List of Plants on Three Mile Island.

Pteridophyta and Spermatophyta.

BY ARTHUR STANLEY PEASE.

THIS list was prepared as follows: In August, 1903, a manuscript list of plants noted on the island was prepared by A. S. Pease. Specimens were collected of only a few of the more important species. In 1906 specimens were secured by J. H. Emerton (May) and R. A. Ware (July). These specimens of 1906 are deposited in the Club herbarium, as are many others, without memoranda as to date or collector. As such a list as this should be based upon actual evidence of the plants themselves, wherever possible, the manuscript list of 1903 has been cited only when no specimens were to be found in the Club herbarium or that of A. S. Pease. Such reports (indicated in the list by the sign #) and a few other reports unsubstantiated by evidence should be immediately replaced by actual specimens. In May, 1901, H. P. Kelsey introduced upon the island 481 plants of 62 species. Of these a very few were probably already indigenous there. The others have been entered in the following list, but not numbered, as they are, of course, not a part of the *native* flora. Some have probably not persisted. The accompanying list is, without doubt, capable of much improvement and increase. The nomenclature is that of the seventh edition of Gray's Manual.
