MARINE AMPHIPODA OF THE FAMILY AMPITHOIDAE FROM SOUTHERN CALIFORNIA

By J. LAURENS BARNARD
Associate Curator, Division of Crustacea

The family Ampithoidae is confined to littoral and sublittoral marine depths of the world, generally in the canopies of kelp or shallow rock bottoms where short-tufted algae grow. Being large-bodied organisms, they are among the most conspicuous amphipods. Indeed, the largest amphipod so far reported in shallow waters of southern California is Cymadusa uncinata (herein a specimen 35 mm. long). The world fauna supports eight genera (not including Amphitholina, which was transferred to the Eophliantidae by Gurjanova in 1958), but only two of these have been found in the present collections, Ampithoe and Cymadusa. A fragmentary specimen of a third genus, probably Paragrubia, has been found at Cayucos, Calif.

The present collections consist of materials dredged by the Velero III of the Hancock Foundation, especially in the channel islands off southern California, and materials of intertidal origin collected by the writer and other workers from Cayucos to La Jolla, Calif. A few samples collected by scuba diving have proved most valuable. There is a need for more extensive diving exploration of kelp holdfasts and canopies and other algal bottoms.

Ampithoids bear spinning glands in pereopods 1 and 2, which are used to form soft parchment-like tubes for inhabitation. Apparently the tubes are formed mostly among the holdfasts of kelps, smaller algae, and surfgrass. Limbaugh in a mimeographed report from Scripps Institution of Oceanography reported on an Ampithoe that rolls up the edge of a Macrocystis blade, "stitches" it along the seam, and lives in the enclosed tube. Ampithoids follow algae down to their photic limit; hence ampithoids live to greater depths in the channel islands off southern California, where the waters are clearer, than along the mainland shelf where the waters are quite turbid and algae rarely grow below 30 meters.

I am indebted to the National Science Foundation for a grant (G-10750) that supported the illustration of this work, and to the Beaudette Foundation for my support. Portions of the materials are deposited in the U.S. National Museum and the Allan Hancock Foundation, University of Southern California.

Key to Species of World Ampithoe

1.	Third pleonal epimeron with a point at the lower posterior corner 2
	Third pleonal epimeron rounded at lower posterior corner 4
2.	Male gnathopod 1: fifth article 1.8 times as long as article 6.
	tarasovi (check mitsukurii also)
	Male gnathopod 1: fifth article subequal to or shorter than article 6. 3
3.	Flagellum of antenna 1 shorter than flagellum of antenna 2. australiensis
	Flagellum of antenna 1 almost twice as long as flagellum of antenna 2.
	lacertosa (= scitula)
4.	Gnathopod 1: palm distinctly transverse, short, corner sharply quadrate,
	article 6 linear, posterior edge straight, article 7 greatly overlapping
	palm (fig. 1a)
-	Gnathopod 1: palm, if present, oblique
5.	Flagellum of second antenna $2-4$ articulate or very stout (fig. $1n$) 6
	Flagellum of second antenna slender or more than 8-articulate (fig. $1m$).
6.	Article 2 of pereopods 3–5 quite narrow, linear plea
_	Article 2 of pereopods 3–5 broad, biconvex
7.	Lobe of article 5 on male gnathopod 2 acute brevipes (of Bate 1862)
	Lobe of article 5 on male gnathopod 2 obtuse but narrow lindbergi
8.	Male gnathopod 2 similar to gnathopod 1 humeralis
	Male gnathopod 2 much larger than gnathopod 1 9
9.	Palm of male gnathopod 2 minutely and irregularly serrete its full
	length
	femorata, brevipes, falsa, orientalis, and those of couplet 10
10.	
10.	Gnathopod 1: article 6 extremely slender (fig. 1a).
	orientalis (of J. L. Barnard 1955)
11	Gnathopod 1: article 6 moderately stout
11.	Female gnathopod 2: palm transverse
	Female gnathopod 2: palm oblique

12.	Article 4 of antenna 2 shorter than article 5. species of southern California
13.	Article 4 of antenna 2 as long as or longer than article 5. tea, new species Pereopod 5: article 5 twice as broad as article 6, subequal to 6 in
10.	length
	Pereopod 5: article 5 not broader but much shorter than article 6 mea
14.	Male gnathopod 2 with tooth defining palm
	Male gnathopod 2 lacking palmar defining tooth
15.	Palm of gnathopod 2 transverse, bearing bilobed tubercle in middle
	of palm mitsukurii (see also valida)
	Palm of gnathopod 2 oblique, or with long hind tooth
16.	Distal lobules of lower lip equal in size pollex and volki
	Lateral distal lobules of lower lip much longer than medial lobules 17
17.	Article 6 of male gnathopod 2 not produced anterodistally.
	simulans (=dalli), kussakini Article 6 of male gnathopod 2 produced into a setose lobe anterodistally
	ramondi
18.	Male antenna 2 with dense tufts of setae
	Male antenna 2 lacking dense tufts of setae
19.	Male gnathopod 2: hind margin of article 6 and palm equal in length 20
	Male gnathopod 2: hind margin of article 6 much longer than palm 21
20.	Article 5 of gnathopod 1 shorter than article 6 alluaudi
	Article 5 of gnathopod 1 much longer than article 6.
0.1	brasiliensis (of Oliveira 1953)
21.	Dense setal tufts of antenna 2 confined to article 5 of peduncle and flagellum
	Dense setal tufts of antenna 2 borne on articles 4-5 of peduncle and flagel-
	lum
22.	Finger of gnathopod 1 matching palm brasiliensis and africana
	Finger of gnathopod 1 overlapping palm zachsi
23.	Palm of male gnathopod 2 with a process (not defining)
24.	Palm of male gnathopod 2 lacking a process
24.	Palm of male gnathopod 2 dransverse
25.	Palm of male gnathopod 2 equal to hind margin of article 6 grubiformis
	Palm of male gnathopod 2 much shorter than hind margin of article 6.
	senegalensis
26.	Palm of male gnathopod 1 moderately excavate (fig. 1e)
	Palm of male gnathopod 1 not excavate
27.	Hind lobe of article 5 on gnathopod 1 truncated
00	Hind lobe of article 5 on gnathopod 1 rounded
28.	Male gnathopod 2: article 6 half as wide as long, flagellum of antenna 1 twice as long as flagellum of antenna 2 rubricata
	Male gnathopod 2: article 6 three-fourths as wide as long, flagellum of
	antennae 1–2 subequal in length rubricatoides
29.	Article 5 of gnathopod 1 nearly as long as article 6. djankonovi (in part)
	Article 5 of gnathopod 1 half as long as article 6 marcuzzii
30.	Palm of male gnathopod 2 transverse japonica (in part)
0.5	Palm of male gnathopod oblique
31.	Distal lobules of lower lip equal in size (fig. 1l) japonica (in part)
	Distolateral lobules of lower lip much larger than medial lobules (fig. 1j). 32

32. Palm of male gnathopod 1 short, scarcely evident, finger overlapping palm considerably, article 6 linear (fig. 1d) longimana Palm of male gnathopod distinct, long, finger matching palm, article 6 suboval (fig. 1c) djankonovi (in part)

Not included in the key are A. kergueleni Stebbing (1888), a female, but see Chevreux (1927) for a possibly correct assignment of a male; A. megaloprotopus Stebbing (1895), which probably belongs in the genus Exampithoe because of its enlarged first gnathopod.

Notes on the Literature of Ampithoe

The genus Ampithoe and many of its species are nomenclaturally quite old. Several species have been based on females or juveniles, and this early confusion still has not been straightened out.

The most important and involved situation is that concerning Ampithoe femorata Krøyer and A. brevipes Dana. Stebbing (1906), without new material, recognized both species but noted their close affinities. By evidence of his synonymies, he considered A. gaudichaudii Milne Edwards a senior synonym of A. femorata, and he included questionably in A. brevipes the species A. peregrina Dana and A. falklandi Bate. These species are scattered widely in the Southern Hemisphere on both sides of South America. Chilton (1921) also reported A. femorata from the Juan Fernandez Islands.

Schellenberg (1931) combined femorata and brevipes and their synonyms, including K. H. Barnard's (1916) reference to brevipes. K. H. Barnard (1932) gave a new name, falsa, to his 1916 brevipes identification from South Africa, but reported on brevipes from the Falkland Islands and mentioned A. chilensis as a possible synonym. Stephensen (1949) reported brevipes from Tristan da Cunha (again) noting the characteristic swelling of article 4 of pereopods 1-2. J. L. Barnard (1952) erroneously identified femorata from California. retrospect, I relied upon Bate's (1862) figure of brevipes (pl. 43, fig. 2) showing the short flagellum of antenna 2. My identification should be referred to A. lindbergi. The early drawings and descriptions of brevipes, falklandi, peregrina, gaudichaudii, and chilensis leave much to be desired in comparison to the better described A. femorata. The gnathopods of the supposedly female falklandi are rather stouter than expected for brevipes, and the fifth article has a posterior lobe. strongly question that falklandi is a synonym of brevipes, as figured in the literature, although falklandi seems to fit brevipes as to be expected of a female. There are discrepancies in the stoutness of article 4 of pereopods 1-2 in the various figures of Bate (1862). Considering the situation in California of several Ampithoes such as humeralis, lindbergi mea, tea, and plea, all very difficult to separate in female, juvenile, and

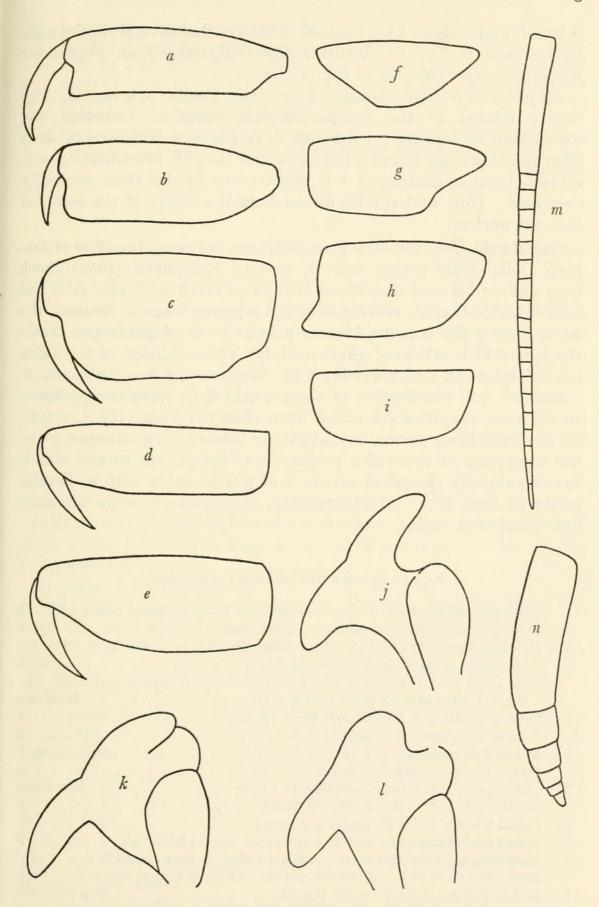

FIGURE 1.—Schematic diagrams of gnathopods, lower lips, and second antennae as represented in keys of *Ampithoe: a-e*, articles 6-7 of first gnathopods; *f-i*, article 5 of first gnathopods; *j-l*, lower lips (halves); *m*, *n*, second antennae.

subadult male stages, I am inclined to believe that several species may be involved in the Falkland-Magellan-Valparaiso-Juan Fernandez femorata-brevipes complex as it now stands.

Ampithoe orientalis (Dana), a tropical Pacific species, is very closely related to the brevipes-femorata complex, including the eoa-mea-annenkovae group; although J. L. Barnard (1955) reported it from the Hawaiian Islands, I am not sure that his identification was correct, because gnathopod 1 is much more slender than originally described. How that species differs from the others of the complex is as yet unclear.

