

# The Mollusca of Stewart Island.

By A. W. B. POWELL, Assistant Director.

This paper is primarily the outcome of a field trip to Stewart Island in October and November, 1934, as the guest of Captain G. M. Turner, who generously made available his launch for dredging work, as well as making possible a fairly comprehensive survey of the coastal areas of the eastern and western sections of the island. Material from the Southern section and Foveaux Strait was available from dredgings in the writer's collection collected many years ago by the late Mr. Augustus Hamilton, as well as from material recently collected by Mrs. R. H. Harrison, of Stewart Island. Mrs. Harrison has been of great assistance in collecting shell-sand samples from a wide range of localities, in securing from time to time material cast ashore after storms, as well as deeper water species obtained from fishing-vessels.

The molluscan fauna of Stewart Island for its latitude ( $47^{\circ}$ S.) is a particularly rich one, very noticeable features being the large size and brilliant colouring of many of its species. This applies equally well to species that are generally distributed in New Zealand, and also to the echinoid *Evechinus chloriticus*, the test of one collected being 155 mm. in diameter. The bright colouring of specimens generally is no doubt due to the exceptional clarity of the water, for the dredge could be seen quite plainly on one occasion while being dragged at a depth of eight fathoms. Two external influences effect the fauna—the cold water west wind drift and to a lesser extent the East Australian warm water current. The latter probably accounts for the occurrence of *Xenophallium*, *Poirieria*, *Pervicacia* and *Cabestana spengleri*, while the Subantarctic element has been strengthened by the record herein of eight additional species; those of Subantarctic origin now being as follows (new records are marked with an asterisk):—*Lissarca*, *Chlamys campbellicus*\*, *Gaimardia*, *Kidderia*\*, *Costokidderia*\*, *Cyaniomactra*, *Condylocardia*, *Margarella*, *Maurea spectabilis*\*, *Macquariella*\*, *Skenella*, *Venustilifer*\*, *Marinula striata*\*, *Kerguelenia*\* and *Onchidella campbelli*.

For the loan of specimens from the Suter collection in the Wanganui Museum the writer is greatly indebted to Mr. J. Grant.

In the faunal list which follows the numbers refer to my check list in "The Shellfish of New Zealand," 1937, The Unity Press Ltd., Auckland; an asterisk signifies that I have examined the material; the symbols in brackets following the name refer to the locality list, and a "T" indicates that the locality cited is the source of the type.

The list comprises 383 species, a considerable fauna for a single area in New Zealand. Twenty-one new species and a new subspecies are described, and five new genera and a new subgenus are proposed.

