> XXV. The Botanical Hifory of Trifolium alpefre, medium, and pratenfe. By Adam Afzeliuls, M. A. Demonfrator of Botany in the Univerffy of Upfal, Foreign Member of the Limnean Society.

Read November 2, 1790.

WITH a view of publifhing a new edition of the Flora Suecica of the late illuftrious Linnæus, I have long been occupied in procuring information concerning the Swedifh Plants. Having fpent ten years in this purfuit, I flattered myfelf with the idea of knowing all thofe defcribed by him, a few only excepted, which I could not perfectly make out. But on my arrival in this country I found myfelf in an error; having met with many of the moft common plants in Sweden, which in England bear quite different names. This difcovery opened to me a new field of ftudy and labour. It was neceffary to examine whether the Englifh or Swedifh botanifts underfood by the true names the plants defcribed by Linnæus. It would indeed be an inexcufable fault in the Swedifh ones, if they, who had conftant accefs to, and were tutored by, their mafter himfelf, fhould neverthelefs be always in the wrong in fuch cafes; accordingly we find the foreign natural hiftorians now and then likewife miftaken.

This is the lefs furprifing, as, in the firf place, Linnæus has often mifquoted fynonymous names from the ancient authors; and, in the fecond place, when he has not given the defcription of the
plants, his characteriftics alone, being fhort and concife, will not always fuffice to diftinguifh his plant from all others. This difficulty is great where there is no recourfe to the fpecimen itfelf which he defigned by fuch a name. A plant might be found in this country, for inftance, which Linnæus never knew; which neverthelefs might agree perfectly with the characteriftics of one in his fyftem, though it differed very effentially from it in many other refpects: this might give rife to miftakes; as has frequently been the cafe.
If Linnæus has been theinvoluntary caufe of fuch confufion, he has, however, a claim to our indulgence; for, independent of his want of leifure for minutely inveftigating every appellation given each plant by various botanifts, he could not, in claffifying nature, derive any affiftance from preceding authors, as thefe in general furnifhed him but with a vague and confufed found of terms, owing to their own ignorance and careleffnefs, whereby they have ftrangely miftaken and confounded many very different plants. This has particularly been the misfortune of that inaccurate compiler Cafpar Bauhin, and in a great meafure alfo of Haller; fo that, in confulting the former efpecially, one is always uncertain what he means. Another confideration is, that Linnæus at that time had no figures to refer to, except thofe of old authors, which at times are only cuts in wood, and for the moft part fo badly executed, that it is a hard matter, and fometimes even impoffible, to pronounce which plant they are precifely meant to reprefent; efpecially when the queftion is of two fpecies nearly related.

But, be this as it may, I find that the wrong quotations of Linnæus have often led other authors into error; owing apparently to their having paid more attention to his citations than to his very characteriftic defcriptions of plants, which however are the chief things to be confidered; and, if maturely weighed, fufficient to pre-
vent many miftakes. I fhall do myfelf the pleafure of communicating fucceffively my obfervations relative to cafes of this nature; but at prefent thall confine myfelf to three fpecies of Trefoil, which, common as they are, particularly two of them, ftill want a good deal of illuftration. Thefe plants have, even till this very time, not only been confounded among themfelves, but alfo with many others. And though we are now furnifhed with good figures of each, ftill the true limits between them are not yet drawn ; nor have thefe fpecies as yet been fo minutely and accurately examined, as for the always invariable and diftinguifhing characteriftics of each to have been pointed out.

In order to form an adequate idea of thefe Trefoils, and to know their hiftory from the beginning to the prefent time, I have examined all authors quoted by Linnæus, Reichard, Murray, and the Englifh botanifts, with many others that I have been favoured with an opportunity of feeing in the large and choice library of Sir Jofeph Banks; without which affiftance, and the examination of the Linnean Herbarium, my enquiries would have been confined and imperfect. In the courfe of my invertigations I have difcovered, that many of the authors cited treat of plants quite different from thofe for which they have been quoted; and that others fpeak in fuch a manner, that it is impoffible to judge to what particular fpecies their inaccurate figures, confufed defcriptions, and vague characteriftics, if at times even all three are to be found together, are the moft applicable. With regard to thofe authors who have either been miftaken themfelves in their quotations, or been mifquoted by others, I have, to the beft of my judgment, endeavoured to put them in their proper places: and, as to the others, I could do no more than make my obfervations, and give my opinion, where particular hints or circumftances have not enabled me to difcover what
they meant. Upon the whole, indeed, thefe authors are of a local ufe only, in pointing out to their own countrymen the places where their native plants are to be found.

In the firft place, therefore, I beg leave to give a brief hiftory of each of thefe three Trefoils, and thew with which each of them has been, and ftill is, confounded, together with my reafons for what alterations I may have made. In the fecond place, I fhall quote the genuine fynonyms of authors, whom I am by fufficient reafons convinced to have treated of thefe plants. And, thirdly, I fhall add an adequate defcription of each, with particular characteriftics fufficient at all times to diftinguifh them from each other, and from the fpecies neareft related to them. To begin then with

## TRIFOLIUM ALPESTRE.

Clufius is, to my knowledge, the firft who mentions this Trifolium, in his Hiftory of the Hungarian and Auftrian Plants. He has left us no figure, but his defcription, brief and imperfect as it is, ftill fuffices to convince us that he meant the real one. He fays that, both in fhape and fize, it much refembles the precedings which is either Tr. pannonicum or Tr. montanum; but that its leaves are fomewhat more narrow; its flowers red, and without fmell; its fpikes in general two in number, one of which is fmaller than the other, and both of them clofe together at the top of the ftalk, without peduncles, and as it were concealed within the uppermoft leaves. This defcription he has afterwards introduced unaltered into his larger Hiftory of Rare Plants.

Cafpar Bauhin has quoted both thefe paffages of Clufius under his Trifolium montanum purpureum majus, in his Pinax; from which it indeed appears probable that he meant the fame plant, but it is not quite certain; as he adds, Trifolii altera Jpecies major, Gefn. and

Trifolium aliud nontanum majus, Thal, who appear to treat of fpecies different from thofe of Clufius. Gefner fays only that his Trifolium is larger and more common than pratenfe: but thefe remarks, though brief, give more reafon to fuppofe he meant Trifol, medium, than alpefre; which latter is rather a fcarce plant, and but little refembling our common clover. On the other hand, Thalius defcribes his Trifolium as having oblongum quafique Jpicatum capitulum; adding that the Trifol. fpicatum, which Tragus calls Cytijus, only differs from it by having longer leaves as well as fpikes, Now the Cytifus of Tragus being Trifol. rubens $\alpha$, it is alfo probable that the plant of Thalius is its variety $\beta$; and if this be the cafe, C. Bauhin would have done better had he placed this quotation under his Trifolium Jpica oblonga rubra. Perhaps this author, never fcrupulous in his quotations, meant, however, by his firftmentioned Trifolium, the real alpeftre.

But, at all events, Bauhin has been indifcriminately quoted by every fucceeding writer that had occafion to treat of either Trifolium alpeftre or medium. Among the authors more immediately fucceeding him, I have had an opportunity of confulting John Bauhin, Ray, Ruppius, Tournefort, and Boerhaave. Both the firt-mentioned, in their Hiftorix Plantarum, have copied the defcription of Clufius; and thus there is no doubt but their Trifolium was the true alpeftre. But Ray has made a mittake in adding Ger. Em. 1186. 4, and Park. IIO3. I; for both thefe treat of Trifolium Spica oblonga rubra, C. B. under which name he has likewife quoted them, and confequently twice on the fame page, and under two different fpecies. Here I muft alfo notice another miftake committed by Ray, or rather, perhaps, by his editor Dillenius. In his Hiftory, aswell as both the firft editions of his Synopfis, he has defcribed a Trifolium which is the real medium, without referring to
any preceding author. But in the third edition we find quoted fuch as have intended the Trifol. alpeftre. Ruppius has done the fame, remarking at the fame time that his Trifolium fere fimile of illi quod feritur in agris ad jumentorum pabulum; and thus it can be no other than the medium. Tournefort and Boerhaave, as ufual, have no defcription, and confequently we cannot judge but from their quotations; and if they knew the meaning of their authors, they certainly intended the alpeftre. Yet Boerhaave has added Morif. 2. I39. I, which is certainly an error, as Morifon there treats of Trifol. rubens $\beta$.

Among recent authors, I mean fuch as wrote after the reformation of botany by Linnæus, and until he named the Trifol. alpefte, I have ftudied Van Royen, Haller, Scopoli, and Hudfon. The firft of thefe has given us only the fpecific differences of his plants, which afford no great information; but ftill, in calling its folia ovato-oblonga, integerrima, he feems rather to hint at the Trifol. medium. That Haller, Scopoli, and Hudfon had alfo this in view, is beyond a doubt, as I fhall foon prove. I will juft obferve here, that Haller, under this head, has not only brought in feveral varieties, which indeed I have not feen, but that appear to be different fpecies; but, according to his ufual practice, has injudicioufly huddled together a vaft number of fynonyms, particularly in his Stirpes Helveticæ, which belong to at leaft three feparate fpecies of Trifolium, viz. rubens $\beta$, alpeffe, and medium.

