Sambucus canadensis. As the flowers of the Laurel (*Kalmia latifolia*) begin to fade those of the Elder of the eastern states (*Sambucus canadensis*) begin to open. This, *Cornus amomum*, and *Rosa virginiana* (or *lucida*) are the last of the native shrubs to make a conspicuous display of flowers in the Arboretum. Plants of the Elder which have sprung up naturally along Bussey Brook are now in bloom, and flowering plants are conspicuous by the small ponds near the junction of the Meadow and Forest Hills Roads. Few native shrubs make a greater show than this Elder with its broad heads of white flowers and lustrous black fruits. In low half swampy ground close to the shore of Massachusetts the Elder and the wild Rose (*R. virginiana*) often grow and flower together, and it is hard to believe that a more beautiful arrangement of summer flowers can be made in New England. In the Shrub Collection there is a form with dull yellow fruit (var. *chlorocarpa*), one with the leaflets deeply divided into narrow segments (var. *acutifolia*), and one with the flower-clusters four or five times larger than those of the wild plant and such large, heavy clusters of fruit that the branches barely support them (var. *maxima*).

Spiraea Veitchii. This Chinese species, introduced by Wilson from western China, is the last of the white-flowered Spiraeas in the Arboretum collection to bloom and one of the handsomest plants of the genus. It is a shrub seven or eight feet high with numerous erect stems, remarkably slender for the stems of such a large plant, and gracefully arching branches which are covered from end to end with broad flower-clusters raised on erect stems. For this climate this *Spiraea* ranks with the very best plants introduced from China in recent years.

Cornus amomum. Attention is called again to the Silky Cornel because it is one of the best of all shrubs to plant in this climate near the banks of streams and ponds where a large mass of foliage to spread out over the surface of water is desired. Examples of this use of this shrub can now be seen at two of the small ponds near the end of the Meadow Road where this Cornel is now covered with flowers. These will be followed in autumn by bright blue fruit; in the winter the purple stems are attractive. The Silky Cornel is a good plant, too, to place in front of groups of trees and shrubs, but it must have room for the free growth of its wide-spreading branches, for when crowded by other plants the branches become erect, and all the character and beauty of the plant is lost. A space of not less than twenty feet in diameter is necessary for the development of a handsome plant of the Silky Cornel.

Cornus arnoldiana. This plant, evidently a natural hybrid between two American species, *Cornus obliqua* and *C. racemosa*, which appeared several years ago in the Arboretum, is a large shrub with erect stems and characters intermediate between those of its parents; flowering a little later than *C. racemosa*, it has been covered with flowers this year. The fruit, which is usually less abundant than the flowers, is white or bluish white. Interesting to students of plants, as are all natural hybrids, *Cornus arnoldiana* is not superior as a garden plant to *C. racemosa* except perhaps in its greater size.

1921. "Sambucus canadensis." *Bulletin of popular information - Arnold Arboretum, Harvard University* 7(12), 47–47. <https://doi.org/10.5962/p.321148>.
