

GARRULUS STRIATUS.

Drawn from Nature and on Stone by E. Gould.

Printed by C. E. Bland.

TAB. XXXVII.

GARRULUS STRIATUS.

Garr. pallidè brunneus, subtus pallidior; corporis supra subtusque plumis in medio albo longitudinaliter striatis; cristâ verticali, remigibus, rectricibusque unicoloribus.

Longitudo corporis, 12 unc.; rostri, $1\frac{1}{4}$; tarsi, $1\frac{5}{8}$.

THIS curious and interesting bird is at present provisionally placed in the genus *Garrulus*. Future researches, however, will most probably bring to light other species assimilating to the present; and it may then be found that the characters in *Garrulus striatus* which differ from those of its present congeners will warrant its being removed from the group where it is now placed. The chief characters on which such a suggestion is hazarded are, the beak more compressed and pointed than the blunt mandibles of the true Jays, and the total want of those markings, and of the general tone of plumage, which are so conspicuous in that well-known group of birds.

The head is crested and of a dull rufous brown; the cheeks, sides of the neck, and back, brown with an olive tinge, each feather having a long narrow longitudinal mark of white; the quills and tail are of a dull rufous colour; the under parts pale brownish grey, each feather being white along its centre; the beak and tarsi are blackish brown.

The bird is figured of the natural size.

Gould, John. 1831. "Garrulus striatus [Tab. XXXVII]." *A century of birds from the Himalaya Mountains* –. <https://doi.org/10.5962/p.323586>.
