

ANACARDIACEAE: Rhoideae: Lithraea*

Fred A. Barkley

Of the approximately 38 genera of the tribe Rhoideae there are four which have stamens twice as many as the petals, the tricarpellary ovary one-celled, and have a disk between the stamens and ovary: Lithraea, Mauria, Schinus and Pachycormus. Lithraea differs from the other three in that it has basal seed and the leaves have a prominent white corneous margin.

The first entity of this genus to be known was apparently described by Molina as Laurus caustica in his Saggio Storia Naturale del Chile 176, in 1782 as "Laurus fol. ovalibus rugosis perennantibus, flor. quadrifidis". Vellozo described an entity from Brazil in 1825 as Schinus molleoides and this was followed by the description in 1833 of Schinus ternifolius Gillies ex Hooker & Arnott, two entities variously treated, but historically mostly treated as synonymous.

In 1826 Miers published Lithraea venenosa in Trav. in Chile 2: 529, thereby establishing the genus Lithraea, by which name these species have been consistently known since that time.

The genus is represented by southern Brazil, Paraguay, Bolivia, Uruguay, Argentina and Chile by a series of polygamo-dioecious poisonous-sapped trees.

* The author wishes to express his appreciation to the American Philosophical Society for a grant which permitted him to visit the more important South American herbaria and to the directors and curators of these herbaria and those from which material has been sent on loan for study. The basic studies for this revision were made at the Fundación Miguel Lillo de la Universidad Nacional de Tucumán. The writer is grateful to the rector, Dr. H. R. Descole, to the late director, Dr. Carlos O'Donell, and to his colleagues in the Botanical Institute for the facilities for study and for their suggestions and encouragement during the study.

Lithrea Gay, Flora Chilena 2: 43. 1846.

Lithrea Hook., Bot. Misc. 3: 175. 1833.

Trees with poisonous sap and slender branches. Leaves alternate, coriaceous, simple, ternate or pinnately 5-foliolate, the compound leaves with narrowly alate rachis and often alate petiole. Panicles usually lateral but clustered in the axils of the uppermost leaves, rarely terminal. The bracts deltoid and caducous. Pedicels usually glabrous above the abscission plate. Calyx usually with 5 semicircular or broadly deltoid lobes, glabrous except the margin of some ciliate. Petals usually 5, valvate, lanceolate, acutish, glabrous. The stamens twice as many as the calyx lobes, in stamine flowers slightly shorter than the petals, the anthers oblong, filaments as long as the anthers or with the alternate ones slightly shorter, in the pistillate flowers 1/2 to 1/3 as large and the anthers completely sterile. The disk with as many lobes as the stamens. The pistil in pistillate flowers with three hemispherical stigmas, one style, and a subspherical ovary with one cavity and one basal ovule, the stamine flowers have much smaller and abortive pistil with two points to each stigma. The fruit has whitish epicarp readily separating from the dark resinous mesocarp, the mesocarp adhering to the bony, smooth to rough endocarp.

Type species: *Lithraea venenosa* Miers, Trav. in Chile 2: 529. 1826 (- *Lithraea caustica* (Mol.) Hook. & Arn.)

The two major problems which confronted the present author were the specimens of the mountains of northwestern Argentina and those from northeastern Argentina which have traditionally been treated as conspecific and a series of specimens from northeastern Argentina to southern Brazil which have been variously segregated.

In regard to the first problem, after a study of the specimens it has seemed better to segregate the Bolivian-Argentinian series of tall trees with large fruits as specifically distinct from the similar but smaller trees with smaller fruits from the lower tropical regions. This mountainous species was first described by Gillies and published by Hooker and Arnott as *Schinus ternifolius* and later described as *Lithraea Gilliesi* Gris. The other major problem involving a complex of the tropical regions, has been treated as two or three distinct species: one a simple-leaved species *L. brasiliensis* March. only more or less separable from the one or two pinnately compound leafed species. The pinnately compound-leaved species, *Lithraea molleoides* (Vell.) Engl., is a plant with leaflets lanceolate-oblong and obtuse. This is common in southern Brazil. In northeastern Argentina is a plant with linear-lanceolate acuminate leaflets, which Hieronymus named *Lithraea Lorentziana*. It has been included in *Lithraea molleoides* by most authors and is united to that species by a large series of intermediate specimens. To the author it appears that there are three entities with some intermediates. The three entities which may well represent specific elements

or cytogenetic studies may show that they are three variations of a single species. At present it seems to the writer best to treat them as two species and one variety, although Lithraea brasiliensis is scarcely better differentiated from Lithraea molleoides than Lithraea molleoides var. Lorentziana.