One should note the strong resemblance between Ampithoe mitsukurii Della Valle (1893) and A. tarasovi Bulycheva (1952), both from Japan; because Ampithoes change so much with age, it is not inconceivable that A. mitsukurii is but a young stage of tarasovi, the latter having the broader, blunter palmar tooth of gnathopod 2 and the longer fifth article of gnathopod 1. The condition of the third pleonal epimeron and lower lip is not clear, to my knowledge, in A. mitsukurii and clarification of these would help solve the problem. In addition, Ampithoe mitsukurii bears close checking with A. valida, for the latter has a narrow medial palmar tubercle on gnathopod 2 and the suggestion at times of a projection at the palmar corner; also it has the slightly elongated article 5 of gnathopod 1 with a distally produced hind lobe. Most probably, A. mitsukurii is an aberrant individual of A. valida.

Key to Species of California Ampithoe

1.	Third pleonal epimeron with a small point at lower posterior corner 2
	Third pleonal epimeron rounded at lower posterior corner
2.	Male gnathopod 1: article 5 with a large, distally produced hind lobe (fig.
	1h), lobes of lower lip bulbous (fig. $1k$) valida
	Male gnathopod 1; article 5 with poorly developed unproduced hind lobe
	(fig. $1f$), lobes of lower lip slender (fig. $1j$) lacertosa
3.	Palm of gnathopod 1 transverse (figs. $1a, b$) 4
	Palm of gnathopod 1 oblique (figs. $1c-e$)
4.	Article 2 of pereopods 3–5 narrow plea (in part)
	Article 2 of pereopods 3–5 broad
5.	Gnathopods 1–2: article 5 equals 6 in length humeralis
	Gnathopods 1–2: article 5 shorter than 6 6
6.	Apical lobes of lower lip projecting equally
	Apical lateral lobes of lower lip longer than medial lobes
7.	Male antenna 2: peduncle stout, article 4.90% as long as article 5 sp.
	Male antenna 2: peduncle slender, article 4 120% as long as article 5 tea
8.	Article 6 of gnathopod 1 stout (fig. 1b) plea (in part)
0	Article 6 of gnathopod 1 slender (fig. 1a) lindbergi
9.	Lobe on article 5 of gnathopod 1 distally produced
	Lobe on article 5 of gnathopod 1 rounded behind (figs. $1f, g, i$) 12

10.	Lobules of lower lip slender, separated
	Lobules of lower lip stout, appressed (fig. 1k) valida
11.	Antenna 2 normally setose in male ramondi
	Antenna 2 strongly setose in male plumulosa
12.	Lobules of lower lip bulbous and appressed (fig. 1k) pollex
	Lobules of lower lip slender and separated
13.	Palm of gnathopod 1 obsolescent, article 5 as long as 6 (fig. 1d) . longimana
	Palm of gnathopod 1 distinct, article 5 much shorter than 6 (fig. 1e).

Ampithoe humeralis Stimpson

FIGURES 2-3

Amphithoe [sic] humeralis Stimpson, 1864, p. 156.—Calman, 1898, pp. 271–273, pl. 33, fig. 4.—Holmes. 1904, p. 241.—Hewatt, 1946, pp. 199, 204.

Ampithoe humeralis.—Stebbing, 1906, p. 636—J. L. Barnard, 1954, p. 29.

Diagnosis: Second and third pleonal epimera rounded behind, with slight lateral ridges; article 5 of male gnathopod 1 longer than article 6, hind edge truncated, not lobate, article 6 rectangular, slender, palm transverse or slightly chelate, finger overlapping palm by its full length; gnathopod 2 like gnathopod 1 except article 5 is slightly shorter, although longer than article 6, and with a distinct, rounded hind lobe; article 6 like that of gnathopod 1; article 2 of pereopods 1–2 about 1.7 times as long as broad; ventral edge of article 1 on antenna 1 lacking ventral spines; antenna 1 much longer than antenna 2, flagellum about four times as long as flagellum of antenna 2, neither flagellum strongly setose; lateral apical lobule of lower lip much longer than medial lobule, coxa 1 not produced forward; peduncular process or uropod 1 long.

Female: Like the male.

Material: Velero stations 1206 (7), 1409 (5), 1489 (1), 2052 (1), 4806 (2), 4822 (2). Barnard stations 33 (1), 42–C–7 (1). Oceanographic Lab., Friday Harbor, Wash., Aug. 16–29, 1949, coll. Dr. J. L. Mohr (13). Guadalupe Island, Dec. 9, 1946, 26–29 fms., coll. Dr. Carl L. Hubbs (1).

Records: Intertidal: Friday Harbor, Wash.; North Bay, Cape Arago State Park, Oreg.; Hazard Reef, S. of Morro Bay, Calif. Islands off southern California: San Nicolas 4–9 fms.; Santa Barbara, 26–39 fms. Point Conception, Calif., 8–9 fms.; off Long Beach, Calif., 13 fms.; Off La Jolla, Calif., 1 fm. Guadalupe Island, Baja California, 26–29 fms.

Relationship: This species is unique in *Ampithoe* for having the male and female gnathopods identical, the male gnathopod 2 being as small as gnathopod 1.

Young males and females are difficult to separate from A. plea, A. lindbergi, A. mea, and A. tea.

Distribution: Puget Sound to Guadalupe Island.

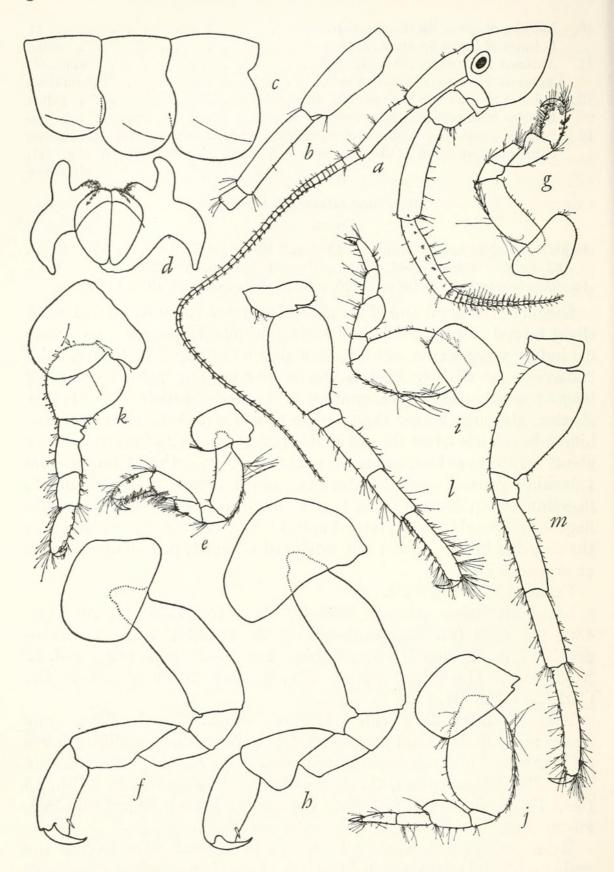

FIGURE 2.—Ampithoe humeralis Stimpson, male, 22 mm., sta. 1206: a, head; b, peduncle of antenna 1; c. metasome; d, lower lip; e, f, gnathopod 1; g, h, gnathopod 2; i-m, pereopods 1, 2, 3, 4, 5.

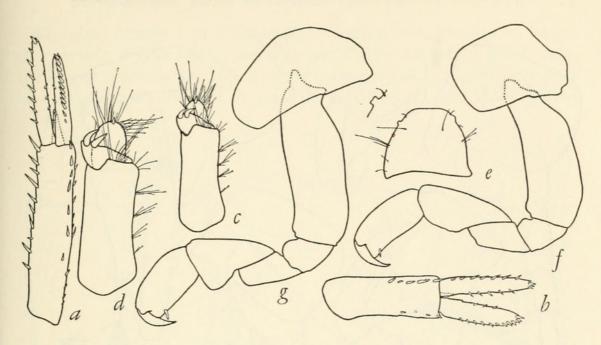

FIGURE 3.—Ampithoe humeralis Stimpson, male, 22 mm., sta. 1206: a-d, uropods 1, 2, 3, 3; e, telson; female, 19 mm.: f, g, gnathopods 1, 2.

Ampithoe lacertosa Bate

FIGURES 4-5

Amphithoë [sic] lacertosa Bate, 1858, p. 362; 1862, pp. 236–237, pl. 41, fig. 5.

Ampithoe lacertosa.—Stebbing, 1906, pp. 633–634.—J. L. Barnard, 1954, pp. 31–33, pls. 29–30.—Nagata, 1960, pp. 175–176, pl. 16, figs. 95–96.

Amphithoë macrurus Stephensen, 1944, pp. 80-83, figs. 30-31.

Dexamine scitulus Harford, 1877, p. 116.

Amphithoë scitulus Holmes, 1904, pp. 314-315, pl. 36, figs. 21-24.

? Amphithoë Stimpsoni Boeck, 1871, pp. 14-15, fig. 5.

Diagnosis: Second and third pleonal epimera with a point at the lower posterior corners; articles 5 and 6 of male gnathopod 1 subequal in length, posterior edge of article 5 formed of a broad, flat lobe bluntly projecting distally, palm oblique; male gnathopod 2 with large rounded lobes on articles 2 and 3, article 5 with an intermediate-sized hind lobe, article 6 greatly elongated, subrectangular, palm transverse, slightly sinuous, slightly cheliform, dactylus stout, fitting palm, apically blunt; article 2 of pereopods 1–2 about 2.2 times as long as broad; ventral edge of article 1 of antenna 1 with several spines; antenna 1 reaching farther than antenna 2, its flagellum about twice as long as flagellum of antenna 2, both flagella poorly setose, but long and with numerous articles; outer apical lobule of lower lip twice as long as inner lobule, peduncle of uropod 3 elongated; peduncular process of uropod 1 poorly developed.

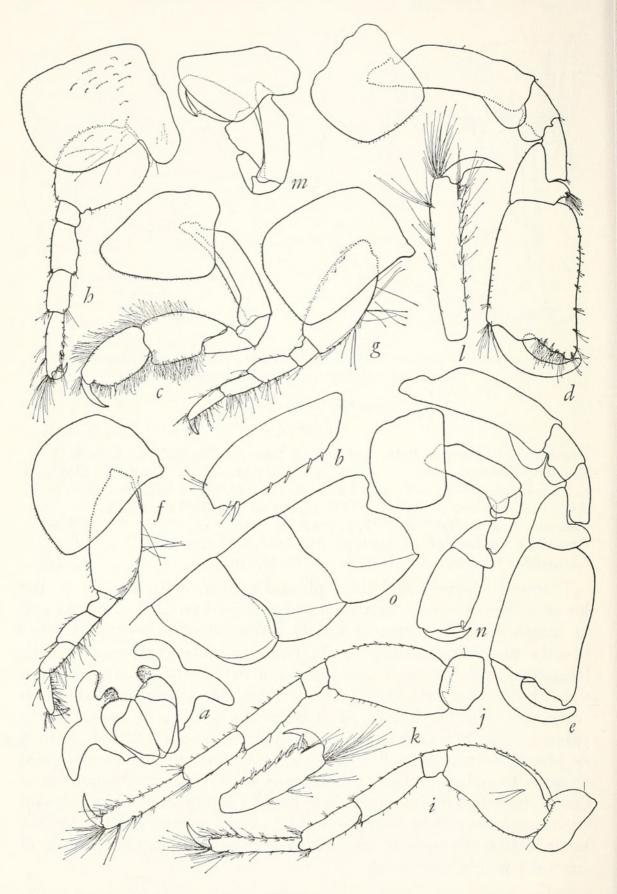

FIGURE 4.—Ampithoe lacertosa Bate, male, 22 mm., sta. 1455: a, lower lip; b, article 1 of antenna 1; c, gnathopod 1; d, e, gnathopod 2; f-j, pereopods 1, 2, 3, 4, 5; k, l, ends of pereopods 3, 5; o, metasome; male, 11 mm., Barnard sta. 33: m, n, gnathopods 1, 2.

