make a great show in early July. These and many of the other Bush Honeysuckles which can be seen in the Arboretum, where there is a large collection of these plants, are excellent shrubs for cold countries like the extreme northern states and Canada. They are very hardy and grow rapidly; their flowers are abundant and handsome and no other shrubs have such brilliant fruit in early summer. These plants like rich well drained soil, and the fact can not be too often repeated that the large growing kinds like *L. tatarica* and most of its hybrids, *L. Morrowii* and *L. Maackii*, must have room in which to grow. A plot of ground twenty to twenty-five feet across is needed for one of these plants if it is to show all its beauty. There are a few good specimens of the large growing hybrids by the Bussey Hill Drive opposite the Lilacs where they have had room to grow, but it has been found necessary to move all the large growing Honeysuckles from the Shrub Collection and make a new planting of them on the slope between the Meadow and the Bussey Hill Roads where most of them will have room enough to grow to a large size. This has been necessary because when these plants are crowded together or their branches are trimmed they are ugly objects and give no idea of their real beauty and value. The red fruit covered with hairs of *Rhus canadensis*, often called *R. aromatica*, are also ripe. This is a shrub two or three feet high as it grows in the Arboretum with spreading and ascending branches, clusters of small yellow flowers which cover the naked branches in early spring, and leaves composed of three leaflets. The leaves of only a few plants turn here in the autumn to a more brilliant scarlet color. This *Rhus* has been largely used in the Arboretum for planting in front of taller shrubs along the borders of the roads.

Stewartia pseudo-camellia is beginning to flower this year two or three weeks earlier than usual. The pure white cup-shaped flowers of this small Japanese tree resemble those of a single-flowered Camellia. In the autumn the leaves turn dark bronze purple an autumn color not seen on the leaves of any other plant in the Arboretum. The smooth pale gray bark not unlike that of a Hornbeam adds to the interest of this tree. The flowers are, however, smaller than those of the two species of eastern North America, *Stewartia pentagyna* and *S. Malachodendron*, and less beautiful than those of the variety *grandiflora* of the former in which the stamens are not yellow but purple. Two specimens of the Japanese tree have been growing for many years on the upper side of Azalea Path.

Koelreuteria paniculata. This Chinese tree which will be in full bloom in a few days, is when in flower the most conspicuous of all the summer flowering trees which are hardy in this climate. It is a round-headed tree rarely more than thirty feet high, with large, compound, dark green leaves and great erect clusters of golden yellow flowers which are followed by large bladder-like pale fruits. This tree, which is hardy in Massachusetts, has been a good deal planted in this country, especially in the gardens of the Middle States. The *Koelreuteria* often appears in American nursery catalogues under the name of "Japanese Lacquer Tree," although it is not a native of Japan and has not lacquer-producing sap.

1922. "Stewartia pseudo-camellia." *Bulletin of popular information - Arnold Arboretum, Harvard University* 8(14), 56–56. <https://doi.org/10.5962/p.321272>.
