defeated Hunniades, and killed above 20,000 of his men; but George Castriot, better known by the name of *Scanderbeg*, being re-established in the estates of his father, defeated the Turks several times, and obliged Amurat to raise the siege of Croia, the capital of Albany. Amurat died, chagrined with his ill-success, and infirm with age, February 11, 1451, at Adrianople. It is observed to this prince's honour, that he always kept his treaties with the greatest fidelity.

AMURCO'SITY, *f.* [*amurca*, Lat.] The quality of lees, or mother of any thing.

To AMUSE, *v. a.* [*amuser*, Fr.] To entertain with tranquillity; to fill with thoughts that engage the mind without distracting it. To *divert* implies something more lively, and to *please* something more important. It is therefore frequently taken in a sense bordering on contempt.—I cannot think it natural for a man, who is much in love, to *amuse* himself with trifles. *Walsh*.—To draw on from time to time; to keep in expectation; as, He *amused* his followers with idle promises.

AMUSEMENT, *f.* [*amusement*, Fr.] That which amuses; entertainment.—Every interest or pleasure of life,

VOL. I. No. 31.

even the most trifling *amusement*, is suffered to postpone the one thing necessary. *Rogers*.

AMU'SER, *f.* [*amuseur*, Fr.] He that amuses, as with false promises. The French word is always taken in an ill sense.

AMU'SIVE, *adj.* [from *amuse*.] That which has the power of amusing:

But amaz'd,

Beholds th' *amusive* arch before him fly,

Then vanish quite away.

Thomson.

AM'WELL, a village in Hertfordshire, a little to the south of the Ware, and twenty-one miles from London. One part is called Amwell-Magna, and the other Amwell-Parva; the head or source of the New River, which supplies London with water, is at the latter place. This canal was projected by Hugh Middleton; he began it in 1606, and finished it in 1612, by the assistance of the city of London, and by aid of parliament; but with a considerable loss of his own property, he perfected the work. The extent of the canal is near thirty-nine miles; it has forty-three sluices, and there are 215 bridges over it.

A'MY, [*amie*, Fr. a she-friend.] A proper name of women.

AMY' PROCHAIN, in law, the next friend who is to be entrusted for an infant or orphan. And infants may sue either by *prochain amy*, or *guardian*; but must answer by guardian. 3 *Salk*. 196.

AMY'CHE, *f.* [from *αμύχω*, Gr. to scratch.] A superficial exulceration, laceration, or scarification, of the skin.

AMY'CLÆ, a city of Laconia, distant about eighteen miles from the metropolis, founded by Amyclus the son of Lacedæmon, and famed afterwards for the birth of Castor and Pollux the sons of Tydæus, eighth king of Sparta. It was afterwards famed for sending a considerable colony of its own inhabitants into Upper Calabria, who built there a city which they called by the same name. This last city was situated between Caieta and Terracina, and gave its name to the neighbouring sea. According to Pliny and Solinus, the territory of Amyclæ was so infested with vipers and other serpents, that the inhabitants were obliged to abandon their dwellings, and settle elsewhere.

AMY'CLUS, son of Lacedæmon and Sparta, and brother to Eurydice the wife of Acrisius. He built the city of Amyclæ, where Apollo had a temple and was surnamed Amyclæus.

AMY'CUS, son of Neptune and Melia, king of the Bebrycians, famous for his skill in the management of the cestus. He challenged all strangers to a trial of strength, and was killed by Pollux when he attempted to overcome him by fraud. Also a companion of Æneas, killed by Turnus, brother to Hippolyta, queen of the Amazons; who opposing the passage of Hercules, who came to wage war with his sister, he was slain by that hero.

AMYG'DALATE, *adj.* [*amygdala*, Lat.] Made of almonds.

AMYG'DALINE, *adj.* [*amygdala*, Lat.] Relating to almonds; resembling almonds.

AMYG'DALIS SIMILIS, *f.* in botany. See THEOBROMA.

AMYG'DALUS, *f.* [*αμυγδαλεα*, from the lines or furrows on the stone, which the Greeks call *αμυγχα*.] In botany, a genus of the icofandria monogynia class, ranking in the natural order of pomaceæ. The generic characters are—Calyx: perianthium one-leaved, tubulous, inferior, quinquefid, deciduous; divisions spreading, obtuse. Corolla: of five petals, oblong-ovate, obtuse, concave, inserted into the calyx. Stamina: filaments about thirty, filiform, erect, shorter by half than the corolla, inserted into the calyx; antheræ simple. Pistillum: germ roundish, villose; style simple, length of the filaments; stigma headed. Pericarpium: a drupe, roundish, villose, large, with a longitudinal furrow. Seed: a nut, ovate, compressed, acute, with prominent sutures on each side, reticulated.

6 K

culated with furrows, and dotted with small holes.—*Essential Character*. Calyx quinquefid, inferior; petals five; drupe having a shell perforated with pores; skin pubescent.

Species. 1. *Amygdalus persica*: all the serratures of the leaves acute, the flowers sessile and solitary. The peach, in its natural state of growth, is a small tree, with spreading branches; the leaves larger than those of the almond. The fruit is roundish, abounding with a grateful sweet-acid juice; the outside is of a pale greenish colour, with a bluish or tawny redness frequently towards the sun, and the skin is lanuginose or woolly; the stone is very thick and hard, full of deep irregular furrows, and incloses a bitter kernel. The wood of this tree is of a reddish brown colour, darker towards the middle, and is fit for the use of the turner. It is of quick growth, and not of very long duration. The original country of its nativity is not known. The Latin name of *malus persica* indicates no more than that it came to the Romans from Persia. It has been cultivated time immemorial in most parts of Asia, has been adopted by almost every nation of Europe, and now flourishes abundantly in America, wherever it has been introduced by the Europeans. We have no exact tradition concerning the time of its first introduction into Greece or Italy. Before we proceed to the varieties of the fruit, for which the peach-tree is principally cultivated, it may be proper to observe, that there are few trees more ornamental in plantations, shrubberies, and wilderness quarters, particularly within view of the house, and in sheltered situations, where they will display their beautiful blossoms early in the spring, about the beginning of April; when flowers, especially on trees, are particularly valuable. The variety with double flowers is highly ornamental for the same purpose, and is certainly one of the most beautiful flowering trees that will admit of cultivation in our climate, in the open air. It will produce some fruit, notwithstanding the flowers are double, but it is of no value unless the trees be trained against walls. The blossoms appear about three weeks later than the common peach.

Parkinson mentions twenty-one sorts of peach cultivated in his time for the fruit.

Mr. Ray, sixty years after Parkinson, gives a list of eighteen different sorts of peaches then in most esteem.

Mr. Miller enumerates thirty-one sorts as the principal known in his time in England; and which in his opinion are sufficient for any gentleman to have a collection continuing through the whole season of fruit.

A good peach ought to have a firm flesh; the skin should be thin, of a deep or bright red colour next the sun, and of a yellowish cast next the wall. The flesh should be of a yellowish colour, full of juice, which should be high-flavoured; the stone small, and the pulp or flesh very thick. When a peach has all these qualities, it may be esteemed a valuable fruit.

The *nectarine* is deemed by botanists to be a variety only of the peach-tree. It is certainly not easy for a common eye to distinguish these trees, when they are not in a state of fructification, nor are their differences such as to warrant our considering them as specifically separate. The nectarine is commonly a smaller tree than the peach; the trunk and larger branches covered with a lighter bark; the smaller branches or twigs more tender and inclining to red; the flowers are less than those of the peach, and of a darker red colour. These differences however are frequently trifling, and by no means constant. The principal distinction certainly is in the fruit, which is smaller and rounder, without any lateral cleft; the flesh or pulp firmer than in the peach, and the rind perfectly smooth.

Parkinson gives six varieties of the nectarine; to these Ray adds six more; but Mr. Miller has only ten varieties:

2. *Amygdalus communis*, or the almond-tree: the lower serratures of the leaves glandular; the flowers sessile and in couplets. The common almond will grow to the height of near twenty feet, with spreading branches. The leaves resemble those of the peach very much, but the lower serratures are glandular; they proceed from buds

both above and below the flowers, whereas in the peach they proceed from the ends of the shoots above and not below the flowers. The form of the flowers is not very different, but they come out usually in pairs, and vary more in their colour from the fine blush of the apple-blossom to a snowy whiteness. The chief obvious distinction is in the fruit, which is flatter, with a coriaceous covering, instead of the rich pulp of the peach and nectarine, opening spontaneously when the kernel is ripe. The shell is never so hard as in the first species, and is sometimes even tender and exceedingly brittle; it is flatter, smoother, and the furrows or holes are more superficial. This tree is scarcely worth considering in England, for the sake of the fruit which it produces. It is a great object in some parts of Italy, and in the south of France, where there are vast plantations of almonds in Provence and Dauphiné. It is common in China and most of the eastern countries; and in Barbary, where it is a native. It seems not to have been cultivated in Italy in the time of Cato, who calls the fruit *nuxes Græcæ*, or Greek nuts. With us however it is very valuable as an ornamental tree in clumps, shrubberies, &c. within view of the mansion: for it displays its delicate red-purple bloom in the month of March, when few other trees have either leaves or flowers. An almond-tree covered with its beautiful blossoms is one of the most elegant objects in nature. In a forward spring they often appear in February, but in this case the frost generally destroys them, and they bear little or no fruit; whereas, when the trees do not flower till March, they seldom fail to bear plenty of fruit, many of which will be very sweet and fit for the table when green, but they will not keep long.

Sweet almonds used in food are difficult of digestion, and afford very little nourishment, unless extremely well comminuted. As medicines, they contribute, on account of their soft unctuous quality, to blunt acrimonious humours in the first passages, and thus, sometimes, give present relief in heart-burns. On expression, they yield near half their weight of oil, which is more agreeable than most of the common expressed oils, and is therefore employed medicinally for obtunding acrid juices, softening and relaxing the solids, in tickling coughs, hoarseness, costiveness, nephritic pains, &c. On triturating the almond with water, it unites with the fluid, into an emulsion or milky liquor, which is prescribed for the same purposes as the oil itself; particularly in heat of urine and stranguries; as a diluent in acute diseases; and for supplying, in some degree, the place of animal milk, with which it has a great analogy. An ounce of almonds forms an emulsion of a due consistence with a quart of water. Gum arabic is an useful addition in most cases. The pure oil triturated with a thick mucilage of gum arabic forms a more permanent emulsion: one part of gum, with an equal quantity of water, is sufficient for four parts of the oil. They are also an useful medicine for uniting substances with water, which of themselves are not miscible with it. Camphor, and the purgative and other resins, triturated with about six times their quantity of almonds, dissolve in water into a milky liquor, and are thus fitted for being taken in a liquid form. The oil of bitter almonds is not distinguishable from the other; and therefore the colleges of London and Edinburgh allow them to be used indiscriminately. The matter which remains after the expression of the oil, retains all the bitterness. Bitter almonds, and emulsions made from them, have been recommended as aperients, resolvents, diuretics, and anthelmintics. The almonds in substance taken freely occasion sickness and vomiting: to dogs, and some other animals, they are poisonous. A simple water, strongly impregnated with their volatile parts by distillation, has been found also poisonous to brutes, and there are instances of cordial spirits flavoured by them being poisonous to man. It is probable, that the noxious matter is that in which its bitterness and flavour reside; and, that the activity of this matter is increased, by its separation from the gross oil and farinaceous substance.

1. The Orange Nectarine. 2. The Sweet Almond. 3. The creeping Dwarf Almond.

substance by which it was enveloped in the kernel itself. The kernels of other fruits, that have any bitterness or particular flavour, appear to be impregnated with a substance of a similar nature to this poisonous principle of bitter-almonds.

3. *Amygdalus pumila*, or double-flowered dwarf almond: leaves veined-wrinkled. These shrubs make a very agreeable variety amongst low-flowering trees, in small wilderness quarters. The single sort flowers the beginning of April, and the double is commonly three weeks later. Its native country is Africa.

4. *Amygdalus nana*, or common dwarf almond: leaves attenuated at the base. The wood of this little tree is hard, of a yellowish chestnut colour, and veined; but the trunk is seldom an inch in thickness. It varies very much in size; the vast plains on the banks of the Volga being annually set on fire, it never rises to any height, but is low and shrubby, creeps very much at the root, and impedes the plough. In Cherson it scarcely attains a span in height; whereas in the Ukraine it grows a fathom high, as it does in gardens, where the leaves are somewhat broader; these are sometimes five inches in length. It blooms in April, at which time all the young shoots are covered with flowers, which are of a peach-blossom colour, and make a fine appearance when intermixed with shrubs of the same growth. It is a native of the northern parts of Asia, particularly abundant in Calmuc Tartary, and very frequent on the banks of the Volga.

5. *Amygdalus incana*, or hoary dwarf almond: leaves lanceolate ferrate wrinkled subsessile, white-tomentose beneath. It may be doubted whether this be any thing more than a variety of *amygdalus nana*.

