

ing branches and stems armed with many spines. This member of the Rose Family is perfectly hardy and the handsomest shrub Manchuria has yet contributed to western gardens. The two specimens in the Arboretum were sent here from St. Petersburg in 1903 and 1906, and have been found difficult to propagate. In recent years fortunately one of the plants has produced a few seeds, and as these have germinated there is reason to hope that if the Arboretum plants become more fruitful this shrub may become a common ornament in northern gardens. It has much to recommend it as a hedge plant. The species from northern China can be seen to most advantage in the Shrub Collection. *Prinsepia uniflora* from western China is a spiny shrub with small white flowers, and though it has little beauty its value for forming impenetrable hedges may prove considerable.

**Corylopsis Gotoana** bloomed this year on the 3rd of April and has never before been so full of flowers which, however, are now beginning to fall. *Corylopsis* is an Asiatic genus of the Witch Hazel Family with fragrant yellow flowers in long drooping clusters and leaves which have a general resemblance to those of the Witch Hazel. *C. Gotoana* was introduced into the Arboretum from central Japan and is the largest and handsomest species, growing from five to six feet tall in this climate, and can be considered one of the handsomest of the early spring flowering shrubs. In the Arboretum it can best be seen on the Centre Street Path. The other Japanese species, *C. pauciflora* and *C. spicata*, are also hardy but in very severe winters the flower-buds are often injured, and they are neither of them as desirable garden plants in this climate as *C. Gotoana*. There are several Chinese species in the Arboretum but their flower-buds are usually killed here.

**Rhododendron mucronulatum**, a native of northern China, which has been growing in the Arboretum for more than forty years, has been covered with fragrant rose-colored flowers this year since the 1st of April and as usual has proved one of the most beautiful and satisfactory of the early flowering shrubs introduced by the Arboretum. It is not easy to explain why this plant, which has so much to recommend it and is so easily propagated, has remained so uncommon in American gardens. The variety *ciliata* discovered by Wilson in Korea is flowering for the first time and promises to be as hardy as the type and even a handsomer plant as the flowers are darker colored. The plants, however, are too young to form any proper estimate of their garden value. They are planted with the type on the lower side of Azalea Path.

**Asiatic Cherries.** When this copy of the Bulletin reaches its readers in eastern Massachusetts the most interesting display of flowers will be made by some of the Cherry-trees of eastern Asia and by early flowering Apricots and Plum-trees. As in previous years, the earliest of these trees to flower is *Prunus concinna*, a native of the mountains of China where it was discovered by Wilson. It is a small tree less than three feet high; the flowers, which are white with a bright red calyx, are less beautiful than those of several of the other Asiatic

1925. "Rhododendron mucronulatum." *Bulletin of popular information - Arnold Arboretum, Harvard University* 11(1), 3–3. <https://doi.org/10.5962/p.321530>.
