The findings, conclusions, and views expressed herein are those of the researchers and should not be considered as the official position of the United States Fish and Wildlife Service or the Illinois Department of Conservation.

ACKNOWLEDGMENTS

Project F-101-R is supported by United States Fish and Wildlife Service Sport Fish Restoration Program (Wallop - Breaux) funds administered by the Illinois Department of Conservation. Mr. Larry Dunham, Mr. Bill Bertrand, and Mr. Michael Sweet of the Illinois Department of Conservation, Dr. Lorin Nevling, Chief of the Illinois Natural History Survey, and Dr. David Philipp, Head of the Center for Aquatic Ecology, provided administrative support. Forbes Biological Station staff, Philip Moy, Eric Hopps, Cammy Smith, Dan Holm, and Ruth Sparks, and Long-Term Resource Monitoring Station staff, at Havana, Stephanie Edwards, Paul Raibley, Steve Stenzel, and Edgar Seward, and Aquatic Ecology Center secretary, Beverley Hubert, provided technical or secretarial support. Special thanks are due to Philip Moy who was the crew chief for the field work on the middle and lower portion on the river. Mr. Robert Illyes continued work on the computerization of the database.

Background

The electrofishing program described in this report adds to a data set begun in 1956 when Dr. William C. Starrett of the Illinois Natural History Survey initiated an annual electrofishing survey of the Illinois River. The survey was supported from a variety of sources until 1985 when funding lapsed. Field work resumed in the fall of 1989 with support from the federal program in sport fish restoration and the Illinois Department of Conservation, as a 5-year Survey and Investigation that extends until 1994.

Organization and Contents of Report

This report is organized according to the 6 jobs described in the Annual Work Plan for Segment 2, and covers the period 1 April 1990 to 31 March 1991. Although a comprehensive analysis of the entire 40-year data set awaits completion of the 5-year investigation in 1994, selected findings are highlighted in each year's annual report. This past year's major findings are reported as Job 6, Presentation of Results, and are briefly summarized below.

The numbers, lengths, and weights of each species of fish caught in 1990 are presented by sampling station in Appendix A. The collections are presented in order by sampling date, and are cross-indexed by location (see the index at the beginning of Appendix A). The Appendix is 76 pages long, and was not attached to all copies of the annual report to save copying and mailing expenses. Copies are available from the Principal Investigator, Dr. Richard E. Sparks, Illinois Natural History Survey; Mr. William Bertrand, Project Officer, Illinois Department of Conservation; and Mr. Jim Allen, Head of the Programs Section, Illinois Department of Conservation. Data are also available for IBM PCs on floppy disks in RBase for DOS.

Summary of Major Findings in 1990

The analysis this year focused on the upper Illinois River where the fish populations have been affected adversely in the past by waste discharges from the Chicago-Joliet metropolitan area, but where game fish populations seem to be recovering as waste treatment improves.

The condition of largemouth bass, smallmouth bass, white bass, and carp, as measured by relative weight, W_r , improved between 1982 and 1985 in the upper Illinois River, but declined by 1989. W_r of the three basses were all above 1.0 by 1985. In contrast, the W_r of channel catfish peaked earlier, at slightly better than 1.0 in 1983, and has since declined to just above 0.8.

Another indicator of a long-term improvement is the development of a sport fishery for sauger in the upper Illinois River. Sauger first appeared in substantial numbers in our catch in 1979 in the upper river, confirming that return of the sauger is a relatively recent event that appears to be associated with water quality improvements made during the decade of the 1970's, starting with the Clean Water Act of 1972.

Although the increased catch of sauger and the improvement in W_r of 4 of 5 species over the last 10 years are encouraging, the decline in W_r values between 1985 and 1989, and the further decline in 1990, are worrisome, particularly since 2 other agencies have obtained similar findings. The Illinois Department of Conservation has noted the same decline in several species of game fish in their electrofishing collections from the river in 1989 and 1990, and Southern Illinois University reports a decline in the W_r of sauger (personal communication, Dr. Roy Heidinger, Professor of Fisheries, Department of Zoology, Southern Illinois University, Carbondale, Illinois, 9 April 1991).

Representatives from all three agencies met in Springfield on 9 April 1991, with representatives from the Illinois Environmental Protection Agency and the Metropolitan

Water Reclamation District of Greater Chicago to discuss possible causes of this decline and to coordinate a more intensive sampling of water quality in 1991. Thus these data sets, including the set from this project, F-101, have demonstrated their utility by providing early warning of a potential problem. It may be possible to identify the cause and take corrective action before the condition of the fish populations in the upper Illinois River revert to the lows that were characteristic of the 1960s.

Job 1. Preparation of Equipment

All old equipment was checked and refurbished as needed. A second timer was added to the control console so that the driver does not have to look to the side at the switchbox to see how long the generator has been running. The old Homelite generator was tuned up and used throughout this sampling season. We measured the voltage to each electrode at the beginning and end of each sampling run to ensure that the output was consistent.