### LIST OF STEWART ISLAND MOLLUSCA.

#### PELECYPODA.

1. *Solemya (Zesolemya†) parkinsoni* Smith 1874 (D-21).
- \*2. *Nucula cl. hartwignana* Fiechter 1864 (D-4, F-4).
- \*3. *Nucula nitidula* A. Adams 1856 (D-21).
- \*4. *Nucula straigei* A. Adams 1856 (F-4).
- \*5. *Nucula castanea* A. Adams 1856 (15, 24).
- \*6. *Nucula dunedinensis* Finlay 1928 (3, 24, 25).
- \*12.1 *Austronucula schencki* Powell n. gen. & sp. (15, 26T).
- \*13. *Nuculana bellula* (A. Adams 1856) (D-11, F-2).
- \*18. *Nucinella maoriana* Hedley 1904 (D-11).
- \*20. *Neilo australis* (Q. & G. 1835) (D-1, D-2, D-4, D-11).
27. *Acar sandersonae* Powell 1933 (D-22).
- \*28. *Arca novaezelandiae* Smith 1915 (3).
- \*29. *Glycymeris (Grandaxinea) laticostata* (Q. & G. 1835) (F-3).
- \*30. *Glycymeris (Glycymerula) modesta* (Angas 1879) (1).
- \*37. *Lissarca stewartiana* Powell 1935 (15).
38. *Lissarca ? trapezina* (Bernard 1897) (D-20T).
- \*39. *Austrosarepta harrisonae* (Powell 1927) (15).
- \*41. *Hochstetteria meleagrina* Bernard 1896 (15, D-20T, F-4).
- \*47. *Cosa costata* (Bernard 1896) (15, D-20T).
48. *Cosa filholi* (Bernard 1897) (15, D-20T).
- \*54. *Perrierina taxodonta* Bernard 1897 (15, D-20T).
- \*59. *Legrandina harrisonae* Powell 1935 (15T).
- \*59.1 *Legrandina turneri* Powell n. sp. (11T).
- \*60. *Mytilus canaliculus* Martyn 1784 (3).
- \*61. *Mytilus planulatus* Lamarck 1819 (2, 3).
- \*62. *Aulacomya maoriana* (Iredale 1915) (2, 12).
- \*63. *Modiolus neozelanicus* (Iredale 1915) (15).
- \*64. *Modiolus areolatus* (Gould 1850) (3).
- \*66. *Musculus impactus* (Hermann 1782) (3).
- \*71. *Pecten (Notovola) medius* Lamarck 1819 (13).
- \*73. *Chlamys suprasilis* Finlay 1928 (15).
- \*74. *Chlamys celator* Finlay 1928 (20T).
- \*75. *Chlamys radiatus* (Hutton 1873) (D-1, D-2, D-15T).
- \*76. *Chlamys dichrous* (Suter 1909) (D-14T).
- \*79. *Chlamys campbellicus* Odhner 1924 (15).
- \*82. *Pallium (Mesopeplum) convexus* (Q. & G. 1835) (15).
- \*84. *Cyclopecten (Cyclochlamys) transenna* (Suter 1913) (15).
- \*88. *Lima zelandica* Sowerby 1876 (1).
- \*91. *Limatula maoria* Finlay 1926 (20).
- \*92. *Limatula suteri* (Dall 1908) (D-11T).
- \*96. *Ostrea sinuata* Lamarck 1819 (D-5, F-4).
- \*99. *Atrina zelandica* (Gray 1835) (12).
- \*102. *Gaimardia forsteriana* Finlay 1926 (15).
- \*105.1 *Kidderia rakiura* Powell n. sp. (1T, 15).
- \*109. *Neogaimardia minutissima* (Iredale 1908) (15).
- \*113. *Costokidderia lyallensis* Finlay 1926 (15).
- \*117. *Hamacuna\* otagoensis* (Powell 1927) (D-6).
- \*118. *Cuna laqueus* Finlay 1926 (F-2).
- \*124. *Cyamiomactra problematica* Bernard 1897 (D-20T).
- \*125. *Cyamiomactra problematica truncata* Suter 1907 (F-2).
- \*126. *Cardita aotearoa* Finlay 1926 (20-T).
- \*129. *Venericardia purpurata difficilis* (Deshayes 1854) (1).
- \*131. *Pleuromeris zelandica* (Deshayes 1854) (D-8, D-11).
- \*132. *Pleuromeris marshalli* Marwick 1924 (F-1, F-5).

### LIST OF LOCALITIES.

#### STEWART ISLAND SHORE STATIONS—

1. Ringaringa Beach (Mrs. R. H. Harrison).
2. Horse Shoe Bay (shell-sand and beach drift. A.W.B.P., Nov., 1934).
3. Half Moon Bay (low-water. A.W.B.P., Nov., 1934).
4. Leasks Bay, Half Moon Bay. (Mrs. R. H. Harrison.)
5. Thule, Paterson Inlet (intertidal rocks, A.W.B.P., Nov., 1934).
6. Ocean Beach (low-water, under stones. A.W.B.P., Nov., 1934).
7. Ocean Beach (seaweed washings. A.W.B.P., Nov., 1934).
8. Ocean Beach (shell-sand. A.W.B.P., Nov., 1934).
9. Native Island (shell-sand and beach drift. A.W.B.P., Nov., 1934).
10. Golden Bay (low-water. A.W.B.P., Nov., 1934).
11. The Old Neck (shell-sand and beach drift. A.W.B.P., Nov., 1934).
12. Paterson Inlet (Mrs. R. H. Harrison).
13. North Arm, Paterson Inlet (low-water. A.W.B.P., Nov., 1934).
14. Mason Bay (low-water under stones. A.W.B.P., Nov., 1934).
15. Mason Bay (shell-sand and beach drift. A.W.B.P., Nov., 1934).
16. Mason Bay (seaweed washings. A.W.B.P., Nov., 1934).
17. Port Pegasus (under Durvillea hold-fasts. Mrs. R. H. Harrison).
18. Stewart Island (Hutton).
19. Stewart Island (Suter 1913).
20. Stewart Island (Finlay).
21. Stewart Island (Traill coll.).
22. Stewart Island (C. R. Laws 1937).
23. Glory Harbour (A. Hamilton coll.).
24. Harold's Bay (A. Hamilton coll.).
25. Cook's Arm, Port Pegasus (Mrs. R. H. Harrison).
26. Rosa Island, Port Pegasus (Mrs. R. H. Harrison).
27. Stewart Island (Odhner 1924).
28. Stewart Island (collected by residents).
29. Ulva Island, Paterson Inlet (A.W.B.P., Nov., 1934).
30. Aker's Point (Mrs. R. H. Harrison, Nov., 1934).