6. *Amygdalus orientalis*, or silvery-leaved almond: leaves lanceolate quite entire silvery perennial, petiole shorter. The leaves of the eastern or silver-leaved almond are silvery, and very like those of the sea purslane, continuing moist of the year. The flowers are very small, and have not been succeeded by fruit yet in England. It was found growing near Aleppo, from whence the fruit was sent to the duke D'Ayen in France, who raised several of the plants in his curious garden at St. Germain's. Mr. Miller procured some of them, which endured the open air in the Chelsea garden, for some years, against a wall, without any covering. It is a native of the Levant.

7. *Amygdalus Cochinchinensis*: leaves ovate quite entire, racemes small subterminal. This is a large tree, with spreading branches; and is a native of the vast woods of Cochinchina.

Propagation and Culture. All the different sorts of peaches have been originally obtained from the stones; so that, where persons have garden enough to allow room for propagating these fruits from seeds, there is no doubt but many good sorts may be obtained, which will be better adapted to our climate than such as are brought from warmer countries; there will be many of them good for nothing, but if we can obtain only two or three valuable sorts, it is sufficient to make amends for the trouble of raising them; but great regard should be had to the sorts; and, if the fruits were permitted to remain upon the trees until they dropped off, the kernels would be fitter for planting, and more likely to grow. The best sorts for sowing are those whose flesh is firm, and cleaves to the stone; and from amongst these you should chuse such as ripen pretty early, and have a rich vinous juice. The stones should be planted in autumn, on a bed of light dry earth, about three inches deep, and four inches asunder; and in the winter the beds should be covered to protect them from the frost, which, if permitted to enter deep into the ground, will destroy them. In the spring, when the plants come up, they should be carefully cleared from the weeds, which should also be observed throughout the summer; and, if the spring should prove very dry, if you refresh them now and then with a little water, it will greatly promote their growth. In this bed they should remain until the following spring, when they should be carefully

taken up, so as not to break their tender roots, and transplanted into a nursery in rows three feet apart, and one foot distant plant from plant in the rows, observing to lay a little mulch upon the surface of the ground about their roots, to prevent its drying too fast; and, if the spring should prove very dry, you should give them a little water once a week, until they have taken root; after which they should be constantly kept clear from weeds, and the ground between the rows carefully dug up every spring to loosen it, so as that the tender fibres may strike out on every side. In this nursery they may continue one or two years, according to the progress they make; after which they should be transplanted where they are to remain, to produce fruit. In removing these trees, you should observe to prune their downright roots, if they have any, pretty short, and to cut off all bruised parts of the roots, as also all the small fibres, which generally dry, and, when left upon the roots after planting again, grow mouldy and decay, so that they are injurious to the new fibres which are shot out from the roots, and very often prevent the growth of the trees; but you should by no means prune their heads, for the plants which are produced from stones are generally of a more spongy texture, therefore more liable to decay when cut, than those which are budded upon other stocks. Besides, as these trees are designed for standards, (for it is not proper to plant them against walls, until you see the produce of the fruit, to shew which of them deserves to be cultivated,) they will never require any other pruning; but only to cut out decayed branches, or such as shoot out very irregular from the sides; for more than this is generally very injurious to them. In planting the trees, it will be the better way to dispose them singly in the quarters of the kitchen garden, where they will thrive, and produce fruit much better than if they are planted near each other in rows; and, as they are thus singly disposed, they will not do much injury to the crops which grow under them. When they have produced fruit, you will soon be a judge of their goodness, and such of them as you dislike may be destroyed; but those which are good may be propagated by inoculating them upon other stocks, which is the common method now practised to propagate these fruits.

You should be provided with stocks of the muscle and white-pear plumbs, which are generally esteemed the two best sorts of plumbs for stocks to inoculate peaches and nectarines upon; as also some almond and apricot stocks, for some tender sorts of peaches which will not grow upon plum-stocks. These should be all produced from the stone, and not from suckers; and they should be transplanted when they have had one year's growth in the seed-bed, for the younger they are transplanted the better they will succeed, and hereby they will be prevented from sending tap-roots deep in the ground; for, by shortening those roots which seem so disposed, it will cause them to put out horizontal roots. These stocks should be planted in rows three feet asunder, and one foot apart in the rows. This is wider than most nurserymen plant them, but we are persuaded they will answer better. When the stocks have grown in the nursery two years, they will be strong enough to bud; the season for which is commonly about Midsummer, or any time in July, when the rind will easily separate from the wood; and you should make choice of some good cuttings of the sorts of fruit you intend to propagate, always observing to take them from healthy trees, and such as generally produce a good quantity of well-tasted fruit; for it is very certain, that any sort of fruit may be so far degenerated, where this care is wanting, as not to be like the same kind. Besides, whenever a tree is unhealthy, the buds taken from that tree will always retain the distemper, in a greater or less degree, according as it has imbibed a greater or less quantity of the distempered juice. Thus, for instance, where a peach or nectarine tree has been greatly blighted, so as that the shoots have grown busled, and the leaves curled up to a great degree, that distemper is seldom recovered again by the greatest art, or at least not under several years management;

for,

for, let the seasons prove ever so favourable, yet these trees will continually shew the same distemper, which many persons are so weak as to suppose a fresh blight, whereas in reality it is no other but the remains of the former sickness, which are spread and intermixed with all the juices of the tree; so that whatever buds are taken from such trees will always retain a part of the distemper. Upon the care which is taken in the choice of the buds, the whole success depends; in general no more is regarded by those nurserymen who are the most careful in propagating the several sorts of fruit-trees, than the taking their buds or grafts from the true kinds of fruit-trees; but there is still more care required to have sound healthy trees, especially in peaches and nectarines; for, if the buds are taken from young plants in the nursery which have produced fruit, the shoots of which are generally very strong and vigorous, these buds will have so vicious a habit, as rarely to be corrected and brought into good order; for they will shoot more like the willow than the peach, the joints being extended to a great distance from each other, the shoots very gross, and the wood pithy; therefore, where the practice of taking the buds from nursery-trees is long continued, there can be little hopes of the trees for aised. I would therefore recommend it to every curious person, to procure their buds from such trees as have been long growing, whose fruit is well flavoured, and the trees perfectly sound; as also never to make choice of the strongest or most luxuriant shoots of these trees, but such shoots as are well conditioned, and whose buds grow pretty close together. And, although these do not make so strong shoots the following years as those which are taken from luxuriant branches, yet they will be better disposed to bear fruit, and will make much better trees. The cuttings with which you are thus to be provided, should always be taken from the trees either in a morning or evening, or else in a cloudy day; for, if they are cut off when the sun is very hot, the shoots will perspire so freely, as to leave the buds destitute of moisture, which is often the cause of their miscarrying; and, the sooner they are put into the stocks when cut from the trees, the better they will take.

In the choice of the trees, you should observe the stocks upon which they have been budded, that they are of the right sort, whether plumb or apricot; that they are sound and young, not such as had been budded the preceding year and failed, nor those which have been cut down. If the size of the stock is near that of a man's finger, it will be better than if they are larger; these should be clear of moss or canker. The buds should be of one year's growth only, and not such as have been cut down in the spring, and made a second shoot; nor should those trees be chosen whose shoots are very strong and luxuriant, but such as have clean shoots, of a moderate size, whose joints are not too far asunder; and those trees which stand on the outside rows, or near the ends of the rows, where they have most air, are generally such; for, where they stand close in the nursery, their shoots are drawn up in length, their joints are much farther asunder, and their buds or eyes are flat; for which reason, we have before advised the planting of the stocks at a greater distance than the nurserymen generally allow them; and, if a careful discreet nurseryman would be at the trouble and expence in the raising of his peach-trees according to this method, he would better deserve three shillings per tree, than one in the manner they are commonly raised; for every person who is at the expence of building walls for fruit, should not think of saving a few shillings in the purchase of their trees; because, if they are bad, or not of the right kinds, there is a great loss of time and expence to no purpose, and the disappointment will be so great, after waiting three or four years, as to discourage many from making farther trials, thinking themselves liable to the same ill-success. When the trees are chosen in the nursery, the next care must be to have them carefully taken up out of the ground, so as not to break or tear their

roots, nor injure their bark; for, as these trees are very apt to gum in those places where they are wounded, there cannot be too much care taken of this. If the trees are to be transported to a distant place, their roots should be closely wrapped either with hay-bands, straw, or pease-haulm, and mats sewed over these, to prevent the air from drying their roots and branches. If the leaves of the trees are not fallen when they are taken up, they should be carefully stripped off before the trees are packed up; for, when there are many of them left, they are very apt to heat, if long in their passage, and often occasion a mouldiness very hurtful to the branches.

We come next to the preparing of the ground to receive the trees. The best earth for peach-trees is such as is taken from a pasture-ground, that is neither too stiff and moist, nor over dry, but of a middling nature, such as is termed hazel loam. This should be dug from the surface of the ground about ten inches deep, taking the turf with it, and should be laid in heaps eight or ten months at least; but that which is prepared one year or more before it be used is still better, that it may have the winter's frost, and summer's heat, to mellow it; during which time it should be often turned, to rot the turf and break the clods, whereby it will be rendered very light and easy to work; and about the beginning of September you should carry it into the garden, and make the borders, which must be raised in height proportionable to the moisture of the garden; but, if the ground be very wet, it will be advisable to lay some rubbish in the bottom of the border to drain off the moisture, and to prevent the roots of the trees from running downward; and in this case it will be proper to make some under-ground drains at the bottom of the border, to convey off the superfluous moisture; which, if detained about the roots of the trees, will greatly prejudice them; then raise a border of earth at least a foot, or in very wet land two feet, above the level of the ground, so that the roots of the trees may always remain dry; but, if the ground be pretty dry, the borders should not be raised above six or eight inches higher than the surface, which will be sufficient to allow for their sinking. As to the breadth of these borders, that cannot be too great; but should never be less than six or eight feet, where fruit-trees are planted, for, when the borders are made very narrow, the roots of the trees will be so confined in four or five years time, that they will seldom thrive well afterwards. The depth of these borders should not be greater than two feet and a half; for, when they are prepared to a great depth, it only entices the roots of the trees downward, which may be the cause of their future barrenness; for, their roots being got down below the influences of the sun and showers, imbibe a great quantity of crude juices, which only add to the luxuriant growth of the trees, and destroy their fruitfulness; besides, whatever fruit are produced from such trees, are not near so well tasted as those are which grow upon trees whose roots lie near the surface, and enjoy the kindly benefit of the sun's heat, to correct and digest whatever crudities there may be in the earth. Where the natural soil of the garden is shallow, and either chalk, clay, or gravel, lies near the surface, these should not be dug out to make pits to receive the earth for the border, as is by some practised, for this will be no better than planting the trees in tubs or cases, for their roots will be confined to these pits; so that when they are extended to the sides, and can get no farther, the trees will blight and decay; and, if it is clay on the sides, the wet will be detained as in a basin, and the earth of the border will be like mud in very wet seasons, unfit therefore for the roots of these trees. Whenever then it so happens that the ground is of either of the sorts before-mentioned, it will be the best way to raise the borders of a proper thickness of good earth over these, rather than to sink down into them; for, when the roots of the trees lie near the surface of the ground, they will extend to a great distance in search of nourishment; but, if they get below the staple of the land, they can find

nothing but four crude pasture, very unfit for vegetation. Your borders, being thus prepared, should lie about three weeks or a month to settle, by which time the season for planting will be come, which should be performed as soon as the leaves begin to decay, that the trees may put out new roots before the frost comes on to prevent them. Your ground being ready, and the trees brought carefully to the place, the next work is to prepare them for planting, which is to be performed in the following manner: you must shorten all the roots, cut off smooth broken or bruised roots, and take off all the small fibres; where any of the roots cross each other, the worst of them must be cut out, that they may not injure the others.

Having thus prepared your trees, you should measure out their distance, which ought never to be less than twelve feet; but, where the ground is very good, they should be planted fourteen feet asunder. After you have marked out the places where each tree is to stand, you must with your spade make a hole wide enough to receive the roots of the tree; then you should place it down, observing to turn the bud outwards, that the wounded part of the stock may be hid from sight; and let the stem of the tree be placed about four or five inches from the wall, with its head inclining thereto; then fill in the earth with your hands, observing to break the clods, that the earth may fall in between the roots, so as no void spaces may be left about them. You should also gently shake the tree with your hands, to settle the earth down the better between the roots; then with your foot gently press down the earth about the stem, but do not tread it down too hard, which is many times a very great fault; for, when the ground is inclinable to bind, the treading it close often renders the ground so hard, as that the tender fibres of the roots cannot strike into it, whereby the tree remains at a stand for some time; and, if the earth be not loosened in time, it frequently dies; so that, whenever you observe the earth of your borders to be bound, either by great rains, or from any other cause; you should dig or fork it, to loosen it again, observing always to do it in dry weather; if in spring or winter; but in summer it should be done in a moist season. Although we have here given directions for the choice of trees from the nursery, after the usual method of planting these trees, which is that of taking such as have made one year's shoot, yet we would prefer those which were budded the preceding summer, and have made no shoot; for, if the bud is found and plump, and the bark of the stock well closed where the bud is inserted, there will be no danger of its growing; and, when the bud has made a shoot the following spring the length of five or six inches, if it is stopped by pinching off the top, it will put out lateral branches, which may be trained to the wall; and this will prevent any cutting off the head, as must be done to those trees which have had one year's growth in the nursery; for these trees do not well bear those large amputations, especially some of the more tender sorts; so by this method of planting these trees in bud, no time will be lost, when it is considered that the trees which have shot must be cut down, and there is a hazard of their shooting again; therefore, we are convinced from experience, that it is the best method.