The new MultiQuip generator was modified to serve as an emergency backup, but did not have to be used this year. Mr. K. Douglas Blodgett constructed a resistor box to reduce the voltage of the MultiQuip to the same level as the old Homelite. He also added safety features recommended in the electrofishing school taught by the U.S. Fish and Wildlife Service.

Job 2. Training Staff

Mr. Phillip Moy, Mr. Eric Hopps, and Ms. Ruth Sparks read the procedures manual and practiced with the equipment in the Illinois River at Havana, under the supervision of Dr. Richard E. Sparks and Mr. K. Douglas Blodgett. All staff had previously taken a Red Cross First Aid and CPR course.

Job 3. 1990 Electrofishing

Water levels in the Illinois River were high much of the summer (Figure 1). By 7 September, water levels in the upper river were close to the mean low river stage, so we began electrofishing that part of the river first. All 26 stations on the Illinois River and the one station on the Mississippi at Brickhouse Slough were sampled by 28 September (Figure 2 and Table 1).

Small fish which could not be positively identified in the field were preserved in formalin and brought back to the Laboratory. They were transferred to alcohol and identified during the winter.

Several interesting observations were made during the course of the field work. Yellow perch were extremely rare in collections made years ago, but this year 2 were captured at Ballard Island Chute. Most of the goldfish had the "wild type" bronze coloration, rather than the white, black, or bright orange characteristic of the "dime store" varieties. The bright colors are probably rapidly selected out of the population now by predators, whereas the predators were virtually absent from the upper river 15 years ago. We saw some "knothead" carp, but the incidence is much lower than formerly. Erosion of fins and barbels on the ventral side of bottom-dwelling fishes is still a problem, indicating some sort of stressor associated with the sediment. An anomalous collection was made at Hennepin Island Chute, where only 2 fish were taken in 0.33 hours of electrofishing. The equipment seemed to be working properly, and the abundance of fish in collections made at the stations above and below Hennepin were about as expected. The generator labored when the electrodes were switched on (as it is supposed to under demand) and the voltages to each electrode were in the normal range. It is possible that fish had abandoned the chute because of some noxious material. No dead fish were observed on the shoreline.

Figure 1. Water surface elevation of the Illinois River at Havana in 1990. Horizontal lines indicate pool stage and flood stage. At pool stage, the water level is maintained at a minimum depth for commercial boat traffic by the navigation dam at La Grange. At flood stage, the river overtops its banks and begins to fill the floodplain. Electrofishing was conducted during the period indicated by the horizontal bar. It is unlikely that the water levels fluctuated as rapidly in January as indicated by the graph. It is more likely that there were problems in reading the gage or there were reporting errors. We were still trying to confirm the January readings with the U.S. Army Corps of Engineers at the time this report was being written.

Fig. 1 Illinois River Water Surface Elevation at Havana as reported by the U.S. Army Corps of Engineers

Figure 2. Location of the 27 sampling stations along the Illinois Waterway. Station 27 is in the Mississippi River, just below the mouth of the Illinois River. Stations 1 and 2 are in the Des Plaines River, which joins with the Kankakee to form the Illinois River. In this report, we define the upper reach of the Illinois Waterway as beginning at River Mile 190, just upstream of Peoria. Stations 1 through 12 are in the Upper Illinois Waterway.

^a Collection 1990-26 was from Britchouse Slough on the Mississippi River

Another discouraging observation is the degree of sedimentation. It was impossible to fish the exact locations sampled in the past at Ballard Island Chute and Detweiller Marina because the boat became stranded. These 2 stations will have to be abandoned and alternative sites picked for 1991. A third station, Turkey Island Chute, changed from a deep to a shallow chute approximately 15 years ago, when it apparently was filled with sandy dredge spoil. The on-site dredge spoil inspection teams will probably avert another Turkey Island Chute. However, gradual filling of some of the remaining side channels and backwaters will continue unless remedial action, such as proposed for a few locations under the Environmental Management Program, is undertaken. Hurricane and Diamond Island chutes in the lower Illinois River remain deep and generally have good fish populations year to year. These chutes have a fairly uniform width and moderate current velocity, and appear to be self-scouring. The same design might be self-maintaining if copied in other parts of the river.

Jobs 4 and 5. Database

Mr. Robert Illyes has made considerable progress at the Survey's main office in Champaign on merging the historical data sets and making them available in an RBase format that will run on an IBM PC. This has not been an easy task because the coding differs markedly between the Starrett-Sparks data set and the set collected by Kenneth Lubinski. During the past 15 years the mainframe computers and the software used for data analysis at Champaign have changed at least twice, adding further incompatibilities and complications.

The historical data are being converted to coding and formats that are consistent with this project (F-101-R), which began in 1989.

Mr. Illyes is developing checking routines that will find obvious errors, such as a 1-inch fish that is listed as weighing 2 pounds, but it may still be necessary to complete one more round of verification by laboriously checking printouts against the original

field data sheets.

