

A. N. Curtis.

Talleypand Place, near  
Jacksonville, Fla. Sept. 2 1885

Prof. A. Gray &  
Levi C. Watson, Esq.

Dear Sir - If I send  
you specimens of cultivated plants  
during the coming year, will you  
be willing to identify them?

As I have written you, I am  
planning a more thorough  
exploration of this State than I  
have heretofore made, with the  
intention, not only of preparing an  
8<sup>th</sup> fascicle, but of informing myself  
more fully as to plants in cultivation  
& the popular names & uses of native &

Do you know the chemical composition of the fiber?  
If colored wholly from the air it could contain but four elements - so not the fiber properly termed chlorinous?  
(I have an impression that I have seen that term applied to it) - The substance appears like the heavy covering of insects - colophose especially -  
to whalebone, as well as to hair, and Oswald  
like to know if there is any marked resemblance  
in their chemical composition. If you have any exact knowledge of this subject - please give me  
the benefit of it - will you kindly thank

J. M. Scoville

I have been writing a 4-column article on "Sub-tropical Florida" for the Trade Ed. of the Times Union & now have in hand for the same a 3-col. article on Fibre-plants. Can you refer me to any very recent publications on this subject - ? relating to production & consumption, manufacture, prices, etc. ?

I shall include Tillandsia usneoides, & wish to write a botanical account of the same for another periodical.

My opinion is that this plant is dependent on living bark to the same extent that lichens are, deriving certain elements from waste bark i.e. those outer layers which receive very little, if any, of the tree's sap. Detached or on dead trees or branches I think the plant is virtually dead.
