IRIS BREVICAULIS IN CANADA.—The discovery of a large colony of *Iris brevicaulis* Raf. near Point Pelee on the north shore of Lake Erie in June, 1953, has extended the known range of this species to Ontario and appears to furnish a new record for the Canadian flora.

This Iris was found growing near the marshy edge of Sturgeon Creek, which empties into Lake Erie about three miles southeast of Leamington at the base of Point Pelee. Along the same stream, growing with Typha angustifolia L. at its mucky margin, were seen numerous scattered individuals of Iris virginica L. var. Shrevei Anderson. The colony of I. brevicaulis was at some distance back from the margin of the creek near a woods, growing in a low marshy area which appeared to be periodically flooded. The shorter flexuous stems of I. brevicaulis contrasted sharply with the longer and straight-stemmed plants of I. virginica var. Shervei.

Specimens from the following collection of *Iris brevicaulis* Raf. have been placed in the Herbarium of the Department of Botany at the University of Toronto and of the Missouri Botanical Garden:—near the marshy edge of Sturgeon Creek, three miles southeast of Leamington, Ontario, June 20, 1953, *J. K. & M. E. Shields* 1348.

Field work in Essex County was carried out under the direction of Dr. J. H. Soper of the University of Toronto and was supported by the Research Council of Ontario. Dr. Edgar Anderson has kindly verified the identification of *Iris brevicaulis*.

J. K. SHIELDS, DEPARTMENT OF BOTANY, UNIVERSITY OF TORONTO.

Volume 56, no. 663, containing pages 45-64, was issued 2 April, 1954.

Shields, J K. 1954. "Iris brevicaulis in Canada." *Rhodora* 56, 80–80.