KEY TO THE TAXA

1 Leaves simple or mostly so.

2 Leaves ovate, heavily coriaceous, the margins entire or slightly irregular, inclined to be scalloped; fruit large: Chile.

3 Leaves and branches glabrous, leaves often larger and more coriaceous, the margin more scalloped.

4. LITHRAEA CAUSTICA

3 Leaves and branches pilose, leaves usually smaller and slightly thinner and less scolloped.

4a. LITHRAEA CAUSTICA var. PILOSA

2 Leaves oblong or ovate-lanceolate, the margin entire or irregular, rarely scolloped; fruit small: Brazil and Argentina.

1. LITHRAEA BRASILIENSIS

1 Leaves compound or mostly so.

2 Fruit small, 4.5-5.5 mm. in diameter; lowlands of north-eastern Argentina to Brazil.

3 Leaflets usually ovate-lanceolate, usually obtuse but often acute.

2. LITHRAEA MOLLEOIDES

3 Leaflets usually linear-lanceolate, acuminate. 2a. LITHRAEA MOLLEOIDES var. LORENTZIANA

2 Fruit large, 7-9 mm. in diameter; highlands of western Argentina and Bolivia.

3. LITHRAEA TERNIFOLIA

1. Lithraea brasiliensis March., Rev. Anacard. 185. 1869.

Ehretia venulosa Spreng. ex Engl. in Mart. & Eichl., Flora Brasil. 12: 395. 1876, in synon.

Lithraea australiensis Engl., Engl. Bot. Jahrb. 1: 422. 1881; Engl., in de Candolle, Monogr. Phaner. 4: 347. 1883, in syn.

Lithraea verrucosa Miers ex Engl. in de Candolle, Monogr. Phaner. 4: 347. 1883, in syn.

Evergreen tree of 7 or 8 m.; branches slender, glabrous or sparsely puberulent, grayish brown; the leaves simple, or leaves

in part with leaflets 2, 3 or 5, leaves thinly coriaceous, the margin white, entire or somewhat irregular, glabrous or very sparsely puberulent on the veins, obtuse at apex or rarely subacute, cuneate at base and decurrent on the 4 to 10 mm. long petiole, 4 to 9 cm. long, 12 to 30 mm. broad, the compound leaves with leaflets sessile, similar to the leaves, the petiole and rachis winged; inflorescences axillary panicles mostly clustered near the apex of the branches, about 5 to 10 cm. long, with the branches of the inflorescence sparsely puberulent; bracts caducous, deltoid, often one larger (5X7 mm.) and two smaller bracts (2 X 4 mm.) clustered together, glabrous except for a few cilia on the margins; pedicels about 1.5 mm. long, sparsely pilose-puberulent below, glabrous and shining above, in fruit to 3 mm. long; sepals 5, rounded-deltoid, glabrous, margin more or less irregular and with very few cilia, 1 X 1 mm.; petals glabrous, obovate, obtuse to subacute, 1 X 2 mm.; stamens 10, anthers 1 mm. long, filaments 1 mm. long; disk 1.5 mm. in diameter; pistil with stigmas 3, flaccid, .2 mm. in diameter; the pistillate flowers with petals .7 X 1.8 mm., stamens with anthers sterile, .5 mm. long, filaments slender .5 mm. long, the disk 1.2 mm. broad, less lobed than in the staminate flowers, the three stigmas large, the style .4 mm. long and the ovary spheroid, 1 mm. in diameter; fruit 4 to 5 mm. in diameter, slightly flattened, style persistent and brownish, epicarp creamy yellow, readily separating from the thin resinous mesocarp; seed lenticular, slightly larger at one end, 4 mm. wide, 5 mm. long, 2.2 mm. thick, essentially smooth, brownish black.