Nearly the fame confufion is obfervable in his edition of Ruppius; for, after having copied the above-mentioned defcription of Trifol. medium by that author, he adds a circumftance that belongs to the rubens. I have at leaft not yet feen any fpecies befides this laft, of which it can be faid, vaginis petiolorum floralium latioribus a vulgari pratenfi differt. That Haller alfo really meant the rubens, I am further induced to believe, from his having, in this edition, left out

Trifolium montanum, fica longifima rubente, C. B. which is found in both the preceding ones; and alfo from his having added the figure of Rivinus, Tав. 12, which indeed reprefents the alpeftre, but for want of attention might eafily be miftaken for the rubens $\beta$.

At laft Linnæus introduced Trifol.alpeftre into the fecond edition of Species Plantarum. But this, inftead of fettling the confufion, ferved rather to increafe it. For, befides the genuine fynonyms of Clufius and J. Bauhin, he has alfo added the uncertain ones of Van Royen and C. Bauhin, together with fome obfervations, which, though very brief, ftill unfortunately regard three diftinct fpecies, viz. alpeftre, medium, and pratenfe. Afterwards he inferted this into the twelfth edition of Syft. Naturæ, with the following alteration-that the word felflibus in the fpecific character was left out, as was neceffary, when he confounded it with medium, which frequently has pedunculated fpikes. A more ample defcription was alfo made, with a view of diftinguifhing it from the pratenfe. But the diftinguifhing marks, taken chiefly from the ftipulx, may fuit the alpeftre as well as the medium, although this latter bears a ftronger refemblance to pratenfe than the former does.

Of all the authors who from that time have treated of the Trifol. alpefre, I am not certain that any one befides Jacquin, Allioni, and perhaps Doerrien, had the real one in view. I fay nothing of Murray and Reichard; as what they have inferted into their editions of the Syftem, is nothing further than copies from the twelfth edition, except their having ftill more confounded it with the medium, by quoting other authors, who were miftaken themfelves.

Thus profeffor Jacquin is the firft perfon to whom we are indebted for a perfect and juft idea of Trifol. alpeftre, from his good figures and defcriptions, firft in his obfervations, and afterwards in his Flora Auftriaca. But his quotations are not all to the pur-
profe; for, in my opinion, independent of the equivocal C. Bauhin, neither Van Royen, Haller, nor Crantz are properly cited. Of the firft of thefe I have already fpoken; and, with regard to the three latter, Haller, meaning to diftinguifh his Trifolium from the pratenfe, mentions, indeed, nothing but what ferves for this purpofe; neverthelefs, when he fays that it has vagina in latiufcula foliola terminata, or fipula lanceolata, folia fupernè raro maculata, calyx glaber, छ forum Jpica obefior, he can hardly intend this for any other than medium. The fame is the cafe with refpect to Crantz, who tells us that his plant has caules ramofi, angulofi, vagine petiolorum friis rubentibus, folia inferiora et media integerrima, fed fuperiora ciliato-ferrata, and calyx bafi dentibuifque coloratis; all of which does not accord with the alpeftre, except that the vagin $æ$ are fometimes, though very feldom, marked with a few red ftreaks, whereas thofe of the medium are almoft always fo.

Before Jacquin, Rivinus had in the laft century given us a pretty good figure of Trifol alpeftre. But although Haller in his Stirpes Helveticæ referred to him, he has neverthelefs happened afterwards to be conftantly overlooked; probably becaufe the plant was not well known until Jacquin publifhed his obfervations. Thus we have now three figures of this Trifolium, all of which are original.

Though profeffor Allioni has not given us any defcription, yet, as he has admitted into his Flora the Trifol. flexuofum of Jacquin, there is reafon to fuppofe his alpefre may be the real one; though he alfo has quoted all the authors fet afide by Jacquin, and whom I have already mentioned; adding Scopoli likewife, who certainly means the Trifol. medium, though he terms it alpeftre; for he fays that it has a caulis fubangulatus, folia fubtus pallidiora, tumor callofus inter ramos et caulem, and calyx glaber friiis rubris exaratus.

Madame Doerrien, as fhe immediately before mentions a TrifoE e
lium which appears to be medium, muft certainly by her alpefore underftand another fpecies, and perhaps the true one; at leaft the defcribes the leaves as having fhort footftalks, and being deftitute of white fpots; and the teeth of the calyx, efpecially the lowermoft, very long and hairy. On account of this laft expreffion, her plant might rather be fuppofed Trifol. rubens; but this conjecture falls to the ground, when fhe fays that the heads of the flowers are roundifh.

The other modern authors who have treated of Trifol. alpefire, feem all to have erred. But as in all probability they have not all had the fame fpecies in view, any more than has been fhewn to have been the cafe with the old writers, I proceed, in order to prefent in a clear point of view this plant, which all along has been fo confufedly defcribed, to enumerate all the Trifolia with which from remoter times to the prefent day it has been confounded, and which are the following, viz.

## 1. Trifolium rubens $\beta$.

As undoubted fynonyms of which I may mention hereTrifolium majus flore purpureo. Ger. Em. p. 1186. n. $\ddagger 40^{*}$

Trifolium montanum majus purpureum. Park. Theatr. p. IIO3, n. I. * Et Trifolium montanum majus flore purpureo. Ibid. p. IIO4, n. I. fig. Jup. integr.
Trifolium purpureum montanum majus fica oblonga. Mor. Hij. ii. p. I39, n. I. * Et Trifolium Lagopoides montanum, 3. Clus. Ibid. fect. 2, tab. 12, fig. I, fec. ord.
All thefe authors exhibit one and the fame "figure taken from Clufius; and of which, in the next article of Trifol. medium, I fhall have an opportunity of fpeaking further. As I have faid before,

Gerard and Parkinfon are cited by Ray, and Morifon by Boerhaave.

To this place might perhaps alfo be referred -
Trifolium aliud montanum majus. Thbal. Herc. p. 123, fq. * Trifolium folio longo flore purpureo Riv. Rupp. Fen. Ed. Hall. p. 254, fq. *
Trifolium fpicis fubglobofis villofis terminalibus feffilibus, caule erecto, foliis lanceolatis ferrulatis. Gmel. Sib. iv. p. 22, n. 20.

Thalius and Ruppius I have before mentioned; and have now only to add, that Haller alfo in his Stirpes Helveticæ has quoted the firt under Trifol. rubens $\beta$, p. 584, n. 11. * As to Gmelin, it is indeed uncertain what he meant, as he has added no defcription; but if his quotation of Trifolium Spica oblonga rubra, C. B. be true, his Trifolium is not alpefre, but rubens. It is poffible too that he may have confounded thefe two fpecies, which fo nearly refemble each other, that miftakes might eafily be made, and are the more pardonable. Notwithftanding this, they are really diftinct; for, befides the Trifolium rubens being in general larger, its leaves are on both fides free from hairs; and in the edges they are finely ferrated by means of the veins running out into fmall curved points directed towards the top, fhorter and longer alternately, exactly as in Trifol. montanum; both vaginæ and ftipulæ, particularly of the floral leaves, are much larger, and not hairy; the former fwelling, and the latter fomerwhat ferrulated : the fpikes in the beginning feffile, and concealed within the floral vaginæ, exactly as in Trifol. alpeftre; but afterwards they grow more or lefs pedunculated, oval, oblong, or cylindrical : calyx fmooth, but its teeth hairy; and the lowermoft of thefe teeth are as long as the whole flower.

$$
\text { Ee } 2 \text { 2. Tri- }
$$

## 2. Trifolium medium.

Although I am but little furprifed at the earlier authors having fometimes miftaken the Trifol. rubens for alpefre, I very much wonder that the modern ones could confound alpefte with medium, or regard this latter as the true alpeftre. Neverthelefs this has frequently been the cafe; for, after it had been named by Linnæus, I have found about twenty authors mentioning a Trifolium which they call alpefre, only two or perhaps three of whom, as I have faid above, may with certainty be affirmed to have treated of the genuine one. Moft of the reft, to judge by their writings, have had the Trifol. medium in view, though, exclufive of its ftipulæ and the characteriftics common to the whole genus, it bears very fmall refemblance to the alpefre: for its ftem is flexuofe, angular and branched; the footfalks longer and divaricated; the leaves broader; the fpikes generally pedunculated; calyx moftly fmooth, and its teeth larger, \&c. Whereas the Trifol. alpeftre has a ftraight, round, and fimple ftem; fhort and erect footftalks; narrow and ftrongly veined leaves; fpikes conftantly feffile; a calyx always downy, and all over of the fame colour; its teeth fhorter than thofe of the medium, but the lowermoft one is proportionably longer.

