At its best *Sorbus americana* is a tree twenty or thirty feet tall, but more often and here in the Arboretum it is a large shrub with spreading stems. The leaves are composed of numerous slender pointed leaflets; the small flowers are creamy white and produced in small crowded clusters which do not appear until the leaves are fully grown; in the autumn these turn dull orange-red some time before falling, but the great beauty of the tree is found in its great clusters of small bright orange-red fruits which by their weight become semi-pendent. The variety *decora* is a larger tree with broader leaflets; the flowers are nearly twice as large, and the fruit which is larger and therefore more showy, is of the same color. This variety grows only along the northern border of the eastern and middle states and northward, and is perhaps the handsomest of all Mountain Ashes. Rarely seen in Massachusetts gardens it is often the chief ornament in those of the more northern parts of the country. There is a group of these Mountain Ashes on the right-hand side of the path leading from the Forest Hills entrance into the Shrub Collection.

Prunus hortulana. This is the handsomest of the American Plums and one of the handsomest of the small trees of eastern North America where it grows on rich bottom-lands from southern Illinois to southern Missouri. This is a tree sometimes twenty or thirty feet high, with a trunk covered with dark scaly bark, and stout, wide-spreading branches which form on the trees growing in the Arboretum a dense, round-topped and shapely head. The flowers, which are produced in few-flowered clusters, are sometimes an inch in diameter and open when the leaves are less than half grown. When the trees are in bloom their appearance is not unlike that of several other Plum trees; and the great beauty of this tree is in its habit, in the long pointed, comparatively narrow and very shiny leaves which are now turning a deep bronze-red color. The fruit, too, which looks like a bright red cherry, is an inch in diameter and droops gracefully on slender stalks. It is beautiful although the flesh is hard and austere, and it is not as a fruit tree but as an ornamental tree that this Plum deserves a place in parks and gardens in which small trees are valued. Two specimens can be seen in the Plum Collection on the right-hand side of the grass walk leading into the Shrub Collection from the Meadow Road.

Magnolias. The leaves of the Asiatic Magnolias fall late in the autumn without much change of color, and those of some of the American species, notably *M. acuminata*, the so-called Cucumber-tree, *M. tripetala*, the Umbrella-tree, *M. Fraseri*, the Mountain Magnolia, and the great-leaved *M. macrophylla*, all turn to shades of yellow and brown, which make these trees so conspicuous at this season of the year. The leaves of the yellow-flowered *M. cordata* are still as green as they were at midsummer. Later they also will turn yellow or brown, but the leaves of the Swamp Bay, *M. glauca*, which are still as beautiful as they have been for the last six months, will fall gradually here late in November or early in December without any change of color. Further south they remain on the branches usually until spring.

The group of American Magnolias is between the Jamaica Plain entrance and the Arboretum building.

Two American Viburnums. *V. Lentago* and *V. prunifolium* are even more beautiful now with their large brightly colored leaves and drooping clusters of large, dark blue fruit than they were late in the spring when they were covered with broad clusters of small, creamy white flowers. These are common eastern American plants and are shrubs or small trees, and there are no better subjects for the decoration of woods or forest glades. *V. Lentago* is the more round-topped plant of the two, with larger leaves and larger clusters of flowers, while *V. prunifolium* which naturally does not grow north of southwestern Connecticut, has more spreading branches, smaller clusters of whiter flowers and narrower leaves of a deeper red at this season of the year. These two Viburnums have been largely used in the Arboretum border-plantations which owe much beauty to them. The decorative value of these plants is now recognized and it is possible to find them in several American nurseries.

Ligustrum vulgare. Attention has often been called in these Bulletins to the value of the common European Privet, *Ligustrum vulgare*. In recent years much attention has been paid by botanists and gardeners to the Privets of eastern Asia, where many species have been discovered. None of these, however, are as valuable in this climate as the European species which is perhaps the handsomest of all hardy, black-fruited shrubs. The bright shining fruit is borne in compact clusters which stand up well on the ends of the branches above the dark green lustrous leaves and remain on the plants during the early winter months and after the dark green leaves have fallen. Formerly this was a common garden plant in the northern states and it is now sparingly naturalized in some parts of the country. There is a form with yellow fruit which is much less beautiful than the type. There is a variety *foliolosa* in the collection which has rather narrower leaves and larger fruit. This shrub, although apparently still little known in our gardens, is one of the handsomest of all shrubs here at this season of the year. The specimen in the Shrub Collection is now covered with its large and brilliant fruits, and is well worth a visit by any one interested in the autumn decoration of gardens.

Abelia grandiflora on Hickory Path near Centre Street is still well covered with flowers. These resemble in shape the flowers of some of the Honeysuckles; they are white faintly tinged with rose color, and their delicate beauty is set off by the small dark green and lustrous leaves. *Abelia grandiflora* is a slender shrub with arching stems from three to four feet high, and is thought to be a hybrid between two Chinese species. Until the introduction by the Arboretum of some of the species of this genus from western China it was believed to be the hardiest of the Abelias. In the Arboretum it suffers in severe winters; but in sheltered positions it flowers well every year and the flowers continue to open during nearly two months. This *Abelia* has become an exceedingly popular plant in the gardens of the southern states and is cultivated with more or less success as far north as New York.

1917. "Magnolias." *Bulletin of popular information - Arnold Arboretum, Harvard University* 3(15), 59–60. <https://doi.org/10.5962/p.320755>.