After you have thus planted your trees, which have made their shoots in the nursery, you should fasten their heads to the wall, to prevent their being shaken by the wind, which would disturb their roots, and break off the tender fibres soon after they were produced, to the no small prejudice of the trees; you should also lay some mulch upon the surface of the ground about their roots, before the frost sets in, to prevent it from penetrating the ground, which would injure, if not destroy, the small fibres; but this mulch should not be laid upon the ground too early, lest it prevent the autumnal rains from penetrating to the roots.

These things being duly observed, they will require no farther care till the beginning or middle of March, according as the season is earlier or later; when you must

cut off the heads of the new planted trees, leaving only four or five eyes above the bud; in doing of which, you must be very careful not to disturb their roots; to prevent which, you should place your foot down close to the stem of the tree, and take fast hold of that part of the stock below the bud with one hand, to hold it steady, while with the other hand you gently slope off the head of the tree with a sharp knife at the intended place, which should always be just above a bud; this should always be done in dry weather; for, if there should be much rain soon after it is done, there will be some danger that the wet will enter the wounded part, and damage the tree; nor should it be done in frosty weather for the same reason, for that would enter the wounded part and prevent its healing over. After you have headed the trees, you should gently loosen the earth of the borders, to admit the fibres of the roots; but you must be very careful in doing this, not to cut or bruise their new roots, which would also damage them; and, if the mulch which was laid about their roots in autumn be rotten, you may dig it into the border at some distance from the roots of the trees; and, when the dry weather comes on, you should pare off some turf from a pasture ground, which should be laid upon the surface of the border about the roots of the trees, turning the grass downward, which will preserve a gentle moisture in the earth, better than any sort of mulch; and this will not harbour insects, as most sorts of dung and litter do, to the no small detriment of the trees. Those trees which are planted in bud, and have not made any shoots, should have their stocks cut down at this season just above the bud, for the buds will rarely shoot unless this is performed; and, the nearer they are cut to the bud, the sooner will the head of the stock be covered by the buds; for, although it may be necessary to leave a part of the stock above the bud, in those trees which are in the nursery, to which the shoots made by the buds may be fastened, to prevent their being broken by the wind; yet, as these are placed against the wall, to which the shoots may be fastened, there will be no want of any part of the stock. In watering these new-planted trees, which should not be done unless the spring proves very dry, you should observe to do it with a nozzle upon the watering-pot, so as to let it out in drops; for, when it is hastily poured down, it causes the ground to bind; and, if you water over the head of the tree, it will be of great service to it. Your waterings should not be repeated too often, nor should they be given in great quantity, both being very injurious to new-planted trees.

In the middle or latter end of May, when these trees will have several shoots six or eight inches in length, you should nail them to the wall, observing to train them horizontally, rubbing off all fore-right shoots, or such as are weak, whereby those which are preserved will be much stronger; but if there are not more than two shoots produced, and those very strong, you should at the same time nip off their tops, which will cause each of them to push out two or more shoots, whereby the wall will be better supplied with branches; you must also continue to refresh them with water in dry weather, during the whole season, otherwise they will be apt to suffer; for their roots having but little hold of the ground the first year after transplanting, if the season should prove very dry, it will greatly retard their growth, if due care be not taken to water them. In the beginning of October, when you observe the trees have done shooting, you should prune them; in doing of which, you must shorten the branches in proportion to the strength of the tree; which, if strong, may be left eight inches long; but, if weak, should be shortened to four or five; then you should train them horizontally to the wall, as was before directed, so that the middle of the trees may be void of branches, for that part of the tree will be easily furnished with wood afterwards; whereas, if the shoots are trained perpendicularly to the wall, those which are the strongest will draw the greatest share of the sap from the roots, and mount up-

wards; so that the side branches will be deprived of their nourishment and grow weaker, until they many times decay; and this is the reason why we see so many peach-trees with one or two upright shoots in the middle, and the two sides wholly unfurnished with branches, whereby the middle of each tree cannot produce any fruit, that being filled with large wood, which never produces any bearing shoots. Nor can the two sides of the trees be regularly filled with fruitful branches, when this defect happens to them; therefore this method should be carefully observed in the training up young trees; for, when they are permitted to run into disorder at first, it will be impossible to reduce them into a regular healthful state afterwards, the wood of the trees being too soft and pithy to admit of being cut down, as may be practised on many other hardy fruit-trees, which will shoot out vigorously again; whereas these will gum at the places where they are wounded, and in a few years entirely decay. The summer following, when the trees begin to shoot, you should carefully look over them, to rub off all fore-right buds, or such as are ill placed, and train those which are designed to remain horizontally to the wall, in their due order as they are produced, for this is the principal season when you can best order the trees as you would have them; whereas, if they are neglected until Midsummer, as is the common practice, a great part of the nourishment will be exhausted by the fore-right shoots, and other useless branches, which must afterwards be cut off: and hereby the remaining shoots will be rendered very weak, and perhaps some part of the wall be entirely unfurnished with branches; which might have been easily supplied in May, by stopping some of the stronger shoots in such parts of the tree where there is a necessity for more branches, which would cause each of them to shoot up two or more side branches below the ends of the shoots, which may be guided into the vacant parts of the tree as they are produced, so as that every part may be regularly furnished with proper wood, which is the greatest beauty and excellency of wall-trees; but you should always forbear stopping the shoots in summer, where there is not a necessity for branches to fill the wall; for there cannot be a greater fault committed than that of multiplying the number of shoots, so as to cause a confusion, whereby the branches will be too weak to produce good fruit; besides, when they are too close laid in against the wall, the air is excluded from the shoots by the great number of leaves, so that the fruit is never duly ripened, and cannot be so well tasted as that which is produced upon such trees where the shoots receive all the advantages of the sun and air to bring it to maturity.

In the pruning of peach and nectarine trees, (which require the same management,) the two following rules should be strictly observed, viz. first, that every part of the tree be equally furnished with bearing wood; and, secondly, that the branches be not laid in too close to each other. As to the first, it must be observed, that peach and nectarine trees produce their fruit upon the young wood, either of the preceding year, or, at most, the two-year shoots, after which age they do not bear; therefore, the branches should be shortened, so as to cause them to produce new shoots annually in every part of the tree; which cannot be done in the ordinary method of pruning, where persons neglect their trees at the proper season when they are most capable of management, which is in April, May, and June; at which time the luxuriant growth of branches may be checked by pinching, and new shoots produced where they are wanting, by stopping the neighbouring branches; which shoots, being produced at that season, will have time enough to ripen and gain strength before the autumn comes on; whereas, all those shoots produced after the middle of June, will be crude and pithy; and, though they may sometimes produce a few blossoms, yet those rarely bring fruit; nor are the future branches good which are produced from such wood, the vessels being too large to strain the juices, so that they

easily admit of great quantities of crude nourishment to pass through them. Therefore, those persons who only regard their wall-trees at two different seasons, viz. the winter and midsummer pruning, cannot possibly have them in good order; for, when all the branches which were produced in the spring are permitted to remain until the middle or latter end of June, (as is the common practice,) some of the most vigorous will draw the greatest part of the nourishment from the weaker branches, which, when the strong ones are taken off, will be too weak to produce fair fruit; and hereby the strength of the tree is exhausted, to nourish the useless branches which are annually cut off; and thus are too many trees managed, and at the same time complaints made of their luxuriance; because two or three shoots, by drawing away the greatest share of the nourishment, grow very strong and woody, (whereas, if the nourishment had been equally distributed to a regular quantity of branches, there would be no sign of their too great strength,) until, by often cutting off these vigorous branches, the trees are either entirely destroyed, or at least rendered so weak as not to be able to produce fruit; for, although by thus weakening the branches, it is often the means to produce a good number of blossoms, as may many times be observed also upon autumnal shoots, yet the utmost of their strength is spent in expanding the flowers, so that they rarely produce fruit; and, very often, the greatest part of the branches die soon after, which is supposed to be occasioned by a blight, when in reality it is nothing less than the fault of those who have the management of the trees. It is therefore of the greatest consequence to wall-trees, especially of these sorts, to go over them two or three times in the months of April, May, and June, to rub off all irregular shoots, and to train in the branches that are left in due order to the wall, that each shoot may have an equal advantage of sun and air, both of which are absolutely necessary to ripen and prepare the wood for the next year's bearing; therefore the oftener the trees are looked over, to divest them of the useless branches, from the time they first begin to shoot in the spring till the autumn, the better will the wood be ripened for the succeeding year. And, by duly observing this in summer, there will not be occasion for so much cutting as is often practised on peach-trees, to their great injury; for their wood-branches are generally soft, tender, and pithy, which, when greatly wounded, are not healed over again so soon as in many other sorts of trees; and the wet, insinuating into the wounded parts, often causes the branches to canker and die; which may be entirely avoided by the gentle easy method of pinching and rubbing off the buds in the manner here directed.

The distance which the branches of these trees should be allowed against the wall, must be proportioned to the size of the fruit or the length of the leaves; for, if we observe how the branches of the trees are naturally disposed to grow, we shall always find them placed at a great distance, as their leaves are larger or smaller; and there is no surer guide to a curious artist than nature, from whence a gardener should always be directed in every part of his profession, since his business is to aid and assist nature, where she is not capable of bringing her productions to maturity; or, where there is room, to make considerable improvements by art; which cannot be any otherwise effected, than by gently assisting her in her own way. But to return to pruning these trees: the branches being carefully trained in, as before directed, in the spring and summer seasons, we come now to treat of the winter pruning, which is commonly performed in February or March; but the best season for this work is in October, when their leaves begin to fall, which will be early enough for their wounds to heal before the frost comes on, so that there will be no danger of being hurt hereby; and the branches of the trees being proportioned to the strength of the roots at that season, all the ascending sap in the spring will be employed to nourish only those useful parts of the branches which are left; whereas, if they are left unpruned

till February, the sap in the branches being then in motion, as may be observed by the swelling of the buds, the greatest part of it will be drawn up to the extreme parts of the branches, to nourish such blossoms as must be afterwards cut off.

Having said thus much concerning the time of pruning, we shall give some general directions how it is to be performed on peach and nectarine trees, which require a very different management from most other sorts of fruits. In pruning these trees, you should always observe where branches are shortened, to cut them behind a wood-bud, which may be easily distinguished from the blossom-buds, which are shorter, rounder, and more turgid, than the wood-buds; for, if the shoot have not a leading bud where it is cut, it is very apt to die down to the next leading bud; so that what fruit may be produced above that will come to nothing, there being always a necessity of a leading bud to attract the nourishment; for, it is not sufficient to have a leaf-bud, as some have imagined, since that will attract but a small quantity of nourishment, the great use the leaves being to perspire away such crude juices as are unfit to enter the fruit. The length you should leave these branches, should be proportioned to the strength of the tree, which, in a healthy strong tree, may be left ten or twelve inches, or more; but, in a weak one, they should not be more than six inches: however, in this you must be guided by the position of the leading bud; for, it is better to leave a shoot three or four inches longer, or to cut it two or three inches shorter than it might be proper to do, provided there be one of these buds, it being absolutely necessary for the future welfare of the tree; you should also cut out entirely all weak shoots, though they may have many blossom-buds upon them; for these have not strength enough to nourish the fruit, but they will weaken the other parts of the tree. In nailing the shoots to the wall, you must be careful to place them at as equal distances as possible, that their leaves, when come out, may have room to grow without shading the branches too much; and you should never nail them upright, if it can be avoided: for, when they are thus trained, they are very subject to shoot from the uppermost eyes, and the lower part of the shoots will thereby become naked.

