

and it may only climb up tree  
all culmous  
Inflorescences over this or all  
involves green & subtomentose & no  
thing like catkins & no wings  
- up tree and 2 to 3 ft.  
long +, most slender ones  
inflorescences not hair like as hair  
and more long and whitish pubescent  
most 2 to 3 ft. long at first it is broad  
inside slender to this reduced to  
narrow & becomes very narrow and  
the last few inches and all  
fully developed with long & thin  
and few slender ones which are, even  
then not long. The long is  
not

San Bernardino Co  
Dear Dr. Gray,  
Herewith I send  
plants for examination -  
same as I have sent you before  
filipes, but the specimens we  
present you show it to be  
indeed the species are distinct  
Bromelia stricta Lodd + Mitchella  
perfoliata - Mr. Nutt  
is looking over the new  
I notice that Aphyllanthes l  
credited to California, but  
you have specimen from  
San B. Mts. Mi. You also  
Verbenaria encelioides from  
may be an introduction which  
but is well established.  
is given as from San Bernadino  
but we have never found it  
think Parry ever got it here  
near Calistoga, north of San B.  
probably a mistake in extending  
the species so far south. On  
you have had H. Fitch's from  
of the San B. Mts. I think

It is your 528 of a  
"San Bernardino"

Parish, S. B. 1884. "Parish, Samuel B. Oct. 11, 1884." *Asa Gray correspondence*