#### STEWART ISLAND LAND MOLLUSCAN STATIONS—

- L 1. Half Moon Bay (Mrs. R. H. Harrison).
- L 2. Ulva Island, Paterson Inlet (A.W.B.P., Nov., 1934).
- L 3. North Arm, Paterson Inlet (A.W.B.P., Nov., 1934).
- L 4. Lee Bay (A.W.B.P., Nov., 1934).
- L 5. Near Ocean Beach (A.W.B.P., Nov., 1934).
- L 6. The Neck, Paterson Inlet (A.W.B.P., Nov., 1934).
- L 7. Observation Rock, Oban (A.W.B.P., Nov., 1934).
- L 8. Near Mason Bay (A.W.B.P., Nov., 1934).
- L 9. Native Island (Subrecurrent in dunes) (A.W.B.P., Nov., 1934).
- L10. Mason Bay (Subrecurrent in dunes) (A.W.B.P., Nov., 1934).
- L11. Half Moon Bay (Suter 1913).
- L12. Stewart Island (Suter 1913).
- L13. Rakiahua River (A.W.B.P., Nov., 1934).
- L14. Fresh Water River (Mrs. R. H. Harrison 1939),

**STEWART ISLAND DREDGE STATIONS—**

- D 1. Off Dynamite Point, Paterson Inlet, 13 fathoms (A.W.B.P., Nov., 1934).  
 D 2. Off The Old Neck, Paterson Inlet, 13 fathoms (A.W.B.P., Nov., 1934).  
 D 3. Mill Bay, Kaipipi Arm, 8 fathoms (A.W.B.P., Nov., 1934).  
 D 4. Paterson Inlet, 13 fathoms (A. Hamilton coll.).  
 D 5. Off Fancy Group, 10-17 fathoms (Captain G. M. Turner).  
 D 6. 50-54 fathoms, Wreck Reef (Suter 1913).  
 D 7. 50 fathoms, Wreck Reef (A. Hamilton coll.).  
 D 8. Oyster Cove (dredged) (Mrs. R. H. Harrison).  
 D 9. Off Half Moon Bay (stomachs of blue cod).  
 D10. Off Half Moon Bay (dredged) (Mrs. R. H. Harrison).  
 D11. Port Pegasus, 18 fathoms (Suter 1913).  
 D12. Port Pegasus, 30 fathoms (A. Hamilton coll.).  
 D13. Port Pegasus, 12 fathoms (Suter 1913).  
 D14. Port Pegasus (stomach of blue cod) (Suter 1913).  
 D15. Stewart Island, 13 fathoms (Suter 1913).  
 D16. Stewart Island, 15 fathoms (Hutton) (Suter).  
 D17. Stewart Island, 24 fathoms (Hutton).  
 D18. Stewart Island, 25 fathoms (A. Hamilton coll.).  
 D19. Stewart Island, 30 fathoms (Hutton & Suter).  
 D20. Stewart Island, 35 fathoms (Suter).  
 D21. Stewart Island (dredged) (A. Hamilton coll.).  
 D22. Stewart Island, 15 fathoms (A. Hamilton, Suter coll.).

**FOVEAUX STRAIT DREDGE STATIONS—**

- F 1. Foveaux Strait (A. Hamilton coll.).  
 F 2. Foveaux Strait, 15 fathoms (A. Hamilton coll.).  
 F 3. Foveaux Strait, 18 fathoms (A. Hamilton coll.).  
 F 4. Foveaux Strait (oyster-dredge) (A. Hamilton coll.).  
 F 5. Foveaux Strait, Ruapuke Oyster Bed (A. Hamilton coll.).  
 F 6. Foveaux Strait (Ashby 1929).  
 F 7. Foveaux Strait (Finlay).  
 F 8. Foveaux Strait (Hutton).  
 F 9. Foveaux Strait (Suter 1913).  
 F10. Foveaux Strait, 17 fathoms (Dr. H. J. Finlay coll.).  
 F11. Foveaux Strait (Bluff oyster scrapings) (Dr. H. J. Finlay coll.).  
 F12. Foveaux Strait, 20 fathoms (Finlay).