Females: Article 5 of gnathopod 1 ranging from shorter to longer than article 6 (the latter, see Nagata, 1960), the larger the female, the longer is article 5. Hence, the gnathopods of young females may be confused with those of A. valida and indeed are like those figured

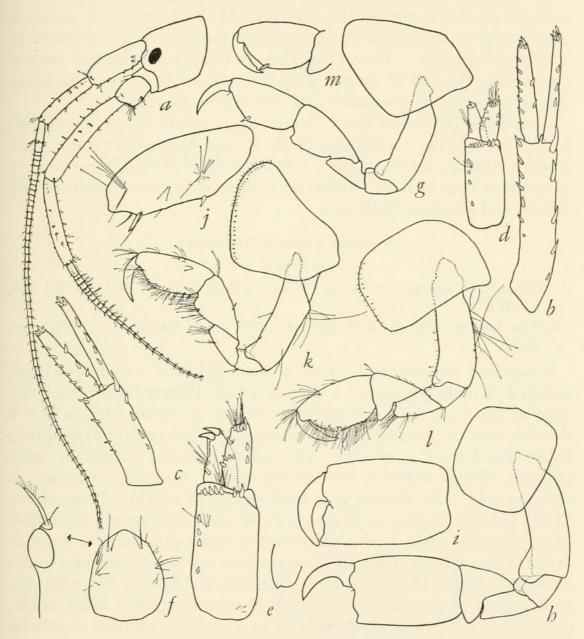

Figure 5.—Ampithoe lacertosa Bate, male, 22 mm., sta. 1455: a, head; b-e, uropods 1, 2, 3, 3; f, telson; male, 15 mm., Barnard sta. 33: g-i gnathopods 1, 2, 2; female, 12.5 mm., Barnard sta. 33: j, article 1 of antenna 1; k-m, gnathopods 1, 2, 2.

by Nagata for A. valida. Gnathopod 2 with article 5 like the male article 5 of gnathopod 2; article 6 a slightly stouter version of the same article in gnathopod 1.

Material: Velero stations 1455 (1), 1646 (1). Barnard station 33 (12). Records: California: Pacific Grove, intertidal; Santa Catalina Island, intertidal; La Jolla, 1 fm.

Remarks: Dexamine scitulus Harford, the type of which was refigured by Holmes (1904), apparently is a female of this species.

The most important clues are the lengths of the antennal flagella and the produced points of the second and third pleonal epimera, unique to this species.

Possibly A. stimpsoni Boeck, from San Francisco, represents a young male of this species, although it could also represent A. japonica Stebbing or A. djakonovi Gurjanova, two species which may occur in northern California. Bate (1862) shows this species having uropod 3 exceeding the end of uropod 2 by a considerable degree. In these southern specimens of smaller size, this is not the case.

Distribution: "Arctic Seas" (Bate 1862), a cold temperate species barely penetrating to tropical limits in the warm temperate, from Kodiak Alaska, south to the Shizueka Prefecture in Japan and to Magdalena Bay in Baja California, with records from Oregon, Puget Sound, and southern California.

Ampithoe lindbergi Gurjanova

FIGURES 6-7

Amphithoe [sic] lindbergi Gurjanova, 1938, pp. 351-354, fig. 49; 1951, pp. 892-895, fig. 620.

Ampithoe femorata Krøyer.—J. L. Barnard, 1952, pp. 24-28, pls. 6-7 (not Krøyer, 1845).

Diagnosis: Second and third pleonal epimera rounded behind; article 6 of male gnathopod 1 slightly longer than article 5, posterior edge of article 5 with a broadly truncated posterior lobe, article 6 slender, rectangular, palm short, transverse, finger greatly overlapping palm; gnathopod 2 of male with subrectangular article 6, palm oblique, slightly concave, but clearly defined, minutely crenulate at defining area, palm shorter than hind margin of article 6, finger short, fitting palm or slightly overlapping it, article 2 with poorly developed distal bump; article 2 of pereopods 1–2 about 2.0 times as long as broad; ventral edge of article 1 on antenna 1 with at least one spine; antenna 1 longer than antenna 2, flagellum nearly four times as long as flagellum of antenna 2; flagellum of antenna 2 very short, stout, strongly setose, progressively decreasing in male in number of articles from about 6 to 3; apical lobules of lower lip short, subequal in length; coxa 1 not produced forward; peduncular process of uropod 1 long.

Female: Gnathopod 1 similar to that of male, article 5 slightly shorter; gnathopod 2 like gnathopod 1 but article 5 even shorter and with moderately well-developed, but rather stout hind lobe; antenna 2 generally with 1-3 more flagellar articles than in male.

Material: Velero station 1664 (15). Barnard stations 27 (3), 42–T–5 (1 juv.?), 42–T–6 (2), 42–T–7 (1), 42–C–7 (2), 43–B–3 (2). Point Fermin, Calif., Jan. 14, 1949, coll. Dr. J. L. Mohr (2).

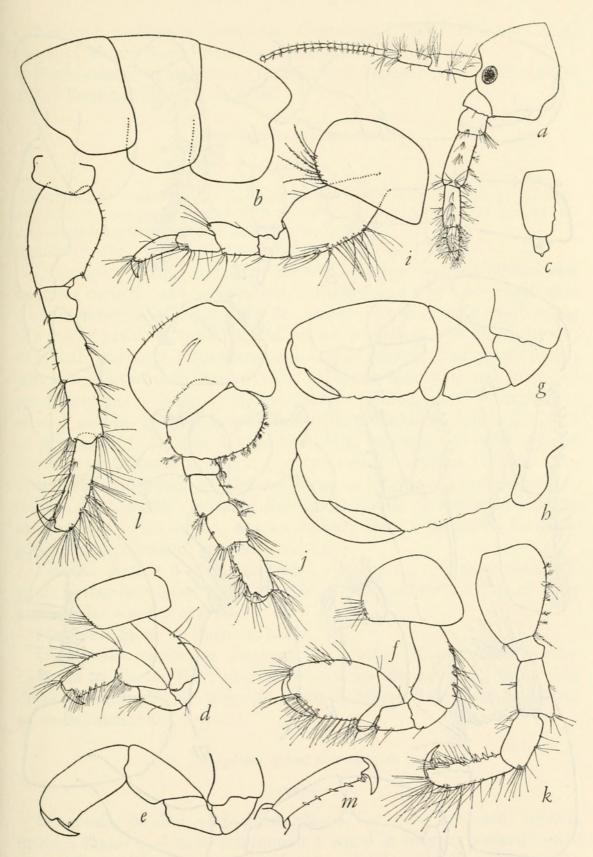

FIGURE 6.—Ampithoe lindbergi Gurjanova, male, 12.0 mm., sta. 1664: a, head; b, metasome; c, flagellum of antenna 2; d, e, gnathopod 1; f-h, gnathopod 2; i-l, pereopods 1, 3, 4, 5; m, end of pereopod 5.

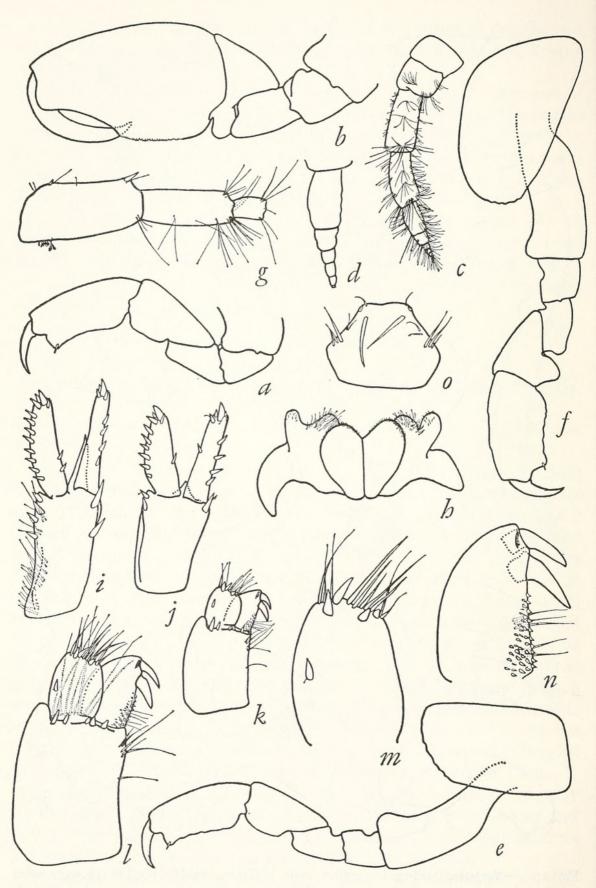

FIGURE 7.—Ampithoe lindbergi Gurjanova, station 1664: a, b, gnathopods 1, 2, male, 11.5 mm.; c-g, female, 9.0 mm.: c, antenna 2; d, flagellum of antenna 2; e, f, gnathopods 1, 2; g, peduncle of antenna 1; h-o, male, 12.0 mm.: h, lower lip; i-l, uropods 1, 2, 3, 3; m, n, inner and outer rami of uropod 3; o, telson.

Records: California intertidal: Cayucos; Hazard Canyon Reef, south of Morro Bay; Point Fermin; Santa Cruz Island.

Distribution: Bering Sea, Okhotsk Sea, Japan Sea to California at Point Fermin, near Los Angeles.

Ampithoe longimana Smith

FIGURE 8

Amphithoë [sic] longimana Smith, 1873, pp. 563-564.—Holmes, 1905, p. 509, fig. Amphithoe longimana.—Kunkel, 1910, pp. 87-90, fig. 34; 1918, pp. 147-149, fig. 43. Amphithoë longimana.—Pearse, 1912, p. 376.

Ampithoe longimana.—J. L. Barnard, 1959, pp. 36-37, pl. 12.

Diagnosis: Second and third pleonal epimera rounded behind and at lower corners, no lateral ridges; articles 5 and 6 of male gnathopod 1 equal in length, slender, palm obsolescent, finger greatly overlapping the end of article 6, hind edge of article 5 shallow, not lobed, broad, flat; male gnathopod 2 rather small, scarcely larger than gnathopod 1, article 5 shorter than 6 and with subacute hind lobe not strongly projecting, palm oblique, sinuous, sharply defined, finger fitting palm; second articles of both gnathopods with anterodistal lobes; article 2 of pereopods 1–2 about 2.5 times as long as broad; ventral edge of article 1 on antenna 1 with one or two spines; antenna 1 longer than 2, flagellum of antenna 1 about 3 times as long as that of antenna 2, flagella both poorly setose, outer apical lobule of lower lip slightly longer than inner lobule, not appressed; coxa 1 produced forward; peduncular process of uropod 1 vestigial.

Female: Article 5 of gnathopod 1 slightly shorter than article 6, palm better developed than in male; gnathopod 2 like that of male

but articles 5 and 6 shorter.

Material: Same as Barnard 1959.

Distribution: Atlantic coast of the United States, from Massachusetts to Florida Bay, Fla.; Bermuda; Pacific America from Bahía de San Quintín, Baja California north to Morro Bay, Calif., confined to embayments and lagoons.

