Viburnum prunifolium, which is known popularly as the Black Haw, is a common shrub in the middle Atlantic states where in early spring, on rocky hillsides and along roadsides and the borders of woods, it rivals in the beauty of its flowers the Flowering Dogwood (*Cornus florida*) which naturally grows in open woods and not in such exposed situations as the Black Haw. *Viburnum nudiflorum* is a large arborescent shrub or a small tree rarely thirty feet high, with a short trunk usually less than a foot in diameter, rigid spreading branches beset with slender spine-like branchlets, ovate to suborbicular, thick, dark green and lustrous leaves which, handsome through the summer, are splendid in the autumn with their dark vinous red or scarlet colors. The white flowers in slightly convex clusters have been produced here this spring in the greatest profusion; in the autumn they will be followed by red-stemmed drooping clusters of dark blue fruits covered with a glaucous bloom, and from half an inch to three-quarters of an inch long. The Black Haw, which is one of the handsomest of the small trees of the eastern United States, takes kindly to cultivation and is quite hardy north of the region of its natural distribution which is in southern Connecticut. It has generally escaped the attention of American nurserymen who in recent years have made better known our northern arborescent *Viburnum Lentago*, the Sheepberry or Nannyberry, a usually larger and for some persons a handsomer plant. The flowers, which are arranged in larger and rather flatter clusters, are pale cream color and not white, but the fruit is as handsome as that of the Black Haw and rather larger. The leaves, too, are large, equally lustrous, and also assume brilliant autumn colors. This *Viburnum* can grow in the shade of larger trees or in open situations which it prefers, and has proved to be one of the handsomest and most useful of the plants which have been largely used in the Arboretum in border and other mixed plantations. The plants here are now covered with flower-buds which will open in a few days. More beautiful than the Black Haw or the Nannyberry, the common tree *Viburnum* of the southern states, *V. rufidulum* is perhaps the handsomest of all the *Viburnums* with deciduous leaves. When it has grown under the most favorable conditions this *Viburnum* is a tree often forty feet high, with a tall stout trunk and branches which spread nearly at right angles from it; the leaves are thick, dark green and lustrous on the upper surface, with winged stalks covered, as are the winter-buds, with a thick felt of rusty brown hair; the flowers are creamy white and the fruit is dark blue covered with a glaucous bloom. This *Viburnum* has been growing in sheltered positions in the Arboretum for many years, but it is only a shrub and does not flower here every year. The plants on Hickory Path near Centre Street are now well covered with flower-buds.

Viburnum rhytidophyllum. This evergreen species discovered by Wilson in western China has attracted a great deal of attention in Europe; there are fine specimens of it in Raleigh, North Carolina, and it flourishes in the neighborhood of Philadelphia. It has lived for several years in the Arboretum, but the cold of ordinary winters destroys most of the leaves and kills the flower-buds. Favored by an exceptionally mild winter, the plants on the upper side of Azalea Path are now

1921. "Viburnum prunifolium." *Bulletin of popular information - Arnold Arboretum, Harvard University* 7(6), 23–23. <https://doi.org/10.5962/p.321116>.