**REJECTED STEWART ISLAND AND FOVEAUX STRAIT RECORDS.**

- Arca reticulata* Suter 1913 (non Gmelin 1790) = *Acar sandersonae* Powell 1933.  
*Bittium cylindricum* Suter 1913 (non Watson 1881). Australian. Rejected by Finlay (1926, Trans. N.Z. Inst., p. 381).  
*Cantharidus picturatus* Suter 1913 (non H. & A. Ad.) Australian. Rejected by Finlay (1926, Trans. N.Z. Inst., p. 356).  
*Cocculina tasmanica* Suter 1913 (non Pilsbry 1895) is *Notocrater craticulata* (Suter).  
*Cytherea subsulcata* Suter 1913 (non Suter 1905). Rejected by Finlay (1926, Trans. N.Z. Inst., p. 470).  
*Dentalium nanum* Suter 1913 (non Hutton 1873) is *D marwicki* Mestayer 1926.  
*Euthria linea traversi* Suter 1913 (non Hutton 1873) is *Buccinulum marwicki* (Finlay 1928).  
*Fissurella huttoni* Suter 1906. Based upon the West Indian *Diodora barbadensis* (Gmelin). Rejected by Finlay (1926, Trans. N.Z. Inst., p. 342).  
*Fulguraria arabica* Suter 1913 (non Martyn 1784) is *Alcithoe swainsoni* Marwick 1926.  
*Helcioniscus mestayerae* Suter 1906. Based upon the East Indian and Melanesian *Cellana testudinaria* Linn. Rejected by Iredale (1915, Trans. N.Z. Inst., p. 432).  
*Myadora brevis, crassa* and *pandoriformis* all of Suter 1913 (non Sowerby 1829, Stutchbury 1835). Rejected by Finlay (Trans. N.Z. Inst., p. 474).

*Pecten aviculoides* Suter 1913 (non E. A. Smith 1885). Juvenile of *Pallium con-vexus* (Q. & G.) Finlay (1926, Trans. N.Z. Inst., p. 452).

*Photinula antipoda rosea* Hutton 1873. Synonym of Subantarctic *Margarella antipoda* H. & J. Finlay (1926, Trans. N.Z. Inst., p. 357).

*Pseudoliotia imperforata* Suter 1908. Juvenile *Modelia granosa* (Martyn) Finlay (1926, Trans. N.Z. Inst., p. 365).

*Schismope beddomei* Suter 1913 (non Petterd 1884). Tasmanian species. N.Z. Shell *S. laqueus* Finlay (1926, Trans. N.Z. Inst., p. 340).

*Subemarginula rugosa* Suter 1913 (non Q. & G. 1834). Australian species. Foveaux Strait shell possibly *Montfortula lyallensis* Mestayer 1928. (No examples seen.)

*Talopena sublaevis* Finlay 1924 (a worn juvenile of *Cantharidella tessellata* (A. Adams 1851).

*Trophon bonneti* Suter 1913 (non Cossmann 1903) is *Axymene pumila* (Suter 1899).

*Trophon corticatus* Suter 1913 (non Hutton 1873) is *Euthrenopsis otagoensis* Powell 1929.

*Trochus chathamensis* Hutton 1873. Foveaux Strait shells are *Thoristella chat-hamensis benthicola* Finlay 1926.

## PELECYPODA.

### NUCULIDAE.

Genus *AUSTRONUCULA* n. gen.

Type: *A. schencki* n. sp.

Schenck in his "Classification of Nuculid Pelecypods" (1934, Bull. Mus. Royal d'Hist. nat. de Belgique p. 18) divides the nuculids into three taxonomic units: (A) those having shells with denticulate ventral margins; (B) those having smooth inner ventral margins; (C) those with divaricate sculpture.

A new species from several Stewart Island localities conforms in hinge details with *Pronucula* Hedley, which belongs to unit (A) but differs in having a smooth ventral margin as in unit (B) and also in having a more conspicuously marked off prodissoconch which is flat and oval. A closely allied species appears to be the South Australian *micans* Angas 1878 and possibly *flindersi* Cotton 1930. The surface is smooth or with weak concentric sculpture.

The previously described New Zealand species—*Pronucula mesembrina* Hedley 1916, *tenuis* Powell 1927 and *maoria* Powell 1937—each have the characteristic radials and denticulate ventral margin of *Pronucula* s. str.

By accepting the presence or absence of valve crenulations as being of taxonomic import in the family it becomes necessary also to segregate the smooth margined *strangei* A. Ad. from the remaining New Zealand species classed under *Nucula* s. str. A name is available in *Ennucula* Iredale 1931, type *Nucula obliqua* Lamarck, Southern Australia.

***Austronucula schencki* n. sp.** Pl. 48, fig. 5.

Shell minute, smooth, light olive-brown, obliquely triangularly ovate, inflated. No sculpture, either radial or concentric. Valve margins smooth. Umbones prominent, prodissoconch oval,

flattened on top and defined by a slight rim. Hinge strong, closely similar to that of *Pronucula*. Teeth few, large, squarish, distant from the large almost perpendicular chondrophore. In the right valve there are four strong anterior teeth and two weak ones posterior to the chondrophore. In the left valve there are four strong anterior, and one weak posterior tooth. The posterior subdorsal margin of the right valve fits into a well marked corresponding groove in the left.

Length, 1.15 mm.; height, 1 mm.; thickness (2 valves), 0.61 mm.

*Holotype*: In Auckland Museum.

*Localities*: Rosa Island, Port Pegasus, Stewart Island (shell-sand, Mrs. R. H. Harrison); Mason's Bay, Stewart Island (shell-sand).

