

A New Species of *Aneflus* from Arizona (Coleoptera: Cerambycidae)

By JOSEF N. KNULL, Department of Zoology and Entomology,
The Ohio State University

In identifying some Cerambycidae the following apparently undescribed species was found.

Aneflus parcalvatus n. sp.

Male. Size and form of *A. calvatus* Horn, elongate, subcylindrical, dark brown, clothed with short recumbent pubescence, small irregular patches of pubescence on elytra.

Head coarsely punctured; antennae when laid along side, extending to apical sixth of elytra, ratio of lengths of segments 1 to 11, 3:.5:2.4:2.4:3:2.8:2.8:2.6:2.6:2.6:3.3, scape subcylindrical, under side of apex slightly emarginate, segments three to seven inclusive spinose at apex, segments five to eleven flattened, carinate, eleventh feebly appendiculate.

Pronotum wider than long, widest at middle, wider at base than at apex; sides rounded with an obtuse tubercle at middle on each side; disk convex with five irregular rugose areas, one in center back of middle, and two on each side, a transverse depression at base; surface rugose. Scutellum densely clothed with recumbent pubescence.

Elytra at base much wider than widest part of pronotum; sides subparallel, broadly rounded in apical sixth to strongly bispinose apices; disk convex with two rather weak costae on each elytron; surface coarsely punctured at base, punctures becoming smaller toward apices.

Abdomen beneath finely punctured, pubescence not dense; last visible sternite broadly emarginate.

Length 35 mm.; width 8.3 mm.

Female. Differs from male by antennae extending to about middle of elytra. Last visible sternite broadly rounded.

Holotype male and *allotype* collected in Santa Rita Mountains, ARIZONA, July 11, 1949 by D. J. and J. N. Knull. *Paratypes* from Arizona as follows: Tucson, July, 1911 and 1919,

G. Hofer; Sabino Canyon, July 12, 1920, G. Hofer and W. D. Edmonston; Nogales, July 7, 1949, D. J. and J. N. Knull, in collection of author; and Tucson, July 5, 1954, M. A. Cazier and W. J. Gertsch, in American Museum of Natural History.

This species can be separated from *A. calvatus* Horn, which it resembles, by the wider prothorax and the mottled pubescence on elytra.

Tenth International Congress of Entomology

The Tenth International Congress will be held in MONTREAL from 17 to 25 August, 1956. The meetings will be held at McGill University and the University of Montreal.

Fifteen sections have been arranged provisionally as follows: Systematics, Morphology and Anatomy, Physiology, Behavior, Ecology, Geographical Distribution, Genetics and Biometrics, Paleontology, Arachnida and other land Arthropods, Agricultural Entomology, Forest Entomology, Medical and Veterinary Entomology, Stored Products Entomology, Biological Control, Apiculture.

Those wishing to receive further information with a view of attending the Congress should notify the Secretary as soon as possible. Those wishing to receive a personal invitation are requested to apply to the Secretary. J. A. DOWNES, Secretary, Division of Entomology, Science Service Building, Ottawa, Ontario, Canada.

Professor Bradley Honored

Professor Emeritus J. Chester Bradley of Cornell University has been elected an HONORARY FELLOW of the ROYAL ENTOMOLOGICAL SOCIETY OF LONDON. Only rarely has this honor been bestowed outside Great Britain, and, at present, Dr. R. E. SNODGRASS is the only other American Honorary Fellow.

Professor Bradley retired from active teaching at Cornell in 1952. He has been a Resident Member of the American Entomological Society since 1902, and he was one of the founders of the original Entomological Society of America in 1906.