Ampithoe plea, new species

FIGURES 9, 10

Diagnosis: Second and third pleonal epimera rounded behind; articles 5 and 6 of male gnathopod 1 equal in length, posterior edge of article 5 with a truncate, rather broad lobe, article 6 rectangular but not very slender, palm well developed, slightly oblique, well defined, finger scarcely overlapping palm; gnathopod 2 in terminal male with article 6 greatly elongated, the full hind margin representing the palm, with a blunt process near the finger hinge, article 7 long,

curved, reaching to end of palm or the full length of article 6, article 2 with poorly developed distal bump; article 2 of pereopods 1 and 2 about 2.0 times as long as broad; ventral edge of article 1 on antenna

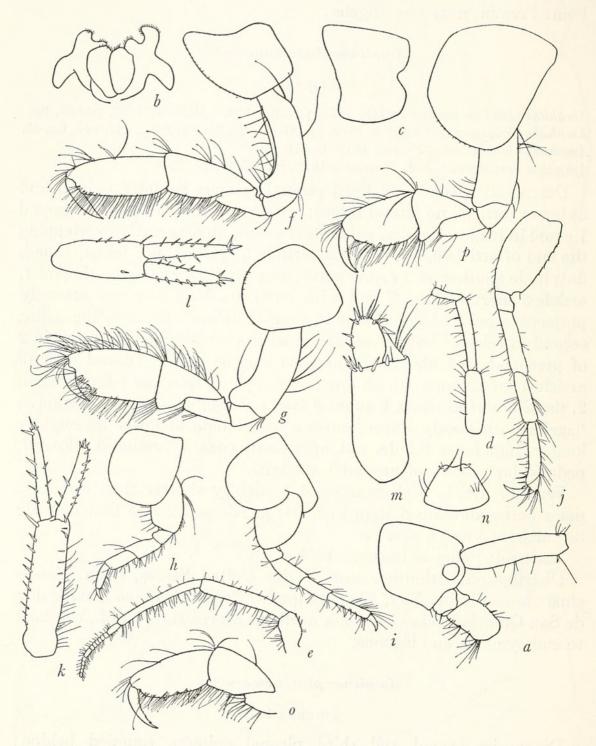

Figure 8.—Ampithoe longimana Smith, male, 9.0 mm., Newport Bay, Calif. (redrawn after Barnard 1959): a, head; b, lower lip; c, pleonal segment 3; d, e, parts of antennae 1, 2; f, g, gnathopods 1, 2; h-j, pereopods 2, 3, 5; k-m, uropods 1, 2, 3; n, telson; female, 9.0 mm.: o, p, gnathopods 1, 2.

1 with a few distal setae; antenna 1 somewhat longer than antenna 2, flagellum four times as long as that of antenna 2; flagellum of antenna 2 very short, stout, about 8-articulate, article 1 of flagellum

especially stout but elongated, conspicuously setose; lateral apical lobule of lower lip projecting more than medial lobule; coxa 1 not produced forward; peduncular process of uropod 1 long.

Female: Flagellum of antenna 2 slender; gnathopod 1 like male but article 5 slightly shorter than 6, article 6 slightly more slender,

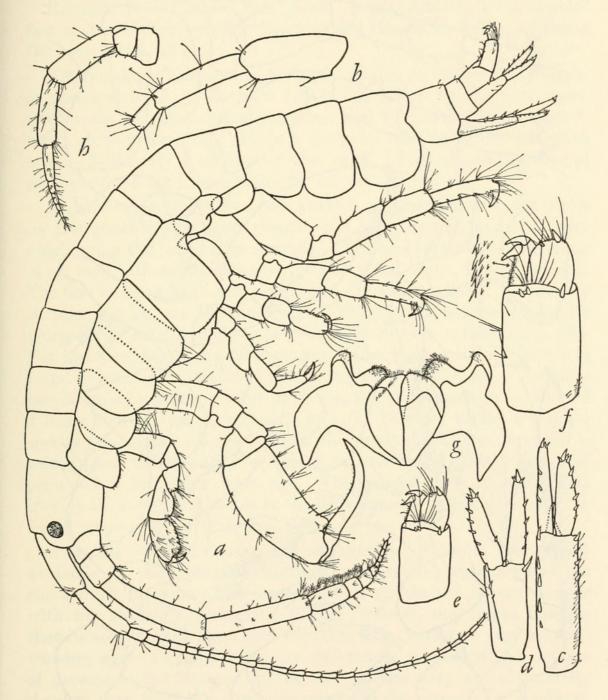

Figure 9.—Ampithoe plea, new species, holotype, male, 8.5 mm., sta. 4806: a, lateral view; b, peduncle of antenna 1; c-f, uropods 1, 2, 3, 3; g, lower lip; female, 7.5 mm.: h, antenna 2.

palm shorter and finger shorter; gnathopod 2 like gnathopod 1 but article 5 short, with moderately better developed hind lobe, articles 6 and 7 slightly stouter than in gnathopod 1; article 2 of both gnathopods with posterodistal edge serrate and strongly setose.

Young male: Gnathopod 2 with shorter finger, process of palm scarcely developed. Apparently with age some second antennal flagellar segments are lost because the young male here has 10 flagellar articles and the terminal male only 8.

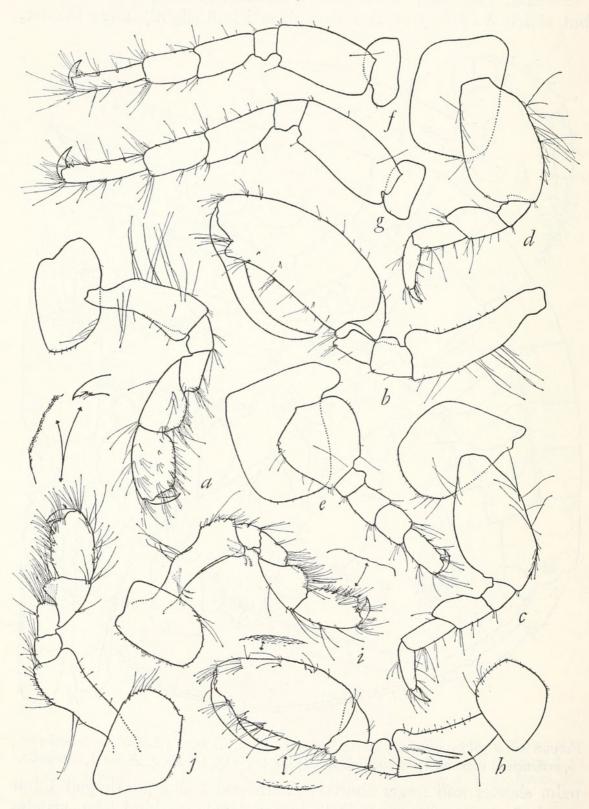

FIGURE 10.—Ampithoe plea, new species, holotype, male, 8.5 mm., sta. 4806: a, b, gnathopods 1, 2; c-g, pereopods 1, 2, 3, 4, 5; young male, 4.5 mm.: h, gnathopod 2; female, 7.5 mm.: i, j, gnathopods 1, 2.

Holotype: Allan Hancock Foundation No. 5737, male, 8.5 mm. Type locality: Velero station 4806, Palos Verdes Headland, Los Angeles Co., Calif., 33-44-13 N., 118-23-08 W., 8 fms., Jan. 6, 1957. Material: Velero stations 4806 (8), 4823 (1 juv.?) 4956 (1). Campbell station 5 (juv. 1?).

Records: Near Coal Oil Point, Calif., 8 fms.; Goleta, living in hold-fast of *Macrocystis pyrifera*; Palos Verdes Headland, Calif.; off Santa Barbara, Calif., 17 m.

Relationship: This species is closely related to A. orientalis Dana, as reviewed by J. L. Barnard (1955) but differs by the very short, stout male second antennal flagellum and by gnathopod 1 which is much stouter, especially article 6, its palm well developed and with article 7 scarcely overlapping the palm. The second articles of pereopods 1–5 are more slender in the new species.

Ampithoe mea Gurjanova (see 1951) is another relative, but again its first gnathopod is more slender, the palm shorter, and the finger overlapping the palm more strongly. The second antennal flagellum of A. mea, although tending to be short and stout, has 22 articles. The first antenna has a stout spine on peduncular article 1. Probably A. mea and A. eoa Gurjanova (see 1951) are synonomous despite Gurjanova's careful analysis of their differences in a table on p. 885. For instance, her figure of pereopod 3 (fig. 616) is indeed pereopod 2 and so is not comparable to the third pereopod of A. eoa. Ampithoe mea is simply a younger stage of A. eoa, the male finger on gnathopod 2 being shorter (see A. orientalis in J. L. Barnard [1955] and other species of Ampithoe herein, where the gnathopodal development is traced) and the disparity in thickness between articles 5 and 6 of pereopod 5 increasing with age. The present new species differs from both A. mea and A. eoa in the development of a process near the finger hinge in adult male gnathopod 2.

Ampithoe lindbergi Gurjanova (see 1951) is a distinct species also available in the present collections. Its second antenna has the short thick flagellum, but again its first gnathopod is very slender with the strongly overlapping finger; however, one might imagine that its second gnathopod could develop into that of A. plea with advancing age. Perhaps there are differences in the second articles of pereopods 3–5 because in the new species they are abnormally slender; they have not been described for the types of A. lindbergi.

Ampithoe annenkovae Gurjanova (see 1951) is another species with the long palm and finger of male gnathopod 2. Its second antennal flagellum is slender although only 9-articulate and perhaps the antenna shown is for the female. If so, and the male antenna had been broken, it would be conceivable that A. annenkovae males are

simply terminations of those of A. lindbergi. The male palmar border of gnathopod 2 in A. annenkovae is furnished irregularly with serrate bumps. The female gnathopod 2 of A. annenkovae is remarkably like the male second gnathopod of A. lindbergi.

Distribution: Southern California.

Ampithoe plumulosa Shoemaker

Figures 11, 12

Ampithoe plumulosa Shoemaker, 1938, pp. 16-19, fig. 1; 1942, p. 39.—J. L. Barnard, 1959, p. 37.

Diagnosis of male: Second and third pleonal epimera rounded behind and at lower corners, no lateral ridges; article 5 of gnathopod 1 shorter than 6, hind edge with a truncated lobe, acutely, but slightly, projecting distally, palm obsolescent; gnathopod 2 with elongated rectangular article 6, palm oblique, sinuous, palmar corner well defined, finger stout, curved, fitting palm, article 5 with narrow subacute hind lobe; second articles of both gnathopods with rounded anterodistal lobes, aberrantly acute in gnathopod 2 (fig. 11i); article 2 of pereopods 1–2 about 2.4 times as long as broad; ventral edge of article 1 of antenna 1 spiniferous; antenna 1 longer than 2, its flagellum much longer than that of antenna 2, flagellum of antenna 2 scarcely longer than article 5 of peduncle but more than 20-articulate, flagellum and article 5 of peduncle densely setose; outer apical lobules of lower lip slender and much longer than medial lobules; coxa 1 produced forward; peduncular process of uropod 1 vestigial.

Female: Gnathopod 2 with a more oblique, but less sinuous palm

than in male, hind lobe of article 5 more obtuse.

Material: Velero stations 878 (1), 1041 (1), 1221 (7), 1440 (1), 1449 (40), 1508 (1), 1509 (4), 2000 (1), 2066 (2), 2080 (19), 4822 (2), 4852 (1), 5364 (3), 5564 (2). Barnard stations 33 (5), 36 (3), 37 (45). Glorietta Bay, San Diego Bay, Mar. 19, 1950, coll. Dr. J. L. Mohr (15); Dana Point, Calif., Jan. 25, 1948, in Phyllospadix, coll. Dr. J. L. Mohr (3). Black Warrior Lagoon, Baja California, Mar. 21, 1956, coll. Drs. J. Soule and W. K. Emerson, station 336 (1).

Records: California intertidal at Santa Catalina Island, Newport Bay, Corona del Mar. Baja California intertidal at Punta Eugenia, 20 miles east of Punta Eugenia, Punta Santa Rosalía, Millers Landing on "west" side of Bahia Sebastian Viscaino. Cedros Island on Phyllospadix. California subintertidal: near Point Conception 9 fms., Gaviota 8 fms., Point Mugu 9 fms., Anacapa Island 15 fms., Newport 11 fms., La Jolla 1 fm. Mexico: Guaymas.

Distribution: British Columbia to Ecuador.