There is not any thing in the business of gardening which has more exercised the thoughts of the curious, than how to preserve their tender sorts of fruit from being blighted in the spring of the year; and yet there has been little written on this subject which is worth notice. The blights, which are so often complained of, do not so much proceed from any external cause, or inclemency in the season, as from a dis temper or weakness in the trees; for, if we observe the trees at that season, where they are the most subject to what is called a blight, we shall find the branches very small, weak, and not half ripened, as also trained in very close to each other; these branches are, for the most part, full of blossom-buds, which is chiefly occasioned by their want of strength. These buds do indeed open, and, to persons not skilled in fruit-trees, shew a great prospect of a plentiful crop of fruit; whereas the whole strength of the branches is spent in nourishing the flowers, and, being unable to do any more, the blossoms fall off; and the small efforts of the leaf-buds are checked, so that many times great part of the branches die away, and this is called a great blight; whereas, at the same time, it may be often observed, that some trees of a different sort, nay, even some of the same sort, were stronger and in health, though placed in the same soil, exposed to the same aspect, and subject to the same inclemency of air, have escaped very well, when the weak trees have appeared to be almost dead; which is a plain indication, that it proceeds from some cause within the tree, and not from any external blight. All this will therefore be remedied, by observing the foregoing directions in the pruning and management of the trees, so as never to overburden them with branches, nor to suffer any particular part of the trees to exhaust the whole nourishment from

the root, which will cause the other parts to be very weak; but to distribute the nourishment equally to every shoot, that there may be none too vigorous, at the same time that others are too weak; and, by continually rubbing off useless or fore-right shoots as they are produced, the strength of the trees will not be spent, to nourish such branches as must be afterwards cut out, which is too often seen in the management of these trees. It sometimes happens, that the roots of these trees are buried too deep in the ground, which, in a cold or moist soil, is one of the greatest disadvantages that can attend these tender fruits; for the sap which is contained in the branches, being by the warmth of the sun put strongly into motion early in the spring, is exhausted in nourishing the blossoms; and a part of it is perspired through the wood-branches, so that its strength is lost before the warmth can reach to their roots, to put them into an equal motion in search of fresh nourishment, to supply the expence of the branches; for want of which, the blossoms fall off and decay, and the shoots seem to be at a stand, until the farther advance of the warmth penetrates to the roots, and sets them in motion; when, suddenly after, the trees, which before looked weak and decaying, make prodigious progress in their shoots; and, before the summer is spent, are furnished with much stronger branches than those trees which have the full advantage of sun and showers, and are more fruitful and healthy; which must certainly be owing to the cause here mentioned, as also to their drawing in a great quantity of crude moisture, which, though productive of wood, is yet unkindly for fruit: if, therefore, this be the case, there is no way of helping it, but by raising up the trees, if they are young; or, if they are too old to remove, it is the better way to root them out, and make new borders of fresh earth, and plant down young trees. This may also proceed from the trees wanting nourishment, which is many times the case, where they are planted in a hard gravelly soil, in which it is the common practice to dig borders three or four feet wide, and three feet deep into the rock of gravel, which is filled with good fresh earth, into which the trees are planted, where they will thrive pretty well for two years, until their roots reach the gravel, where they are confined as if planted in a pot; and, for want of proper nourishment, the branches continually decay every year. This cannot be helped where the trees have been growing some years, without taking them entirely up, or by digging away the gravel from their roots, and adding a large quantity of fresh earth, that may afford them a supply of nourishment a few years longer; but trees so planted, cannot by any art be continued long in health. But if the unfruitfulness of the trees does not proceed from any of the before-mentioned causes, and is the effect of unkindly seasons, then the best method yet known is, in dry weather, to sprinkle the branches of the trees gently with water soon after the blossoming season, and while the young-set fruit is tender, which should always be done before noon, that the moisture may evaporate before the night comes on; and, if in the night you carefully cover the trees with mats, canvas, or some such light covering, it will be of great service to them: however, where the trees are strong and vigorous, they are not so liable to suffer by a small inclemency as are those which are weak, so that there will be few seasons in which there may not be hopes of a moderate quantity of fruit from them, though there should be no covering used; for, where these coverings are used, if it is not performed with great care and diligence, it is much better to have none, but to trust to the clemency of the season; for, if the coverings are kept too close, or continued too long, the trees will receive more injury thereby than if they had not been covered. However, I must repeat in this place, a management generally attended with success; which is, the putting up two feather-edge deal boards joined together, over the top of the trees, so as to form a pent-house, to cast off perpendicular wet. These should be fixed up when the trees begin to blossom, and should remain till the

the fruit is well set, when they should be taken down to admit the dew and rain to the leaves and branches of the trees; and, where the wall is long, and exposed to currents of wind, if, at the distance of forty feet from each other, some cross reed-hedges be fixed, to project about ten feet from the wall, these will break the force of the wind, and prevent its destroying the blossoms; and these may be removed as soon as the danger is over. These things have been practised with great success; and, as there will be little trouble in covering and uncovering by this method, after they are fixed up, there is less danger of neglect than where the trouble is great, or to be often repeated.

When your fruit is set, and grown to the bigness of a small nut, you should look over the trees and thin them, leaving the fruit at least five or six inches asunder; the sooner this is done, the better it will be for the remaining fruit; and, if it should sometimes happen, that a part of those left should be destroyed, yet the remaining ones will be much the larger or better tasted for it, and the trees will gain more strength; the fruit, when but few, will be much larger, better tasted, and the trees in a condition to bear well the succeeding year; whereas, when they are overcharged with fruit, it is always small, ill-tasted, and the trees are generally so much weakened, as not to be in a condition for bearing well for two or three years after. The quantity of fruit to be left on large full-grown trees, should never be greater than five dozen upon each; but on middling trees, three or four dozen will be enough.

If the season should prove hot and dry, it will be proper to draw up the earth round the stem of each tree, to form a hollow basin of about six feet diameter, and cover the surface of the ground in this basin with mulch; and, once in a week or fortnight, according to the heat and drought of the season, pour down eight or ten gallons of water to the root of each tree; or, where there is an engine which will disperse the water in gentle easy drops like rain, if the same or a larger quantity of water be sprinkled all over the branches of the trees; this, soaking down to the roots will keep the fruit constantly growing, which will prevent its falling off the trees, as it generally does where this method is not practised; and the fruit, being thus constantly nourished, will be much better tasted, and hereby the trees will be maintained in vigour; so that it is what we can from long experience recommend, as one of the most necessary things to be practised by all lovers of good fruit. But this should not be continued longer than while the fruit is growing, for afterwards it will be hurtful to the trees and fruit, for a dry autumn ripens both wood and fruit better than a moist later season.

When the peach-trees are carefully managed in the spring of the year, according to the rules laid down, all the nourishment which the roots can supply will be usefully employed in the support of such shoots only as are to be continued, as also the quantity of fruit which is proper for each tree, therefore both must of consequence be rendered better; for where there is not this care, the trees soon grow ragged, and are not furnished properly with branches; and those shoots which are produced, are some of them very weak, and others very luxuriant, whereby the trees are rendered very unsightly, as also unhealthy, and never continue many years fruitful; and by thus training the branches to the wall as they are produced, the fruit will be always exposed to the sun and air; which, in the common method of managing these trees, by letting their branches grow long all the spring, they are deprived of; and, by the timely rubbing off all luxuriant shoots, it will save much trouble, and prevent the use of the knife in summer, which is very hurtful to these trees, for there will be no need to shorten any of the shoots in summer.

The culture of the nectarine differs in nothing from that of the peach: only the buds should be taken from bearing trees, and not from young nursery trees, as is too often practised.

The common and dwarf almonds are propagated by

inoculating a bud of these trees into a plum, almond, or peach, stock, in the month of July. The next spring, when the buds shoot, you may train them up either for standards, or suffer them to grow for half-standards, according to your own fancy; though the usual method is to bud them to the height the stems are intended to be; and, the second year after budding, they may be removed to the places where they are to remain. This is the only method by which the sort can be continued with certainty: but, if a variety of fruit be wanted, or stocks for budding, they must be raised from the fruit. In order to which, having procured a quantity of well-ripened almonds, either sow them in October or November, or preserve them in sand till February or March. The seminary should be in a good light soil, and the stones should be put in two inches deep, in rows a foot distant from each other. When they are two years old, plant them out in the nursery, in rows three feet wide, and eighteen inches asunder in the rows. Train them with single stems, from five to eight feet in height, by pruning off all the side shoots; then top them with your knife at the proper height, to force out a set of branches, in order to give the head its first regular form, letting them afterwards branch out in their own way; but, if they be intended as stocks for budding, they must not be headed, but trained straight up till after the budding is performed. The best season for transplanting these trees, if for dry ground, is in October, as soon as the leaves begin to decay; but, for a wet soil, February is much preferable: and observe always to bud upon plum stocks for wet ground, and upon those of almonds and peaches for dry.

AMYGDALUS ÆTHIOPICA. See BRABEUM.

AMYGDALUS INDICUS. See TERMINALIA.

AMY'LACEOUS, *f.* [from *amylum*, Lat. starch.] A term applied to the fine flour of farinaceous seeds, in which consists their nutritive parts.

AM'YMONE, one of the fifty Danaides; she married Enceladus, and killed him the first night of their nuptials, in pursuance of her father's order: but, feeling a remorse of conscience, she retired into a wood; where, intending to shoot a deer, she wounded a satyr, who pursued her and even offered her violence; but she, imploring the help of Neptune, was delivered by him, but suffered from him what she only apprehended from the satyr, and brought forth Nauplis.

AMYN'TA, *f.* in literary history, a beautiful pastoral comedy, composed by Tasso; the model of all dramatic pieces wherein shepherds are actors. The *Pastor Fido*, and *Filii di Sciro*, are only copies of this excellent piece.

AMYN'TOR *f.* [αμυντωρ, formed of the verb αμυνω, *I defend*, or *avenge*.] properly denotes a person who defends or vindicates a cause. In this sense, Mr. Toland intitles his defence of Milton's life, *Amyntor*, as being a vindication of that work against Mr. Blackhall and others, who had charged him with questioning the authority of some of the books of the New Testament.

AMYN'TOR, king of the Dolopes, a people of Epirus, who was killed by Hercules for refusing him a passage through his country. A son of Egyptus, who was killed by his wife Damone the first night of his nuptials.

AM'YON, *f.* [from α priv. and μυς, a muscle.] A limb so emaciated that the muscles scarcely appear.

AM'YOT (James), bishop of Auxerre and great almoner of France, was born of an obscure family at Melun, the 30th of October, 1514, and studied philosophy, at Paris, in the college of cardinal Le Moine. He was naturally dull and heavy; but, diligence and application made amends for these natural defects. He left Paris at the age of twenty-three; and went to Berri with the Sieur Colin, who had the abbey of St. Ambrose in that city. At the recommendation of this abbot, a secretary of state took Amyot into his house to be tutor to his children. The cause of his advancement at court is said to be as follows:

As Henry II. was making a progress through his kingdom, he stopped at a small inn in Berri to sup. After supper,

supper, a young man sent in to his majesty a copy of Greek verses. The king being no scholar, gave them to his chancellor to read, who was so pleased with them, that he recommended to his majesty to take the young man to Paris, and to make him tutor to his children. Charles IX. to whom Amyot had been preceptor, on the post of great almoner of France being vacant, gave him that honourable piece of ecclesiastical preferment; and gave him, some time afterwards, the bishopric of Auxerre, as well as a rich abbey; with all which Amyot appeared to be so little contented that he asked for another rich abbey to append to them. Charles was much surprised, and reminded Amyot, that he had always assured him that he had bounded his desires to a few hundred pounds a-year. "True, sire," replied the prelate, *mais l'appetit vient en mangeant*; "the appetite encreases by eating." Henry III. who had also been his pupil, gave him the Order of the Holy Ghost. Amyot died in 1593, at the age of seventy-nine. Not long before his death, he was much pressed to write the history of his country. "I love my sovereigns too well," said he, "to write their lives." Amyot's translation of Plutarch will ensure him immortality: it is the best translation ever made of that entertaining and instructive writer. The French language owes him the obligation of having refined and polished it. The edition of Amyot's Plutarch, printed by Vascosan, in 13 vols. 12mo. is the edition preferred by the connoisseurs in books for the elegance of its typography.

AMYRALDISM, *f.* a name given by some writers to the doctrine of universal grace, as explained and asserted by Amyraldis, or Moses Amyrault, and others his followers, among the reformed in France, towards the middle of the 17th century.

AMYRAULT (Moses), an eminent French Protestant divine, born at Bourguet in Touraine in 1596. He studied at Saumur, where he was chosen professor of theology; and his learned works gained him the esteem of Catholics as well as Protestants, particularly of cardinal Richelieu, who consulted him on a plan of re-uniting their churches, which however, as may well be supposed, came to nothing. He published a piece in which he attempted to explain the mystery of predestination and grace, which occasioned a controversy between him and some other divines. He also wrote, An Apology for the Protestants; a Paraphrase on the New Testament; and several other books. This eminent divine died in 1664.

AMYRIS, *f.* [from *a* intensive, and *μυρον*, ointment or balm.] In botany, a genus of the octandria monogynia class, in the natural of terebinthaceæ. The generic characters are—Calyx: perianthium one-leafed, four-toothed, acute, erect, small, permanent. Corolla: of four, oblong, concave, spreading petals. Stamina: filaments awl-shaped, erect. Antheræ oblong, erect, the length of the corolla. Pistillum: germ superior, ovate; style thickish, the length of the stamens; stigmas four-cornered. Pericarpium: a drupaceous roundish berry. Seed: a round shining nut.—*Essential Character.* Calyx, four-toothed. Petal, four, oblong. Stigma, four-cornered. Berry, drupaceous.