### PERRIERINIDAE.

Genus *LEGRANDINA* Tate & May 1901.

Type (orig. desig.): *L. bernardi* Tate & May.

***Legrandina turneri* n. sp.** Pl. 48, fig. 7.

Shell very small, moderately convex, thin but not fragile, sub-ovate, beaks about central, flattened, the broadly rounded prodissoconch defined by a faint rim. Externally the shell is smooth, except for concentric growth lines, but internally the ventral margin shows faint crowded crenulations. When subjected to strong transmitted light crowded radials are seen to occupy the whole shell, but do not show either on the outer or inner surfaces. Hinge rather massive but comparatively short. Right valve with two cardinals, almost joined above, but strongly divergent below. There are five oblique lamellae on each side of the cardinal area. In the left valve there are two cardinals fused into one large triangular tooth, as well as the lamellae corresponding to those of the right valve. Adductor scars typical. Pallial line simple and entire. Colour pale buff, two thirds of the shell from the posterior end stained dark reddish-brown.

Length, 2.75 mm.; height, 2.4 mm.; thickness (one valve), 0.6 mm.

*Holotype*: In Auckland Museum.

*Localities*: Old Neck Beach, Paterson Inlet, Stewart Island. Coll. (A.W.B.P., Nov., 1934); Harrington Point Beach, Otago Harbour (Dr. C. R. Laws coll.).

This makes the third New Zealand *Legrandina*, the other two being *aucklandica* Powell 1933 from Faith Harbour, Auckland Islands, and *harrisonae* Powell 1935 from Mason's Bay, Stewart Island.

## PECTINIDAE.

Genus *CHLAMYS* Bolten 1798.

*Chlamys campbellicus* Odhner 1924. Pl. 50, figs. 10-14.

1924. *Chlamys campbellicus* Odhner. Pap. Dr. Mort. Pac. Expd. 1914-1916. pt. 19, N.Z. Mollusca, p. 61, pl. 2, figs. 36-39. Type. Perseverance Harbour, in 20 fathoms, Campbell Island. Dimensions: Height, 32 mm.; breadth, 29 mm.

Four specimens which I ascribe to this species were collected on Mason Bay Beach, West Coast of Stewart Island, by Mrs. R. H. Harrison. Similar specimens occur in 40-50 fathoms off Cape Saunders, Otago, including occasional much larger specimens up to 68 mm. in height (Dr. C. R. Laws collection). Further occurrences are: 55 fathoms, 31 miles S. from Wellington and 25 miles E. from Cape Campbell (Dr. P. Marshall), the largest example being 70 mm. in height; and 50 fathoms off the southern end of Macquarie Island, the largest being 69 mm. in height.

It seems likely that the Recent specimen of unknown locality in the Dominion Museum collection, recorded as *delicatulus* by Thomson (1919, Trans. N.Z. Inst., vol. 51, p. 480) belongs here also.

Certainly these larger examples of *campbellicus* closely resemble the fossil *delicatulus* Hutton, type from Mid-Pliocene (Nukumaruan) beds at Castle Point, N.Z., but there are constant differences in sculpture between the two, nevertheless.

The profile of the ribs in both valves is lower in *delicatulus* and the interstitial radials become spinose only at a comparatively mature stage of growth.

In the left valve there is but a single interstitial radial in *delicatulus* except, towards the margin in large specimens, whereas in *campbellicus* three to five spinose radials occupy the interspaces commencing at a very early stage. *Delicatulus* exhibits a single interstitial riblet up to 35 mm. in height, whereas three riblets frequently appear at 15 mm. in *campbellicus*. The largest *delicatulus* I have measures 94 mm. x 94 mm.; also the species is less convex than the Recent *campbellicus*. The right valve is very similar in both species.

There is little doubt that *campbellicus* is the direct Recent descendant of the Pliocene *delicatulus*.

Dimensions of *campbellicus*:—

Height, 32 mm.; breadth, 29 mm. (holotype).

Height, 30 mm.; breadth, 27.5 mm.; Mason Bay, Stewart Island.

Height, 27 mm.; breadth, 25.25 mm.; Mason Bay, Stewart Island.

Height, 68 mm.; breadth, 67 mm.; 40-50 fathoms, Cape Saunders.

Height, 69 mm.; breadth, 68 mm.; Macquarie Island.

Height, 70 mm.; breadth, 69.5 mm.; 55 fathoms, Cape Campbell.

### GAIMARDIIDAE.

Genus KIDDERIA Dall 1876.

Type: *Kidderia minuta* Dall.

