# The ornithological importance of Thrumshingla National Park, Bhutan

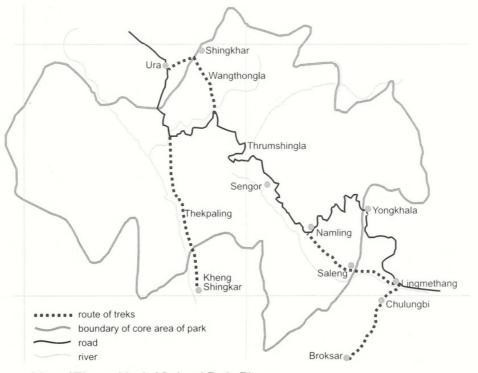

## CAROL INSKIPP, TIM INSKIPP and SHERUB

Thrumshingla National Park is one of four national parks in Bhutan and was gazetted in 1998 to ensure the conservation of biodiversity in the central belt of the country. Two bird surveys have been carried out in the park: in April and May 1998 and in January 2000. Based on these surveys and records from other sources, a list of 345 bird species has been compiled for the park up to the end of May 2000. This includes three globally threatened species, 15 of Bhutan's near-threatened species and eight of the country's 11 restricted range species. Warm broadleaved forest was found to be the most valuable for bird species in both the breeding season and in winter, followed by cool broadleaved forest. Fir and hemlock, especially those with an understorey of rhododendron and bamboo, were the richest forests for birds at higher altitudes.

### **INTRODUCTION**

Bhutan lies in the eastern Himalayas, one of the world's biodiversity 'hotspots' and identified as an Endemic Bird Area by BirdLife International (Stattersfield et al. 1998). The country has an extensive protected area system, encompassing 26% of its land area and covering the full range of the nation's major ecosystem types. Thrumshingla is one of four national parks in Bhutan and was proposed in 1993 to ensure the conservation of biodiversity in the central belt of the country (Anon. 1998). The park was officially gazetted in July 1998 when a park manager and other staff were appointed and became functional with the support of the WWF Bhutan Programme. Thrumshingla lies in east-central Bhutan (see Map) partly in the dzongkhags/districts of Bumthang, Lhuntse and Mongar. The park's core area is 768 km<sup>2</sup> and is surrounded by a buffer zone. The area around the small village of Sengor, near the middle of the park, is a multi-use zone. Bhutan's main east-west highway runs through approximately the middle of the park from Bumthang, via Ura, Sengor, Namling, Yongkhala to Lingmethang. The park's altitudinal range extends from 1,400 m below Saleng in the core area and 700 m at Lingmethang in the buffer zone to over 6,000 m at Thrumshingla Peak.

Like most of Bhutan, Thrumshingla National Park is largely covered in forests, which are of high quality and relatively unexploited, compared to forests elsewhere in the Himalayas. In the subtropical zone, the main forest types are warm broadleaved forest, which grows on moist slopes, and chir pine *Pinus roxburghii*, which forms open dry forests on dry slopes and in dry valleys. Cool broadleaved forest grows above the warm broadleaved forest and is replaced by oak *Quercus* on less moist slopes, and by Blue Pine *P. wallichiana* in dry areas. Other coniferous forests that are widespread at higher altitudes in the park up to the tree-line are hemlock *Tsuga dumosa* and fir *Abies spectabilis*, which grow on moist slopes, and spruce *Picea*, which occupies

Map of Thrumshingla National Park, Bhutan

drier zones. Bamboo is extensive in high-altitude coniferous forests and supports a good population of red panda *Ailurus fulgens*, which has been adopted as the emblem of the park. There are pastures in the alpine zone above the treeline, and in forest clearings in the subalpine and temperate zones. There are a few villages and relatively small associated areas of cultivation in the park, especially in the subtropical zone. In a survey carried out in April 2000, the north-western quadrant of the Park was identified as a core area for tiger *Panthera pardus* (Yonzon 2000).

Up until the end of May, 2000 a total of 345 bird species had been recorded in the park's core area and buffer zone, including 312 species in the core.