## 3. Trifolium pratenfe.

Linnæus fays of Trifol. alpefte that it is ramis copiofifimis luxurians in fatis. But I am confident he never faw either the alpeftre or the medium in a cultivated fate; and confequently that by this expreffion he points at the pratenfe, which is commonly cultivated in Sweden as well as other countries; and, through cultivation, varies into fuch a refemblance to Trifol. medium, that, without ftrict and minute examination, they can hardly be diftinguifhed. Still the pratenfe has always caules bafi adjcendentes, and they are not flexuofe; branches
branches and leaves erect, but not divaricated; vaginæ and ftipulæ much larger than thofe of the medium, and the ftipulæ terminating in a fetaceous awn; the fpikes fingle, and without a peduncle; the flowers erect, not divaricated; and the loweft tooth of the calyx far fhorter than the tube of the corolla, \&cc.

As Linnæus confounded Trifol. medium with alpefte, and faw it growing in Sweden on all dry hills near forefts, refembling the cultivated pratenfe, we fee the origin and reafon of the above-mentioned expreffion, ramis copiofifimis luxurians in Satis; which however he afterwards excluded, having probably obferved his miftake. How far the Trifol. alpefre is fit for cultivation, I cannot determine; but, as to medium, I have reafon to think it is not. For I have obferved the fame fingularity refpecting it which profeffor Jacquin mentionsthat, when planted in gardens, in a good and loofe foil, it generally grows more flender, and particularly its fpikes become fmaller; but on eminences, in a dry, hard, and uncultivated clay bottom, it grows fpontaneoufly very luxuriant.

## 4. Trifolium pannonicum.

To this I think may be referred -
Trifolium alpeftre. Gouan. Illuftr. p. 52. *
Many cultivated plants being feen producing variegated flowers, it has been fuppofed that the fame might alfo be the cafe with refpect to the wild ones. But on ftricter fearch it will be found, that in this point plants are moftly in the fame predicament with animals, the tame or domefticated individuals of which vary greatly as to colour, but not the wild ones. It has alfo been difcovered that various plants with differently-coloured flowers, which have been long efteemed only varieties of each other, are really diftinct fpecies; and that, on more minute examination, befides the difference
of colour firft obferved, they alfo differ in other refpects, particularly as to their parts of fructification. Thus when profeffor Gouan fays of his Trifol. alpeftre, that it has flores ocbroleuci, there is reafon to fufpect its not being the real one; and as we have no other fpecies than the ocbroleucum, pannonicum, and montanum, which anfwer to this defcription, and are otherwife as to their form and appearance nearly related to the alpefte, it may naturally be fuppofed that he meant one of thefe three: now it cannot be either the ochroleucum or the montanum, as he has feparately mentioned thefe in the fame place ; confequently his Trifol. alpeftre muft either be the pannonicum, or a new fpecies.

## TRIFOLIUM MEDIUM.

If my conjecture already mentioned refpecting Gefner be juft, he is the firft author who treats of this Trifolium. But the firft certain account of it was given by Ray in his Hiftory ; and it is evident, from his defcription, that he meant the real one. As in its appearance it refembles the pratenfe, he has juftly compared them together, faying, that the medium is in all refpects larger; that the leaves are not always marked with white fpots, and that they have more confpicuous veins, particularly on the under fide; that the fpikes are more round, having long peduncles; and that the flowers are of a deeper purple. But he commits an error in believing it to be the fame as that cultivated in meadows: yet he has altered this in the firf edition of his Synopfis; and in the fecond he kept them feparate, as did alfo Dillenius in the third edition. He is the firft who added the fynonymous appellations of other authors, but unfortunately fixed upon thefe three, Clufius, J. Bauhin, and C.Bauhin, neither of whom meant the fame plant as he did, or the Trifol. medium; but, on the contrary, the alpeftre; efpecially the two firft, as is mentioned above.

After Ray, this Trifolium was mentioned by Ruppius, Tournefort, Boerhaave, Van Royen, Haller, Wilfon, Scopoli, Hill, and Hudfon; and thefe are the only writers I have found noticing it, before Linnæus named it. Tournefort and Boerhaave only quoted Ray, and mentioned his plant as feparate from Trifolium montanum purpureum majus, C. B. which latter, confequently, they could not take for the medium, but rather for the alpefire, where, if it were to be cited at all, it ought to have its doubtful place. With refpect to Ruppius, Van Royen, Haller, and Scopoli, I have already faid what I thought neceffary, and that they have all miftaken it for the alpefre; at leaft in this refpect, that under it they generally quoted fuch authors as meant the alpefire. The fame is done by Wilfon and Hill; who, moreover, only copied what they found in the third edition of Ray's Synopfis.

Mr. Hudfon, in his firft Flora Anglica, called it Trifol. medium, giving it a new character, and adding the doubtful quotation of C . Bauhin, as well as the true one of Ray. Mr. Hudfon did not then know that Linnæus, a year ago, had given it the fame name in his Novitiæ Floræ Suecicæ, which are fubjoined at the end of the fecond edition of his Fauna Suecica. At all events, it was not eafy to difcover what Linnæus meant; as he neither added character nor defcription, and afterwards neither mentioned the Trif. medium any where in his works, nor referred to this place in the Novitix. The extrication of this would alfo have been impoffible to any but Swedes who could go to Jumkil, where he fays this Trifolium grows. This place, which is famous for the number of its rare plants, is fituated about thirteen miles from Upfal. I have vifited it, and found there the Trif. medium. Befides, I have feen it under the fame name, by the authority of Linnæus, in all old Swedifh Herbariums, and efpecially in his own. Further, as it is in fome meafure
meafure a medium fpecies between the alpeftre and pratenfe, I think I have reafon to prefer the oldeft name, and which was given by Linnæus himfelf; though he afterwards changed it for alpeftre, or rather confounded thefe two fpecies. Hence he fays, in the fecond edition of Species Plantarum, that Trifolium alpefte grows alfo in Sweden; whereas no other than the medium is found there.

It appears as if Linnæus had been led into this miftake by the ftipulx, which in both are fimilar, and very different from thofe of Trifol. pratenfe, though in other refpects the alpeftre and medium have few things in common. However, it feems as if fucceeding botanifts had generally regarded the Trifol. medium as the alpefte, and confounded the fynonyms of both; whereas, neverthelefs, properly fpeaking, the medium has neither caulis erectus, nor folia lanceolata ferrulata. But having in various authors obferved various notions of thefe and other terms, this no longer appears fingular to me. At all events it is certain that the Trifol. alpefre of all the Englifh botanifts, of Crantz, Scopoli, Pollich, Leers, Muller, Retzius, Lieblein, and perhaps alfo of Gmelin, Scholler, Mattufchka, Reichard, and Willdenow, is no other than the Trifol. medium; for I am informed that this latter only, and not the former, grows in England and Scotland, as Dr. Stokes has before obferved; and the fame I can fay of Sweden, Denmark, and Norway. Befides, the figure of Muller plainly evinces that his Trifol. alpeftre is the medium.

That Crantz, Scopoli, Pollich, Leers, and Lieblein have made the fame miftake, is evident from their defcriptions, as with regard to the two firf I have fhewn above; and, as to the three latter authors, they compare their Trifolium with the pratenfe, faying that its ftem is for the moft part depreffed, or almoft lying on the ground (efpecially at the bafes), fomewhat angular, and furnifhed with joints; the leaves are feldom fotted, and are on the under
fide of a lighter green; the flowers of a deeper purple, and the fpikes nearly globular. Pollich and Leers add, that they are larger, and generally fhorter, or have longer peduncles, particularly when grown old; and that the calyx is moftly without hair, and marked with red-brown lines or nerves. But when Leers further adds, that the foliola are lineari-lanceolata, and calycis dentes brevifimi, infimo tubo corolla dimidio breviore, the former obfervation fuits better with Trifol. alpefre, and the latter with Trifol. pratenfe. Lieblein has likewife made this remark on the teeth of the calyx, namely, that they are very fhort.

Scholler in his Flora, and Mattufchka in his Enumeratio, have only copied what Linnæus has faid in the twelfth edition of his Syftem, under the head of Trifol. alpefre; but Gmelin in his Stirp. Tubing., Reichard in his Flora, and Willdenow, have no defcription at all. In his Flora, Mattufchka has indeed faid many pretty things; all of which, however, are equally applicable to alpeftre and to medium. Thus it is impoffible to determine, with any degree of certainty, what fpecies the Trifolium of thefe authors really is; but, if I am not much miftaken, they have all intended the medium. This, however, I only fay by way of conjecture, leaving it to time further to elucidate this matter.

With regard to Gorter, who inferted the Trifolium of Ray as a variety of pratenfe; nor with regard to Nonne and Gattenhof, who have mentioned Trifolium Spicis villofis foliis infdentibus, vaginarum caudis latioribus, Hall. and added the often-mentioned and doubtful fynonyms of C. Bauhin and Van Royen; nor, laftly, with regard to Jenkinfon, who has taken up Trifol. medium probably from Mr. Hudfon, and only tranflated the character he gave of it into Englifh—have I much more to fay. Though all thefe authors have no defcription, Nonne excepted, who has added that inaccu-
rate obfervation of Haller's, out of his edition of Ruppius's Flora Jenenfis, of which I have made mention above, viz. that the vagince petiolorum floralium are broader than thofe of the Trifol. pratenfe; it ftill feems probable to me, that they all meant the Trifol. medium.