Species. 1. *Amyris elemifera*, or gum-elemi tree: leaves ternate, and pinnate with five lobes, downy, underneath. Marcgraaff describes it as a lofty tree with a small trunk, covered with a smooth grey bark; growing almost in the manner of a beech-tree. The flowers come out very close together at the axils of the leaves. The fruit is the size and figure of an olive, and the colour of a pomegranate, having an odoriferous pulp within it. Gummi elemi is a resin from this tree, brought over in oblong roundish cakes, generally wrapped up in flag-leaves. The best sort is softish, somewhat transparent, of a pale whitish-yellow colour, inclining a little to greenish. This resin is only used as an ingredient in a digestive ointment called *unguentum elemi*, which is made from one pound of gum elemi, ten ounces of turpentine, two pounds of prepared

mutton suet, and two ounces of oil of olives. Native of Carolina and Brazil.

2. *Amyris sylvatica*: leaves ternate, crenate, acute. A shrub erect, leafy, branching, but little, from two to fifteen feet high, according to the soil and situation. The whole abounds in turpentine of a strong disagreeable smell. Gum elemi has erroneously been supposed to be yielded by this plant. Found plentifully about Carthagera, in woods near the sea. Flowers in August.

3. *Amyris maritima*, or small shrubby sweet wood: leaves ternate, crenulate, obtuse. A dwarf shrub, branching, with a juice like that of the former, but pleasanter, and smelling like rue. It is always found about the Havannah, on rocks by the sea-side; flowering from June to September.

4. *Amyris Gileadenfis*, or balsam of Gilead tree: leaves ternate, quite entire; peduncles one-flowered, lateral. The balsam of Gilead tree is a shrub with purplish branches, straited a little, having protuberant buds loaded with balsamic resin.

5. *Amyris opobalsamum*, or balsam of Mecca tree: leaves pinnate, leaflets sessile. The true opobalsamum, according to Prosper Alpinus, is at first turbid and white, of a very strong pungent smell, like that of turpentine; but much sweeter and more fragrant, like mint, varying according to its goodness, and of a bitter, acrid, astringent, taste: on being kept it becomes thin, limpid, light, of a greenish hue, and then of a gold colour; after which, it grows thick, like turpentine, and loses much of its fragrance. A curious balsam is sometimes met with, smelling like a mixture of rosemary and sage flowers, exceedingly fragrant, limpid, and thin: dropped on water, it spreads itself all over the surface, imparting to the liquor a considerable share of its taste and smell: the grosser part, that remains on the top of the water, is so tenacious, as to be easily taken up at once with the point of a needle, which is reckoned a characteristic of the true balsam. This seems to be the same with that which Bergius says he has had from England, under the name of balsam of Gilead. Gerlach (as quoted by Bergius) relates, that the trees which produce the opobalsamum, or balsam of Mecca, grow near Bederhounin, a village between Mecca and Medina, in a sandy rocky soil, confined to a small tract, about a mile in length. In the beginning of April, the trees drop their juice from gashes which are made in the smaller branches, into vessels set under them to receive it. A gash does not yield above three or four drops in a day, weighing about a drachm; nor will even the best trees yield more upon the whole in a season than from ten to fifteen drachms. The inhabitants use it as a sudorific, particularly in the rheumatism: but it is adulterated upon the spot. Lady Mary Wortley Montague informs us, that the balm of Mecca, of the best quality, is not easy to be got, even at Constantinople: that, applying some of it to her face, it became swelled and red during three days, but that her complexion was much mended by the operation: and that the ladies all use it at Constantinople, and have the loveliest bloom in the world. Its great scarcity has prevented its coming into use among us: nor are its virtues; probably, superior to those of some of the resinous juices more common in the shops; all these substances being in their general qualities alike, though differing in the degree of their gratefulness, pungency, and warmth. An inferior sort of balsam is prepared from boiling the young twigs and leaves gently in a large quantity of water; the balsamic matter rises to the surface, which is skimmed off. After they have thus procured all they can, it is said that they increase the fire, and a large quantity of thicker balsam like turpentine rises, which is preserved by itself, and is that principally which we have in Europe. The other only can be obtained by presents; and, that which distils naturally from the trees, scarcely supplying the fragrant and great officers, there is none of it sent out of the country.

Hasselquist describes the true balsam of Mecca as being yellow and pellucid, with a most fragrant resinous balsamic smell; as being very tenacious, and drawing out into long threads: that it is taken to three grains to strengthen a weak stomach, and that it is a most excellent remedy for wounds. To know whether it be adulterated, they drop some into a glass of water; if it remain still on the surface, it is of little value; but if it instantly extend itself over the whole surface, and may be taken off the water with a hair, silk, or thread, it is then of the best kind. The drugs used to adulterate this balsam, are oil of sesamum, cyprus turpentine, and ostrich fat. Mr. Bruce has given two figures of the balsam tree; one of the whole tree, the other a single branch with the dissection of the fruit. These he says may be depended on, as being carefully drawn, after an exact examination, from two very fine trees brought from Beder Hunein. One of these was five feet two inches high from where the red root begins, or which was buried in the earth, to where it divides itself first into branches. The trunk at thickest was about five inches diameter, the wood light and open, and incapable of being polished, covered with a smooth bark of bluish-white, like a standard cherry-tree in good health, which has not above half that diameter; indeed a part of the bark is a reddish brown; it flattens at top like trees that are exposed to snow, blasts, or sea-air, which gives it a stunted appearance. It is remarkable for a penury of leaves. The flowers are like those of the acacia tree, white and round, only that three hang upon three filaments or stalks, where the acacia has but one. Two of these flowers fall off and leave a single fruit; the branches that bear this are the shoots of the present year; they are of a reddish colour, and tougher than the old wood; it is these that are cut off and put into little fagots, and sent to Venice for the theriaca, when bruised or drawn by fire, and formerly these made the xylobalfamum. The great value set upon this drug in the east remounts to very early ages. We know from scripture, that the Ishmaelites, or Arabian carriers and merchants, trafficking with Indian commodities to Egypt, brought with them balm as part of the cargo. Strabo alone of all the ancients, has given us a true account of the place of its origin. "Near to this," says he, "is the most happy land of the Sabeans, and they are a very great people. Among these frankincense, myrrh, and cinnamon, grow, and in the coast that is about Saba, the balsam also." Among the myrrh trees behind Azab, all along the coast to the straits of Babelmandel is its native country. It grows to a tree above fourteen feet high, spontaneously and without culture, like the myrrh, the coffee, and frankincense, tree; they are all equally the wood of the country, and are occasionally cut down and used for fuel. We need not doubt but that it was early transplanted into Arabia, that is, into the south part of Arabia Felix, immediately fronting Azab: the high country of Arabia was too cold for it, being all mountainous, and water freezing there. The first plantation that succeeded seems to have been at Petra, the ancient metropolis of Arabia, now called Beder or Beder Hunein. Afterwards, being transplanted into Palestine, it obtained the name of *balsamum judaicum*, and balm of Gilead, and became an article of commerce there. Prosper Alpinus says, that Messener, an eunuch, governor of Cairo 1519, caused to be brought from Arabia forty plants, which he placed in the garden of Mattareah. Bellonius relates, that in his time there were ten plants at Mattareah. There were none existing when Mr. Bruce visited Cairo, but some of the Christians then living there remembered one plant in that garden. There were three productions from this tree very much esteemed among the ancients. The first was called *opobalsamum* or juice of the balsam, which was the finest kind, composed of that greenish liquor found in the kernel of the fruit: the next was *carpobalsamum*, made by the expression of the fruit when in maturity: the third was *xylobalfamum*, the worst of all; it was an expression or

decoction of the small new twigs of a reddish colour. But the principal quantity of balsam in all times was produced by incision, as at this day. The wound is made by an axe, when the juice is in its strongest circulation in July, August, and the beginning of September. It is then received into a small earthen bottle, and every day's produce is poured into a larger, which is kept closely corked. The Arabs Harb, a noble family of Beni Koreish, are the proprietors of it, and of Beder, where it grows. It is a station of the emir Hadje, or pilgrims going to Mecca, half way between that city and Medina. Some books speak of a white sort, brought by the caravans from Mecca; and others of a balsam of Judea, but these are counterfeits and adulterations. The balsam of Judea was lost long ago, but as late as Galen's time it was growing in many places of Palestine besides Jericho. When Sultan Selim conquered Egypt and Arabia in 1516, three pounds was then the tribute ordered to be sent to Constantinople yearly, and this is still kept up. The remainder is sold or farmed out to some merchants; who, to increase the quantity, adulterate it with oil of olives and wax, and several other mixtures, consulting only the agreement of colour; formerly, we are told, it was done with art, but nothing is easier detected than this fraud now. It does not appear that the ancients had ever seen this plant, they describe it so variously; and Prosper Alpinus corroborates the errors of the ancients, by saying it is a kind of vine (*viticofus*). The figure he has given is a very bad one. The juice, when first received into the bottle from the wound, is of a light yellow colour, apparently turbid, in which there is a whitish cast, which arises from the globules of air that pervade the whole in its first state of fermentation; it then appears very light upon shaking. As it settles and cools, it turns clear, and loses that milkiness. It then has the colour of honey, and appears more fixed and heavy than at first. After being kept some years, it becomes of a much deeper yellow, and of the colour of gold, but continues perfectly fluid, and loses very little of taste, smell, or weight. The smell at first is violent and strongly pungent, like that of volatile salts. In its pure and freest state it dissolves easily in water. If dropped on a woollen cloth, it will wash out easily, and leaves no stain. It is of an acrid, rough, pungent, taste; is used by the Arabs in all complaints of the stomach and bowels, is reckoned a powerful antispetic, and of use in preventing any infection of the plague. These qualities it enjoys probably in common with balsam of Tolu, Peru, &c. which we have received from America. It is always used and particularly esteemed by the ladies, as a cosmetic; as such it has kept up its reputation in the east to this day. The manner of applying it is this: you first go into the tepid bath till the pores are sufficiently opened, you then anoint yourself with a small quantity, and as much as the vessels will absorb; never-fading youth and beauty are said to be the consequences.

6. *Amyris toxifera*, or poison ash: leaves pinnate; leaflets petiolate, plane. Catesby describes his poison-wood as a small tree, with a light-coloured smooth bark. The mid-rib of the leaf as seven or eight inches long, and the pedicles as an inch in length. The fruit as hanging in bunches, shaped like a pear, of a purple colour, covering an oblong hard stone. From the trunk a liquor distils as black as ink, which the inhabitants say is poison. Birds feed on the fruit. Native of America.

7. *Amyris protium*: leaves pinnate, leaflets petiolate, waved. Native of the East Indies. Perennial.

8. *Amyris ambrosiaca*: leaves pinnate, petiolate; panicles crowded, axillary. A tree with a trunk thirty feet high, branching at the top. The whole tree is extremely sweet-scented, and pours out a very odorous balsam from the wounded trunk or branches, which is used in the dysentery; the dose is one drachm in red wine: this is also used in houses and churches to burn as a perfume. It grows in the woods of Guiana and by the sea-shore, flowering and fruiting in September.

3. *Amyris balsamifera*, or sweet amyris, or white candle-wood, or rose-wood: leaves two-paired. It grows to a considerable size, and is one of the most valuable timber-trees in the island of Jamaica, but not common. The wood is white, and of a curled grain when young, but grows of a dirty clouded ash-colour with age: it bears a fine polish, and has a pleasant smell. It is heavy, and in great repute among cabinet-makers. All the parts of this tree are full of warm aromatic particles, and may be used in baths and fomentations. The berries are oblong, and have much of the taste of the balsam copaiba. An infusion of the leaves has a very pleasant flavour, is highly cephalic, strengthens the nerves, and is particularly restorative to weak eyes. There are several species of amyris in Jamaica, the leaves and bark of which are impregnated with a fine balsamic juice; and, if the body was tapped at the proper season, might be found to transude a thick liquor resembling that of the Gilead balsam, to which the taste of this bark, and wood of the smaller branches, bears a very exact relation. See *XIMENIA*.

AN, art. [*anc*, Sax. *een*, Dut. *ene*, Ger.] The article indefinite, used before a vowel, or *h* mute. One, but with less emphasis; as, there stands *a* house.—Since he cannot be always employed in study, reading, and conversation, there will be many *an* hour, besides what his exercises will take up. *Locke*.—Any, or some; as, *an* elephant might swim in this water:

A wit's a feather, and a chief a rod;
An honest man's the noblest work of God.

Pope.

Sometimes it signifies, like *a*, some particular state; but this is now disused.—It is certain that odours do, in a small degree, nourish; especially the odour of wine; and we see men *an* hungred do love to smell hot bread. *Bacon*.

—*An* is sometimes, in old authors, a contraction of *and* if:

He can't flatter, he!

An honest mind and plain; he must speak truth.
An they will take it, so; if not, he's plain. *Shakespeare*.

Sometimes a contraction of *and* before *if*:

Well I know

The clerk will ne'er wear hair on's face that had it.
—He will *an' if* he live to be a man. *Shakespeare*.