#### **METHODS**

Two bird surveys have been carried out in the park: in April and May 1998 (Inskipp and Inskipp 1998) and in January 2000 (Inskipp *et al.* 2000). These were organized by the Royal Government of Bhutan Nature Conservation Division and, in 2000, also by the recently appointed park manager and his staff. Hands-on training in bird identification and survey techniques was provided for park staff during both surveys. Locations, habitat types, altitudes and dates were noted for all records, as well as the length of time spent in each habitat type. The overall altitudinal range of all species recorded was extracted from these data. A Global Positioning System was used to determine the co-ordinates of locations en route.

A method of assessing species richness developed by John MacKinnon (MacKinnon and Phillips 1993) was used for each main vegetation type. This measures how rich an area or habitat is for bird species and is a relatively simple and quick method for comparing one area or habitat with another.

Each species encountered is recorded until a list of 20 is reached. Then a new list (number 2) is started and a further 20 species is recorded. Each list must contain 20 different species, but subsequent lists can include species previously listed. However, efforts must be made to exclude the same individual birds from the lists. Then list number 3 is recorded. Ideally lists are repeatedly made until no new species are recorded. A running species total is obtained by extracting the number of species in list 2 that were not in list 1 and so on throughout all the lists recorded for each area or habitat. Species-richness is the species total reached when no new species are recorded. This should be approximately the number of species present in that habitat or area at that time of the year. Some species, because they are very skulking or nocturnal species, will perhaps be overlooked.

Other bird records for the area have been collected by the Royal Government of Bhutan Nature Conservation Division (Pradhan 1997a, 1997b, Sharma 1998). In addition, a significant number of records have been made by several foreign bird tour groups, who have spent a few days in the park in recent years, birdwatching along the road between Ura and Lingmethang. Their visits started in about 1995 and have mainly been in April, but also in January, March and early May.

#### SIGNIFICANT BIRD RECORDS

A total of 14 species recorded in Bhutan have been identified as globally threatened by BirdLife International (BirdLife International in prep.), and three of these have been found in the park, where they probably breed. Moreover, as many as 15 of Bhutan's 24 near-threatened species have also been recorded in the park. BirdLife International has also identified bird species with restricted ranges, that is with world breeding ranges less than 50,000 km<sup>2</sup>, used to define the Eastern Himalayas Endemic Bird Area (Stattersfield et al. 1998). Eleven restricted-range species have been recorded in Bhutan, and eight of these have been recorded in Thrumshingla and probably breed. Of these eight species one is globally threatened and four are nearthreatened. Here we provide status and natural history notes on this suite of species and one other that does not qualify as a restricted-range species but is, nevertheless, local and rare throughout its range.

CHESTNUT-BREASTED PARTRIDGE Arborophila mandellii Globally threatened, restricted-range species. Rare and local in the park, but probably resident. Found in warm broadleaved forest with bamboo between 1,860 m and 1,980 m between Yongkhala and Namling. Seven were recorded in April 1998 (King 1998), one was heard in April 1998 on 1 May 1998 (Farrow 1998 and Inskipp and Inskipp 1998), three to four were heard on 16-18 April 1999 (Farrow 1999), one was heard in April 1999 (Holt 1999) and four on 23 April 2000 (Farrow 2000a); a pair duetted on 13 and 14 May 2000 (Bishop 2000).

SATYR TRAGOPAN Tragopan satyra Near-threatened species. Uncommon altitudinal migrant within the park. Recorded in January and from March to early May between 1,900 m and 3,850 m in cool broadleaved and fir forests; favours forests with a well-developed bamboo understorey. Up to three were regularly recorded between Yongkhala and Sengor: in March 1994 and April 1995 (Bishop 1999c), January 1995 (King 1995), April 1997 (Farrow 1997, King 1997), April 1998 (Farrow 1998, Inskipp and Inskipp 1998, King 1998), April 1999 (Farrow 1999) and April 2000 (Farrow 2000b). A maximum of seven was heard in fir forests 2 km below Sengor at dawn in May 2000 with three additional birds heard the following morning (Bishop 2000). One to two birds were recorded between Gayzamchu and Thekpaling, between Gayzamchu and Ura, near Ura, and between Thrumshingla and Sengor in April 1998 (Inskipp and Inskipp 1998).