At laft Profeffor Jacquin has given us information concerning this Trifolium, by means of a feparate defcription, and a good figure of it, in his Flora Auftriaca, where he calls it fexuofum. But, though fifteen years have now elapfed fince its publication, ftill I have found none but the Chevalier Murray, Profeffor Allioni, and Dr. Stokes, who have referred to it. The firft of them has placed it under alpefre, though there were juft as good reafons for making this a diftinct fpecies as many other new plants which he has inferted in the fourteenth edition of the Syftem. Profeffor Allioni has faid no more concerning it, than that it grows in Piedmont, and has an annual root; which remark furprifes me the more, as it is defcribed by all others to be perennial: a circumftance I can prove by my own experience. Dr. Stokes has given us pretty good obfervations on the fubject, collected from various quarters. Befides thefe three authors, no others who have written after the publication of Profeffor Jacquin's figure, have attended to it, although they have meant the fame plant. Some of them had perhaps not then feen this figure, but all cannot plead this excufe.

Thus, though Profeffor Jacquin is the firft who has given us a proper idea of Trif. medium, and taught us to feparate it from the real alpefire, ftill I cannot conceive but that he has confounded it, at the fame time, with another equally diftinct fpecies: for he has quoted as fynonymous Trifolium majus iii, Cluf. and, to the beft of my judgment, this is the rubens $\beta$. For this I will give my reafons, which I fhall chiefly take from the very defcription of Clufus.

He fays of this Trefoil of his, that it is by far larger than the next preceding, viz. the alpefre; that it has alfo thicker ftems; that its leaves are friata, dorfo magis eminente et elato, laxa quadam veluti vagina caulem amplectentia, duplo longiora et per oras denticulata; and, laftly, that the fpike is oblongior and major. All this, and efpecially what he fays of vaginæ and foliola, does by no means agree with Trifol. medium. He mentions, indeed, at the fame time, that the ftalks are nodof, or have genicula, and that the calyx is hairy; but by the firft I do not believe he underftands any flexure but the joints (nodi), which in the Trifol. rubens are larger than in any other, owing apparently to the very large, and as it were inflated, vaginæ of the ftipulx. And as to the latter obfervation, the calyx of the Trifol. rubens is indeed always naked; but fo is, for the moft part alfo, that of the medium. Still both of them have hairs on the teeth of the calyx; but the rubens has thofe hairs both longer and in greater abundance; which, being divaricated, almoft cover the calyx, fo that at firft fight it appears to be all over hairy. Clufius therefore may be excufed for thus defcribing it.

This author immediately after fubjoins his Trifolii majoris iii altera Species, of which he only obferves, that vel magnitudine vel foliorum et forum forma aut colore, nibil aut quam minimum differt. Folia tamen angufiora illorum longitudinem aliquantum excedere videntur, et florum Spica longior effe. This being by common confent Trifol. rubens $\alpha$, the next preceding can be no other than the variety $\beta$. For it is not probable that Clufius, who for his time was very accurate, fhould have found fo great a likenefs between two plants fo different as Trifol. rubens and medium are. Befides, as he has four fpecies of his Trifol majus, which he compares together, faying that, as to their external appearance, they are all fimilar; the chain will be uninterrupted, if they are fuppofed to be Trifolium montanum, or perhaps
pannonicum, alpefre, rubens $\beta$, and rubens $\alpha$; but it will be broken if, inftead of ribens $\beta$, the medium is inferted, whote form and appearance are very different from all the other three. It is true, the figure of his Trifolium majus iii. feems rather to refemble the medium than the rubens, being hairy and fomewhat branched. But the fame may be faid of his figure of Trifolii majoris iii altera fpecies: and thus neither of thefe figures of Clufius can be taken for Trifol. rubens, or elfe both of them muft. I believe, however, the latter opinion is the fafert, as his defcriptions fo well agree with Trifol. rubens, and as it is not yet perfectly certain whether this plant does not at times become branched. Laftly, as to the hairs which Clufius has reprefented in the edge of his figures, I believe they are rather meant to reprefent their fine teeth, than any hairinefs.

Having endeavoured to prove that the Trifolium majus iii of Clufius ought to be confidered as the fecond variety of Trifol. rubens with broader leaves and fhorter fpikes, I fhall conclude by citing a few fynonyms, as an addition to thofe quoted in the preceding article of Trifol alpeftre. Thefe are-

Trifolium maximum purpureo flore. Cluf. Pann. p. 760, n. 3. * Et Trifolium majus iii. Ibid. p. 762. Et ejuld. Hift. vi. p. 245, n. iii *.
Trifolium fpica oblonga rubra. Baub. Pin. p. 328. Ray, Hi/t. i. p. 944, n. 7. *
Trifolium purpureum majus, folio et fpica breviore. Baub. Hijt. ii. $p$. 375, fig. inf.
Trifolium majus tertium purpureum, Clufio. Baub. Hif. ii. p. $375 .^{*}$

The figure of John Bauhin, as well as thofe of Gerarde, Parkinfon, and Morifon, as already mentioned, are only re-impreffions of the original of Clufius, whofe defcription is likewife copied in
part by Gerarde and Parkinfon, but entirely by Ray, Morifon, and J. Bauhin in the laft-mentioned place, where it is not accompanied by a figure. But this the author has inferted in the former place along with the figure of Trifol. rubens a, which variety he has alfo defcribed there himfelf. Dr. Stokes, after the example of Profeffor Jacquin, has quoted under his Trifolium flexuofum, not only the figure of Clufius, but alfo thofe of Gerarde, Parkinfon, and J. Bauhin, to which he has added another by Parkinfon, which reprefents the upper part of Trifol, pannonicum, or elfe the montanum.

## TRIFOLIUM PRATENSE.

Although we have but few figures of Trifol. alpeftre and medium, viz. three of the former and two of the latter, thofe of the pratenfe are more numerous. If I were to fay I had feen upwards of fixty myfelf, it might perhaps, true as it is, found extravagant. Of thefe, fifteen or fixteen may be efteemed originals, and all the others either copies, or only re-impreffions from the fame plates of thofe publifhed before. This laft was moft cuftomary in the two laft centuries. And thus thefe figures conftitute feveral fets, which $I$ thall briefly touch on, adding a few obfervations on their merit, and how far they may deferve to be quoted.

In an old book called Ortus Sanitatis, printed at Venice, 1426, in folio, appears a Trifolium, which I fuppofe to be meant for the pratenfe; though, from the barbarifm of thofe times, both figure and defcription are fo indifferent, that nothing certain can be affirmed refpecting them. In the defcription, feveral fpecies certainly are confounded; and the figure, though the foliola refemble thofe of Trifol. pratenfe, and the fpike is feffile between the floral leaves, ftill erroneoufly reprefents two oppofite leaves nearly in the middle of the ftem. In a later edition of this book, publifhed $\mathrm{I}_{517}$,
occurs the fame figure and defcription. In the third tome of Brunfelfii Herbarium, printed in Latin at Strafburg, $\mathbf{I}_{53} \mathbf{6}$, in folio, I have feen another and better figure; which, under the name of Brunella, feems to reprefent Trifol. pratenfe. Still the figure is not diftinct enough to enable me to judge of it with abfolute certainty.

But the firft evident figure of this Trifolium that I have feen, is found in Roefslin's Herbal, printed in German, at Frankfort on the Mayne, by Egenolphus, 1532, in folio. It is fmall, but reprefents the plant tolerably with one fingle ftem, with proper leaves, and a feffile fpike. Of this figure I have found thirteen reimpreffions, which are in Egenolphi Imagines et Effigies, a work which contains only figures, and of the former of which there are three editions; in Dorftenii Botanicon, in two places, under the name both of Epitbynum and Trifolium; in both the Latin editions of Diofcorides by Ryff or Rivius; and in the Hiftory of Lonicerus in Latin, as alfo in his German Herbal, of which I have feen two editions, under Uffenbach's name; and in this century, another by Ehrhart. The figures of Egenolphus and Rivius, as alfo thofe of Lonicerus himfelf, are in general coloured.

Fuchfen, or, as he is more commonly called, Fuchfius, in his Hiftory in Latin, printed at Bafil, 1542 , in folio, gave us a new and a good figure of this Trifolium, reprefented in its natural fize and pofition, with feveral ftems; and it is not much to our honour that this is ftill almoft the beft extant. The only thing that might be faid againft it, is, that a few of the fpikes are reprefented pedunculated, and the floral leaves are not always oppofite and feffile, as they ought to be. Of this figure we have a coloured re-impreffion in the German Herbal of this author; of which afterwards, firft Tragus in his Hiftory, and after him Dodonæus in
his Imagines, have each given us a copy on a fmaller fcale, engraved fo that the figure is reverfed. Neither of them can be called good, but that of Dodonæus is the beft ; and of this we find a reimpreffion in the fecond edition of his Imagines, as alfo in the French, Dutch, and Englifh tranflations of his Pemptades, and in both editions of Turner's Herbal. At laft John Bauhin, in his Hiftory, has given us a new and fmall copy of the figure of Fuchfius, altered for the worfe, though not reverfed.

