PREFACE.

The formation of a representative collection of the insect fauna of a country is not as a rule considered to be the work of economic entomologists. This is due to the fact that in most countries the fauna has generally been fairly thoroughly worked up by amateurs and a good public reference collection in a museum is available for the use of the economic entomologist. In Egypt, however, at the time of the creation of the Department of Agriculture, there was no such public collection, and the only works devoted to the insects of Egypt alone, apart from a number of more or less incomplete lists without descriptions, were three brief memoirs published by the "Société Entomologique d'Egypte." In view of these circumstances the collection, of which the ensuing pages contain a list of the hitherto identified species, has been brought together in the course of the past four years with a view not so much to adding to the systematic knowledge of the fauna of the country as to assisting in economic work.

A well classified and identified collection is always essential as the basis for both economic and biological research, since without having a name for an insect by which it can always be recognized, it is practically impossible either to benefit from the knowledge that other workers have obtained about it or to pass on to them the knowledge that one obtains oneself. Of course, in the making of a large collection, large numbers of species of no importance to the agriculturist are sure to be dealt with. Of the 154 families mentioned in the following list, however, about 100 include species of economic interest, and it is always useful to know something about the relatives of a dangerous or a useful insect. Again, it is often almost as necessary to be able to say definitely that a certain insect is not, and is not likely to become, of economic importance as to be able to say that

another is. And this can only be done by having a fairly complete knowledge of the insects of the country.

One of the most important reasons for working up the fauna, however, is in connection with the importation of insect pests. For instance, Durrant, writing on "Tineina bred from Cotton Bolls" in the "Bulletin of Entomological Research," August 1912, upholds the idea that the pink boll worm was imported into India from Egypt, the exact reverse of the actual fact, and the information which was then available led Dudgeon, in his article on "The Pink Boll Worm" in the "Agricultural Journal of Egypt," 1912, to express the opinion that it had occurred in Egypt for many years, whereas it is now fairly certain that it has been imported between 1903 and 1910. Neither of these mistakes would have been made if the Lepidoptera of the country had previously been properly worked up. If the pink boll worm had been discovered in the original consignments of Indian cotton which brought it to the country, nothing would have been done to prevent its entry if such opinions as the above were possible, whereas if the distribution and history of the pink boll worm had been known as it is now, steps might very easily have been taken to prevent the calamity that the importation of this pest has proved to be. On the other hand, if the fauna of the country is not properly known, much trouble and expense may be spent on trying to keep out of the country an insect which is a dangerous pest elsewhere, but which as a matter of fact may be already present, occurring in small numbers only, being kept under control by an unfavourable climate or other natural agents.

For much assistance in the identification of the species in the following list we must express our gratitude particularly to the Imperial Bureau of Entomology and also to the following specialists:—

Orthoptera : La Baume.

Hymenoptera : R. du Buysson, G. Meade-Waldo, Rev. F. D.

Morice, C. Morley, R. E. Turner, Prof. Gy. Szépligeti.

Coleoptera : Several local entomologists, particularly G. Ferrante and A. Alfieri.

Lepidoptera : J. H. Durrant, P. P. Graves.

Thysanoptera : C. B. Williams.

Diptera : Prof. Becker.

Rhynchota : W. L. Distant, A. L. Montandon, Prof. R. Newstead, Prof. Van Schouteden.

Many other insects have been identified with the aid of the available literature, amongst which may be mentioned :—
