

Algal Collections from Funafuti Atoll

V. J. CHAPMAN¹

IN SEPTEMBER, 1951, H.M.S. "Challenger" visited Funafuti Atoll in the Ellice Islands in connection with seismic experiments. Biological materials were collected from the reef and samples were dredged from the floor of the lagoon. No algal material was collected in the latter but some was obtained from the reef stations, the location of which is shown in Figure 1. In the report accompanying the material (Challenger 2320/12/3) it is stated that the seaweed samples are good random ones. Considerable differences in respect to both abundance and proportions of species are evident at the various stations. No algal collections appear to have been made on previous visits, not even during the celebrated visit to put down the bore through the reef in order to determine the depth of coral (Finckh, 1904). Recently an extensive treatment of the algae of Bikini Atoll has been published (Taylor, 1950) and this has proved very helpful in the present study. The list of species from Funafuti is not as extensive as one might have expected but this may be a result of the lack of a trained botanist among the collectors.

I am grateful to Dr. Drouet for checking one or two doubtful species among the Myxophyceae and to Dr. Yale Dawson for

the identification of *Wurdemannia miniata*. The collection has been deposited at the Auckland Institute and Museum, Auckland, New Zealand.