Matthiolus, in his Commentary on Diofcorides, publifhed in Latin at Nenice, ${ }^{1554}$, in folio, began a new fet of figures. He reprefents the plant, diminifhed, pretty well, with many ftems from the fame root; but, as to the floral leaves, he has committed the fame fault with Fuchfius, and rather in a greater degree. It appears to me as if he had had the figure of the latter by him when he made his own, for they have an imperfect refemblance to each other, except that the figure of Matthiolus has the points of the foliola rounder, and the fpikes longer. This figure has afterwards been reprinted, or with more or lefs variation copied, in various works. Exact re-impreffions of it I have feen in the fecond Latin edition of the Commentary of Matthiolus, in the Latin Compendium of the fame author, in the French tranflation by Moulin, and the Italian one by Coftantini, and another later in the fame language; further, in the Hiftoria Lugdunenfis, which Linnæus calls Dalechampii, and the French tranflation of it ; and, laftly, in the Diofcorides in Spanifh, by De Laguna. It muft be remarked that Matthiolus, in his Compendium, has committed two errors; firft, in tranfpofing the figures of Trifol. pratenfe and montanum; and, fecondly, that in the defcription belonging to the latter, but inferted under the former, he mentions it as having purple flowers.

Of the copies of Matthiolus's figures I have feen three kinds. A larger one, in the Latin edition of his Commentary, in 1565 , fomewhat improved, and reprefenting the plant nearly in its natural fize: this has been copied in the Italian tranflations of this work, in the years 1568 and 1604 . Secondly, one of the fame fize with the original, in the Latin Epitome of Matthiolus, by Camerarius ; but inferior in this refpect, that all the fpikes are reprefented oval, and pedunculated, orwithout floral leaves. Neverthelefs it has been reprinted by Uffenbach in his German tranflation of Durantes's Herbario, by Becker in his Parnaffus, and by Zvingerus in his Theatrum, both of them in German. Thirdly, one kind much fmaller than the original one, but otherwife perfectly fimilar, found in the French tranflations of Matthiolus's Commentary, by Pinet. Camerarius has altered one of the abovementioned faults committed by Matthiolus in his Compendium, and reftored the figures of Trifol. pratenfe and montanum to their right places; but he has retained the other, faying, that Trifol. montanum has purple flowers.

Another fet of figures of the Trifol pratenfe originated with Tabernæmontanus, in his Herbal, printed in German at Frankfort on the Mayne, 1588 , in folio. His figure is of the fame fize as the original or firft one by Matthiolus, to which it bears fome refemblance; but is better in this refpect, that all the fikes are furnifhed with clofe floral leaves, which however rather appear to reprefent a large calyx than real leaves. Re-impreffions of this figure I have feen in eight places, viz. in Tabernæmontani Icones, and four later editions of his Herbal, the firft of which was publifhed by Cafper Bauhin, and afterwards reprinted; the third by Hieron. Bauhin, likewife reprinted in this century; further in Gerarde's Herbal, and in Cafper Bauhin's edition of the Commen-
tary of Matthiolus in Latin, of which I have feen a fubfequent edition.

The ten remaining figures of Trifol. pratenfe are all to be regarded as originals, and are publifhed by Rivinus, Zannichelli, the author of Spectacle de la Nature, Blackwell, Weinman, Kniphof, Knorr, Regnault, Zorn, and Profeffor Vahl. All thefe are genuine in this refpect-that they are intended to reprefent the honey-fuckle Trefoil, as is evident from their pofture, flipulæ, foliola, and clofe floral leaves, \&c. But that of Kniphof is, as ufual, a very poor one; which indeed I would have paffed over in filence, but that it has been referred to by more than one author. The figures of Zannichelli, Weinman, and Zorn are fomewhat better ; and thofe of Blackwell and Regnault tolerably good: but both thefe authors, as well as Zorn, have been unfortunate in reprefenting the fegments of the calyx very different from nature. The figures of Rivinus and Knorr are pretty good. That in Spect. de la Nature is an indifferent one, and appears to be made from the cultivated variety: indeed it is pity that the otherwife good figure of Profeffor Vahl feems to be alfo drawn from a cultivated fpecimen; for the whole of its pofture nearly approaches to that of Trifol. medium, the leaves being too much pointed to reprefent the wild plant. But its principal diftinguifhing characteriftics, the broad and awned ftipulx, as well as the feffile fpike placed between two oppofite ternate feffile leaves, are very well expreffed.

Of all the figures now mentioned, Linnæus himfelf has quoted none but that of Camerarius, in both editions of the Flora Suecica and Species Plantarum; that of John Bauhin only in Hortus Cliffortianus; and that of Rivinus alone in his firft Flora. To particularize which of thefe figures all G g
other authors have referred to, would be too tedious; it fuffices to mention, that I have feen a few of each fet quoted, but, what is furprifing, moftly thofe of inferior merit; whereas the good one of Fuchfius has been in this century quoted by no one but Haller and Dr. Stokes.

It feems, therefore, that the Trifol. pratenfe, as having been known from the earlieft ages, and being one of the moft common plants in Europe, ought to have been exempt from the confufion in which many others are involved, and which is more excufable when fome rare or lefs known plant is in queftion. Still it ftands unfortunately in the fame predicament; and Cafpar Bauhin, according to his ufual practice, began the confufion: for his Trifolium pratenfe purpureum, with his perplexed defcription and mifplaced citations, comprehends at leaft three diftinct fpecies, befides the genuine pratenfe; under which laft his Trifolium pratenfe purpureum is generally quoted by moft authors, who thereby have authorifed the blunder of Bauhin, not to mention other feparate miftakes committed by fome of them. I therefore efteem it neceflary in this place to enumerate all the plants which I have found miftaken for the Trifol. pratenfe, or confounded with it. But I fhall previoufly fpeak of

Trifolium pratenfe purpureum minus, foliis cordatis. Ray ${ }_{\text {k }}$ Syn. iii. p. 328, n. $5{ }^{*}$ tab. I3, fig. I.
This Haller has introduced as a different fpecies in his Stirp. Helv. p. $5^{8} 5$, n. 13*, but in his Hift. i. p. 164, n. $378^{*}$, he has inferted it as a variety of another Trefoil, which certainly is the ocbroleucum; and on the other hand adduced the authors really belonging to this latter, under Trifol pratenfe, as I am going to obferve. Linnæus, probably mifled by Haller, has alfo brought in this plant of Ray's, under his Trifol. ocbroleucum, in Syft. Nat.
tom. iii. p. 233. * But the Englifh botanifts, who ought to be better acquainted with it, feparate it from the Trifol. ochroleucum, fince, befides other differences, it has purple flowers; and they make it a variety of Trifol. pratenfe, on account of its having a fimilar, though ftarved appearance; the ftipulæ being in like manner awned, and the teeth of the calyx likewife nearly equal, as Dr . Sibthorp and Mr. Hudfon have informed me. But it differs in other refpects very materially; having the leaves oppofite ; the foliola fmall, fhort, and inverfely heart-fhaped; and the peduncle very long, and deftitute of floral leaves.

The other plants that have been confounded with Trifol. pratenfe, though widely differing from it, are the following, viz.

## 1. Melampyrum arvenfe.

Trifolium majus. Brunf. Herb. tom, iii. p. 47.
This paffage in Brunfels, Cafpar Bauhin has quoted under his Trifolium pratenfe purpureum, But to judge from the figure annexed, for there is no fuch thing as defcription, the plant is by no means any Trefoil, though called fo, but certainly a Melampyrum ; as John Bauhin has already remarked in his Hiftoria, tom. ii. p. 375, and which Haller in his Stirp. Helv. p. 626, n. 2, has taken for the arvenfe, which indeed it appears to be. This figure of Brunfels's is a re-impreffion of one in his Herb. ii. p. 58, where it has only obtained a German name.

## 2. Trifolium repens.

Trifolium pratenfe. Lob. Adv. p. 380. Hit. p. 493. (ed. Lat. 1576 .) P. ii. p. 35. (ed. Belg. 1581.) Icon. ii. p. 29. Dodod. Pempt. p. 556. (ed. 1583.) p. 565. (ed. 1616.) et p. 898. (ed. Belg. 1644.) Ger. Emac. p. 1185, n. I.

Trifolium pratenfe vulgare purpureum. Park. Theatr. p. IIIO, n. I.