**Kidderia rakiura** n. sp. Pl. 48, fig. 1.

Shell of moderate size, thin, white, transversely elongate, inflated, very inequilateral, the beaks almost anterior. Rostrum short, narrowly rounded, but not angulate. Sculpture of distinct but fine crowded concentric growth lines. Beaks bluntly rounded. Ventral margin straight to slightly concave at the anterior end, where it rises to the rostrum. Hinge teeth small, sometimes obsolete; right valve with two oblique small cardinals, left valve with one. There is a short oblique internal resilium and a comparatively short submarginal ligament.

Length, 6.75 mm.; height, 4.3 mm. (holotype).

Length, 8.4 mm.; height, 4.9 mm.; thickness (2 valves), 4.5 mm. (paratype).

*Holotype*: Presented to Auckland Museum.

*Locality*: Ringaringa Beach (cast ashore after storm), Stewart Island (Mrs. R. H. Harrison).

The species is nearest allied to the Snares Island *acrobeles* (Suter 1913), being of similar outline, but it is considerably larger, has more pronounced concentric growth striae, no trace of radial folds, a weaker hinge and a shorter ligament.

### CONDYLOCARDIIDAE.

Genus BENTHOCARDIELLA Powell 1930.

Type (orig. desig.): *B. pusilla* Powell.

**Benthocardiella rakiura** n. sp. Pl. 48, fig. 6.

Shell minute, thin, semi-transparent, white, moderately convex, obliquely oval, anterior end produced. Surface glossy, but crowded with fine concentric striations. Valve margins smooth. Prodissococonch moderately large, circular, with a rounded margin and a prominent boss in the middle. Hinge typical, except that it lacks the hooked process on the posterior cardinal of the left valve. Left valve with three cardinals, a long prominent anterior one and a pair of short posterior teeth, the uppermost the larger, confluent with the valve margin and terminating at the chondrophore in a slight swelling. Right valve with three cardinals, a long slender anterior one near to the valve margin, a shorter and much heavier one beneath, and a single short anterior tooth. In this genus modifications in respect to position, shape and strength of the hinge teeth are brought about by the relative obliquity of the shell shape.

Length, 1.15 mm.; height, 1.2 mm.

*Holotype*: In Auckland Museum.

*Locality*: Old Neck Beach, Paterson Inlet, Stewart Island, in beach drift (A.W.B.P., Nov., 1934).

The species resembles a *Pachykellya* in shape except for the prodissoconch.