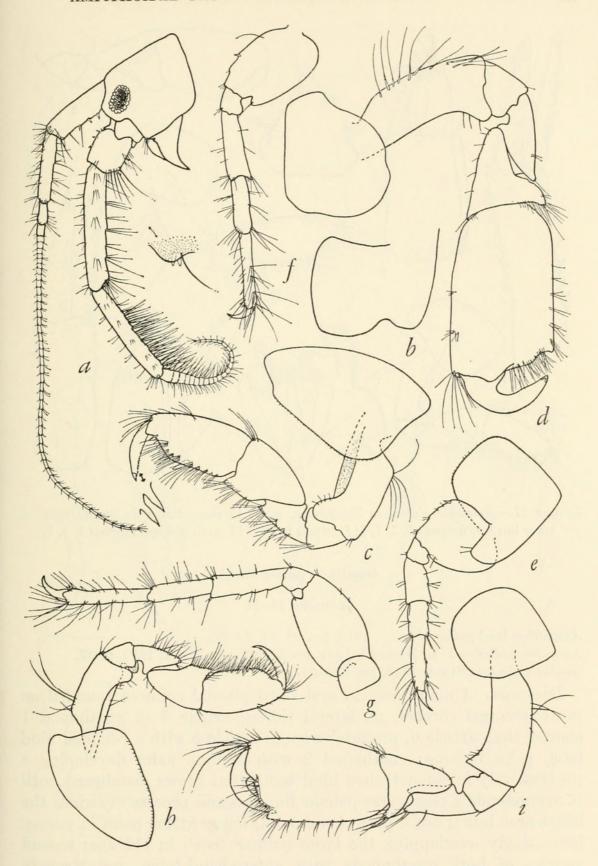

Figure 11.—Ampithoe plumulosa Shoemaker, maie, 13 mm., Bahía de San Quintín: a, head; b, third pleonal epimeron; c, d, gnathopods 1, 2; e-g, pereopods 3, 4, 5; younger male: h, i, gnathopods 1, 2.

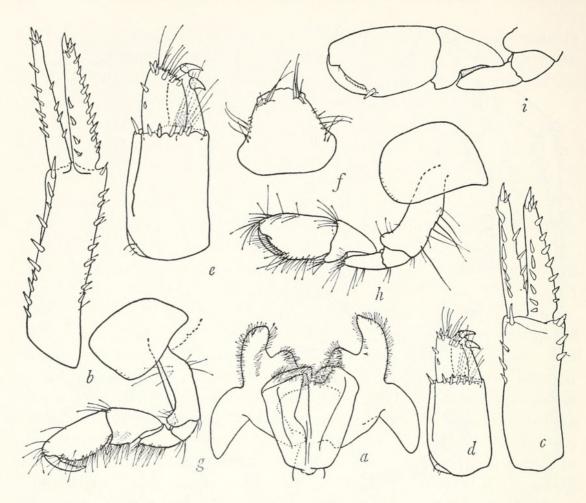

FIGURE 12.—Ampithoe plumulosa Shoemaker, male, 13 mm., Bahía de San Quintín: a, lower lip; b-e, uropods 1, 2, 3, 3; f, telson; female, 12 mm.: g-i, gnathopods 1, 2, 2.

Ampithoe pollex Kunkel

FIGURES 13-14

Amphithoe [sic] pollex Kunkel, 1910, pp. 92–94, fig. 36. Ampithoe pollex.—J. L. Barnard, 1954, pp. 29–31, pls. 27–28; 1959, p. 37. Grubia indentata Stout, 1913, pp. 656–657.

Diagnosis of male: Second and third pleonal epimera rounded on posteroventral corners, no lateral ridges; article 5 of gnathopod 1 shorter than article 6, posterior edge of article 5 with a rounded hind lobe, palm oblique; gnathopod 2 with oblique palm developing a progressively larger detached hind tooth that grows distalward until it overextends a transverse palmar line; a small process overrides the hinge area but is not a part of the palm; finger fitting palm in young, increasingly overlapping the large palmar tooth in old age; second articles of both gnathopods with anterodistal lobes, not strongly prominent in gnathopod 2; article 5 of gnathopod 2 with a slender, subobtuse hind lobe; article 2 of pereopods 1–2 about 3.2 times as long as broad; ventral edge of article 1 of antenna 1 not spiniferous; antenna 2 slightly longer than antenna 1, flagellum of antenna 1

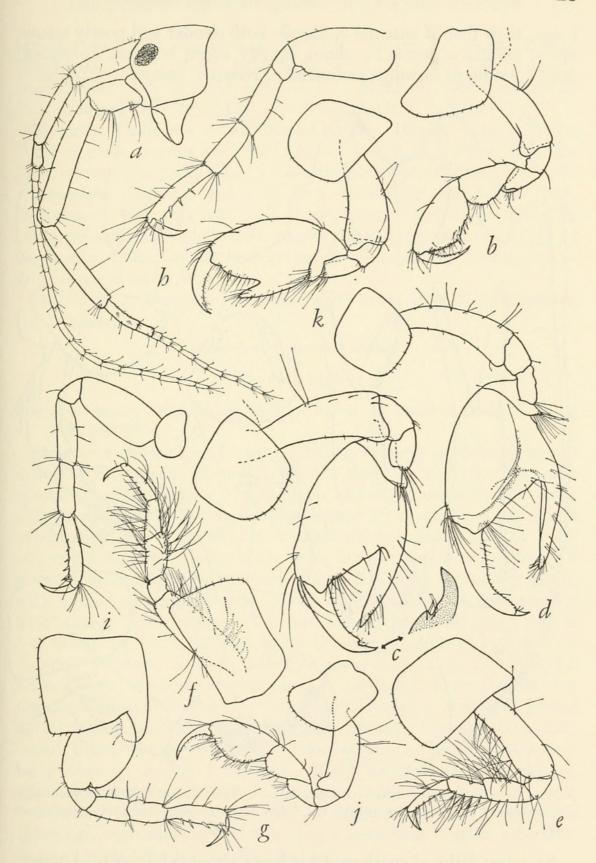

Figure 13.—Ampithoe pollex Kunkel, male, 5.0 mm., Bahía de San Quíntín: a, head; b, gnathopod 1; c, d, gnathopod 2; e-i, pereopods 1, 2, 3, 4, 5; young male, 4.0 mm.: j, k, gnathopods 1, 2.

longer than that of antenna 2, flagella both slender and poorly setose; apical lobules of lower lip about equally short, bulbous, appressed; coxa 1 produced forward; peduncular process of uropod 1 vestigial.

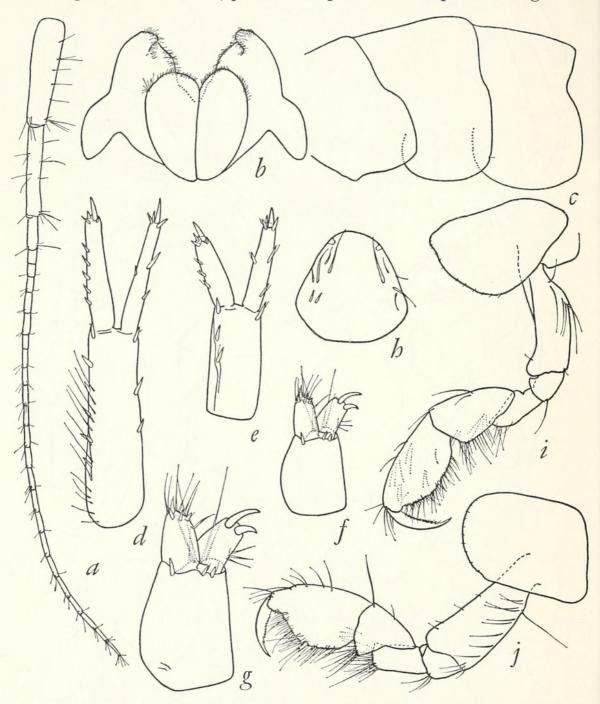

Figure 14.—Ampithoe pollex Kunkel, male, 5.0 mm., Bahía de San Quintín: a, antenna 1; b, lower lip; c, metasome; d-g, uropods 1, 2, 3, 3; h, telson; female, 6.0 mm.: i, j, gnathopods 1, 2.

Females: Palm of gnathopod 2 oblique, about as long as hind margin of article 6, article 5 with subacute hind lobe, broader than in male gnathopod 2.

Material: Velero station 1933 (1). Barnard stations 13 (26), 21 (2), 31 (21), 1 (40), 9 (23), 38 (11 samples with 154 specimens), 42 (14

samples with 151 specimens), 43 (10). Estero de Punta Banda (Ensenada), Mar. 21–23, 1951, coll. Dr. J. L. Mohr (20); Laguna Beach, Calif., Jan. 24, 1948, coll. Dr. J. L. Mohr (8); Coronado Yacht Harbor, San Diego Bay, Mar. 19, 1950, coll. Dr. J. L. Mohr (10).

Records: California intertidal at Cayucos, Hazard Canyon Reef, Point Fermin, Corona del Mar, Laguna Beach, San Diego Bay, La Jolla, Santa Catalina Island, Estero de Punta Banda, Baja California.

Remarks: Ampithoe pollex is very closely related to A. folki, Gurjanova (1938 and 1951); all of the differences that are noted in antennae and gnathopods between the drawings herein and those of Gurjanova (1951) could be attributed to mounting techniques or expressions of infraspeciation.

Distribution: Bermuda; eastern Pacific from Oregon to northern Baja California.

Ampithoe ramondi Audouin

FIGURES 15, 16

Ampithoe ramondi.—Shoemaker, 1942, p. 40.—J. L. Barnard, 1955, pp. 28-29 (with references).

Diagnosis: Second and third pleonal epimera rounded behind; article 5 of male gnathopod 1 shorter than 6, hind lobe truncate, poorly developed, article 6 rectangular and rather slender, palm very oblique and poorly developed but defined by a strong spine, finger overlapping palm; gnathopod 2 with oblique and excavate palm strongly defined by a subacute process, distal anterior end of article 6 strongly produced, heavily setose, article 6 rather long for the genus, with a moderately developed, broad and blunt hind lobe, article 2 with a large blunt lobe at anterodistal corner; article 2 of pereopods 1-2 about 2.5 times as long as broad; ventral edge of article 1 on antenna 1 setose, antenna 1 longer than antenna 2, flagellum 2.5 times as long as flagellum of antenna 2, antenna 2 moderately setose, flagellum slender, slightly longer than peduncular article 5; lateral apical lobule of lower lip projecting strongly, medial lobule very broad, blunt, scarcely projecting; coxa 1 produced forward; peduncular process of uropod 1 vestigial. Body bleached clear in alcohol, eyes dense eosin in color.

Female: Gnathopod 1 like that of male, gnathopod 2 typical of *Ampithoe*, with short article 5 having a somewhat broader lobe than normal, palm oblique, slightly concave.

Material: Velero stations 1378 (1), 4861 (2), 4938 (2), 5631 (2), 6206 (5).

Records: The medial apical lobule of the lower lip figured by Chevreux and Fage (1925) (as A. vaillanti) is more slender and more projecting than in the present material from California.

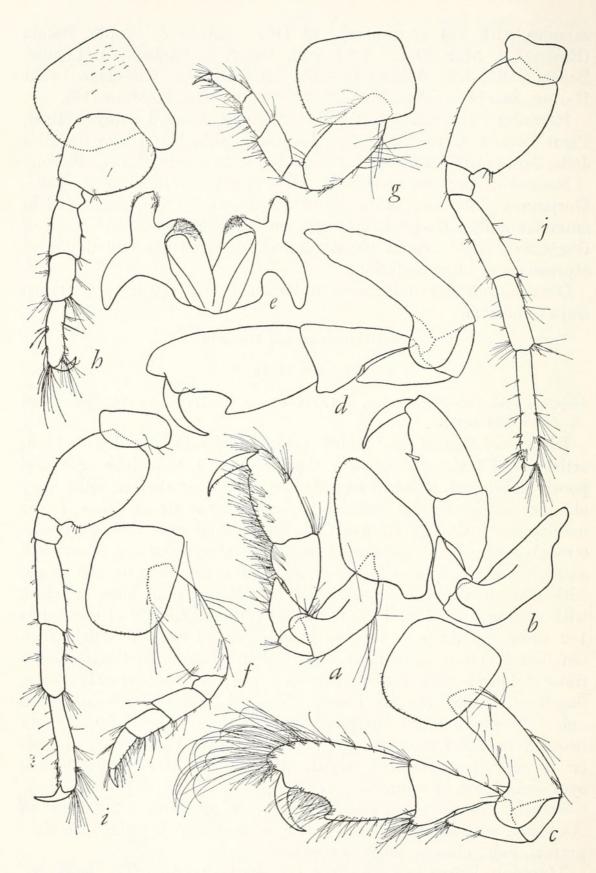

Figure 15.—Ampithoe ramondi Audouin, male, 11.5 mm., sta. 6206: a, b, gnathopod 1: c, d, gnathopod 2; e, lower lip; f-j, pereopods 1, 2, 3, 4, 5.