Lobel, in his Adverfaria, has indeed no figure; and gives a defcription which comprehends at leaft two fpecies, the Trifol. repens and pratenfe. But that he chiefly had the repens in view, appears from his fubfequent Hiftoria or Obfervationes, in which he has given a pretty good figure of this plant, and at the fame time referred to the above-mentioned Aḑverfaria. Of this original figure by Lobel, re-impreffions have afterwards been made in all the above works. It bears fo near a refemblance to the Trifol. repens, as to leave us no room to doubt: and for this reafon it appears to me the more furprifing, that fo many both ancient and modern authors could refer to it for the pratenfe, which it in no manner refembles. Thus I have feen Lobel cited by Cafpar and John Bauhin, by Morifon, by Haller, in Stirp. Helv. and by Knorr; Dodonæus by Haller, both in his Stirpes and Hiftoria, by Linnæus, in both the editions of Flora Suecica, by Gorter, in both the editions of Flora Belgica, by Knorr, in his Thefaurus, by Mr. Hudfon, in the laft edition of Flora Anglica, and by Profeffor Vah1, in Flora Danica; Gerarde by Mr. Hudfon, in both the editions of his Flora, and by the Rev. Mr. Relhan, in the Flora Cantabrigienfis ; and, laftly, Parkinfon by Ray, both in his Hiftoria, and in all the three editions of his Synopfis, by Haller, in his Stirpes, by Wilfon, Hill, and Mr. Hudfon, in both places.

Haller happened firft, either by an error in writing or printing, to mifquote the laft Latin edition of Dodonæi Pemptades, viz. p. $36_{5}$ inftead of 565 ; and, after him, this fault has been invariably copied by all the above-mentioned authors, except Gorter, who altered it in the laft edition of his Flora Belgica. Haller alfo recommends the figure by Dodonæus as a good one, but Crantz criticifes
ticifes it as bad; and Dr. Stokes is the firft who has remarked that this, as well as thofe by Lobel, Gerarde, and Parkinfon, does not belong to Trifol. pratenfe, but to repens.

Gerarde, in his Herbal, has a genuine figure as well as defcription of Trifol. pratenfe; the former taken from Tabernæmontanus, as I have faid above. But Johnfon, who publifhed a new, and, as himfelf called it, improved edition of Gerarde, thought this figure not good enough ; and therefore inferted in its room the figure above cited, which reprefents the Trifol. repens, and is borrowed either from Lobel or Dodonæus; at the fame time retaining Gerarde's defcription: and thus unluckily confourided plants fo different as the creeping and purple Trefoil are. Parkinfon, who afterwards publithed his Theatrum, copied the laft edition of Gerarde ; and, as he faw the flowers were there defcribed purple, he thought it beft to infert that circumftance in the very title: by this means the white Trifol, repens came to be called by him purpureum.

## 3. Trifolium ochroleucum.

Trifolium montanum majus, flore albo fulphureo. Merr. Pin. p. 121.
Trifolium lagopoides annuum hirfutum, pallidè luteum feu ochroleucum. Mor. Hijf. ii. p. 141, n. 12. * Et Trifolium lagopoides, fl. ochroleuco. Ibid. fect. 2, tab. 12, fig. 12.
Trifolium pratenfe hirfutum majus, flore albo fulphureo feu ochroleuco. Ray. Hijt. i. p. 943, n. 8. \% Et Syn. iii. p. 328 , n. 3 . ${ }^{*}$

Triphylloides alpina, flore albo. Ponted. Anthol. p. 241.*
Trifolium Lagopoides flore fubluteo. Vaill. Par. p. 195, ก. 5 .

All thefe five authors Haller has quoted in his Stirp. Helv. p. 586 , under var. $\beta$, flore albo of Trifol. pratenfe. But in his Hiftory, tom. i. p. 164, he has only cited Morifon and Ray under var. d, flore ochroleuco, of the fame Trefoil. Of this laft, Linnæus alfo in the beginning confidered the plant of Pontedera to be a variety, as appears from his Flora Lapponica and Hortus Cliffortianus; but afterwards he juftly omitted this quotation.

That Merrett's Trifolium is the ochroleucum, is very probable from its being a native of England; and that Ray meant the fame, is evident beyond doubt from his defcription : but with refpect to Morifon, the matter is not fo clear ; for both his defcription, in which occur the terms folia acuta, and his figure, which reprefents the leaves narrow, lanceolate, and pointed inftead of rounded at the ends, appear rather to indicate the Trifol. pannonicum, though the fpecimen in Bobart's collection at Oxford is Trifol. ocbroleucum. It is far more difficult to make out what Pontedera aimed at; for, from his prolix defcription, nothing further can be concluded, than that the leaves, principally in the margin, as well as the whole calyx, are hairy; the flowers white and monopetalous; and that the feed-veffels generally contain one feed. Hence it follows, however, that his plant can neither be Trifol. repens nor montanum: and, independent of thefe two, I can think of no other capable of being called in queftion, except the Trifol. ocbroleucum and pannonicum. But, as the above-mentioned characters are equally applicable to both of them, and as thefe two laft-mentioned plants themfelves are fo nearly related as to be fcarcely diftinguifhable but by their fize, and the fhape of their leaves, it is impoffible to determine which of them Pontedera had in view. The plant of Vaillant is ftill more difficult to afcertain, for he has given no defcription at all.
4. Trifolium montanum.

Trifolium pratenfe ii. Dur. Herb. p. 1014. (ed. Germ. Uffenbach. 1619. Franc. ad Moen. $4^{\circ}$.)
This Trefoil, which undoubtedly is the montanum, C. Bauhin has quoted under his Trifolium pratenje purpureum. But as he is in every refpect inaccurate, he has termed it Trifolium pratenfe alterum; and called his author by his Chriftiain name Cafore, inftead of his furname Durante.

In all old authors, the Trifol. montanum always follows after the pratenfe, under the name of album or acutum, or elfe, which is the moft common, pratenfe alterum or pratenfe album: and the figures of it have likewife had the fame fate and changes, as I have before mentioned of thofe of the pratenfe. However, the montanum was not fo early known; for it does not occur in Roefslin's Herbal, nor in the firft edition of Egenolphi Imagines, or of Loniceri Hiftoria. Among this fet of figures it appears for the firft time in Ryff's edition of Diofcorides, printed at Frankfort on the Mayne, by Egenolphus, in 1543, folio: otherwife, the firft figure I have feen of it is in Fuchfii Hiftoria publifhed the preceding year. This is not only good, but the beft of thofe that have fallen under my infpection.

While on the fubject of Trifol. montanum, I muft not pafs over in filence the careleffnefs of C. Bauhin with refpect to this plant, as indeed to almoft all others: for he has quoted Trifolium majus i. Cluf. Pann. p. 76 x , and Hit. vi. p. 245, both under his Trifolium montanum album, Pin. p. 328 , which probably is the genuine montanum; and under his Trifolium pratense album, Pin. p. 327 , which all authors have taken for the repens. Further, under this his Trifolium pratenfe album, he has cited Fuchfius, Matthiolus, Lonicerus, Turner, Camerarius, and Laguna, all of whom certainly meant the

Trifol. montanum; Lobelii Adverfaria, and Thalius, who appear to have had the repens in view, at leaft Lobel ; Durante, who has drawn the Trifol. pratenfe; and, laftly, Tragus and Dodonæus, who on this fubject are fo inexplicit, that I cannot determine their meaning. The queftion is then, where is the Trifolium pratenfe album of Bauhin to be quoted, whether under repens, pratenfe, or montanum? I think, moft probably under the laft-mentioned, if at all; as moft of the authors quoted by him had this fpecies in view.

## 5. Trifolium, an incarnatum?

Trifolium pratenfe purpureum vulgare. Mor. Hif. ii. p. 138, n. 5. * Et Trifolium pratenfe purpureum. Ibid. fect. 2 , tab. $\mathrm{I}_{2}$, fig. 6.
This plant of Morifon's, generally taken for Trifol. pratenfe, I have feen cited in three different manners. Boerhaave in the fecond edition of his Hortus Lugdunenfis, Haller in his Stirp. Hely. and Seguier in his Plantr Veronenfes, mention the page without taking notice of the figure ; whereas Lightfoot and Relhan only refer to the figure. Linnæus quotes both.

As Morifon under the defcription has not directed us to the figure, nor at the faid figure referred to the body of the work for a defcription of it, we are very uncertain whether in thofe two places he had the fame plant in view. His confufed defcription, which is for the moft part borrowed from C. Bauhin, affords but trifling or rather no information. And although Morifon, in thus confounding feveral fpecies together, may ftill have meant to point at the true Trifol. pratenfe, yet his figure will by nomeans fuit that plant; but ratherrefembles $\mathcal{T}$ rifol. incarnatum, and perhaps it is even drawn from this fpecies: but, if fo, it betraysgreatcareleffnefs in Morifon, who has, in two places befides, defrribed and drawn the laft-mentioned Trefoil; viz. under Trifo-

Itum purpureum et annuum, folio birfuto rotundo, Trifolii pratenfis albi forma, Mor. Hift. ii. p. 140, n. 3. * Et Trifol. lagopoides Trifolii pratenfis folio, Ibid. fect. 2, tab. 12, fig. 3. And under Trifolium purpureum lagopoides birfutum annuum rotundifolium, Spica dilutè rubente, Mor. Hift. ii. p. 140, n. 6. * Et Trifolium lagopoides rotundif. birfut. Ibid. fect. 2, tab. $I_{3}$, fig. 6, a leaf only. The complete figure reprefents Trifol. angufifolium. This Linnæus has not quoted; but the whole of the paflage immediately preceding, which belongs to Trifol. incarnatum, he has inferted under his Trifol. Squarrofum.