Job 6. Presentation of Results

Results from this project were included in a talk presented at the 29th annual meeting of the Illinois Chapter of the American Fisheries Society in Urbana, Illinois on 6 March 1991, and were presented at a meeting of fishery biologists and environmental engineers concerned with the relationships between water quality and the status of fish populations in the Upper Illinois Waterway in Springfield on 9 April 1991. The general increase in relative weight of 5 species of fish, including 4 sport species, from 1982 to 1985 was good news for the fishery managers and water quality managers, as was the appearance of substantial numbers of sauger in the catch, starting in 1979. However, recent declines in relative weights of the same species, including sauger, prompted the Illinois Department of Conservation (IDOC) to call the meeting in Springfield, which was attended by Dr. Sparks and Mr. K. Douglas Blodgett from the Illinois Natural History Survey, and by representatives from the Illinois Environmental Protection Agency, the Cooperative Fisheries Unit at Southern Illinois University, and the Metropolitan Water Reclamation District of Greater Chicago. The information on relative weights and sauger catch that was presented at these meetings is summarized below and in the accompanying figures.

Relative Weight, W_r . The standard length-weight relationships used for comparison with the values from the Upper Illinois River were taken from sources cited in Murphy, Willis and Springer (1991) and listed in their Table 1: Stephen (1978) for carp, Anderson (1980) for channel catfish and smallmouth bass, Brown and Murphy (in press) for white bass, and Wege and Anderson (1978) for largemouth bass.

The relative weights of white bass, smallmouth bass, and largemouth bass increased to values greater than 1.0 between 1982 and 1985 (Figure 3). The greatest increase occurred in smallmouth bass, whose W_r values went from approximately 0.8 in 1983 to 1.3 in 1985. No electrofishing was done from 1986 through 1988, so we do not know what happened to the W_r values in this interval. However, the values for all three species were lower in 1989-1990 than in 1985. Changes in weight-length relationships, including W_r , can reflect changes in the food supply, water quality, habitat quality, or in the length range of the fish. One might speculate that these three species may show the same pattern because they have similar feeding habits: they consume invertebrates when young and graduate to larger prey, primarily fish, as adults.

The hypothesis that the quality or abundance of forage for adult sport fish might explain the common downward trend does not explain why the common carp, a bottom-feeding omnivore that is capable of consuming detritus, shows the same pattern. Also, the channel catfish shows a unique pattern: its W_r value peaked in 1983, declined through 1985, and is at an intermediate level in 1989-1990. The channel catfish is an omnivore that consumes benthic macroinvertebrates, but will also take small fish. Without information on populations of forage organisms, including benthic macroinvertebrates, it is virtually impossible to test the food deficiency hypothesis.

There is a suggestive negative correlation between W_r values and ammonia concentrations in the Upper Illinois River (personal communication, 9 April 1991, Mr. William Bertrand, Streams Program Administrator, Illinois Department of Conservation). The un-ionized form of ammonia is toxic to fish and other aquatic animals. The concentration of municipalities and industries in the Chicago-Joliet discharge ammonia, as well as nitrogen-containing organic matter that accumulates in sediment deposits and

Figure 3. Relative weight, W_r , of common carp, channel catfish, white bass, smallmouth bass, and largemouth bass collected from the upper Illinois Waterway, 1982-1990. No electrofishing was conducted from 1986 through 1988.

Fig. 3 Fish collected from the Upper Illinois Waterway (RM 190+) during INHS electrofishing surveys

could form ammonia under anaerobic conditions. Again, more information is needed to determine whether this correlation is coincidental or causal. Virtually any pollutant that occurs in sewage or industrial effluent will occur in higher concentrations in the upper river, near the sources, than farther downstream, so ammonia is only one suspect.

In order to determine whether the slight declines we observed in W_r values between 1989 and 1990 might be attributable to different length ranges of fish captured in the two years, the weight-length values were plotted and visually examined (Figures 4-8). With the exception of smallmouth bass, the lengths in the two years overlap and are in the same range. Too few smallmouth bass were captured in the Upper River in 1990 to make a valid comparison of W_r values (Figure 8).

Sauger. Although the sampling design of the long-term electrofishing program is biased against sauger and walleye (no tailwaters are sampled and no night electrofishing is done), it is gratifying to note that the increased catch of sauger, starting in 1979, is verified independently by the IDOC sampling program and by the development of a sport fishery for sauger in the Upper Illinois River (Figure 9). Fish sampling begun in 1990 as part of the Long Term Resource Monitoring Program (LTRM) likewise shows that a substantial population of sauger occur in the La Grange Pool of the Illinois River, just below the navigation dam at Peoria (Figure 1). Although the increased catch of sauger, like the W_r values, shows an improvement in the fish populations that may be related to improved water quality in the last decade, the recent decline in numbers of sauger and in W_r since 1985 may be an early warning of impending problems, and an incentive to determine and correct the causes.