Relationship: This species resembles A. simulans in its juvenile form but differs by the distally produced article 5 of gnathopod 1.

Distribution: Circumtropical. Most northerly mainland shelf record in California is at San Mateo Point, north of Oceanside.

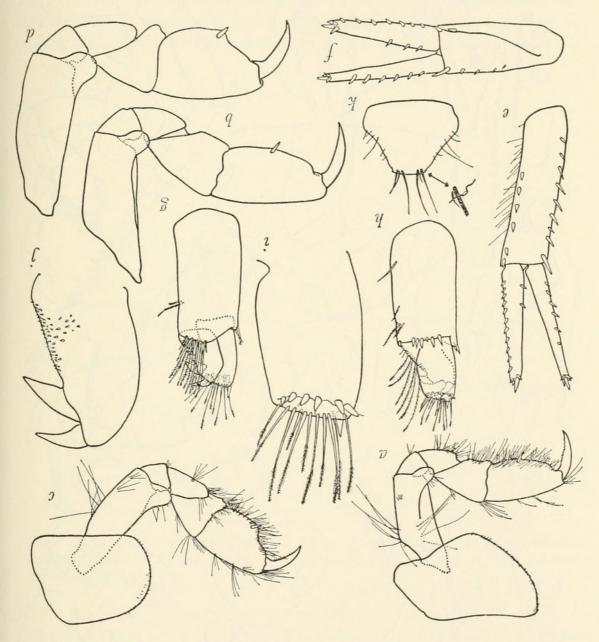

Figure 16.—Ampithoe ramondi Audouin, female, 11.0 mm., sta. 6206: a, b, gnathopod 1; c, d, gnathopod 2; male, 11.5 mm.: e-h, uropods 1, 2, 3, 3; i, j, inner and outer rami of uropod 3; k, telson.

Ampithoe simulans Alderman

FIGURES 17, 18

Ampithoe simulans Alderman, 1936, pp. 68–70, figs. 44–47.—J. L. Barnard, 1954, pp. 33–34, 1 fig.

? Amphithoe corallina Stout, 1912, pp. 134-136, figs. 76-77.

Diagnosis: Second and third pleonal epimera with a faint suggestion of a point at the lower posterior corners; article 5 of male gnathopod

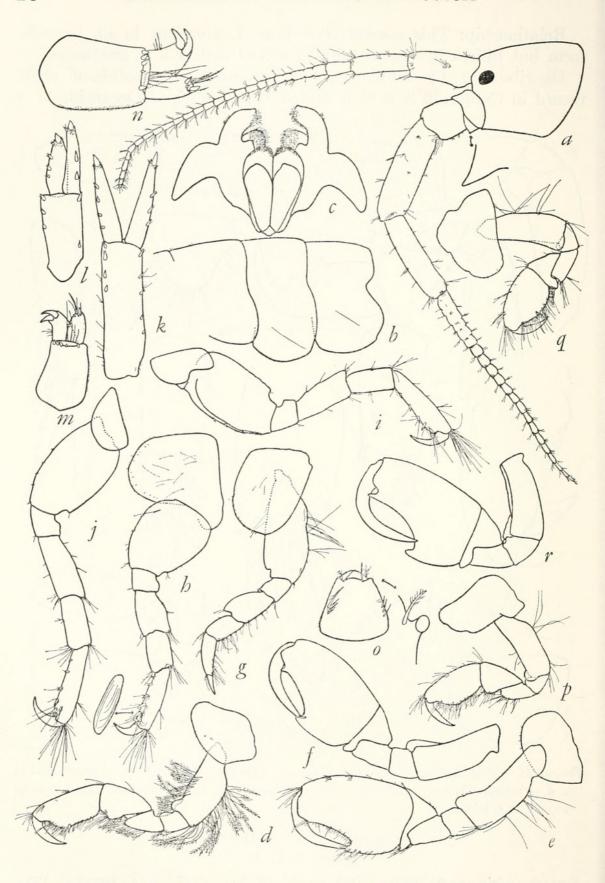

Figure 17.—Ampithoe simulans Alderman, a-o, male, 13 mm., sta. 1463: a, head, enlargement shows ventral surface of gland cone projecting medially; b, metasome; c, lower lip; d, gnathopod 1; e, f, lateral and medial views of gnathopod 2; g-j, pereopods, 1, 3, 4, 5; k-n, uropods 1, 2, 3, 3; o, telson; female, 9 mm., 8-29-50, coll. J. L. Mohr: p, q, gnathopods 1, 2; male, 11 mm., same sample: r, gnathopod 2.

1 shorter than article 6, posterior edge of article 5 with a shallow, broad hind lobe, palm oblique; articles 2–5 strongly setose; male gnathopod 2 with palm quite oblique, excavated to form a short thumb at defining corner which increases in extension with the elongation and further disproportion of the palm, a small process near the finger hinge increasing in development also; dactylus fitting palm in young males, failing to fit palm in old males; article 2 of pereopods 1–2

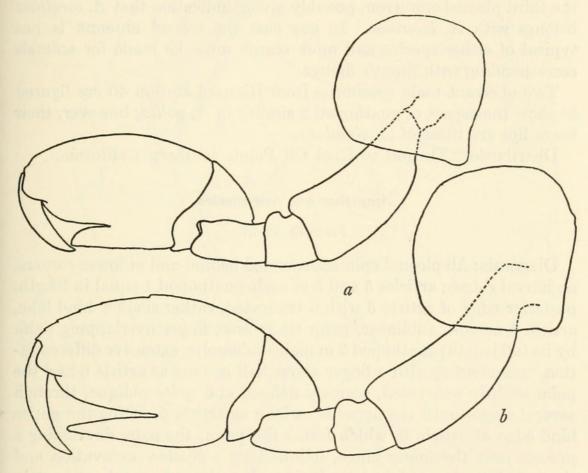

FIGURE 18.—Ampithoe simulans Alderman, aberrant specimens similar to A. pollex in second gnathopodal morphology: a, male, 8.0 mm., Barnard sta. 40-A; b, male, 9.0 mm., Barnard sta. 40-A.

about 2.5 times as long as broad; ventral edge of antenna 1, article 1 not spiniferous; antenna 2 longer than antenna 1, flagellum of antenna 1 longer than that of antenna 2, flagella both poorly setose; outer apical lobule of lower lip slightly longer than inner lobule, the two small apical spines on sixth articles of the pereopods are fluted (see figures); coxae 1 and 2 scarcely half as long as coxae 3–5; peduncular process of uropod 1 vestigial.

Female: Article 5 of gnathopod 1 shorter than article 6, the appendage not as setose as on male; article 5 of gnathopod 2 like that of male gnathopod 2, much shorter than on gnathopod 1, with a narrow hind lobe.

Material: Reported by Barnard, 1954. Velero stations 1463 (1), 1489 (1). Barnard station 40 (2).

Records: Coos Bay, intertidal; North Bay, Cape Arago State Park, Oreg., intertidal. Coal Oil Point, near Goleta, Calif.

Remarks: Possibly Ampithoe corallina represents a senior synonym of this species. The shape of the lower lip and gnathopod 1 correspond well with the female of A. simulans but Stout draws a small point on the third pleonal epimeron, possibly giving indication that A. corallina belongs with A. lacertosa. In any case the second antenna is not typical of either species and more search must be made for animals corresponding with Stout's figures.

Two aberrant male specimens from Barnard station 40 are figured to show the aspect of gnathopod 2 similar to A. pollex; however, their lower lips are those of A. simulans.

Distribution: Oregon to Coal Oil Point, southern California.

Ampithoe tea, new species

FIGURES 19-21

Diagnosis: All pleonal epimera rounded behind and at lower corners, no lateral ridges; articles 5 and 6 of male gnathopod 1 equal in length, posterior edge of article 5 with a truncated, rather shallow hind lobe, article 6 narrow, sublinear, palm transverse, finger overlapping palm by its full length; gnathopod 2 in male undergoing extensive differentiation, commencing with a finger about half as long as article 6 and the palm slightly excavated, scarcely defined and quite oblique, through several stages until the finger is as long as article 6, fitting the entire hind edge of article 6, which forms the palm, the palm developing a process near the finger hinge, followed by a shallow excavation and then a relatively straight but sloping edge, the palmar edge minutely crenulated; the finger becoming increasingly bent at its base; article 2 of gnathopod 2 with poorly developed distal bump; article 2 of pereopods 1 and 2 strongly inflated, 1.9 times as long as broad; article 2 of pereopod 3 broader than long; ventral edge of article 1 of first antenna not spiniferous; antenna 1 much longer than antenna 2, the flagellum of antenna 1 more than four times as long as that of antenna 2, the latter flagellum rather short, 0.5 times as long as article 5 of peduncle, and the second antenna rather setose; article 4 of peduncle 120% as long as article 5; outer apical lobule of lower lip somewhat longer than medial lobule; coxae 1 and 2 shorter than 3 and 4 but not broadened, coxa 1 not produced forward; peduncular process of uropod 1 long.

Female: Article 5 of gnathopod 1 shorter than article 6 and thus shorter than in the male; gnathopod 2 with article 6 similar to that of

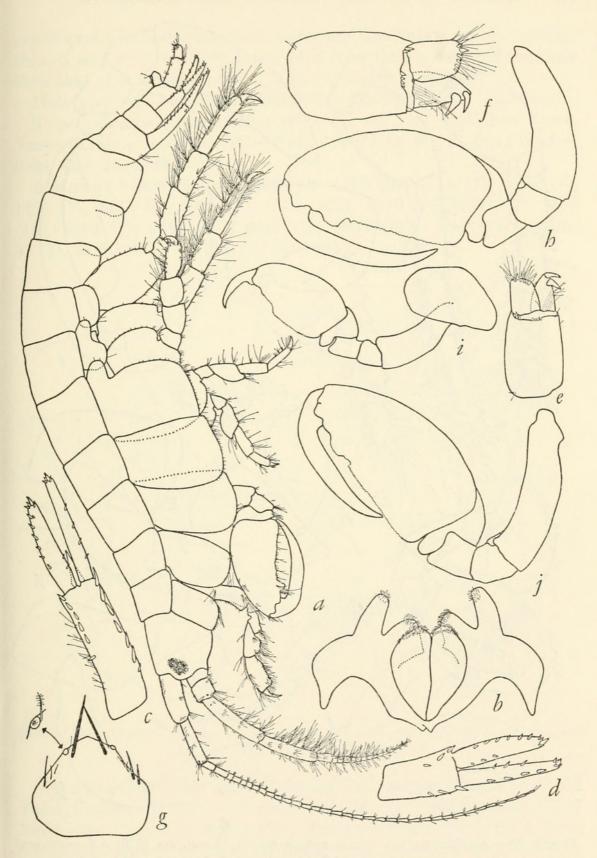

Figure 19.—Ampithoe tea, new species, male, holotype 12.0 mm., sta. 1870: a, lateral view; b, lower lip; c-f, uropods 1, 2, 3, 3; g, telson; male, 10 mm.: h, gnathopod 2; male, 6.0 mm.: i, gnathopod 1; male, 8.0 mm.: j, gnathopod 2.