Finding myfelf unable to extricate this confufed Trifolium pratenfe purpureum of Morifon's, I wrote a letter fome time ago to Profeffor Sibthorp at Oxford, afking the favour of him to examine the old Herbariums under his care, in order to difcover whether they might not throw fome light on the matter. His anfwer is as follows: " The plant in Bobart's Herbarium, under this title of Morifon's, " is Trifol. ochroleucum; which, however, as I never faw it with " purple flowers, I can fcarcely think Morifon meant. But there "s is a paffage in the defcription of his Trifolium lagopoides an" nuum hirfutum pallidè luteum feu ochroleucum, p. 141, n. I2, "which feems to point at his Trifolium pratenfe purpureum; " namely, Vide ejufdem iconem in tab. duodecima, ante lagopoides penna" tum, et refer buc propter colorem, extra gregem Trifoliorum Spicatorum "Seu lagopoideorum fore purpureo illic donatorum. The figure I confefs " has a confiderable refemblance to that of Trifol. incarnatum; " but this has an annual, not a perennial, root."

## 6. Trifolium mibi ignotum.

Trifolium pratenfe. Ginel. Tubing. p. 227.*
This is quoted by Reichard in his Syftema Plantarum; but as Gmelin fays that it has caulis procumbens, folia lanceolata, and capiHh
tulum folitarium aut geminum, there is reafon to doubt its being Trifol. pratenfe; but when he further adds, that it has Jipulde lineares crenate, it is evident he cannot mean this fpecies. Had he not at the fame time made feparate mention of Trifol. rubens, I flould have fuppofed he here hinted at it under the wrong name of prasenfe. At leaft I do not for my part know of any other fpecies with crenated ftipulx, which Gmelin can poffibly have intended.

HAVING thus finifhed the hiftory of the Trifolium alpefte, medium, and pratense, and pointed out with what plants they. have in former, as well as prefent times, been confounded, it remains for me to defcribe them botanically, and under each to infert the proper fynonyms. With a view of duly diftinguifhing the Trifol. alpeftre and medium, which have always been miftaken for one another, I fhall bring in all the authors I have feen that mention them. But with refpect to Trifol. pratenfe, 1 think I need only take notice of thofe who have either figures or defcriptions, or who have been cited by Linnæus and Reichard; and yet their number is fo very great, that I almoft fear to mention them. In order to prevent all further confufion in future, I have found it neceffary to give each of thefe Trefoils a new character, as their prefent fpecific differences are not fufficient to diftinguifh them from all others, ftill lefs from one another. I fhall now retain the fame order as above, fince I think that to be the moft natural.

1. Trifolium alpeftre, fpicis denfis, corollis fubæqualibus, ftipulis fetaceis divergentibus, foliolis lanceolatis, caulibus frictis fimpliciffimis.

Trifolium

Trifolium alpeftre. Linn. Spec. Plant. ed. 2, p. 1082.* Syf. Nat. ed. 12, tom. ii. p. 502. * Mant. Plant. ii. p. 4.51. Murr. Syjt. Veg. ed. 13, p. 573, * et ed. 14, p. 688. * Reich. Syjt. Plant. ## Dubia.

> Trifolium alpeftre. Doerr. Naf.p. 236, n. 7.*
> Trifolium montanum purpureum majus. Baub. Pin. p. 328.

Habitat in locis ficcis montanis fylvaticis Hungarix, Auftrix, Bohemix, Moravix, Stirix, Clufius, facquin, Pedemontii, Allioni, et forfan Naffovix, Doerrien.
Radix obliquè defcendens, infra tellurem repens, fufca.
Caules ftricti, fimpliciffimi, teretes, pallidè virides.
Stipula longæ, fetaceæ, uni-nerves, villofæ, cauli approximatæ, a fe invicem divergentes, vaginantes: vaginis anguftatis, femiamplexicaulibus, margine utrinque rectis, initio villofis ciliatifque, dein glabris et vix nifi in finubus inter ftipulas petiolumque ciliatis.
Petioli fubrquales, breviffimi, longitudine ftipularum, erecti.
$\mathrm{Hh}_{2}$
Foliola

Foliola fubæqualia, ejufdem figurx, lineari-lanceolata, acutiufcula et fafciculo pilorum terminata ; fupra evidentius fubtus obfoletius venofa, verfus oras e crebrioribus majoribufque venis concurrentibus quafi ftriata; margine ad tactum fcabra, oculis nudis fubintegerrima, fed armatis fubtiliter denticulata, et paucis brevibufque pilis inftructa.
Spica ovalis, vel folitaria et feffilis intra folium florale dependens, vel plerumque gemina, et tum altera in proprio folio breviter pedunculata feriufque florens precociorem deprimit.

## Flores erecti, denfe imbricati.

Periantbium villofiffimum, ochroleucum ; ftriis parum obfcurioribus. Dentes pallidè virides, fuperiores bini æquales et tubo perianthii breviores, inferiores bini etiam æquales fed fuperioribus paulò longiores et tubum perianthii ut plurimum æquantes, infinus longitudine tubi corollæ fed proximis dentibus duplo longior et interdum ultra.
Corolla inodora, tota faturatè purpurea: alis vexillo vix brevioribus, carinâ verò parum longioribus.
Congruit qua ftaturam et habitum præfertim Trifoliis rubenti, montano et pannonico, quæ vero ab illo fatis differunt; nempe-
Rubens vaginis inflatis ftipulifque fubferratis multo majoribus; foliolis fpinulofis e venis excurrentibus in hamulos ad apicem folioli verfos, alternos minores; fpicis longis pedunculatis; perianthio glabro, dentibus quatuor fuperioribus bafi dilatatis breviffimis, inferioribus binis paullulò longioribus, infimo filiformi, longitudine totius corollæ, et proximis dentibus faltem. triplo longiori.
Montanum caulibus angulato-ftriatis, multifloris; foliolis iifdem ac in Trifolio rubenti; fpicis pedunculatis; perianthio glabriufculo,
culo, dentibus quatuor fuperioribus æqualibus, infimo parum longiori ; corollis tetrapetalis albis, vexillo fubulato.
Pannonicum caulibus fubangulatis, fxpè ramofis; Atipulis fubulatis ciliatis ; foliolis utrinque villofis, obfoletè venofis ; fpicis majoribus pedunculatis; dentibus perianthii quatuor fuperioribus fubæqualibus vel inferioribus binis parum longioribus; corollis albidis. His, præter alia, etiam differt Trifolium ochroleucum pannonico fimillimum.
2. Trifolium medium, fpicis laxis, corollis fubxqualibus, ftipulis fubulatis conniventibus, caulibus flexuofis ramofis.

Trifolium alpeftre. Gmel. Tubing.p.228. Scholl.Barb.p.168, n. 595.* Mattujch. Fl. Sil. p.165, n.542. * Et ejufdem Enum. p. 186, n. 690. * Reich. Moeno-Franc. P. 2, p. 46, n. 52 I. Willden. Berol. p. 242, n. 749.

Trifolium fpicis villofis fubovatis, caule erecto, foliis ovato-oblongis integerrimis. Roy. Lugd. p. 380. n. 21.

Trifolii pratenfis altera fpecies major. Gefn. Hort. p. 285.
Habitat in locis ficcioribus elatis, præfertim fruticofis, fylveftribus cretaceis et argillofis, in Anglia, Scotia, Suecia, Dania, Auftria, Carniolia, Pedemontio, Hollandia, Helvetia, et variis Germanix partibus.

