LETTER OF TRANSMITTAL.

U. S. DEPARTMENT OF AGRICULTURE,
BUREAU OF STATISTICS,
Washington, D. C., March 21, 1912.

SIR: I have the honor to transmit herewith manuscript prepared by Royal T. McKenna, of this bureau, which contains a compilation, first, of the annual and average production of important agricultural products in the leading producing countries, with the percentage which each contributes to the so-called "world" production; second, similar data respecting exports of certain agricultural products; and, third, data respecting imports of certain agricultural products.

The compilation is useful for ready reference. Much of the current information of crop production and movement is unintelligible to the average reader, because comparative figures are not given. Statistical data are of comparative value; for instance, a statement of the yield of wheat in Russia this year would have little value to most persons until they learned the average yield to which this year's yield may be compared, and, also, the relative importance of Russia as a wheat-producing country.

To supply such data for comparison this manuscript has been prepared, which I recommend to be published as Circular No. 31 of the Bureau of Statistics, entitled "Annual and Average Production of and International Trade in Important Agricultural Products, by Countries."

Very respectfully,

VICTOR H. OLNSTED,
Chief of Bureau.

HON. JAMES WILSON,
Secretary of Agriculture.

ANNUAL AND AVERAGE PRODUCTION OF AND INTERNATIONAL TRADE IN IMPORTANT AGRICULTURAL PRODUCTS, BY COUNTRIES.

Annual statistics of production and distribution, to have practical value, must be correlated with comparable statistics. A statement that a specified country has produced this year 100,000,000 bushels of wheat has in itself little meaning. The query naturally arises: Is this production unusually large, indicating a liberal supply, or does it indicate a short supply, likely to cause a tendency toward higher prices? The mere statement of the year's production does not give sufficient information to answer the queries.

Furthermore, is the country in question an important factor, either in the production or in the international trade in this product?

Crop news, especially that which appears in the daily or weekly press, frequently contains bare facts relative to the indicated production of a specified country, without comparative data. Traders, who are constantly engaged in the business, may be able to comprehend such information readily, but many readers, although interested in the subject, may not be similarly well informed nor have the necessary comparative data in hand. For the purpose of having in convenient form data of the average production of and trade in certain crops in important countries, the following tables have been prepared.

Late, and, in most cases, official data have been used in every instance.

The figures of production in the United States relate only to continental United States, except that those relating to coffee and sugar production include Porto Rico and Hawaii.

The expression "world's total production" of crops, used as in trade circles, includes only countries for which trustworthy data are available. Official data can be obtained from most Governments, but there are a few large countries for which the official data are incomplete; and some, such as China and Persia, for which official data of production are lacking.

In the figures of "world" crop production the crops of wheat and flaxseed harvested in the Southern Hemisphere from November to February of any year are coupled with those harvested in the Northern Hemisphere in the succeeding autumn.

Statistics of the exports and imports of products specified in this circular represent substantially the international trade of the world. It should not be expected that the totals of the world's exports and imports in the same year will agree. Among sources of disagreement are these: (1) Imports received in the year subsequent to year of export; (2) different periods of time covered in the year of the various countries; (3) lack of uniformity among different countries in the classification of goods; (4) different practices and varying degrees of failure in recording countries of origin and ultimate destination; (5) different practices of recording reexported goods; (6) different methods of treating free ports.

The exports given are of domestic produce, with a few exceptions, and the imports are imports for consumption as far as it is feasible and consistent so to express the facts. While there are some inevitable omissions, on the other hand there are some duplications because of reshipments that do not appear as such in official reports. For the United Kingdom import figures refer to imports for consumption, when available, otherwise total imports less exports of "foreign and colonial merchandise."

The exports and imports of the United States include Alaska, Porto Rico, and Hawaii.

A revision of the international trade tables is now being made in the Division of Production and Distribution of the Bureau of Statistics. This revision seems advisable on account of (1) a change in the official equivalent of the kilogram recently adopted by the bureau; (2) a failure in a few cases to use exactly the same classification from year to year for such composite groups as sugar, wool, and oil cake; (3) new returns received from important countries. The revised totals for world's exports and imports will therefore differ slightly in some cases from the totals published in the Yearbooks of the department and used in this circular. This revision is being made as rapidly as practicable.

^a The United States crop is computed from the official returns, which are for rough rice, allowing 45 pounds rough to 1 bushel, and 162 pounds rough to 100 pounds clean. China, which is omitted, has a roughly estimated crop of 50,000,000,000 to 60,000,000,000 pounds. Other countries omitted are Afghanistan, Algeria, Colombia, Federated Malay States, Persia, Trinidad and Tobago, Turkey (Asiatic and European), Venezuela, and a few other countries of small production.

^b Data for British India refer to years beginning April 1 of the years mentioned in the heading. Production given here is estimated unofficially for the entire country on the basis of official returns for about 0.7 per cent of the area harvested.

^c Estimated from official returns of exports of this country, and from per capita consumption of rice in Japan, 1894-1903, including food, seed, and waste, but not including rice used for sake (270 pounds per annum).