YELLOW-RUMPED HONEYGUIDE Indicator xanthonotus Near-threatened species. Rare and local. Singles were seen between Sengor and Yongkhala, usually near bees' nests, on 14 April 1997 (King 1997), 7 April 1998 (King 1998), 19 April 1998 at 2,200 m (Farrow 1998), 14 April 1999 (Holt 1999) and on 19 April 2000 (Kazmierczak and Fisher 2000). Two were seen on 14 April 1999 at 2,200 m (Farrow 1999). A male was observed in a narrow canyon, persistently attending what appeared to be a nest, in the middle storey of a huge broadleaved tree above a small stream at 2,100 m on 13 May 2000 (Bishop 2000). The nesting habits of this species are unknown.

149

RUFOUS-NECKED HORNBILL Aceros nipalensis Globally threatened species. Fairly common and probably resident. Recorded from January to mid May and in October in warm broadleaved forest with mature trees from 1,005 m to 1,930 m, subject to altitudinal movements. Regularly recorded between Yongkhala and Namling (many observers); also seen around Thekpaling, including six pairs on 1 February 1997, the largest number seen in one area, and between Thekpaling and Kheng Shingkhar (Inskipp and Inskipp 1998), below Saleng in January 2000 (Inskipp et al. 2000), and in the buffer zone around Chulungbi, between Chulungbi and Gulibi, at Broksar and in the Yunari Chu valley in January 2000 (Inskipp et al. 2000). A pair excavated a nest hole and engaged in courtship display between Yongkhala and Namling at 1,900 m on 19 April 1998 (Farrow 1998).

WARD'S TROGON Harpactes wardi Near-threatened, restricted-range species. Rare and local, probably resident; recorded in January and from March to mid May in cool broadleaved forests with vines and hanging creepers between 2,000 m and 2,400 m. One to three birds were regularly recorded below Namling from 2,000 m to 2,200 m: 31 March 1994 (Bishop 1999c), 7 and 8 May 1996 (King 1996), 22 and 23 March 1997 (Redman 1997), April 1997 (Bishop 1999c) 14, 15 and 18 April 1997 (King 1997), 7 April 1998 (King 1998), 11 April 1998 (Bishop 1999c, Holt 1998), 18 April 1998 (Farrow 1998), 13 and 14 April 1999 (Holt 1999), 17 April 1999 (Farrow 1999), 28 January 2000 (Inskipp et al. 2000) and 20-21 April 2000 (Farrow 2000a). A group of four was apparently involved in a territorial dispute at 2,200 m in May 2000 (Bishop 2000). Five were seen at 2,300 m on 19 April 1997 (Farrow 1997). Five were also observed near Omdor at 2,210-2,400 m on 8 January 2000 (Inskipp et al. 2000).

BLUE-NAPED PITTA *Pitta nipalensis* Near-threatened species. Rare, probably resident. One was heard in the park below Namling at 1,820 m on 14 April 1999 (Holt 1999) and on 19 April 1998 at 1,800 m (Farrow 1998) and one was seen in the park in November 1999 (Yonzon 2000). One was seen in the buffer zone near Chulungbi at 1,235 m in dense moist herbage in warm broadleaved forest on 17 January 2000 (Inskipp *et al.* 2000) and two were recorded in the buffer zone at 1,050 m on 18 March and 22 April 2000 (Farrow 2000a,b).

LONG-BILLED THRUSH Zoothera monticola Near-threatened species. Rare, status uncertain. Singles were seen near Lingmethang on 16 January 1995 (Dreyer 1995), and between Yongkhala and Sengor on 6 April 1998 (King 1998).

RUFOUS-BREASTED BUSH ROBIN *Tarsiger hyperythrus* Nearthreatened species. Frequent winter visitor to warm broadleaved and cool broadleaved forests between 990 m and 2,500 m. Six were seen between Lingmethang and Namling on 18 January 1995 and two on the following day (King 1995); two between Yongkhala and Namling on 27 January 2000 and two at Namling on 28 January 2000 (Inskipp *et al.* 2000). One at Gayzamchu in April 2000 (C. Leahey pers. comm. to D. Bishop). In the buffer zone one was seen near Lingmethang on 17 January 1995 (King 1995), one near Chulungbi at 1,130 m on 15 January 2000, four near Broksar at 1,830 m on 20 January, three between Yunidrang and Ngala Pang on 22 January and two between Lingmethang and Saleng in the Shongar Chu valley on 26 January (Inskipp *et al.* 2000).