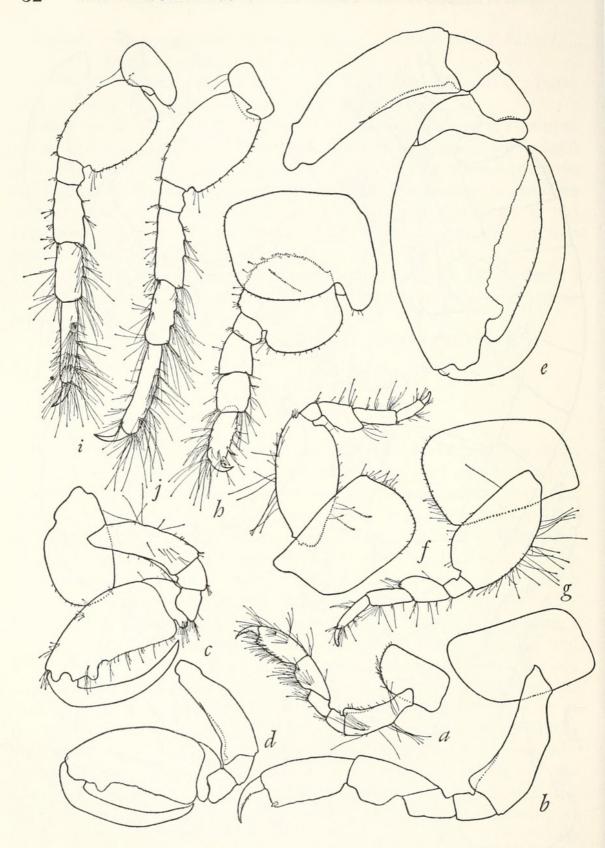

Figure 20.—Ampithoe tea, new species, male, holotype, 12 mm., sta. 1870: a, b, gnathopod 1; c-e, gnathopod 2; f-j, pereopods 1, 2, 3, 4, 5.

gnathopod 1 in both sexes but stouter and less linear, article 5 shorter than 6 and with well-developed hind lobe that is relatively stouter than that of male gnathopod 2; antenna 2 poorly setose.

Holotype: Allan Hancock Foundation No. 4921, male, 12.0 mm.

Type locality: Velero station 1870, 0.2 mi. NE. of Willow Cove, Santa Catalina Island, 33–22–17 N., 118–20–55 W., 21 fms., dredge, kelp, Aug. 25, 1949.

Material: Velero stations 1221 (2), 1370 (2), 1375 (1), 1381 (7), 1407 (1), 1453 (3), 1623 (1), 1870 (122), 1871 (44), 1924 (3), 2080 (13), 5369 (7), 6695 (37), 6696 (2), 6803 (15). Barnard stations 33 (7), 37 (1), 39-J-1 (?16), 39-K-1 (11).

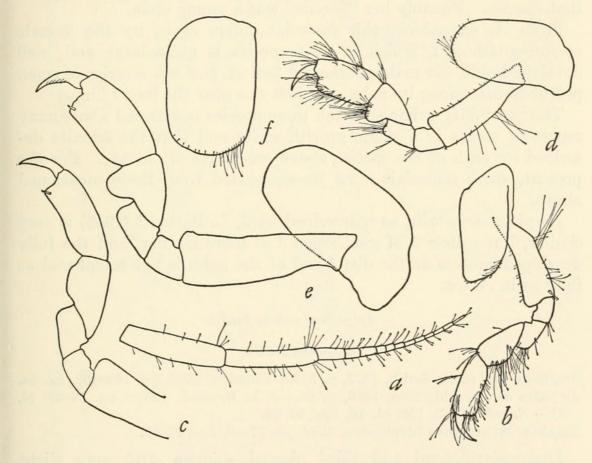

Figure 21.—Ampithoe tea, new species, female, 8.5 mm., sta. 1870: a, antenna 1; b, c gnathopod 1; d, e, gnathopod 2; f, coxa 3.

Records: California, intertidal: Santa Catalina Island; Coal Oil Point; Corona Del Mar. Santa Catalina Island, several localities, 18-37 fms.; near Point Conception, 2-3 fms.; off Santa Barbara, 9 fms.; off Laguna Beach, 10 fms.; La Jolla, 1 fm.: 20 miles east of Punta Eugenia, Baja California, intertidal; Guadalupe Island, Baja California, 25 fms.

Relationship: This material differs from Ampithoe eoa Gurjanova (1938 and 1951) by the equally broad fifth and sixth articles of pereopod 5, by the development of a palmar process near the finger

hinge of gnathopod 2, and by the much more slender second gnathopod of the female having a transverse, not oblique and slightly sinuous

palm.

From A. mea Gurjanova (1938 and 1950) this species differs by the development of a palmar process on male gnathopod 2, the broader second article of pereopod 3 and the more slender female gnathopod 2 with transverse palm. The present material corresponds with A. mea in the strongly setose second male antenna; the male gnathopod 2 figured by Gurjanova could be one stage of the development in the present material. The female gnathopod 2 shown by Gurjanova, however, is most distinct; otherwise I should assign this material to that species. Possibly her "female" was a young male.

From A. annenkovae this material differs again by the female second gnathopod, which in that species is quite large and well developed, and the male gnathopod 2 of A. mea has a series of small protuberances along its palm, not just one near the finger hinge.

The possibility exists that the three species mentioned above may represent stages in a single growth series and that the females described for each of the species above are stages of old age. For the present, these materials must be segregated from those mentioned above.

Ampithoe orientalis, as redescribed by J. L. Barnard (1955) is very similar, but article 6 of gnathopod 1 is more slender, and the fully developed process at the distal end of the palm is not sculptured as fully as in A. tea.

Ampithoe valida Smith

FIGURES 22, 23

Amphithoë [sic] valida Smith, 1873, p. 563.—Paulmier, 1905, pp. 164–165, fig. 34. Ampithoe valida, Alderman, 1936, p. 68.—J. L. Barnard, 1954a, pp. 34–35, pl. 31—Nagata, 1960, 176, pl. 16, figs. 97–98. Ampithoë shimizuensis Stephensen, 1944, pp. 77–80, figs. 27–28.

Diagnosis: Second and third pleonal epimera with very slight points at lower posterior corners; article 5 of male gnathopod 1 slightly longer than article 6, posterior edge of article 5 forming a broad hind lobe with a distal projection, article 2 strongly setose, palm oblique; gnathopod 2 with large rounded lobes on articles 2 and 3, article 5 with narrow hind lobe, article 6 elongated, rectangular, palm transverse, bearing a quadrate middle bump, finger curved, fitting palm; article 2 of pereopods 1–2 about 2.5 times as long as broad; ventral edge of article 1 on antenna 1 bearing setae, no spines; antennae 1 and 2 equal in length, flagellum of antenna 1 twice as long as that of antenna 2, neither flagellum strongly setose; apical lobules of lower lip so broad and appressed that they mask their separating

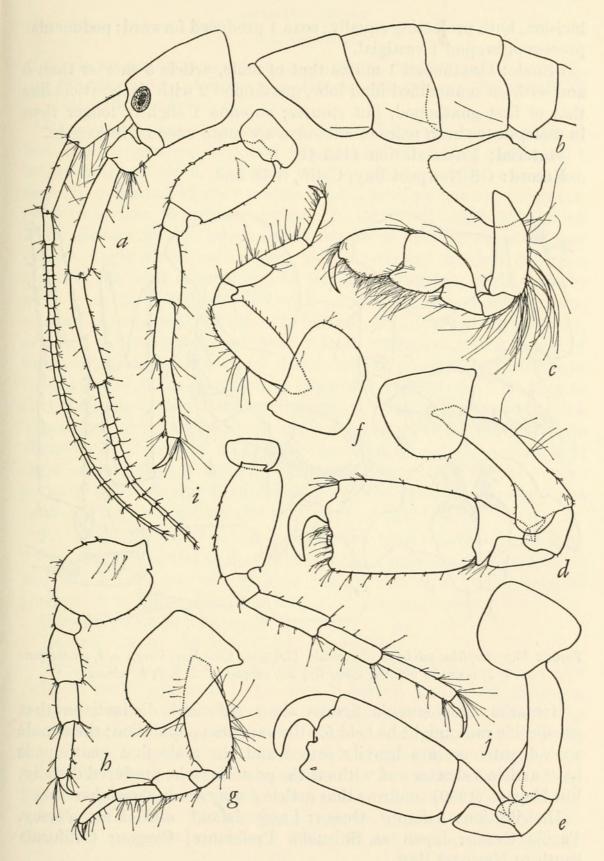

Figure 22.—Ampithoe valida Smith, male, 10.0 mm., Coos Bay, Oreg.: a, head; b, metasome; c, gnathopod 1; d, e, gnathopod 2; f-j, pereopods 1, 2, 3, 4, 5.

incision, both projecting equally; coxa 1 produced forward; peduncular process of uropod 1 vestigial.

Female: Gnathopod 1 unlike that of male, article 5 shorter than 6 and with an unmodified hind lobe, gnathopod 2 with sixth article like that of first gnathopod, but stouter; antenna 1 slightly longer than in male, hence both pairs of antennae are more unequal in length.

Material: Velero station 1453 (1).

Record: Off Newport Bay, Calif., 6-18 fms.

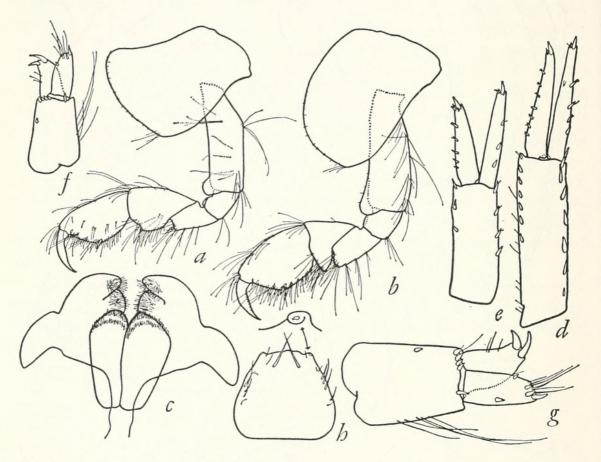

FIGURE 23.—Ampithoe valida Smith, female, 12.0 mm., Coos Bay, Oreg.: a, b, gnathopods 1, 2; male, 10 mm.: c, lower lip; d-g, uropods 1, 2, 3, 3; h, telson.

Remarks: Stephensen's figures show sufficient distinctions that subspecific rank might be held for the Japanese population; the female second antennae are heavily setose and the male first gnathopods have article 5 shorter and without the posterior lobe produced distally, but Nagata (1960) confirms that article 5 appears as shown herein.

Distribution: Atlantic Ocean: Long Island and New Jersey. Pacific Ocean: Japan at Shizuoka Prefecture; Oregon; California south to Newport Bay.

Ampithoe species

FIGURES 24, 25

Refer to: Amphitoe [sic] mea Gurjanova, 1938, pp. 361-364, fig. 53; 1951, pp. 882-885, fig. 616. Ampithoe eoa.—J. L. Barnard, 1954, pp. 27-28, pls. 25-26 (not Gurjanova 1938).

Diagnosis of present material: All pleonal epimera rounded behind and at lower corners, no lateral ridges; article 6 of male gnathopod 1 longer than article 5, posterior edge of article 5 with a rounded. scarcely truncated, shallow posterior lobe, article 6 narrow, sublinear. palm transverse, finger overlapping palm by its full length; gnathopod 2 of male in a state of intermediacy compared with Ampithoe tea, new species, finger about half as long as hind edge of article 6, palm not distinct, the hind edge of article 6 minutely serrate, with a slight notch near distal end, article 2 with a poorly developed distal bump; article 2 of pereopods 1-2 strongly inflated, 1.6 times as long as broad; article 2 of pereopod 3 broader than long; ventral edge of article 1 of first antenna with a few distal slender spines; antenna 1 much longer than antenna 2, the flagellum of antenna 1 about 3 times as long as that of antenna 2, the latter flagellum short, 1.3 times as long as article 5 of peduncle, articles stout, antenna 2 well setose, article 4 of peduncle about 90% (aberrantly 60% as in figured male) as long as article 5; outer apical lobule of lower lip somewhat longer than medial lobule: coxae 1 and 2 shorter than 3 and 4 but not broadened, coxa 1 not produced forward; peduncular process of uropod 1 long.

