Another Asiatic Honeysuckle, *Lonicera Morrowii* of the Amour region in eastern Siberia, is a plant of great decorative value if sufficient space for its development can be provided for it. It has gray-green foliage, comparatively large yellowish flowers and bright red fruits. It is largely planted in the Boston Parks and in Franklin Park there are specimens which are twenty feet across and probably ten or twelve feet high. Like other Bush Honeysuckles, *L. Morrowii* hybridizes easily with other species, and most of the plants raised from seeds now sold by American nurserymen under this name are hybrids of this species with *L. tatarica* and are erect-growing plants of little value for those who want plants with the peculiar habit of *L. Morrowii*.

Two trees which add beauty and interest to the Arboretum at this time are two Viburnums, the eastern American Viburnums, *V. prunifolium*, which is already dropping its flowers, and *V. Lentago*, a bush-like tree sometimes thirty feet high. Not many small trees are more useful than these American Viburnums for the decoration of American parks and gardens, and nurserymen fortunately recognize this fact and now grow them in large quantities, especially *V. Lentago* which is the more northern species of the two. The flowers of *V. prunifolium* are whiter than those of *V. Lentago* which are faintly tinged with yellow, but the flower-clusters and leaves of the latter are larger. *V. prunifolium* is more apt to grow with a single trunk than *V. Lentago* which is often a large arborescent shrub and is a more southern species.

Magnolia Watsonii is a shrub first found in a Japanese nursery and is unknown as a wild plant. Its relationship is with *M. parviflora*, a small Japanese tree which grows as far north as Korea. The Arboretum has plants raised from seeds gathered in Korea by Wilson which have not yet flowered but which ought to be hardier than the Japanese plant which is not very satisfactory here. *M. Watsonii* has usually not been hardy in the Arboretum but this year there is a plant on Hickory Path near Centre Street covered with blossoms which are extremely fragrant, differing in this from *M. parviflora*, and in its larger flowers and shorter flower-stalks. When better known it may prove to be only a variety of *M. parviflora*.

Daphne genkwa is one of the beautiful shrubs discovered by Wilson in western China. It is not a success in eastern Massachusetts but this year there is a plant in the Arboretum with a few flowers. On Cape Cod and Long Island it grows into a fine shapely round-topped bush with bluish fragrant flowers which are followed by yellow fruit. It is still very rare in gardens. If the fruit on the few plants known in the United States is distributed in good hands it should in the course of a few years be common on Cape Cod and southward.

1924. "Daphne genkwa." *Bulletin of popular information - Arnold Arboretum, Harvard University* 10(8), 32-32. <https://doi.org/10.5962/p.321467>.