BLUE-FRONTED ROBIN Cinclidium frontale Nearthreatened species. Rare and local, possibly a summer visitor. Recorded from March to early May in cool broadleaved forests between 1,850 m and 2,400 m. All records are from between Yongkhala and Namling: a male at 1,850 m on 3 March 1994 and a pair seen at almost the same site on 25 April 1997 (Bishop 1999c), two recorded at 2,300 m on 19 April 1997 (Farrow 1997), one male was seen and another heard on 14 April 1998 (Holt 1998), two heard at 2,300 m and 2,500 m on 18 April 1998 (Farrow 1998); four singing on 2 May 1998 from 2,300 m to 2,345 m (Inskipp and Inskipp 1998); two singing males on 14 April 1999 (Holt 1999), three at 2,400 m on 14 April and two at 2,200 m on 17 April 1999 (Farrow 1999), two singing on 19 April 2000 (Kazmierczak and Fisher 2000) and one to two at 2,300 m and 2,400 m on 20 and 21 April (Farrow 2000a).

PURPLE COCHOA *Cochoa purpurea* Near-threatened species. Rare, recorded in April in warm broadleaved and cool broadleaved forests between 1,860 m and 2,220 m. A pair was seen between Yongkhala and Namling at 2,220 m on 26 April 1997 (Bishop 1999c), one was heard above Yongkhala at 1,860 m on 29 April 1998 (Inskipp and Inskipp 1998); one was seen between Yongkhala and Namling in April 1999 (Farrow 1999); one was heard below Namling on 13 April 1999 (Holt 1999), one at 1,900 m on 18 and 19 April 1999 (Farrow 1999) and one on 18 April 2000 (Kazmierczak and Fisher 2000).

BEAUTIFUL NUTHATCH *Sitta formosa* Globally threatened species. Rare and local in warm broadleaved forest, presumably resident. A flock of 21 was seen near Thekpaling at 1,900 m on 29 January 1997 (Pradhan 1997a) and a flock of seven in the same area on 23 April 1997 (Pradhan 1997b).

YELLOW-VENTED WARBLER Phylloscopus cantator Nearthreatened, restricted-range species. Frequent, possibly a summer visitor; recorded from March to early May in warm broadleaved forest between 800 m and 1,840 m. Regularly recorded between Yongkhala and Namling: in April 1995 (Bishop 1995), April 1996 (Bishop 1996, Holt 1996), March 1997 (Redman 1997), April 1997 (Bishop 1997, King 1997), April 1998 (Bishop 1998, Holt 1998, King 1998), April and May 1998 (Inskipp and Inskipp 1998), April 1999 (Holt 1999), May 1999 (Bishop 1999) and April 2000 (Kazmierczak and Fisher 2000). More frequently recorded between Lingmethang and Yongkhala in the buffer zone from March to early May in warm broadleaved forest at lower altitudes between 800 m and 1,840 m (many observers). The highest number recorded in the park was 20 found in the same area on 26 April 1998 (Inskipp and Inskipp 1998); also recorded between Thekpaling and Kheng Shingkhar in April 1998 (Inskipp and Inskipp 1998).

BROAD-BILLED WARBLER Tickellia hodgsoni Restricted range species. Uncommon and local, probably resident, recorded from 1,025 m (January) to 2,500 m (early May) in bamboo in warm broadleaved and cool broadleaved forests. It was seen below Namling from 1,865 m to 2,360 m in April and May: one on 7 May 1996 (King 1996), one on 22 March 1997 (Redman 1997), one on 14 and 15 April 1997 (King 1997), four on 19 April 1997 (Farrow 1997), three on 6 and 7 April 1998 (King 1998), singles on 16 and 17 April 1998 (Farrow 1998), two on 30 April, one on 1 May and two on 2 May 1998 (Inskipp and Inskipp 1998), one on 14 April 1999 (Holt 1999), three on 16 April 1999 (Farrow 1999) and a pair in early May 1999 (Bishop 1999). Several pairs and individuals singing at c. 2,500 m in April 2000 (Bishop 2000) and seven on 20 April 2000 (Farrow 2000a). Also one was seen at Saleng at 1,690 m on 9 January 2000, and one between Saleng and Lingmethang in the Shongar Chu valley in the buffer zone at 1,025 m on 12 January 2000 (Inskipp et al. 2000).

