Evergreen Barberries. The four Chinese evergreen Barberries, *Berberis Julianae*, *B. Sargentiana*, *B. verruculosa* and *B. Gagnepainii*, from which so much has been expected, have suffered seriously. *B. Julianae* and *B. Sargentiana* will probably not recover, and there is little hope that much garden beauty will ever be obtained in this region from evergreen Barberries, for all the Mahonias which have been grown here are in unusually bad condition this spring, with the exception of the dwarf *Mahonia* or *Berberis repens* from the Rocky Mountains, and even this has lost many of its leaves. All the forms of the European Box, although carefully protected, have suffered badly and some have been killed. Even the Japanese Box (*Buxus japonica*), which has been growing in an exposed position here for twenty years without protection, will lose for the first time some of its leaves from the ends of the branches. This handsome plant has suffered, however, less than might have been expected, and if Box is to be planted in eastern Massachusetts with the expectation that it will be a permanent garden ornament it is this Japanese species which must be used. The Chinese climbing Honeysuckle (*Lonicera Henryi*), which had proved perfectly hardy until last winter and from which much was expected, has lost all its leaves, but as its stems are still alive it may recover. *Teucrium chamaedrys* and *Salvia officinalis* are nearly killed, and *Daphne cneorum*, which has usually done well in the Arboretum, has suffered seriously in the Shrub Collection and on Azalea Path. The two evergreen Chinese Viburnums which have lived in the Arboretum for several years, *Viburnum rhytidophyllum* and *V. buddleifolium*, have lost all their leaves but may possibly recover.

Thanks probably to the abundant rains of the summer and autumn, the Rhododendrons in the Arboretum have suffered less than they did three years ago, although in some of the gardens near Boston the loss of these plants has been more serious than ever before, whole plantations which have been growing for thirty or forty years having been destroyed. In the Arboretum the only species which has suffered is *R. micranthum*, the only evergreen Chinese Rhododendron which has ever lived long enough in the Arboretum to flower and which has now lost many of its upper branches. There are dead branches on some of the Catawbiense hybrids, and among them, in addition to a number of hybrid seedlings sent to the Arboretum for trial by an English nursery, the following have been killed: James Smith, Marshall Brooks, Mrs. Thomas Agnew, Marquis of Waterford and Gomer Waterer. One specimen of Mrs. C. S. Sargent, which has always been considered one of the hardiest of all the Catawbiense hybrids, has been so injured that it will have to be removed. *Rhododendron azaleoides*, or *fragrans*, one of the hybrids between a Rhododendron and an Azalea, has also been killed.

Prunus incisa has bloomed in the Arboretum every spring for three or four years but has never been as full of flowers or as beautiful as it has been during the present week. This Cherry is a native of Japan and is abundant on the eastern and southern slopes of Fuji-san and on the Hakone Mountains. It is a large shrub or under favorable conditions a small tree twenty-five or thirty feet high; the flowers appear before the deeply cut leaves in drooping clusters; their calyx is bright

red; the petals are white or occasionally tinged with rose color, and the anthers are bright yellow. The petals fall early but the calyx, which gradually grows brighter in color, remains for some time on the young fruit and is showy. *Prunus incisa* has been perfectly hardy here and none of the flower-buds were injured by the cold of last winter. It has the advantage, too, of flowering while still a small shrub. This Cherry has remained rare in American and European gardens and appears to be still little known.

Plums. The flower-buds of few Plum-trees have been injured and these trees promise to bloom unusually well this year. The first to flower have been the Canadian Cherry (*Prunus nigra*) and the Chinese *Prunus salicina*, the parent of the so-called Japanese Plums of pomologists. These will soon be followed by *Prunus alleghaniensis*, *P. americana*, *P. Watsonii*, *P. Munsoniana*, *P. hortulana*, *P. domestica*, and several others. The Plums are planted with the Apricots, which are also beginning to bloom, next the Cherries, near the junction of the Meadow and Valley Roads.

A pink-flowered Pear-tree. Among the Pear-trees raised from the seeds collected by Wilson in western China there are plants in the Peter's Hill Nursery and on the southern slope of Bussey Hill which have bloomed this year for the first time and have been conspicuous for their pale pink flowers which open from rose-colored buds. The flowers of all described species of *Pyrus* are pure white and this pink-flowered form is an interesting addition to the list of trees with showy flowers. It has been considered a variety of *Pyrus Calleryana* but differs from that Pear-tree in its smoother red brown bark, in the dense coat of tomentum which covers the branchlets, and in its earlier pink flowers not more than three-quarters of an inch in diameter, and, it is possible that when the fruit is known, it may prove a new species. The Chinese Pears have handsome foliage and beautiful flowers, and they are all excellent hardy ornamental trees in the Arboretum. They will bloom well this year, and the large specimen of *P. oboidea* near the Forest Hills entrance has been covered with flowers during the week.

Some Maple Flowers. It is not often that the Sugar Maple (*Acer saccharum*) in Greater Boston so completely covers itself as it has this spring with its long gracefully drooping clusters of pale yellow flowers which early in May make this tree, although now less conspicuous than in the autumn, a charming feature of the northern forest. A true lover of the country, life in cities and their suburbs has little attraction for the Sugar Maple. It needs the free and pure air of the forest and of the country roadside, and finds its greatest happiness on the low hills of northern New England and Michigan, or in the rich protected valleys of the Appalachian Mountains. In such positions no Maple tree surpasses it in size and beauty, and few trees equal it in the splendor of the coloring of its autumn foliage. The large, cup-shaped bright red flowers of one of the forms of the Japanese *Acer diabolicum* (var. *purpurascens*) have been very beautiful this week, and as a spring-flowering tree this small Maple well deserves more general cultivation. The leaves, too, are large and handsome. There are three plants in the Maple Collection, and a number of others in the mixed plantations near the top of Peter's Hill.

1918. "Prunus incisa." *Bulletin of popular information - Arnold Arboretum, Harvard University* 4(2), 7-8. <https://doi.org/10.5962/p.320795>.
