

(13) where are the title page and index
coming!! ~~etc.~~) you say you cannot
distinguish *Baccharis glomeruliflora*
from *B. halimifolia*. Are you in the same
condition still? Also you say you have
not seen *Coryza sinuata*, Ell. Have you
had it sent you since? I am reminded of
you every day or have been for a few weeks
past, seeing it in flower in the streets of
the city as I walk to the College.

Is there any mode of distinguishing
Lizia aurea from *Maspisium aureum*, when
the fruit is wanting? All my fruiting speci-
mens belong to the former; those in flower
only, I cannot refer with certainty, but pre-
sume them to belong also to the former, as
you say the latter is rare.

Can you find time to answer all
my queries?

With respects to Mrs. Gray

I am dear Sir

Yours truly

Lewis R. Gibbes

Prof. Asa Gray
Cambridge Mass.

Where is the enclosed *Coryza* described in the *Flora*? What is the name of the
Crucifer?

My dear Sir,

I received your note by
Miss Murray, and with pleasure
complied with your request therein
expressed, and did the honors of our ci-
ty, as well as I was able, at least in
the botanical line, leaving the enter-
tainment in the gastronomic line,
to others, to whom that subject was
more familiar. I brought Mrs. Gibbs
to my aid, and we took Miss M.
on two or three excursions, and she
appeared to be gratified with our
efforts to please her. If my spring
vacation had occurred sooner I think
I would have accompanied her in her
visit to Florida, whether I have been
long desirous of going.

She brought two pretty ferns from

Charleston 2nd June 1838

the interior of East Florida, over which she made great roving, as we were not able to refer to descriptions of them. I have the same things from West Florida. One of them is allied to *Pteris*, having the fruit-dots marginal and continuous; it is simply pinnate, with the pinnae bifid, in the fertile ponds, of which I have only an imperfect pinna, and the sterile ponds are palmately divided; some of these last Miss M. brought. The other is an *Asplenium*, looking more like a *Ruta-maria* than ^{like} any other of our *Asplenia*, but entirely different from it. Neither of them are "in the books," certainly not in Pursh, the only enumeration your terms with descriptions, that I have access to, if you except Eaton. Miss M. said that she sent you specimens. What are they and where are they described? or even mentioned?

I have also from Florida a new *Adir-*
autum, quite distinct from *A. pedatum*.
Do you know it?

Miss M. also gave me a fern picked up somewhere in her peregrinations but where she could not remember. The adjoining figure will give you some idea of it. Frond simple, pinna alternate, elliptical, with a slight acumination or mucronation. Fruit dots marginal, on each edge of the pinna, not distinct from each other. Stalk and Rachis chaffy; about 10 inches long. Nothing like it is known in the United States and I suspect she obtained it at some garden, most probably at Washington. Do give me the name of it, and reference to description.

Where have you described *Angelica* *Curtissii*?

Decandolle, at page 308 of Part VII sectio prior refers to a table of Meissner's, giving analysis of genera of Composite, perhaps of other families. Has it been published? Where to be had?

In the second vol of the Flora of N.A.