TYPE: Gaudichaud 925 from Sao Paulo, Brazil, in the Paris Herbarium.

The range of the species is from Minas Geraes, Brazil to Misiones, Argentina.

Common names: "Aruera", "Salitre", "Laurel del Monte", "Molle de beber", "Arbol malo", "Litre", "Aroeira Braba", "Pan de Bugre", "Brauna".

Lithraea chichita Speg. in Speg. & Girola, Cat. Descr. Maderas 395. 1910.

Lithraea molleoides Engl. ex Cabrera, Rev. Museo de La Plata n.s. 2:38, 1938, pr. p.

Tree to 5 meters with slender glabrous branches gray to tannish-gray; the leaves alternate, glabrous, 5-foliolate or partly 3-foliolate (very rarely with a simple leaf); leaflets about equal, 4-7 cm. long, 6-10 mm. broad, linear-lanceolate, acute to acuminate at the apex, narrowly cuneate at the base, sessile, margin entire or slightly irregular; panicles lateral and axillary, clustered near the apices of the branches, erect, the branches very sparsely and shortly pilose; bracts caducous, deltoid, glabrous except ciliate on the margins, .5 mm. broad, .7 mm. long, usually associated with two caducous bracteoles .2X .3 mm.; pedicels about 1 mm. long in flower, increasing to 2 mm. in fruit, sparsely pilose below, enlarged and glabrous above; calyx lobes deltoid-semicircular, glabrous, .8 mm. wide, .5 mm. long; stamens usually 10, in the staminate flowers anthers oblong, 1 mm. long, filaments .5 mm. long, in the pistillate flowers anthers much smaller; disk about 1 mm. broad, lobes as many as the stamens; stigmas 3, style 1, ovary one-celled and one seeded, in the pistillate flowers about 1 mm. broad, much smaller in staminate flowers; fruit 5 mm. long, 5 mm. broad, 4 mm. thick, with smooth creamish or greenish-white epicarp which readily separates from the resinous mesocarp, the mesocarp adhering to the endocarp; seed tan, smooth 4 mm. long, 4 mm. broad, 2 mm. thick.

TYPE: Niederlein 1590, Esteros y Paso de Ibera, 7 October 1886, in the Herbarium of the National Museum in Buenos Aires.

Common names: "Chichita", "Chicha", "Aruera", "Arbol malo", "Molle Guazu", "Molle Gris", "Molle", "Corazon de bugre."

The species ranges from southern Brazil, through Uruguay and Paraguay, to northeastern Argentina.

3. *Lithraea ternifolia* (Gillies) Barkley, Rom. n. comb.

Schinus ternifolia Gillies ex Hook. & Arn., Bot. Misc. 3: 177. 1833

Schinus tenuifolius Steud., Nom. ed. 2. 2: 530. 1841.

Lithraea Gilliesii Griseb., Goett. Abh. 19: 114. 1874.

Schinus Terebinthifolius var. ternifolius March., Rev. Anac.
166. 1869.

Tree to seven meters, branches tannish gray, at first minutely and sparsely puberulent but soon glabrate; leaves compound (or rarely the first leaf on a branch simple), glabrous, alternate; leaflets 3-5, thinly coriaceous, ovate-lanceolate, acuminate or rarely abruptly obtuse, the base cuneate, sessile, the margins entire or slightly irregular, the lateral one inequalateral, the terminal equalateral, mostly 5-8 cm. long, 8-25 mm. broad, rachis narrowly winged, 1.5-2.5 cm. long, petiole not winged, 2.5-4.5 cm. long; inflorescences lateral and subterminal panicles more or less clustered at the ends of branches, erect in flower, more or less lax in fruit, 3.5-5.5 cm. long, at first very sparsely puberulent (or glabrous) and soon glabrate; bracts .4 mm. broad (usually associated with 2 similar but smaller bracteoles), glabrous except with a few sessile glandular cilia on the margins, deltoid; pedicels about 1 mm. long or in fruit to 4 mm. long, at first sparsely pilose but becoming glabrate; the calyx with 4 to 5 glabrous lobes 1 mm. broad and .5 mm. long, with margins bearing a few sessile and glandular trichomes; petals 4-5, lanceolate, 1 mm. broad, 2.5 mm. long; in the staminate flowers the 8 to 10 stamens with filaments .6 mm. long, anthers oblong, 1 mm. long, while in the pistillate flowers they are less than half as large with the anthers sterile; the disk about 1 mm. broad, lobes as many as the stamens; the pistil of the staminate flowers with pistil .5 mm. long, .25 mm. broad, but in the pistillate flowers the ovary 1 mm. broad and the 3 stigmas hemispherical; fruit 6 mm. long, 8 mm. broad, and 4-5 mm. thick, glabrous, stigmas persistent, brownish, epicarp creamish-yellow or greenish-white, readily separating from the thin black resinous mesocarp; seed faintly rugose, 5 mm. long, 6 mm. broad, 2.8 mm. thick.

