J. R. LOWRIE.

**POTATO PIERCED BY GRASS.**—Mr. A. C. Brigham, of Trumbull, Ohio, sends me a freshly dug potato which has been pierced completely through by a growing stem of grass; probably *Poa pratensis*. The potato is three inches long and two inches thick, of regular shape, and with a smooth, uninjured skin. The grass entered from the side, near the "stem" end of the potato, and issued at the "eye" end, its course being somewhat curved. If it entered vertically, as is probable, it emerged horizontally, being carried forward, perhaps, by the contemporaneous growth of the potato. The original root of the grass was not seen, that part being broken away an eighth of an inch outside of the point of entrance. Dissection reveals the perfect stem of the grass imbedded in the center of the potato. After emergence the grass struck upward in a vigorous shoot five inches beyond the potato, appearing above the ground in half a dozen green leaves. Many long, tender roots extend out from the stem above its point of liberation. The potato suffered no discernible irritation at being thus pierced, and the grass, also, was in no way exhausted by its exploit.—ALBERT A. WRIGHT, Oberlin, Ohio.

**NELUMBINUM LUTEUM.**—I just saw specimens of *Nelumbium luteum* from Grass Lake, Lake Co., Illinois. It is a new locality for the plant, which is by no means common here.—M. HARRINGTON, Sycamore, Ill.

Harrington, M . 1878. "Nelumbium luteum." *Botanical bulletin* 3(12), 100–100.