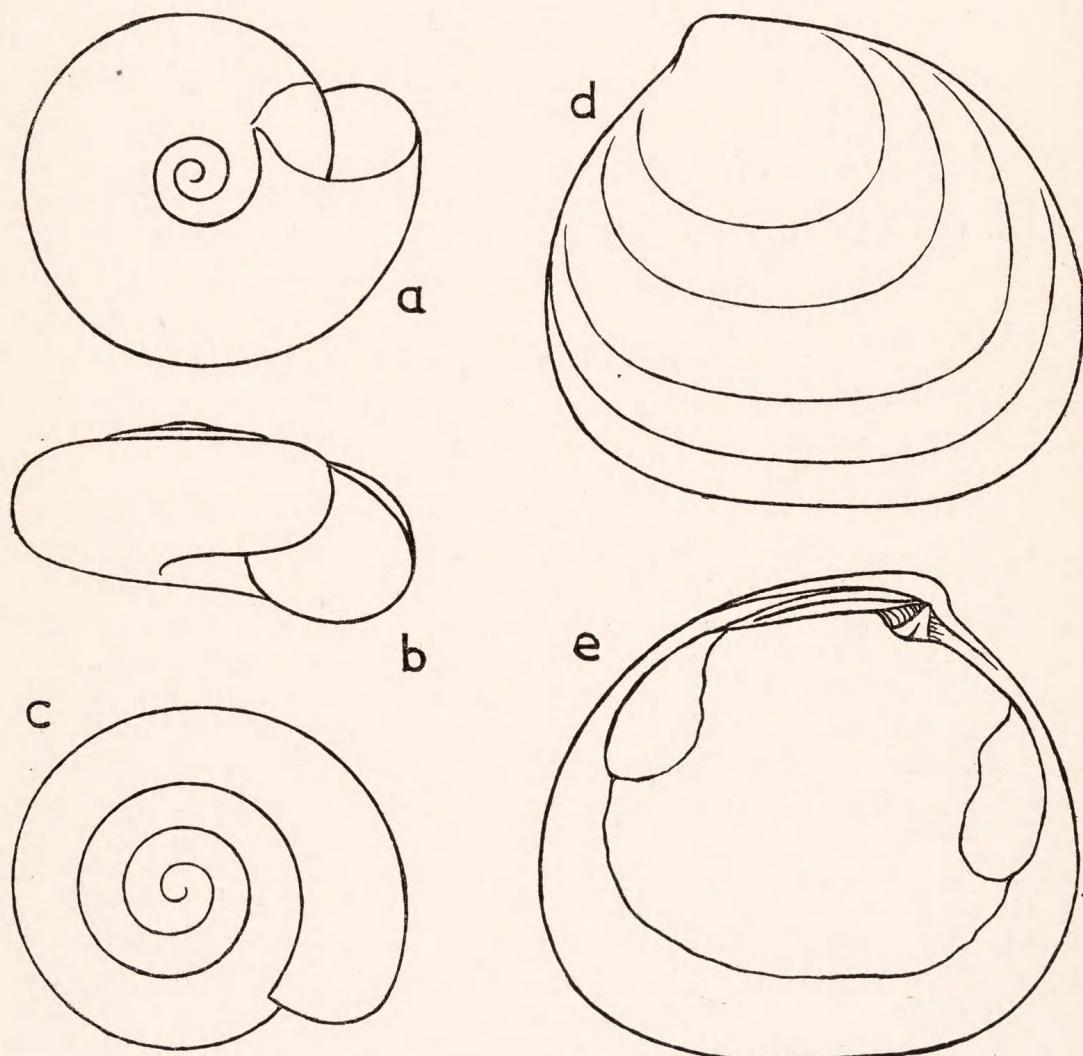

### UNGULINIDAE.

Genus *ZEMYSIA* Finlay 1926.

Type (orig. desig.): *Lucina zelandica* Gray.

*Zemysia rakiura* n. sp. Text figures d. and e.

This species is close to *zelandica*, but can be separated at all growth stages by the position of the beaks, which are at the anterior third (in *zelandica* they are almost central), by the somewhat oblique-oval outline, the dorsal and the ventral margins being flattened for more than half the diameter of the shell, and

a, b, c. *Fectola (Subfectola) rakiura* Powell n. sp. Holotype (1.65 x 0.8 mm.).  
 d, e. *Zemysia rakiura* Powell n. sp. Holotype (10.5 x 9.2 mm.).

subparallel, by the smoother surface and slightly greater convexity. The only difference in the hinge is that the bifid cardinal of the right valve is more broadly triangular.

Superficially the species has a striking resemblance to *Marikellia rotunda* (= *Kellya suborbicularis*), and it is constantly of much smaller size.

Length, 10.5 mm.; height, 9.2 mm.; thickness (one valve), 2.75 mm. (holotype).

Length, 10.1 mm.; height, 9.4 mm.; thickness, 2.25 mm. (juvenile *zelandica*).

*Holotype*: In Auckland Museum.

*Locality*: Ringaringa Beach, Stewart Island (Mrs. R. H. Harrison).

## ERYCINIDAE.

Genus *PUYSEGURIA*\* Powell 1927.

Type (orig. desig.): *P. cuneata* Powell 1927.

**Puyseguria tani** n. sp. Pl. 48, fig. 2.

Shell minute, equivalve, obliquely sub-ovate. Beaks bluntly rounded, small. Prodissoconch not plainly marked off. Surface smooth apart from faint concentric growth lines. Valve margins thin, smooth. Hinge-plate strong, interrupted in the middle by an oblique internal resilium. Right valve with a strong anterior elongated lateral bent over as a thin lamella at the proximal end, leaving a triangular cavity beneath; posterior lateral smaller, long and narrow.

Left valve a strong medially grooved (hardly bifid) triangular cardinal and a weak elongated anterior and posterior lateral.

Colour reddish-brown, darkest at umbo, lightest at ventral margin.

Length, 1.3 mm.; height, 1.2 mm.; thickness (one valve), 0.3 mm.

*Holotype*: In Auckland Museum.

*Locality*: Old Neck Beach, Paterson Inlet, Stewart Island. Coll. (A.W.B.P., Nov., 1934).

The species is nearest allied to *prognata* Powell 1927, from 170 fathoms, off Puysegur Point, differing in being less inflated, less oblique, having a smaller prodissoconch and in the brown coloration.

Named after Captain G. M. Turner's dog Tan.

---

\*Corrected spelling of genus which appeared as *Puysegeria*.

## Genus ROCHEFORTULA Finlay 1926.

Type (orig. desig.) : *Rochefortia reniformis* Suter.

***Rochefortula decapitata* n. sp. Pl. 48, fig. 4.**

Shell small, quadrate-oval, inequilateral, beaks broad and flattened, situated at about the posterior third. Surface apparently smooth, but really sculptured with dense, microscopic radial striae; there is no true concentric sculpture, only moderately wide spaced growth lines. Hinge plate narrow, restricted by the flattened beaks. Right valve with two divergent strong cardinals, left valve with two lamellate weaker teeth.

Length, 2.8 mm.; height, 1.95 mm.

*Holotype*: In Auckland Museum.

*Localities*: Rosa Island, Port Pegasus, Stewart Island (in shell sand), Mrs. R. H. Harrison) (Type); Waitangi, Chatham Islands; Faith Harbour, Auckland Islands; Snares Islands, 50 fathoms.