Sometimes it is a contraction of *as* if.—My next pretty correspondent, like Shakespeare's lion in Pyramus and Thisbe, roars *an'* it were any nightingale. *Addison*.

ANA, adv. [*ana*]—A word used in the prescriptions of physic, importing the like quantity; as, wine and honey, *a* or *ana* ℥ii; that is, of wine and honey each two ounces.

In the same weight innocence and prudence take,
Ana of each does the just mixture make. *Cowley*.

ANA, *f.* in matters of literature, a Latin termination, adopted into the titles of several books in other languages. *Anas*, or *books in ana*, are collections of the memorable sayings of persons of learning and wit; much the same with what we otherwise call *table-talk*. Wolfius has given the history of books in *ana*, in the preface to the *Casauboniana*. He there observes, that, though such titles be new, the thing itself is very old; that Xenophon's books of the deeds and sayings of Socrates, as well as the dialogues of Plato, are *Socraticana*; that the apophthegms of the philosophers called by Diogenes Laertius the sentences of Pythagoras and those of Epictetus, the works of Athenæus, Stobæus, and divers others, are so many *anas*. Even the Gemara of the Jews, with several other oriental writings, according to Wolfius, properly belong to the same class. To this head of *ana* may likewise be referred the *Orphica*, the *Pythagoræa*, *Æsopica*, *Perrhœnea*, &c. Scaligerana was the first piece that appeared with a title in *ana*. It was composed by Isan de Vassan, a young Champanois, recommended to Jos. Scaliger by Casaubon. Being much with Scaliger, who was daily visited by the men of learning at Leyden, De Vassan wrote down whatever things of

any moment he heard Scaliger say. And thus arose the *Scaligerana*, which was not printed till many years after, at Geneva in 1666. *Patin*. *Let.* 431. Soon after came the *Perroniana*, *Thuana*, *Naudæana*, *Patineana*, *Soberiana*, *Menagiana*, *Anti-Menagiana*, *Furetiana*, *Chevæana*, *Leibnitziana*, *Arlequiniana*, *Poggiana*, &c.

ANABAPTISTION, *f.* the same with *ABAPTISTION*.

ANABAPTISTS, [*Anabaptiste*, Fr. of *ana* *βαπτίζω*, Gr. i. e. to rebaptize.] a name which has been indiscriminately applied to Christians of very different principles and practices; though many of them object to the denomination, and hold nothing in common, besides the opinion that baptism ought always to be performed by immersion, and not administered before the age of discretion.

The Donatists may be considered as a kind of Anabaptists in the earlier ages, though not then denoted by this name; for they contended, that those Christians of the catholic church who joined themselves to their respective parties should be rebaptized. But we must not class under the same denomination those bishops of Asia and Africa, who, in the third century, maintained, that baptism administered by those whom they called heretics was not valid, and therefore that such of them as returned into their churches ought to be rebaptized. Nor do the English and Dutch Baptists consider the denomination as at all applicable to their sect: by whom the baptism appointed by Christ is held to be “nothing short of immersion, upon a personal profession of faith;” of which profession infants being incapable, and sprinkling being no adequate symbol of the thing intended, the baptizing of profelytes to their communion, who in their infancy had undergone the ceremony of sprinkling, cannot, it is urged, be interpreted a repetition of the baptismal ordinance.

Anabaptists, in a strict and proper sense, appear to be those who not only rebaptize, when they arrive at an adult age, persons that were baptized in their infancy, but also, as often as any person comes from one of their sects to another, or as often as any one is excluded from their communion and again received into the bosom of their church, they baptize him. And such were many of the German Baptists. But the single opinion common to all the sects to which the name of *Anabaptists* has been indiscriminately applied, is that of the invalidity of infant baptism, in whatever way administered: and hence the general denomination of *Antipadobaptists*; which includes Anabaptists, Baptists, Mennonites, Waterlandians, &c. as distinguished by their respective peculiarities; though *Anabaptists* seems to have been adopted by most writers as the general term.

The Anabaptists appear to have made little noise, or to have been little noticed, before the time of the reformation in Germany. The most prudent and rational part of them considered it possible, by human wisdom, industry, and vigilance, to purify the church from the contagion of the wicked, provided the manners and spirit of the primitive Christians could but recover their lost dignity and lustre; and seeing the attempts of Luther, seconded by several persons of eminent piety, prove so successful, they hoped that the happy period was arrived in which the restoration of the church to purity was to be accomplished, under the divine protection, by the labours and counsels of pious and eminent men. Others, far from being satisfied with the plan of reformation proposed by Luther, looked upon it as much beneath the sublimity of their views; and consequently undertook a more perfect reformation, or, to express more properly their visionary enterprise, they proposed to found a new church, entirely spiritual, and truly divine.

This sect was soon joined by great numbers, and by many persons whose characters and capacities were very different, though their views seemed to turn upon the same object. Their progress was rapid; for, in a very short time, their discourses, visions, and predictions, excited commotions in a great part of Europe, and drew into their communion a prodigious multitude, whose ignorance rendered them easy victims to the illusions of enthusiasm.

thusiasm. The most pernicious faction of all those which composed this motley multitude, was that which pretended that the founders of the *new and perfect church*, were under the direction of a divine impulse, and were armed against all opposition by the power of working miracles. It was this faction that, in the year 1521, began their fanatical work, under the guidance of Munzer, Stubner, Storck, &c.

These persons were disciples of Luther; but, well-knowing that their opinions were such as would receive no sanction from him, they availed themselves of his absence to disseminate them in Wittenberg, and had the address to over-reach the piety of Melancthon. Their principal purpose was to gain over the populace, and to form a considerable party. To effect this, says Bayle, they were industrious and active, each in his own way. Storck, wanting knowledge, boasted of inspiration; and Stubner, who had both genius and erudition, laboured at commodious explications of Scripture. Not content with discrediting the court of Rome, and decrying the authority of consistories, they taught, That among Christians, who had the precepts of the gospel to direct and the Spirit of God to guide them, the office of magistracy was not only unnecessary, but an unlawful encroachment on their spiritual liberty; that the distinctions occasioned by birth, or rank, or wealth, being contrary to the spirit of the gospel, which considers all men as equal, should be entirely abolished; that all Christians, throwing their possessions into one common stock, should live together in that state of equality which becomes members of the same family; that, as neither the laws of nature nor the precepts of the New Testament had placed any restraint upon men with regard to the number of wives which they might marry, they should use that liberty which God himself had granted to the patriarchs.

They employed at first the various arts of persuasion to propagate their doctrine. They preached, exhorted, admonished, and reasoned, in a manner that seemed proper to impress the multitude; and related a number of visions and revelations with which they pretended to have been favoured from above. But when they saw that these methods of making profelytes were not attended with such success as they expected, and that the ministry of Luther and other eminent reformers was detrimental to their cause, they had recourse to more expeditious measures, and attempted to propagate their doctrine by force of arms. Munzer and his associates, in the year 1525, put themselves at the head of a numerous army, composed for the most part of the peasants of Suabia, Thuringia, Franconia, and Saxony; and declared war against all laws, government, and magistrates of every kind, under the pretext that Christ was now to take the reins of civil and ecclesiastical government into his own hands, and to rule alone over the nations. But this seditious crowd was soon routed and dispersed by the elector of Saxony and other princes; and Munzer their ringleader ignominiously put to death, and his factious counsellors scattered abroad in different places. Many of his followers, however, survived, and propagated their opinions through Germany, Switzerland, and Holland. In the year 1533, a party of them settled at Munster under the direction of two Anabaptist prophets, John Matthias a baker of Haerlem, and John Bockholdt a journeyman taylor of Leyden. Having made themselves masters of the city, they deposed the magistrates, confiscated the estates of such as had escaped, and deposited the wealth they had amassed in a public treasury, for common use. They made preparations of every kind for the defence of the city; and sent out emissaries to the Anabaptists in the Low Countries, inviting them to assemble at Munster, which was now dignified with the name of Mount Sion, that from hence they might be deputed to reduce all nations of the earth under their dominion. Matthias, who was the first in command, was soon cut off in an act of phrensy by the bishop of Munster's army; and was succeeded by Bockholdt, who was proclaimed by a special

designation of heaven, as he pretended, king of Sion, and invested with legislative powers like those of Moses. The extravagancies of Bockholdt were too numerous to be recited: it will be sufficient to add, that the city of Munster was taken after a long siege and an obstinate resistance; and Bockholdt the mock monarch was punished with a most painful and ignominious death. It must, however, be acknowledged, that the rise of the numerous insurrections of this period ought not to be wholly attributed to religious opinions. The first insurgents groaned under the most grievous oppressions; they took up arms principally in defence of their civil liberties; and of the commotions that took place, the Anabaptist leaders above-mentioned seem rather to have availed themselves of the opportunity, than to have been the prime movers. That a great part of the main body consisted of Anabaptists, seems indisputable; but it appears from history, that a great part also consisted of Roman Catholics, and a still greater number of persons who had scarcely any religious principles at all. Indeed, when we read of the vast numbers that were concerned in those insurrections, of whom it is reported that 100,000 fell by the sword, it is reasonable to conclude that a great majority of them were not Anabaptists.

The Baptists in England and Holland are to be considered in a very different light from the enthusiasts we have been describing; and it appears equally uncandid and invidious, to trace up their distinguishing sentiment, as some of their adversaries have done, to those obnoxious characters, in order to associate with it the ideas of turbulence and fanaticism, with which it certainly has no natural connection. Their coincidence with some of those oppressed and infatuated people in denying baptism to infants, is acknowledged by the Baptists: but they disavow the practice which the appellation of *Anabaptists* implies; and their doctrines seem referable to a more ancient and respectable origin. They are supported by history in considering themselves as the descendants of the Waldenses, who were so grievously oppressed and persecuted by the despotic heads of the Romish hierarchy; and they profess an equal aversion to all principles of rebellion on one hand, and to all suggestions of fanaticism on the other. The denomination of *Menonites*, by which they are distinguished in Holland, they derive from Menno, the famous man who finally gave confidence and stability to their sect.

ANABA'SII, *f.* in antiquity, were couriers who were sent on horseback, or in chariots, with important dispatches.

ANABA'SIS, *f.* [*αναβαινω*, Gr. to ascend or climb.] In botany, a genus of the pentandria digynia class, ranking in the natural order of holoraceæ. The generic characters are—Calyx: perianthium three-leaved; leaflets roundish, concave, obtuse, spreading. Corolla: five-petalled; petals ovate, equal, less than the calyx, permanent. Stamina: filaments filiform, longer than the corolla; antheræ roundish. Pistillum: germ roundish, acuminate, ending in two styles; stigmas obtuse. Pericarpium: a berry, roundish, surrounded by the calyx, dilated. Seed: single, screw-shaped.—*Essential Character.* Calyx three-leaved; corolla five-petalled; berry one-seeded, surrounded by the calyx.

Species. 1. *Anabasis aphylla*, or leafless anabasis: without leaves; the joints emarginate. It is a perennial plant, and has been found wild on the shores of the Caspian.

2. *Anabasis foliosa*, or leafy anabasis: leaves sub-clavate. This is seldom more than half a foot in height; more or less branched; and is annual. Found wild on the shores of the Caspian.

3. *Anabasis tamariscifolia*, or tamarisk-leaved anabasis: leaves awl-shaped; pericarps juiceless. A shrub with white branches, very smooth. Native of Spain.

4. *Anabasis spinosissima*, or thorny anabasis: shrubby; branches without leaves, but full of spines. Its native place of growth is unknown.

ANABA'THRA, *f.* in ancient writers, denote a kind of steps or ladder whereby to ascend to some eminence. In this sense we read of the anabathra of theatres, pulpits, &c.

ANACARDIUM.

The Acajou or Cashew-nut Tree.

&c. Anabathra appears to have been sometimes also applied to ranges of seats rising gradually over each other.

ANABATHRA is more particularly applied to a kind of stone blocks raised by the highway sides, to assist travellers in mounting or alighting, before the use of stirrups was invented.

ANABIBA'ZON, *f.* in astronomy, the Dragon's Head, or the northern node of the moon, where she passes the ecliptic from the south to the north latitude.

ANABLEPS, *f.* in ichthyology, the trivial name of a species of cobitis. See COBITIS.

ANABO'A, a small island situated near the coast of Loango in Africa, in E. lon. 9°. N. Lat. 1°. Here are several fertile valleys, which produce plenty of bananas, oranges, pine-apples, lemons, citrons, tamarinds, coconuts, &c. together with vast quantities of cotton.

ANABO'LÆUM, or ANABO'LE, *f.* in antiquity, a kind of great or upper coat, worn over the tunica.

ANABO'LEUS, *f.* in antiquity, an appellation given to grooms of the stable, or equerries, who assisted their masters in mounting their horses. As the ancients had no stirrups, or instruments that are now in use for mounting a horse, they either jumped upon his back, or were aided in mounting by anabolei.

ANABROCHIS'MOS, or ANABROCHISMUS, *f.* [from *ανα, sursum*, and *βροχος*, Gr. a noose.] An operation which was used to be performed on the hair of the eye-lids when they are offensive to the eye.

