INTRODUCTION

The 575 photographs listed in this Index are cross-referenced as to (1) Gemini Flights, (2) Oceanographic Features, and (3) Geographic Locations. No listings for flights III and VI were made because none of the photographs taken showed significant oceanographic features.

The photograph numbers in the Index listings are those used in the Bureau of Commercial Fisheries (BCF) file at Galveston. Numbers and dates of the photographs with oceanographic features are not necessarily consecutive since the selections for the Index were made from a file of more than 700 photographs. We have used the BCF numbers to avoid a burdensome repetition of the much longer numbers of the National Aeronautics and Space Administration's Photographic Laboratory at the Manned Spacecraft Center, Houston, Texas. The NASA/MSC color and black and white photograph numbers that correspond to the BCF catalog numbers are listed in the last section of the Index. Should any photographs be ordered, the NASA/MSC color or black and white number must be noted for the type of photograph required. Orders may be addressed to:

Oceanographic Features

The Index categories of Gemini Flights and Geographic Locations are self-explanatory, however, some comments are needed regarding the oceanographic features.

Phenomena have been listed which are obvious and useful to the BCF interpretative studies. The individual features are not totally inclusive. For example, barrier islands, sand bars, and sand spits are in Coastal Deposits. Turbid water, from whatever cause, is included in Coastal Sediments, except for those photographs in which the Discolored Water seemed to be from factors other than suspended sediments. Lagoons are "coastal lagoons" and Calcareous Reefs include atolls.

Photographs from which the current directions and patterns can be evaluated for the instant the photograph was taken are listed under the category of Currents. Features indicating currents may be (1) turbid water, (2) slicks, (3) bow, or shock waves around islands, or (4) island wakes. The

latter two differ significantly and have therefore been listed under separate categories.

Local Winds are noted by the distribution of clouds, usually along coasts and usually depicting the land and sea breeze regimes.

Reflection of the sun from the sea surface has been photographed and is listed under Sun Glitter. Many of these photographs show amazing features within the area of the sun's reflection; currents, current shears, eddies, upwelling, and water-mass boundaries are some examples.

The largest category is Clouds, which is not surprising, for the direct relationship between the sea and the tropical marine atmosphere is made clear from many spectacular examples in the Gemini photographs. Consequently, we have listed a number of cloud types, arrangements, and patterns, some of which require an explanation.

Cloud Lines are usually cumulus and in a linear arrangement, dictated by some local condition. Where cloud lines clearly form as a Convergence, they are listed again under that category.

Bénard Cells are oceanic cumulus clouds arranged in polygonal cells. The use of Bénard's name is purely a convenience and implies no origination.

Von Kármán Eddies are counter-rotating cloud arrangements downwind from islands. As with Bēnard, use of von Kármán's name is a convenient identification of the phenomenon.

Bow Waves are the cloud distribution patterns resulting from the clouds passing close to an island and are similar to waves produced from the bow of a ship.

Contrails are the distinct linear cloudlike features frequently formed behind aircraft.

The standard 8 x 10 inch, black and white photograph has proven useful for distinguishing most features, however, the color photograph is imperative for sun glitter, turbid water, or underwater structure feature definition. Color and black and white prints both are suitable for casual inspection and interpretation. Contact transparencies of the 70-mm film are used for more detailed examination. These transparencies can be viewed satisfactorily using a binocular microscope magnifying up to about 15 diameters.

A photograph depicting oceanographic features is included in Section I of this Index for each of the Gemini flights and may be found

preceeding the actual listing of photographs for that flight.

These photographs were taken with a slightly modified, handheld Hasselblad 500 C camera.