TYPE: There probably exists in the Kew Herbarium a specimen, but this has not been seen by the present writer, nor any direct citations of it.

Common names: "Molle de beber", "Molle blanco", "Molle dulce", "Molle de Cordoba", "Molle", "Palo Negro", "Molle de bebe."

This species ranges from Central Bolivia to Central Argentina, mostly in the mountains.

396. 1876, in syn.

Shrub or small tree to four meters tall, evergreen; branch-
es (mostly growing in length in February) greenish-tan and mod-
erately thick, later becoming tan and then dark gray-brown,
glabrous; leaves simple, lamina thickly coriaceous, glabrous,
broadly lanceolate to ovate or rotund, obtusely acute, obtuse
or emarginate at apex, cuneate to truncate at base, usually 21
x 55 mm. to 33 x 45 mm. but rarely from 16 x 25 mm. to 75 x 110

mm., veins white and prominent, margin thick and white, entire to irregular and subrenate, petiole 3 to 15 mm. long, thick, often winged almost to base by the decurrent lamina, glabrous; panicles axillary, 1 to 5 cm. long, very sparsely pilose at the base of the inflorescence; flowers yellow; bracts lanceolate-deltoid, brownish, about 1 mm. long, persistent; pedicels in flower 1 mm. long, in fruit 2 mm. long, very sparsely pilose; masculine flowers with calyx brownish-yellow, glabrous, lobes five, about two times as long as broad, petals 5, yellow, lanceolate, glabrous, obtuse and slightly inrolled at apex, 3 mm. long, 1 mm. wide, stamens 10, anthers 1.6 mm. long, filaments 1.5 mm. long, enlarged twoard the base; disk cream-colored, 10 lobed, 1 mm. in diameter; pistil 1 mm. long, three stigmas and styles and a flaccid ovary; feminine flowers with calyx yellowish, glabrous, lobes about as long as broad, persistent, petals 5, yellowish, broadly lanceolate, obtuse and enrolled at apex, 2 mm. long, 1 mm. wide, tardily deciduous, stamens 10, anthers 5 mm. long, filaments 6 mm. long, slender, disk cream-colored, 10 lobed, 1 mm. in diameter, pistil 2 mm. long, 3 hemispherical stigmas, style 1.5 mm. long, ovary spherical 1.3 mm. in diameter; fruit 12 mm. long, 11 mm. wide, 3.5 mm. thick, the stigma and style brownish-black, persistent, epicarp cream-yellow, readily separating from the black thin resinous mesocarp, seed tan-brown, very slightly rugose, 4.5 mm. high, 5.5 mm. wide and 2.5 mm. thick.

Typical specimen: Kausel 874 from las planicies del Rio Claro, Curico, Chile, 18 January 1941.

Common names: "Litre", "Lithi", "Llithi".

The species is limited in distribution to central Chile.

Specimens examined:- CHILE: Beechey s.n. (G); La Leona, 1828, Bertero 413 pr.p. (G); Dombey s.n. (LISU); "Perou", Dombey 884 (G, L) and 885 (L, NY); 31 Oct. 1896, Dusen s.n. (S); Gay s.n. 4a. *Lithraea caustica* var. *pilosa* Engl. in Martius & Eichler, *Flora Brasil* 12²: 396. 1876.

