PREFACE

The Unpublished Data Report series is intended as a readily available source of basic data collected for lakes and watersheds in the Muskoka-Haliburton area of Ontario. These data were collected as part of the Acid Precipitation in Ontario study.

The Acid Precipitation in Ontario Study (1979 - present) was initiated, in part, to investigate the effects of the deposition of strong acids on aquatic and terrestrial ecosystems in Ontario. The primary findings of these studies have been and will continue to be published as reviewed papers and technical reports.

ABSTRACT

Snow was collected and analyzed as part of the Biogeochemistry program to determine chemical and hydrological inputs to groundwater flow in two Dorset area watersheds. Graphs of chemistry, snow depth and water equivalence data for the winters of 1989/90, 1990/91 and 1991/92 are included, as is meteorological data for the same time period. Complete data summaries are also included for data collected from January 1988 to April 1992.

METHODS

Snow sampling

Methods used for collection of data in this report remain unchanged from those used in a 1989 data report (Ont. Min. Envir., 1989). Snow was collected from the same six sites in both the Harp 5 and Plastic 1-08 watersheds. The Hawkeye Lake study was discontinued in 1989 and no further samples were collected from this watershed.

Snow was collected for chemical analysis on a weekly basis during the season for as long as there was a sufficient amount of snow on the ground to provide an uncontaminated sample. Debris falling from trees throughout the winter eventually resulted in contaminated samples as the debris accumulated and the snow pack decreased. Sampling for snow depth and water equivalence of the snow continued until there was no snow left on the ground. This varied from site to site, depending on the aspect of the slopes and the amount of shading from the overstory.

All sites were sampled for density and water equivalence on a weekly basis. This was usually done at the same time as chemistry sampling, but the sampling schedule was often increased during periods of rapid change at the sites (see data summaries for exact sampling dates). A visual estimate of percent snow cover was made at each site during each visit.

Meteorological Data

Daily precipitation and temperature data was collected at meteorological stations located adjacent to the collection sites at Harp and Plastic Lakes. A description of the site locations and equipment used can be found in the 1989 snow core data report (Ont. Min. Envir., 1989). Where data was not available from these sites due to equipment malfunction it was obtained from the next closest meteorological site. Heney Lake meteorological site was used to fill in missing Harp data, while Paint Lake meteorological site data was used when Plastic Lake data was not available.

Summary Data Tables

Summary tables 1 to 12 contain chemistry and deposition results of individual sites from January, 1988 to April, 1992. In the snow depth and water equivalence columns the mean and standard deviation of three samples taken during one visit is presented. Values are not weighted by the percent snow cover. The results of the chemical analysis for each site are also presented in this table. Iron, manganese, aluminum, magnesium and dissolved organic carbon were added to the list of parameters in December, 1989. Data is available in Lotus 123 format upon request.

Chemistry Graphs

Selected parameters (same as previous report) were plotted versus time. The graphs show the mean and standard deviation of the results from all the sites in the watershed. For most of the season all six sites are included. During snowmelt in the spring, however, some sites lost their snow cover earlier than others. Some sites were also judged to contain too much debris to be sampled. In these cases the plotted data represents only the mean and standard deviation of those sites that were sampled.

Snow Deposition and Weather Graphs

The graphs showing snow depth and water equivalence are also the mean of six sites. All data is weighted by the percent cover for that sampling date. Cover is usually 100%, except during spring when it varies between sites. During these times a mean of the percent cover from the six sites was used to represent the entire watershed.
