able to expect that this Juniper may prove the most valuable plant which has yet been tried to hold the drifting sands of our eastern coast.

Juniperus Sabina. The dwarfest of all the prostrate Junipers in the Arboretum collection is a form of this European species with branchlets ascending only a few inches from prostrate stems and covered with dark blue-green scale-like leaves. The right name for this little plant is probably var. *cupressifolia*; another name is var. *nana*. A better known variety of *Juniperus Sabina* is the var. *tamariscifolia* from the mountains of central and southern Europe. This is a dwarf plant with procumbent or rarely ascending branches and needle-shaped, slightly incurved, dark green leaves marked on the upper surface with a white line.

Autumn colors in the Arboretum have been at their best this week, although the leaves of many plants have already fallen and those of many others, especially of the trees and shrubs of eastern Asia, are still as green as they were at midsummer. Some of the most brilliant plants during the week have been individuals of the White Oak (*Quercus alba*), the leaves of other individuals being still entirely green; the Tupelo or Sour Gum (*Nyssa sylvatica*), of which there are a number of plants by the pond near the junction of the Meadow and Bussey Hill Roads; the American Smoke-tree (*Cotinus americanus*); the Fragrant Sumach (*Rhus canadensis* or as it has been often called, *R. aromatica*), which has been largely used as a border plant along the drives; many species of Crataegus on the eastern slope of Peter's Hill; the curious Japanese Apple (*Malus Tschonoskii*); the Tulip-tree (*Liriodendron Tulipifera*) which is always splendid in its golden autumn dress; the Black Haw of the southern woods with its dark red leaves and fruit just turning from white to dark blue; the Sweet Gum (*Liquidambar Styraciflua*), with its star-shaped leaves turning scarlet and yellow. In early spring the Arboretum owes much to the flowers of one of the native species of Juneberry (*Amelanchier oblongifolia*) which has been largely planted along the drives where there are now many large specimens. During the past week these plants have been as beautiful and conspicuous as they were in May, for the leaves have turned the color of old gold and have retained this color for several days. All the American species of Amelanchier are beautiful spring-flowering plants, and although they do not remain many days in flower no other shrubs can be more safely used to enliven wood and swamp borders in the northern states. The bright scarlet of the leaves of the Highbush Blueberry (*Vaccinium corymbosum*) is not now surpassed in brilliancy by that of any other plant in the Arboretum. Attention has often been called in these Bulletins to the value of this native shrub for garden decoration. Fortunately it was early planted in large numbers in the Arboretum shrubbery and many of the plants have now grown to a good size and show their value. As an ornamental plant this Blueberry has everything to recommend it. The habit is excellent; it blooms freely and the flowers are handsome; they are followed by large dark blue fruits of the best quality, and if for no other reason it deserves a place in any garden for the late and splendid colors of its dying leaves. A number of plants at the entrance of Azalea Path opposite the Bussey Hill Overlook show the different shades of color the leaves assume at the end of October.

1916. "Juniperus Sabina." *Bulletin of popular information - Arnold Arboretum, Harvard University* 2(16), 64–64. <https://doi.org/10.5962/p.320608>.