Lithraea caustica f. *pilosa* (Engl.) Cabr., *Rev. Museo de La Plata* n.s. 2: 38. 1938.

Tree with moderately slender rigid branches, branches ten and densely pilose at first, later becoming tannish-gray and eventually glabrate; leaves simple, oblong-obovate, 4-7 cm. long, 1.5-3.5 cm. broad, coriaceous, margin somewhat waxy but rarely plicatulate, subentire, white corneous, the veins whitish, the veins above, and the under surface, soft pilose at least at first, eventually becoming glabrate, apex truncate or emarginate, base broadly cuneate and slightly decurrent on the 5-7 mm. long, pilose petiole; inflorescences terminal and subterminal contracted panicles; axis of the panicle long pilose; bracts lanceolate-deltoid, pilose, 1.2 mm. long, .7 mm. broad, usually having two bracteoles associated, these less than half as large; pedicels in flower 1 mm. long, in fruit 2 mm. long,

sparingly long pilose; calyx very sparingly long pilose, the 5 lobes bluntly deltoid, .8 mm. broad, .6 mm. long, margin ciliate with long simple hairs; petals ovate-acute, 2 mm. long, 1.4 mm. broad, glabrous except for a pilosity of three or four hairs near the center outside; stamens in the staminate flowers with anthers 1 mm. long, oblong, the filaments about .7 mm. long or the alternate ones slightly shorter, in the pistillate flowers stamens less than half as large and the anthers sterile; disk about 1.1 mm. broad, lobes as many as the stamens; pistil in the pistillate flowers with three hemispherical stigmas, one style, and ovary hemispherical about 1 mm. in diameter, in the staminate flowers the pistil much smaller and the stigmas with two points; fruit 6 mm. long, 7 mm. wide, 4 mm. thick, the epicarp whitish, separating readily from the resinous dark mesocarp, the mesocarp adhering to the bony endocarp; seed brown, 5.5 mm. high, 6.5 mm. wide, and 3 mm. thick, upper margin slightly rough.

Typical specimen: Werderman 501, from Hacienda Montegrande, Curico, Chile, 800 m., alt., Dec. 1924.

Common name: "Litre".

The variety is limited in distribution to central Chile.

Specimens examined:- CHILE: La Leona, 1828, Bertero 413 p.pr. (G); 1855-1856, Germain s.n. (G); Agua de Piedra, Sept. 1860, Philippi s.n. (SGO) and Iter Tinguiririca, s.n. Description of plates

PLATE I. Lithraea caustica (Molina) Hooker & Arnott,
Claude-Joseph 839, January 1919, from Santiago, Chile, in the
United States National Herbarium. Photograph by J. Araque M. X.25

PLATE II. Lithraea brasiliensis March., Dusen 8740, from
Parana, Brazil, in the Missouri Botanical Garden Herbarium.
Photograph by J. Araque M. X.25

PLATE III. Lithraea ternifolia (Gillies) Barkl., Gillies,
San Luis, Argentina, in the Royal Botanic Garden Herbarium, Kew.
Photograph by courtesy of the Royal Botanic Garden, Kew.

PLATE IV. Lithraea caustica var. pilosa Engl., Wilkes, 1838-
1842, Chile, in the New York Botanical Garden Herbarium.
Photograph by the author.

PLATE V. Lithraea molleoides (Vell.) Engl., Widgren 1082,
Caldas, Minas Geraes, Brazil, 1845, from the Herbarium of the
Naturhistoriska Riksmuseet of Stockholm. Photograph by the
author. X.25

PLATE VI. Lithraea molleoides var. Lorentziana Hieron. ex
Lillo, Rambo 26310, Rio Grande do Sul, Brazil, 14 January
1945, in the Herbarium of the Fundacion Miguel Lillo of
Tucuman, Argentina. Sometimes a leaf of Lithraea brasiliensis
will be ternate and appear much as the leaves of Lithraea
molleoides. The leaves of Lithraea molleoides and of Lithraea
ternifolia are very similar, however, the fruit of the latter
is nearly twice the diameter of the former. Photograph by
the author.