Radix obliquè defcendens, infra tellurem repens, fufco-cinerafcens.
Caules fuffruticulofi, infernè obliqui fubtrigoni (ficcati exactè trigoni), fupernè erectiufculi teretes, geniculato-flexuofi, ramofi: ramis e tumore axillari callofo adfurgentibus, faturatè virides, interdum hic illic rubentes.
Stipula longx, fubulatæ, $3-5$ nerves, glabræ, ciliatæ, a caule divergentes, inter fe conniventes, vaginantes: vaginis anguftatis, fubamplexicaulibus, margine utrinque rectis, initio villofis, dein glabris ciliatis.
Petioli inæquales, inferiores ftipulis multo longiores, fuperiores ferè breviores, omnes fubdivergentes.
Foliola inæqualia, initio et infernè ovata, dein et medio oblonga, tandem et fupernè ferè lanceolata et fæpè fubattenuata, foliorum infimorum multo minora obtufiffima et interdum retufa, reliquorum majora et acutiora, omnia fupra obfoletius fubtus evidentius venofa, fupra etiam lunulis binis pallidis longitudinalibus et ad apices contiguis frequenter notata, verfus oras e venis concurrentibus fubftriata, margine villis pluribus longiufculis appreffis inftructa, ad tactum vix fcabra, oculis nudis. integerrima, fed armatis tenuiffimè denticulata, prefertim in foliis fuperioribus.
Spica initio fpheroides, tandem globofa vel ovalis, folitaria vel gemina ; alterâ plerumque ferius florente, feffilis vel pedunculata, una vel utraque; pedunculis inæqualibus, unico vel duobus foliis floralibus fuffulta ut plurimum dependentibus.
Flores divergentes, laxè imbricati.
Periantbium compreffufculum, glabrum vel rarius pilofum, pallidum et fæpè hic illic purpurafcens, præfertim in fpicæ vertice: friis faturatè viridibus et interdum purpureis. Dentes virides et plerumque
plerumque fimul qua partem rubentes, fuperiores bini æquales et tubo perianthii breviores, inferiores bini etiam æquales fed fuperioribus longiores et tubum perianthii vel æquantes vel paullum excedentes, infimus longitudine tubi corollæ, fed proximis dentibus multo, non tamen duplo, longior.
Corolla odorata : vexillo alis vix longiore fubmucronato, ftriis faturatius purpureis inftructo; alis pallidioribus carinâ parum longioribus.
Differt a Trifolio alpeftri abundanter, ut e defcriptione utriufque comparata facilè patet. Sed præterea $a b$ eo etiam diftinguitur partibus plurimis majoribus et colore obfcuriori præditis; radice magis lignofa et terræ tenacius inhærente; caulibus diffufis et vix umquam folitariis; fipulis latioribus, ut et vaginis, quæ venis infuper crebrioribus gaudent fæpiufque purpureis; petiolis fubpilofis et non villofis; folio florali fæpius unico; foliolis multo latioribus et plerifque oblongis, fubtus glaucefcentibus nervoque minori inftructis, verfus oras obfoletius ftriatis: Spica donec integra floreat, vertice depreffa, et plantæ cultæ minori; perianibio ftriis magis elevatis remotifque, dentibus minus pilofis et infimo proportione breviori, utpote longitudinem dentium proximorum duplam non attingente; corolla dilutius purpurea, præfertim in alis, et ceteroqui qua magnitudinem formamque fimillima illis in Trifolio rubenti.
3. Trifolium pratenfe, ficis denfis, corollis inæqualibus, dentibus calycinis quatuor æqualibus, ftipulis ariftatis, caulibus adfcendentibus.

## Dubia.

Trifolium pratenfe purpureum. Bauh. Pin. p. 327.* Trifolium. Ort. Sanit. cap. 476 (ed. 1426 et 1517). Brunella. Brunf. Herb. tom. iii. p. 26.
Habitat in pratis et pafcuis per totam Europam copiosè; etiam in Siberia, Gmelin, et America Septentrionali, Herb. Banks. Locis pinguioribus, humidiafculis et apricis præfertim lætatur; nec tamen fterilia, ficciora atque umbrofa refpuit.
Radix ferè perpendiculariter defcendens, infra tellurem vix repens, granulata, cinerea.
Caules adfcendentes, infernè altero latere planiufculi (ficcati trigoni), ceterum teretes, fupernè ftriati, fæpius fubramofi ; ramulis patentibus, tumore axillari deftitutis; virides, rarius rubi-cundo-tincti.
Stipula breves, latæ, venofæ, glabræ, conniventes, ariftatæ: arifta capillari viridi apice præfertim pilofa, vaginantes: vaginis dilatatis, amplexicaulibus, margine utrinque arcuatis, glabris, rarius fubpilofis.
Petioli inæquales, plerumque longiffimi et ftipulis multoties longiores, patentes.
Foliola inæqualia, ovata vel ovalia, obtufa, foliorum infimorum multò minora, ferè orbiculata, retufa, omnia fupra depreffofubtus elevato-venofa, fupra etiam macula centrali fubfagittata pallida plerumque notata, fubciliata, integerrima vel interdum leviter et acutè crenulata.
Spica ovata, obtufa, folitaria vel rariffimè gemina, interdum pedunculata, plerumque vero feffilis intra folia duo floralia oppofita erecta.
Flores erecti, densè imbricati.
Periantbium fericeum, pallidum et interdum qua partem purpureum : ftriis faturatè viridibus vel rubris, rarius fufcis. Dentes
virides et fæpè magis minufque rubentes, fuperiores quatuor æquales, longitudine tubi perianthii, infimus paullò longior, fed tubo corollx brevior, fructu maturo illi patentiffimi, bic erectus.
Corolla odorata: vexillo alis longiore truncato et fæpè emarginato, ftriis faturatius purpureis inftructo; alis pallidioribus, carina longioribus.
Differt a Trifolio medio vehementer, ut comparata utriufque defcriptio facilè evincit, fed infuper huic etiam eft diffimile radice multò minori; caulibus non flexuofis, plantr fpontanex humilioribus, magis procumbentibus, fæpè folitariis, haud rarò fimpliciffimis, ramulifque fi adfunt paucioribus; Aipulis parvis et aliter formatis; vaginis multò majoribus, non ciliatis, et fæpius rubro- vel fufco- venofis; foliis floralibus femper binis; foliolis brevioribus, plerifque ovatis, obtufioribus, fxpius albido-maculatis, obfoletius venofis; fupra venis plantæ vive depreffis, ficcatæ vero paullulum elevatis ; fpica minori, multò rarius pedunculata geminaque, et vertice non depreffa; perianthio nunquam prorfus glabro; corolla minori, multò magis inæquali, plerumque pallidius purpurea, faltem alis apice non, ut in Trifolio medio, coloratioribus; vexillo anguftiori; et tandem quod prius floreat.
Var. $\beta$. planta agrefti multò major magifque glabra, caulibus pluribus; foliolisacutioribus; fpica frpius pedunculata non adeo rarò gemina ; perianthio plerumque villofiori, dente infimo proportione longiori; vexillo alifque corollæ magis divergentibus; ftylo frequenter breviori; legumine fæpè difpermo. In hoc ftatu culto, quum caules fint diffufi et ad flexionem quafi tendant, e longinquo Trifolium medium adeò refert, ut pro eo facillimè accipi
queat; fed propiori infpectione, Aipulis prefertim dentibufque calycinis longè diverfis, fine ulla difficultate poteft dignofci.
Var. 2. non nifi corollis albis differt, in fatis interdum occurrit, inter plantas agreftes multò rarior eft ; ex Angliæ comitatu Derbienfi allatam vidi in Herb. Banks.
Preter has varietates, Trifolium pratenfe foliolis etiam quaternis, licet rariffimè, reperiri, inter omnes conftat.

IN examining Trifolium alpeftre, medium, and pratenfe, I have found them agree in very many refpects. To prevent tautology, I have taken care to avoid mentioning in their defcriptions any circumftance common to all thefe three fpecies; but, for the fake of a more complete knowledge of the genus, I fhall here in one place enumerate them all. However, as I have not had an opportunity of feeing Trifol. alpefre living, I cannot with abfolute certainty determine the nature of its ftamina, piftilla, feed-veffels, and feeds; but what I fhall mention with refpect to thefe parts of fructification, I have chiefly taken from Trifol, medium, and particularly from the pratenfe. But as to the reft, I know they agree in the following circumftances.

Radix perennis, teretiufcula, ramofa.
Caules ex eadem radice plerumque plures, fpithamxi, pedales et ultra, folioff, infernè glabri, fupernè villofi vel magis minufve pilofi.
Folia alterna, vaginis infidentia, petiolata, ternata; floralia feffilia vel breviter pedunculata, plerumque duo oppofita; altero femper minore.
Wagine membranacex, integerrimx, ochroleucx, nervofo-venofx
(voffs nempè fimplicibus, verfus oras repetito-dichotoniis, vifidibus vel purpureis, et in Trifalio pratenfi interdum fufcis), terminatæ Petiolo intermedio, et excurrentes in Stipulas laterales integerrimas et virides, in Trifolio autem pratenf fæpè rubrovel fufeo-venofas. Vaginæ ftipulæque florales ceteris multò ampliores.
Petioli fupra canaliculati, ceterum ftriatuli, villofi vel magis minufve pilofi.
Foliola fubfeffilia, nervofo-venofa ut vaginæ, fupra glabra fubtus fubvillofa, inprimis juniora, et pallidiora; floralia minora anguftiora et plerumque lanceolata.
Sfica terminales: floribus feffilibus in rachi fubangulata aphylla villofa.
Pcrianthium turbinato-cylindricum, monophyllum, tubulofum, abbreviatum, inferum, perfiftens, decemftriatum; ftriis elevatis; quinquedentatum; dentibus finu rotundato remotis, fetaceis, pilofis, rectis, infimo interdum adfcendenti in Trifolio medio, et forfan etiam alpeftri.
Corolla monopetala, purpurea, marcefcens, papilionacea; vexillo reflexo alifque patentibus obtufis, carina coloratiore.
Filamenta decem, hyalina, apice virefcentia, unum totum liberum capillare, novem in membranam germen involventem infernè connata, fupernè libera, primum fubulata et dein apice incraffata.
Antherce fubrotundæ incumbentes flavæ.
Germen ovatum vel oblongum glabrum virefcens.
Siylus unicus, deorfum attenuatus, adfcendens, hyalinus.
Stigma fimplex deflexum obtufum prafinum.
Legumen ovale vel oblongum compreffiufculum glabrum monofpermum,