ANABRO'SIS, *f.* [*αναβρωσκω*, Gr. to devour.] A corrosion of the solid parts by sharp humours, or any medicine. The same as *diabrosis*; it occasions a discharge of blood, and often happens in the lungs.

ANACALYPTE'RIA, *f.* [of *ανακαλυπτω*, Gr. to reveal,] according to Suidas, were presents made to the bride by her husband's relations and friends when the first uncovered her face and shewed herself to men. These presents were also called *επαυλαια*: for, among the Greeks, virgins before marriage were under strict confinement, being rarely permitted to appear in public, or converse with the other sex; and, when allowed that liberty, wore a veil over their faces, termed *καλυπτεον*, or *καλυπτρα*, which was not left off in the presence of men till the third day after marriage; whence, according to Hesychius, this day was also called *anacalypterion*.

ANACAMP'SEROS, *f.* in botany. See CLAYTONIA, PORTULACA, and SEDUM.

ANACAMPTE'RIA, *f.* in ecclesiastical antiquity, a kind of little edifices adjacent to the churches, designed for the entertainment of strangers and poor persons.

ANACAMP'TIC, *adj.* [*ανακαμπω*, Gr. to bend back, to reflect; commonly said of echoes, which are sounds produced anacampitically, or by reflection.] Reflecting, or reflected. An *anacampitic* sound, an echo; an *anacampitic* hill, a hill that produces an echo.

ANACAMP'TICS, *f.* The doctrine of reflected light, or catoptrics. It has no singular.

ANACAR'DIUM, *f.* [*ανα, sine*, and *καρδια, cor*; without heart: because the pulp of the fruit, instead of having the seed inclosed, as is usually the case, has the nut growing out at the end of it.] In botany, a genus of the polygamia monoecia class, ranking in the natural order of holoraceæ. The generic characters are—I. Hermaphrodite flower. Calyx: perianthium five-leaved; leaflets ovate, concave, coloured, erect, deciduous. Corolla: petals five, lanceolate, acute, three times as long as the calyx, upright at bottom, reflex at the end. Stamina: filaments ten, united at the base, upright; nine of them capillary, shorter than the calyx; one thicker, double the length of the others, lying on the germ in front; antheræ roundish; in the longer filament large and fertile, in the rest small. Pistillum: germ kidney-shaped, obliquely emarginate in front; style subulate, bent in, the length of the corolla; stigma small, roundish, depressed, concave. Pericarpium: none; receptacle fleshy, very large, obovate. Seed: nut

kidney-shaped, large, at the top of the receptacle; with a thick shell, cellular within, and abounding in oil. II. Male flowers, either mixed with the hermaphrodites, or on a distinct tree. Calyx, corolla, and stamina: as in the hermaphrodites. Pistillum: germ none or abortive.—*Essential Character.* Calyx five-leaved; petals five, reflex; antheræ ten, one only fertile; nut kidney-shaped, on the top of a fleshy receptacle.

There is only one species, known by the name of *anacardium occidentale*, or cashew-nut, cassu, or acajou. It is an elegant tree, twenty-feet high. According to Browne, not more than twelve or sixteen feet in height, spreading much as it rises, and beginning to branch at the distance of five feet from the ground. Long, on the contrary, affirms, that in good soils it spreads to the size of a walnut-tree, which it much resembles in the shape and smell of the leaves. The trunk seldom exceeds half a foot in diameter. The fruit or apple has an agreeable sub-acid flavour, with some degree of refringency. Some of these are of a yellow, and others of a red, colour, owing probably to some difference in the soil or culture. The juice expressed from the fruit, and fermented, yields a pleasant wine; and, distilled, a spirit is drawn from it, far exceeding arrack or rum; making an admirable punch, and powerfully promoting urine. Some planters in the West Indies roast the ripe fruit, or slice one or two into a bowl of punch, to give it a pleasant flavour. The refringency of the juice has recommended it as a very signal remedy in dropical habits.

The nut springs from one end of the apple. It is of the size and shape of a hare's kidney, but is much larger at the end next the fruit than at the other. The outer shell is of an ash-colour, and very smooth; under this is another which covers the kernel; between these there is a thick inflammable oil, which is very caustic; this will raise blisters on the skin, and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell. This oil has been used with great success in eating off ring-worms, cancerous ulcers, and corns; but it ought to be applied with caution. It is also esteemed an excellent cosmetic with the West-India young ladies, but they must certainly suffer a great deal of pain in its application; and, as fond as our British females are of a beautiful face, it is highly probable they would never submit to be stayed alive to obtain one. When any of the former fancy themselves too much tanned by the scorching rays of the sun, they gently scrape off the thin outside of the stone, and then rub their faces all over with the stone. Their faces immediately swell and grow black; and the skin, being poisoned by the caustic oil above-mentioned, will, in the space of five or six days, come entirely off in large flakes, so that they cannot appear in public in less than a fortnight; by which time the new skin looks as fair as that of a new-born child. The kernel, when fresh, has a most delicious taste, and abounds with a sweet milky juice. It is an ingredient in puddings, &c. When older it is generally roasted; and in this state is not so proper for costive habits. Ground with cacao it makes an excellent chocolate. When kept too long, it becomes shrivelled, and loses its flavour and best qualities. The thick oil of the shell tinges linen of a rusty iron-colour, which can hardly be got out; and, if any wood be smeared with the oil, it prevents the wood from decaying. It would therefore be an excellent preservative to house-timbers, and ships' bottoms. From the body of the tree is procured, by tapping or incision, a milky juice, which will stain linen of a deep black, that cannot be washed out again. This tree also annually transudes from five to ten or twelve pounds weight of a fine semi-transparent gum, similar to gum arabic, and not inferior to it in virtue or quality, except that it has a slight astringency, which perhaps renders it, in some respects, more valuable. It is a native of both Indies, and was cultivated in 1699, by the duchs of Beaufort.

Propagation and Culture. The cashew-tree is easily raised

fed in its native country from the nut. It is there of very quick growth, bearing fruit in two years after it is planted. But in England the plants are with great difficulty preserved; though, by their first shoots from the seeds, they appear so strong and vigorous, as to promise a much greater progress than they are ever seen to make. They are easily raised from the nuts, which are annually brought from America in great plenty; each of these should be planted in a small pot filled with light sandy earth, and plunged into a good hot-bed of tanner's bark, being careful to prevent their having wet, till the plants come up, for the nuts frequently rot with moisture. If the nuts are fresh, the plants will come up in about a month after planting, and in two months more they will be four or five inches high, with large leaves; from this quick growth, many persons have been deceived by supposing them hardy, and that they would continue the like progress, whereas they seldom advance much farther the same year. The plants must be constantly kept in the stove, for they are too tender to live abroad in England, in the warmest season of the year, nor will they thrive in a common greenhouse in summer. As these plants abound with a milky acrid juice, they should have but little water, even in summer; and, in winter, if they are sparingly watered once in a fortnight, it will be sufficient, for their roots are tender and soon perish with moisture. When these plants are transplanted, it will be the best method to break the pots, for the roots do not put out many fibres to hold the earth about them, so that, in shaking them out of the pots, most of the earth will fall away from their roots, and when this happens the plants seldom survive it, therefore, in breaking the pots, the same caution must be had not to disturb the earth more than can be avoided; then the plant, with the ball of earth to its roots, should be put into a pot one size larger than that in which it had before grown, filling up the pot with light sandy earth, and plunge the pots again into the hot-bed. These plants should not be removed oftener than once a year, nor should they be put into large pots; for, unless their roots are confined, they will not thrive.

ANACARDIUM, *f.* in botany. See AVICENNIA.

ANACARDIUM OFFICINARUM, *f.* in botany. See SEMECARPUS.

ANACATHARTIC, *f.* [ανακαθαρσις, Gr. of ανα, above, and καθαιρω, to purge.] A medicine that purges upwards; sometimes employed for emetics; sometimes to promote or increase the salivary discharge; but most commonly implying, agreeable to the sense made use of by Hippocrates, *expectorants*, or medicines promoting the discharge of matter, whether mucous or purulent, from the lungs.

ANACEPHALÆOSIS, *f.* [ανακεφαλαιωσις, Gr. of ανα, again, and κεφαλαιον, a summing up the heads of things:] Recapitulation, or summary of the principal heads of a discourse.

ANACES, a name given to Castor and Pollux, from their clemency to the conquered, when they made war against the Athenians, to recover their sister Helen, whom Theseus had carried away. Their festivals were called Anacea.

ANACHARSIS, a famous Scythian philosopher, who conversed with Solon, and lived an austere life. Upon his return from his travels through Greece, he attempted to change the ancient customs of Scythia, and to establish those of Greece; which proved fatal to him. The king shot him dead in a wood with an arrow. A great many statues were erected to him after his death. He is said to have invented tinder, the anchor, and the potter's wheel; but the latter is mentioned by Homer, who lived long before him. Anacharsis flourished in the time of Cræsus.

ANACHORET. See ANCHORET.

ANACHREMP'SIS, *f.* [ανω, upwards, and χρεπτομαι, Gr. to hawk.] The hawking up any thing from the lungs.

ANACHRONISM, *f.* [αναχρονισμος, Gr. of ανα and

χρονισμος, of χρονος, time.] In chronology, an error in computation of time, by which an event is placed earlier than it really happened. Such is that of Virgil, who makes Dido to reign at Carthage in the time of Æneas, though, in reality, she did not arrive in Africa till 300 years after the taking of Troy. An error on the other side, by which a fact is placed later, or lower than it should be, is called a *parachronism*. But, in common use, this distinction, though proper, is not attended to; and the word anachronism is used indifferently for the mistake on both sides.

ANACLASTIC GLASSES, *f.* a kind of sonorous phials or glasses, chiefly made in Germany, which have the property of being flexible; and emitting a vehement noise by the human breath. They are also called *veixing glasses* by the Germans (*veixier gläser*), on account of the fright and disturbance they occasion by their resiliency. The anaclastic glasses are a low kind of phials with flat bellies, resembling inverted funnels, whose bottoms are very thin, scarcely surpassing the thickness of an onion-peel: this bottom is not quite flat, but a little convex. But upon applying the mouth to the orifice, and gently inspiring, or as it were sucking out the air, the bottom gives way with a prodigious crack, and of convex becomes concave. On the contrary, upon expiring or breathing gently into the orifice of the same glass, the bottom with no less noise bounds back to its former place, and becomes gibbous as before. The anaclastic glasses first taken notice of were in the castle of Goldbach; where one of the academists *Naturæ Curiosorum*, having seen and made experiments on them, published a piece expressing on their history and phenomena.

ANACK, a sort of bread made of oatmeal.

ANACLASTICS, *f.* [ανα and κλαω, Gr.] An ancient name for that part of optics which considers refracted light; being the same as what is usually called *dioptrics*.

ANACLASTIC CURVE, a name given by M. de Mairau to certain apparent curves formed at the bottom of a vessel full of water, to an eye placed in the air; or the vault of the heavens, seen by refraction through the atmosphere.

ANACLETE'RIA, *f.* [of ανα and καλεω, Gr. to call.] In antiquity, a solemn festival celebrated by the ancients when their kings or princes came of age, and assumed the reins of government. It is so called, because, proclamation being made of this event to the people, they went to salute their prince during the anacletaria, and to congratulate him upon his new dignity.

ANACLETICUM, *f.* in the ancient art of war, a particular sound of the trumpet, whereby the fearful and flying soldiers were rallied, and recalled to the combat.

ANACLINO'PALE, *f.* [ανακλινοπαλε, Gr.] In antiquity, a kind of wrestling, wherein the champions threw themselves voluntarily on the ground, and continued the combat by pinching, biting, scratching, and other methods of offence. The anaclinopale was contradistinguished from the *orthopale*, wherein the champions stood erect.

ANACLINTERIA, *f.* in antiquity, a kind of pillows on the dining bed, whereon the guests used to lean. The ancient tricliniary beds had four pillows, one at the head, another at the feet, a third at the back, and a fourth at the breast. That on which the head lay, was properly called by the Greeks *ανακλιντησιον*, or *ανακλιντηρον*; by the Romans *fulcrum*, sometimes *pluteus*.

ANACOE'NOSIS, in rhetoric, a figure whereby we seem to deliberate, and argue the case with others upon any matter of moment.

ANACOLLE'MATA, *f.* [ανακολλω, Gr. to glue together.] Medicines applied to the forehead or nostrils to stop bleeding; also medicines that will breed flesh, and conglutinate the parts.

ANACOE'LUTHON, or ANACOE'LUTHUS, *f.* [ανακολεθω, Gr. of α priv. and κολουω, consequent; i. e. an in-consequence in discourse.] A figure in rhetoric, when a word that is to answer another is not expressed.

ANACON'DO,

ANACON'DO, *f.* in natural history, is a name given in the island of Ceylon to a very large and terrible rattlesnake, which often devours the unfortunate traveller alive, and is itself accounted excellent and delicious food.