SLENDER-BILLED SCIMITAR BABBLER Xiphirhynchus superciliaris Near-threatened species. Uncommon altitudinal migrant. Recorded in January and from March to mid May between 1,700 m and 2,940 m in warm broadleaved, cool broadleaved, fir and hemlock forests; favours forest with a well developed bamboo understorey. Up to four birds regularly recorded between Sengor and Yongkhala: March 1994 (Bishop 1994), April 1995 (Bishop 1995), April 1996 (Bishop 1996), April 1997 (Bishop 1997, Farrow 1997), April 1998 (Farrow 1998), May 1998 (Inskipp and Inskipp 1998), April 1999 (Farrow 1999, Holt 1999), May 1999 (Bishop 1999) and April 2000 (Farrow 2000). The highest number recorded was three pairs in April 1998 (Bishop 1998). One to two birds were also recorded between Gayzamchu and Thekpaling and between Gayzamchu and Ura in April 1998 (Inskipp and Inskipp 1998), and around Omdor and Saleng in January 2000 (Inskipp et al. 2000).

RUFOUS-THROATED WREN BABBLER Spelaeornis caudatus Near-threatened and restricted-range species. Uncommon and local, probably resident in dense thickets in gullies in cool broadleaved forest, often associated with several very large rocks. Up to four birds were regularly recorded below Namling between March and mid May from 1,800 m to 2,200 m: March 1994 and April 1995 (Bishop 1999c), April 1996 (Bishop 1999c), 18 April 1996 (Holt 1996), 8 May 1996 (King 1996), 22 March 1997 (Redman 1997), April 1997 (Bishop 1997), 19-22 April 1997 (Farrow 1997), 6-8 April 1998 (King 1998), 15 April 1998 (Holt 1998), 18 and 19 April 1998 (Farrow 1998), 13-15 April 1999 (Holt 1999), 17-18 April 1999 (Farrow 1999), 17 March and 20-23 April 2000 (Farrow 2000a,b), 14-15 April and 11-15 May 2000 (Bishop 2000). A maximum of seven was recorded there on 15 April 1997 (King 1997).

SPOTTED WREN BABBLER Spelaeornis formosus Nearthreatened species. Uncommon and probably resident. Recorded in March and April in dense undergrowth in warm broadleaved forest and cool broadleaved forest, often near a stream, from 1,000 m to 2,270 m. One to two birds were regularly recorded between Lingmethang and above Yongkhala: in March 1994 (Bishop 1994), April 1996 (Bishop 1996), March and April 1997 (Bishop 1997, Farrow 1997, Redman 1997), April 1998 (Farrow 1998), April 1999 (Farrow 1999) and April 2000 (Kazmierczak and Fisher 2000). Several were singing there from 14-16 April and 13-16 May 2000 (Bishop 2000). Also one to two birds were recorded between Gayzamchu and Thekpaling, between Thekpaling and Kheng Shingkar and near Kheng Shingkhar in April 1998 (Inskipp and Inskipp 1998).

WEDGE-BILLED WREN BABBLER Sphenocichla humei Nearthreatened and restricted-range species. Rare and very local. A flock of 12 was seen in the buffer zone at Chulungbi on 15 January 2000 in bamboo in broadleaved forest at 1,130 m (Inskipp *et al.* 2000).

BLACK-HEADED SHRIKE BABBLER *Pteruthius rufiventer* Rare and local, probably resident in cool broadleaved forest. One was seen below Namling on 10 April 1998 at 2,300 m (Bishop 1999c), three were seen in the same area at 2,390 m on 28 January 2000 (Inskipp *et al.* 2000) and two males were singing at 2,500 m and 2,700 m on 11 May (Bishop 2000).

HOARY-THROATED BARWING Actinodura nipalensis Restricted-range species. Uncommon and local; probably resident in cool broadleaved and hemlock forests; recorded in January, from March to early May and in October from 2,205 m to 2,840 m. Only recorded between Sengor and Namling: one was seen in October 1991 (Inskipp and Inskipp 1993), two in March 1994 (Bishop 1994), seen in April 1995 (Bishop 1995), two in April 1997 (Farrow 1997), one in April 1997 (King 1997), four in April 1998 (King 1998) and singles in April 1998 (Bishop 1998, Farrow 1998), one in April 1999 (Farrow 1999) and two in April 2000 (Farrow 2000). A maximum of 10 was seen on 5 January 2000 (Inskipp *et al.* 2000).

