DESCRIPTION OF A NEW DIPLOMORPHA.

By W. D. Hartman, M.D.

(Communicated by J. C. Cox, M.D., F.L.S.)

(Plate xxi., figs. 1, 3, and 6.)

Diplomorpha Coxi, Hartm.

Shell ovate, thick and stout, body whorl inflated, apex acute; whorls 4½, rounded, suture impressed, body whorl nearly two-thirds the length; transverse striae coarse; epidermis absent. Colour a soiled white, with the apical whorls a pale reddish-saffron colour, labium white, widely reflected, thick, and slightly revolute, with a heavy deposit on the pillar lip. Umbilicus open, exhibiting one revolution, aperture a soiled white, with a reddish colour within the inner margin of the labium. L. 27, D. 15, L. apt. 10, D. apt. 6 mm.

Hab.—Aneiteum, New Hebrides (Dr. Cox, per S. Raymond Roberts).

Obs.—Some ten years ago Dr. Cox sent me this shell, which I returned to him as unknown. At that time I was unacquainted with the genus. Since then I have possessed all the species, and I take great pleasure in associating this fine shell with the name of one who has done so much for the science of conchology.