ANA'CREON, a Greek poet, born at Teos, a city of Ionia, flourished about 532 years before the Christian æra. Polycrates, tyrant of Samos, invited him to his court, and made him share with him in his business and his pleasures. He had a delicate wit, as may be judged from the inexpressible beauties and graces that shine in his works: but he was fond of pleasure, was of an anorous disposition, and addicted to inebriety; yet, notwithstanding his irregularities, he lived to the age of eighty-five; when, we are told, he was choked by a grape-stone which stuck in his throat as he was regaling on some new wine.

There is but a small part of Anacreon's works that remain; for, besides his odes and epigrams, he composed elegies, hymns, and iambics. His poems which are extant were rescued from oblivion by Henry Stephens, and are universally admired. The verses of Anacreon are sweeter, says Sealiger, than Indian sugar. His beauty and chief excellence, says Madam Dacier, lay in imitating nature, and in following reason; so that he presented to the mind no images but what were noble and natural. The odes of Anacreon, says Rapin, are flowers, beauties, and perpetual graces; it is familiar to him to write what is natural and to the life, with an air so delicate, so easy, and graceful, that among all the ancients there is nothing comparable to the method he took, nor to that kind of writing he produced. None has given a juster character of his writings than Mr. Cowley, in the speech of Cupid:

All thy verse is softer far
Than the downy feathers are
Of my wings, or of my arrows,
Of my mother's doves and sparrows:
Graceful, cleanly, smooth, or round,
All with Venus' girdle bound.

ANACREON'TIC VERSE, *f.* in ancient poetry, a kind of verse, so called from its being much used by the poet Anacreon. It consists of three feet and a half, usually spondees and iambuses, and sometimes anapests. Such is that of Horace, *Lydia, dic per omnes*.

ANACRISIS, among the ancient Greeks, was a kind of trial or examination, which the archons, or chief magistrates of Athens, were to undergo before their admission into that office. The anacrisis stands distinguished from the *docimasia*, which was a second examination, in the forum.

ANACRISIS, among civilians, was an investigation of truth, interrogation of witnesses, and enquiry made into any fact, especially by torture.

ANACROSIS, *f.* in antiquity, denotes a part of the Pythian song, wherein the combat of Apollo and Python are described. The anacrosis was the first part, and contained the preparation to the fight.

ANACY'CLUS, *f.* [*ανακυκλον*, to encircle.] In botany, a genus of the syngenesia polygamia superflua class, ranking in the natural order of compositæ discoidæ. The generic characters are—Calyx: common, hemispherical, imbricate: with many ovate, flat, sharp scales. Corolla: compound, radiate; with numerous hermaphrodite corollas in the disk; from five to ten females in the ray, scarcely higher than the disk; hermaphrodites funnel-shaped, with a quinquesid spreading border; females with a flattened tube, and an ovate entire border. Stamina: in the hermaphrodites; filaments five, capillary, very short; antheræ cylindric. Pistillum: germ flattened, stigma bifid, in the hermaphrodites; with a membrane on each side; style filiform, the length of the corolla; and two slender reflex stigmas in the floscules. Pericarpium: none; calyx unchanged. Seed: in the hermaphrodites, solitary, oblong, compressed, naked, or without down; in the females with a very broad membranaceous wing on each side, and emarginate at top, but without down. Recep-

taulum: chaffy; chaffs obtuse, with a point.—*Essential Character.* Receptacle chaffy; down emarginate. Seeds in the ray membranaceous.

Species. 1. *Anacyclus creticus*, or trailing anacyclus: leaves decompound, linear; divisions subdivided, flat. 2. *Anacyclus orientalis*, or eastern anacyclus: leaves compound, bristly, acute, straight. The two first sorts grow naturally in the islands of the Archipelago, from whence Tournefort sent their seeds to the royal garden at Paris. They are low plants, whose branches trail on the ground. The first sort has fine-cut leaves, like those of chamomile; the flowers are small, white, and grow single, with their heads declining; these are like those of the common May-weed. The second has leaves like those of the ox-eye; the flowers are white, like those of chamomile.

3. *Anacyclus aureus*, or golden-flowered anacyclus: leaves bipinnate, roundish, hoary, hollow-dotted. Native of the south of Europe, and the Levant. Cultivated here in 1570.

4. *Anacyclus valentinus*, or fine-leaved anacyclus: leaves decompound, linear; divisions subdivided, roundish, acute; flowers flosculose. Grows a foot and a half high, sending out many side branches; the leaves are finely divided like those of chamomile, and are hairy; the flowers grow single at the extremity of the branches, and are of a bright yellow colour, with a silvery scaly calyx. These are as large as those of the ox-eye. A native of Spain and Italy. Cultivated in 1656, by Tradescant. It flowers in June and July.

Propagation and Culture. All these plants are annual; the seeds should be sown early in the spring in a border of light earth, where they are designed to remain, and require no other care but to keep them clean from weeds, and to thin the plants where they are too close. As they have no great beauty, a few plants only may be left for the sake of variety. They flower in July and August, and their seeds ripen in September.

ANADAVADÆ'A, *f.* in ornithology, a barbarous name for a species of birds. See ALAUDA.

ANADE'MA, *f.* among the ancients, denotes an ornament for the head, wherewith victors at the sacred games had their temples bound.

ANADIPLO'SIS, *f.* [*αναδιπλωσις*, of *αναδιπλω*, Gr. to redouble.] Reduplication; a figure in rhetoric, in which the last word of a foregoing member of a period becomes the first of the following; as, *He retained his virtues amidst all his misfortunes, misfortunes which only his virtues brought upon him.*

ANADROMOUS, *f.* among ichthyologists, a name given to such fishes as go from the sea to the fresh waters at stated seasons, and return back again; such as the salmon, &c.

ANADUOMENE VENUS, in the Grecian mythology, answered to the Sea Venus in the Roman, and was the appellation given to one of the chief deities of the sea. The most celebrated picture in all antiquity was that of this goddess by Apelles; and the famous Venus of Medici is a Sea Venus.

ANADYOMENE, a name of Venus, who is said to have emerged from the waters of the sea.

ANÆDEI'A, *f.* in antiquity, a denomination given to a silver stool placed in the Areopagus, on which the defendant, or person accused, was seated for examination. The word is Greek, *αναδεια*, which imports imprudence; but, according to Junius's correction, it should rather be *αναδεια*, q. d. innocence. The plaintiff, or accuser, was placed on an opposite stool, called *hybris*, or injury; here he proposed three questions to the party accused, to which positive answers were to be given. The first, Are you guilty of this fact? The second, How did you commit the fact? The third, Who were your accomplices?

ANÆSTHESIA, *f.* [from *α*, non, and *αισθησις*, *sensio*, Gr.] Insensibility, or loss of feeling by the touch. A resolution of the nerves, occasioning a loss of feeling: the same

fame as flupor. Dr. Cullen ranks this genus of difeafes in clafs locales and the order dyſæſthefie.

ANÆTIS, or ANATIS, a furname of the moon, given to it by the Perfians; who, as Strabo informs us, had feveral temples dedicated to this deity. They confecrated the flaves to her, as well men as women; but what is more ſtrange, they prostituted their daughters publicly to her honour; which, however, did not hinder their marriage.

ANAGALLIDASTRUM, *f.* in botany. See CENTUNCULUS.

ANAGALLIS, *f.* [*αναγλαω*, Gr. to laugh; becauſe, by curing the ſpleen, it diſpoſes perſons to be chearful.] In botany, a genus of the pentandria monogynia clafs, ranking in the natural order of rotaceæ. The generic characters are—Calyx: perianthium five-parted, ſharp, permanent; diviſions keeled. Corolla: wheel-shaped, border five-parted; diviſions ovate-orbiculate, with the claws connected. Stamina: filaments erect, ſhorter than the corolla, ſhaggy below; antheræ ſimple. Piſtillum: germ globoſe; ſtyle filiform, ſlightly bending; ſtigma capitate. Pericarpium: a globoſe one-celled capſule, opening tranſverſely. Seeds: very many, angular. Receptaculum: globoſe, very large.—*Eſſential Character.* Corolla rotate; capſule opening horizontally.

Species. 1. *Anagallis arvenſis*, or common pimpernel: in this genus the leaves are oppoſite, ſeſile, ſmooth, underneath dotted with brown. Gærtner obſerves, that he could never ſee the hemiſpherical hollow ſeeds which Haller deſcribes. Dr. Withering obſerves, that the leaves, when magnified, appear froſted over with very minute ſhining glands. It is an annual plant, and flowers from May to Auguſt, in ploughed grounds and gardens, particularly in ſandy ſoils. The bloſſoms open about eight in the morning, and cloſe in the afternoon; hence its name of ſhepherd's or poor man's weather-glaſs. But, if rain fall, or there be much moiſture in the air, the flowers either do not open, or cloſe up again. Small birds are very fond of the ſeeds. Schreber ſays, that ſheep eat it readily; by the experiments in *Aman. acad.* it appears, that kine and goats feed on it, but that ſheep reſuſe it. It was formerly celebrated for its medical qualities, and given in maniacal caſes, and even in the hydrophobia, but is now fallen into diſuſe. It appears, however, ſays Lewis, that it has ſome claim to the reſolvent and detergent virtues, aſcribed to it by ſome writers. Plukenet mentions a variety with larger leaves, four together placed croſſ-wiſe; and Ray ſays, he has found it among corn in England. Bobart found it with a white flower in Cowley-field. There is another variety, with a fleſh-coloured flower; but none of theſe are conſtant. There is alſo another, with a worn-out purple flower, which has ſeveral years continued the ſame in the Chelſea garden; but there is little difference in the leaves of this and the common ſort.

2. *Elore cœruleo*, or blue-flowered pimpernel: leaves undivided; ſtem procumbent; corolla finely notched. This is ſuppoſed to be only a variety, but we can affirm it never alters; and the plants before they ſhew their flowers are ſo different, as to be eaſily diſtinguiſhed. There is a variety of this with the flower of a deeper blue, the ſeeds of which came from Nice; and this retained its colour for many years in the Chelſea garden. Ray, Linæus, and others, take the blue pimpernel to be only a variety of the red. Haller, following Blair and Boehmer, and followed by Allioni, inclines to think it a diſtinct ſpecies; and ſays, that it is a taller plant, with ſmaller leaves and larger flowers; that the capſule is more ovate; but eſpecially that the diviſions of the calyx are narrower, and the petals ferrate about the edge. In the wild plants the flowers were rather ſmaller than in the common ſort; and the petals of this are finely notched about the edge, as well as of that. Haller mentions finding the blue ſort with three and four leaves together. Blue pimpernel grows wild in Sweden, Germany, and Switzerland; with us between Stockwell and Camberwell, and near Mitcham

in Surry; near Hiſton in Cambridgſhire; and Bredon-hill in Worceſterſhire.

3. *Anagallis monelli*, or upright pimpernel: leaves undivided; ſtem erect. A very beautiful ſmall plant, producing great numbers of fine blue flowers in April and May. Native of Verona. Cultivated in 1648, in the Oxford garden.

4. *Anagallis latifolia*, or broad-leaved pimpernel: leaves heart-shaped, ſtem-claſping; ſtem compressed. Very nearly allied to the firſt ſpecies; but diſtinguiſhed by its large broad leaves and compressed ſtem. A trailing annual plant.

5. *Anagallis linifolia*, or flax-leaved pimpernel: leaves linear; ſtem erect. Grows wild in Spain and Portugal.

6. *Anagallis tenella*, or bog pimpernel, purple looſeſtrife, or money-wort: leaves ovate, ſharpish; ſtem creeping. Not uncommon on bogs; flowering from June to Auguſt.

7. *Anagallis verticillata*, or verticillèd pimpernel: ſtem-leaves verticillèd; ſtem erect; ſtem a foot high, quadrangular, branching; leaves in fours or fives; on the branches only in pairs.

8. *Anagallis pumilla*, or dwarf pimpernel: ſtem erect, leaves roundiſh acute ſeſile. Native of Jamaica. Annual.

Propagation and Culture. The four firſt ſorts, being annual, are propagated from ſeeds, which ſhould be ſown ſoon after they are ripe. The firſt, though a beautiful little plant, being a common weed, is never cultivated, except in botanic gardens. The ſecond, third, and fourth, require to be ſheltered from extreme cold. The fifth, being a bog plant, cannot be cultivated in gardens, without a ſituation proper for it; though it will flouriſh well enough in pots of bog-earth plunged in water. The ſixth, if it be a diſtinct ſpecies, has not yet been cultivated with us. See CENTUNCULUS, EVOLVULUS, LYSIMACHIA, and PÆDEROTA.

ANAGALLIS AQUATICA. See GRATIOLA, MONTIA, PEPLIS, SAMOLUS, and VERONICA.

ANAGALLIS COERULEA. See GRATIOLA.

ANAGLYPHICE, or ANAGLYPHIC ART, *f.* [*αναγλυφικη*, Gr.] The art of carving, chaſing, engraving, or imboſſing, plate.
