The following key will aid in separating the three species of Alienates.

Key to the males of Alienates

1.	Forewing with only 2 longitudinal veins (Fig. 2), forelegs stout with length to width ratio of tibia and femur less than 3.0, posterior lobe of pronotum twice as long as anterior lobe
	millsi, new species
	Forewing with 3 or 4 longitudinal veins, forelegs more slender with femur and tibia length to
	width ratio greater than 3.0, posterior lobe of pronotum more than twice as long as anterior
	lobe
2.	Forewing with four veins (Fig. 3), posterior lobe of pronotum less than three times as long
	as anterior lobe
	Forewing with three veins (Fig. 4), posterior lobe of pronotum three times as long as

ACKNOWLEDGEMENTS

I wish to thank Lewis J. Stannard, José A. Mari Mutt, Richard C. Froeschner, and Pedro Wygodzinsky for their comments and encouragement. Part of this work was completed during my stay at the Department of Entomology, University of Illinois and the Illinois Natural History Survey.

EMENDATION OF *EUMESOSOMA* COKENDOLPHER¹

James C. Cokendolpher²

Dr. Jürgen Gruber, of the Naturhistorisches Museum Wien, recently brought to my attention that Eumesosoma Cokendolpher 1980 (Arachnida: Opiliones) is not feminine in gender as I stated. The Greek stem "soma" $(\sigma\omega\mu\alpha)$ is neuter. Accordingly, Eumesosoma ocalensis should be emended to Eumesosoma ocalense Cokendolpher 1980.