YELLOW-THROATED FULVETTA Alcippe cinerea Nearthreatened species. Probably resident; recorded in January, from March to mid May and October in warm broadleaved and cool broadleaved forests between 1,600 m and 2,500 m. Locally fairly common between Yongkhala and Namling (many observers). Several observed collecting and carrying nest material there on 12 May 2000 (Bishop 2000). Also recorded between Thekpaling and Kheng Shingkhar and around Kheng Shingkhar in April 1998 (Inskipp and Inskipp 1998). A maximum of 40 was seen between Lingmethang and Yongkhala on 19 January 1995 (King 1995). One was seen carrying nest material between Thekpaling and Kheng Shingkhar on 19 April 1998 at 1,740 m (Inskipp and Inskipp 1998).

WHITE-NAPED YUHINA Yuhina bakeri Restricted-range species. Probably resident; recorded in January and from March to mid May, mainly in warm broadleaved forest with an understorey of tall bamboo, also in cool broadleaved forest from 1,005 m to 2,030 m (many observers). Generally fairly common, but common in the Yunari valley in the buffer zone (Inskipp *et al.* 2000). Regularly recorded between Yongkhala and Namling; also recorded between Gayzamchu and Thekpaling and between Thekpaling and Kheng Shingkhar in April 1998 (Inskipp and Inskipp 1998), between Omdor and Saleng and below Saleng in January 2000 (Inskipp *et al.* 2000), and in the buffer zone in the Yunari valley, around Broksar and Chulungbi and at Gulibi in January 2000 (Inskipp *et al.* 2000). A maximum of 80 was seen between Lingmethang and Namling on 18 January 1995 (King 1995).

GREATER RUFOUS-HEADED PARROTBILL Paradoxornis ruficeps Near-threatened species. Very local and probably resident; only recorded above Yongkhala where fairly common in a narrow altitudinal belt from 1,825 m to 1,930 m in warm broadleaved forest (many observers). Regularly recorded in January, from March to early May and in October. A maximum of 45 was recorded on 18 January 1995 (King 1995).

Table 1 Important habitats for birds

Number of spec	ies recorded
Warm broadleaved forest	210
Cool broadleaved forest*	146
Fir	89
Hemlock	71
Agricultural land/around habitation	68
Wetlands (rivers, streams & marshes)	17

\* This habitat has not been comprehensively surveyed and the figure is proportionally low compared with the other habitats

Warm broadleaved forest was found to support the highest diversity of bird species; 62% of species recorded in the park were found there. This forest type was important for birds throughout the year, supporting the highest number of both breeding and wintering species. Many species in the park are altitudinal migrants descending to winter in warm broadleaved forest. The warm broadleaved forests around and below Saleng (1,270-1,700 m) in the core area of the park were found to be especially rich in bird species and numbers. We have not previously seen or heard of such bird densities in Himalayan forests. Single species flocks included up to 30 Green-tailed Sunbirds Aethopyga nipalensis, 100 Rufous Sibias Heterophasia capistrata, 30 Black-faced Warblers Abroscopus schisticeps and 50 Whiskered Yuhinas Yuhina flavicollis.

Cool broadleaved forest was found to be less diverse in bird species, but also valuable for birds throughout the year. Although the birds in this forest type are underrecorded, it is unlikely that the final species total will approach that found in warm broadleaved forest. Fir and hemlock forests with rhododendron and bamboo were found to be the richest in bird species at higher altitudes. A well-developed bamboo understorey was valuable for birds in all forest types, supporting rare species and specialities such as Chestnut-breasted Partridge, Satyr Tragopan, Broad-billed Warbler, Slender-billed Scimitar Babbler, Wedge-billed Wren Babbler and parrotbills. The two globally threatened species, Rufous-necked Hornbill and Beautiful Nuthatch, are dependent on mature trees, and the hornbill needs fruiting trees throughout the year.