Female: Article 5 of gnathopod 1 shorter than article 6; gnathopod 2 with article 6 similar to that of gnathopod 1 in both sexes but stouter and less linear, article 5 shorter than 6 and with well-developed posterior lobe that is narrower than in A. tea, new species.

Material: Barnard station 5 (5).

Record: Corona del Mar, Calif., intertidal.

Remarks: The specimens differ from the figures of A. mea Gurjanova (and A. eoa Gurjanova) in the female second gnathopod, having a transverse palm with a strongly overlapping finger. In A. mea the female second gnathopod has an oblique, excavated palm with the finger fitting it and a longer fourth article of antenna 2. I suggest the possibility that A. mea females shown by Gurjanova may be either aberrant, gerontic females commencing to demonstrate male conditions or subadult males. The correspondence of A. annenkovae Gurjanova (see 1951) to A. mea is striking. The male and female second gnatho-

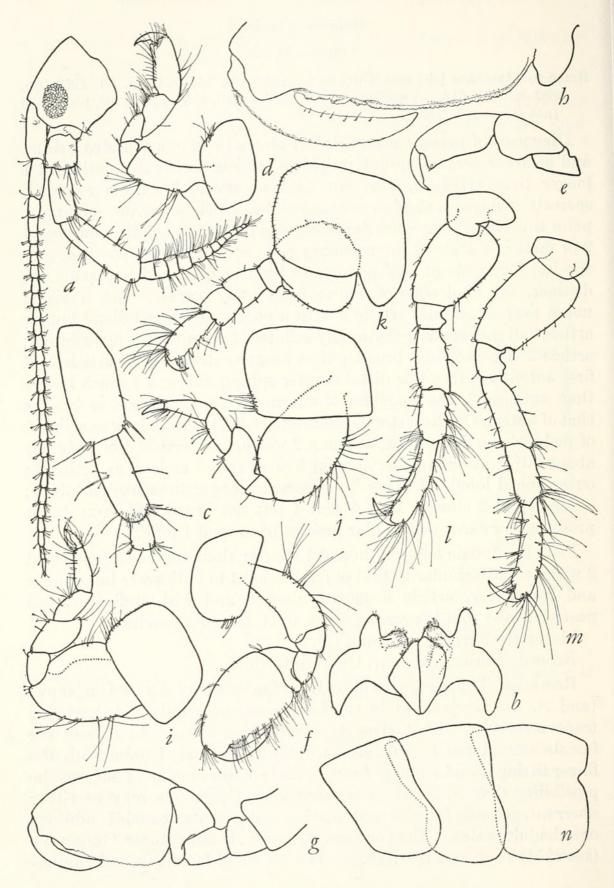

FIGURE 24.—Ampithoe species, male, 8.0 mm., Barnard sta. 5: a, head; b, lower lip; c, peduncle of antenna 1; d, e, gnathopod 1; f-h, gnathopod 2; i-m, pereopods 1, 2, 3, 4, 5; n, metasome.

pods are simply later growth stages if one considers that A. mea undergoes the same terminal development seen in other Ampithoes. If those two species prove to be the same, then the female second gnathopod may be normal in A. mea and the present material would have to be established nomenclaturally.

A. eoa has a broadened fifth article of pereopod 5 and longer and more truncate article 5 of male gnathopod 1.

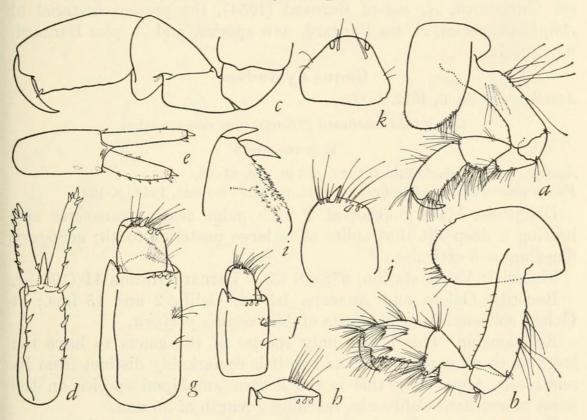

FIGURE 25.—Ampithoe species, female, 9.6 mm., Barnard sta. 5: a, gnathopod 1; b, c, gnathopod 2; male, 8.0 mm.: d-g, uropods 1, 2, 3, 3; h, end of peduncle of uropod 3; i, j, outer and inner rami of uropod 3; k, telson.

Ampithoe orientalis, as redescribed by J. L. Barnard (1955), has a somewhat more slender sixth article of gnathopod 1 and an elongated, slender, second antenna.

The second gnathopod of the female A. annenkovae (see Gurjanova, 1951) is enlarged somewhat as in the male and has an oblique palm.

The material identified by Barnard (1954) as A. eoa differs from that species in the structure of pereopod 5 and by the equal lobation of the lower lip. Except for the male gnathopods, that material might be confused with A. lindbergi. Both A. mea and the present material have the unequal lobation of the lower lip; hence A. eoa of Barnard (1954) is unassignable to a known species, but is not worthy of designation until more Oregonian materials can be studied. Because only 5 specimens of the present material are known from the coast of southern California and they have the aspect of the northern

Ampithoes, it is presumed they represent a marginal population that will find assignment to a northern species. The aberrancy of the shortened fourth article of antenna 2 of one of the males indicates the marginality of the deme.

In summary, these several populations of closely related ampithoes are now recorded, but relationships and taxonomic assignments are still unclear: Ampithoe mea Gurjanova, A. eoa Gurjanova, A. annenkovae Gurjanova, A. eoa of Barnard (1954), the present material of Ampithoe species, A. tea Barnard, new species, and A. plea Barnard, new species.

Genus Cymadusa

Acanthogrubia Stout, 1912, p. 143.

Cymadusa uncinata (Stout), new combination

FIGURES 26-28

Acanthogrubia uncinata Stout, 1912, p. 146, figs. 81–83.

Paragrubia uncinata.—Shoemaker, 1941, p. 188.—Hewatt, 1946, p. 199.

Diagnosis: Male gnathopod 2 with palm nearly transverse and bearing a deep slit that splits off a large posterior tooth; accessory flagellum 3-5 articulate.

Material: Velero station, 878–38 (3). Barnard station 41 (100+). Records: Goleta and Anacapa Island, Calif., 2 and 15 fms.; at Goleta collected from holdfasts of Macrocystis pyrifera.

Relationship: This is the only species of the genus to have the large tooth of gnathopod 2, and so it is remarkably distinct from its relatives. Apparently this is the largest amphipod species on the coast of southern California, reaching a length of 35 mm.

Shoemaker transferred this species to *Paragrubia*, but it belongs with *Cymadusa* because gnathopod 1 is smaller than gnathopod 2, the reverse of the condition of *Paragrubia*.

Distribution: Southern California.

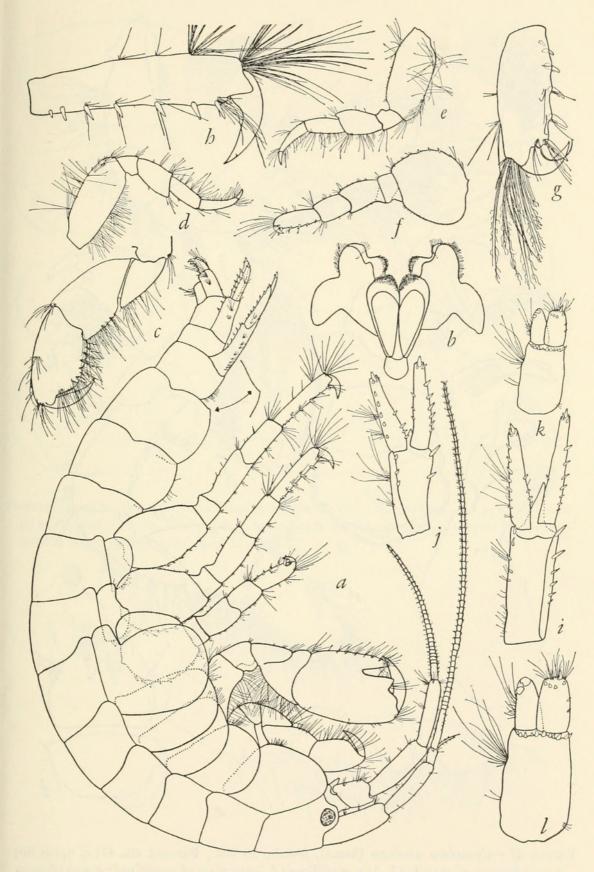

FIGURE 26.—Cymadusa uncinata (Stout), male, 20 mm., Barnard sta. 41: a, lateral view; b, lower lip; c, gnathopod 1; d, e, pereopods 1, 2; f, g, pereopod 3; h, pereopod 5; i-l, uropods 1, 2, 3, 3.

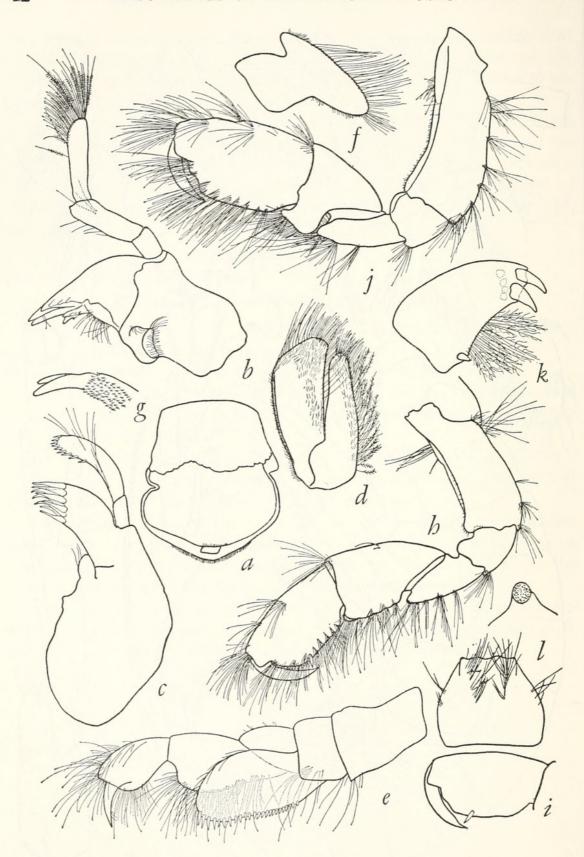

FIGURE 27.—Cymadusa uncinata (Stout), female, 30 mm., Barnard sta. 41: a, upper lip; b, mandible; c, d, maxillae 1, 2; e, maxilliped; f, inner plate of maxilliped; g, end of maxillipedal palp; h, i, gnathopod 1; j, gnathopod 2; k, outer ramus of uropod 3; l, telson.

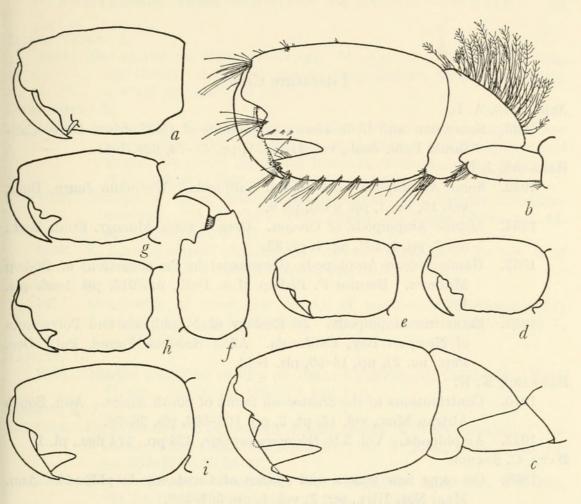

FIGURE 28.—Cymadusa uncinata (Stout), female, 30 mm., Barnard sta. 41: a, medial view of gnathopod 2; male, 20 mm.: b, c, lateral and medial views of gnathopod 2; developmental stages in male gnathopod 2: d-i.
