THE
STARRY GLOBE-MADREPORE.

GENERIC CHARACTER.

Animal resembling a Medusa.

Coral marked with lamellar striated cavities.

SPECIFIC CHARACTER.

NEARLY GLOBOSE MADREPORE, marked with innumerable star-shaped cavities.

This Madreporæ is so fully described in its specific character as to require little to be added except the size of the coral, which equals that of the Brain-Madreporæ. It is a native also of the same seas; and like that species, is not unfrequently marked by one or more round perforations, which sometimes bear the resemblance of natural excavations round which the animal fabricators of the coral have begun their operations, and at other times have more the appearance of the perforations of some species of Terebellæ.