Forests in relatively small areas in the park have been cleared to make way for agriculture, pastures and villages, the latter mainly in the buffer and multi-use zones. Species recorded in these cleared areas were either only found in these habitats or frequently recorded there. A significant number of other species were occasionally recorded in open areas (especially below 1,850 m), either because they were passing through these habitats from one forest to another, or because they temporarily moved from adjacent forest to feed in open areas. A few species which breed in forests, notably Plain-backed Thrush Zoothera mollissima and Long-tailed Thrush Z. dixoni were mainly recorded in pastures in winter, but in the breeding season they were restricted to forests. The cleared areas support a far lower number of bird species than forests, especially broadleaved forests, at similar altitudes, although birds were more easily located in open areas.

The authors are very grateful to the Nature Conservation Division, Department of Forests, Bhutan for arranging counterparts in 1998 and 2000 and logistics in the field in 1998 and to Dr Sangay Wangchuk, Head of the Nature Conservation Division for allowing us to write this paper. We are indebted to Sonam Wangchuk, Park Manager, and Sangay Dorji, Park Warden, for organizing field logistics in 2000, and also our itinerary which proved to be excellent. We warmly thank all those who worked with us in the field, especially Sangav Dorji, Park Warden, and Rinchen Singye and Sherubla, Park Forest Guards, in 2000, and also those who accompanied us in 1998: Pema Gyaltsen (Deputy Ranger), Sangay Dorji (Assistant Taxidermist and Deputy Ranger) and Yeshey Dorji (Forest Guard) from the Nature Conservation Division, B. S. Mongar from Bumthang Forest Services Division and Tashi our cook. CI and TI greatly appreciate the invitation from the Nature Conservation Division to visit Bhutan in 1998 and 2000. Special thanks go to the WWF Bhutan Programme for both funding our visits and the avifauna-cum-training surveys of the park. Finally, we are grateful to the following people who generously gave us their bird records from Thrumshingla National Park: David Bishop (Victor Emanuel Nature Tours), Niels Drever, Dave Farrow (Birdquest), David Fisher (Sunbird), Paul Holt (Sunbird), Hannu Jannes, Krys Kazmierczak (Sunbird), Ben King (KingBird Tours), Rebecca Pradhan (Royal Society for the Protection of Nature, Bhutan), Nigel Redman, and Durga Devi Sharma (Nature Conservation Division).

CRIMSON-BROWED FINCH Propyrrhula subhimachala	r4	WB	1770, 2500, 2700	2, 3, 5, 6, 8, 11, 13, 15, 23, 27, 30
SCARLET FINCH Haematospiza sipahi	r3	CB, WB	1700-2180	3, 5, 6, 7, 8, 10, 11, 14, 20, 24, 26, 27, 28 29, 32, 33
RED CROSSBILL Loxia curvirostra	r3	F, H	2960-3550	3, 5, 7, 14, 19, 21, 23, 24, 30
BROWN BULLFINCH Pyrrhula nipalensis	r4			4, 8, 20, 28, 30
Red-HEADED BULLFINCH Pyrrhula erythrocephala	r3	F, H, WB	1660, 3170	1, 3, 5, 6, 8, 10, 11, 14, 19, 21, 23, 24, 29 30
GREY-HEADED BULLFINCH Pyrrhula erythaca	?5	СВ	2700	8,14
Collared Grosbeak Mycerobas affinis	r?4	F	3100-3670	1, 5, 6, 8, 10, 14, 23, 26, 30
Spot-winged Grosbeak Mycerobas melanozanthos	r4	WB	1360-1770	2, 4, 5, 8, 24, 27, 33
WHITE-WINGED GROSBEAK Mycerobas carnipes	r3	F	3140-3950	1, 3, 5, 8, 12, 13, 23, 24, 25, 30
Gold-Naped Finch Pyrrhoplectes epauletta	r4		1850-2300	4, 8, 11, 13, 27, 29, 30
Emberizinae				
Crested Bunting Melophus lathami	r4	А	830-1100	16, 24, 25, 32
Little Bunting Emberiza pusilla	w4	А	950-2240	23, 24

#### Key to checklist

Bold type indicates species recorded in the core area of the park; the other species were recorded only in the buffer zone.

r resident

summer visitor S

winter visitor W

passage migrant m

?

status uncertain

1 locally 1 common

- 2 fairly common
- 3 frequent

4 5

rare

uncommon

# Habitats:

Cool broadleaved forest CB

F Fir forest

Hemlock/rhododendron forest Η

- А Agriculture/pasture/around habitation
- W Wetlands
- WB Warm broadleaved forest