At first sight the species may be taken for juvenile *reniformis*, but that species at all stages of growth has very small projecting beaks, stronger radial striae and distinct concentric ridges. The new species apparently never reaches the size of adult *reniformis*.

***Rochefortula taieriensis* n. sp. Pl. 48, fig. 3.**

Shell small, ovate, beaks small but bluntly rounded, situated a little posterior to the centre. Dorsal margin descending rather steeply from the beak, anterior, posterior and ventral margins broadly rounded. Surface smooth except for exceedingly fine and dense radial striae. There is no true concentric sculpture, only distant growth lines. Hinge of right valve with two short, stout, divergent cardinals, that of left valve with two lamellae thickened slightly at their proximal ends.

Length, 2.6 mm.; height, 2.2 mm.

*Holotype*: In Dr. H. J. Finlay Collection, Auckland Museum.

*Locality*: Taieri Beach, Otago, in shell sand.

From *decapitata* the new species differs in being much less elongate and in having the dorsal slopes descending more steeply and the beaks considerably smaller.

Another species of this group is my *Mysella bidentifera* (Powell 1933) from Tom Bowling Bay.

True *reniformis* occurs throughout New Zealand and at the Chathams.

**GASTEROPODA.****FISSURELLIDAE.**

Genus *TUGALI* Gray 1843.

Type: *Tugali elegans* Gray.

***Tugali stewartiana* n. sp.** Pl. 50, figs. 7, 8 and 9.

Only one *Tugali* seems to occur at Stewart Island, and it is quite distinct from the four known Recent forms.

It is more coarsely sculptured than any other New Zealand species, the radials being dominant and regularly alternating in strength. The concentric ridges also are fewer and stronger than in *elegans*. The early sculpture is openly netted as in *bascauda*, but the sinus rib upon breaking up becomes triple, as in *elegans* and *colvillensis*. In shape the new species is elongate oval, less tapered than *elegans*, yet not so bluntly rounded as either *bascauda* or *suteri*. The convexity of the shell approximates that of *elegans*. The holotype has twelve strong radials and eleven considerably weaker intermediates on the short posterior slope from the apex back to the margin. The marginal crenulations are slightly irregular, due to the alternation in strength of the radials.

Length, 20.5 mm.; breadth, 12.5 mm.; height, 6.25 mm. (paratype).

Length, 21.75 mm.; breadth, 13.5 mm.; height, 7.25 mm. (holotype).

Length, 27.5 mm.; breadth, 18.25 mm.; height, 10 mm. (paratype).

*Holotype*: In author's collection, Auckland Museum.

*Localities*: Ringaringa (type) and Horse Shoe Bay, Stewart Island (Mrs. R. H. Harrison).

**STOMATELLIDAE.**

Genus *MARGARELLA* Thiele 1893.

Type (orig. desig.): *Margarita violacea* King.

***Margarella turneri* n. sp.** Pl. 49, fig. 12.

This species differs from the variably coloured *decepta* in its constant pattern of wide spaced zigzag, axial, purplish-brown bands, turbinate shape, and smaller, more circular aperture. The ground colour is pale cream, with a trace of greenish irridescence, two bright pink spiral lines on the spire whorls, and occasionally one or two similar lines on the base. In adult specimens the pink lines are absent from the body-whorl and the penultimate, above the periphery. There are eleven (variation in paratypes 9-11) zigzag bands on the body-whorl. When axial colour markings augment the spiral or zoned pattern in *decepta* they are invariably

more numerous, narrower, closer spaced and more diffused as a network. Surface smooth and polished except for a few subobsolete basal spirals. Imperforate but with a shallow crescentic depression bordering the columellar callus, which is white. Interior highly iridescent, with the zigzag pattern showing through. Whorls 5.

- Height, 7.75 mm.; diameter, 8 mm. (Holotype).
- Height, 8 mm.; diameter, 8.25 mm. (Paratype).
- Height, 8.5 mm.; diameter, 8.75 mm. (Paratype).
- Height, 8 mm.; diameter, 9 mm. *decepta* (Kakanui).
- Height, 7.5 mm.; diameter, 8.5 mm. *decepta* (Kakanui).
- Height, 9 mm.; diameter, 10.5 mm. *decepta* (Kakanui).

*Holotype and paratypes:* In Auckland Museum.

*Locality:* Island of Ulva, Paterson Inlet (Type) and Ringaringa, Stewart Island. Always on seaweed covered rocks at low tide, never under the holdfasts of *D'Urvillea*, where *decepta* is found exclusively.

#### **Margarella puysegurensis n. sp. Pl. 49, fig. 13.**

This species is closely allied to *turneri*, but has a more variable pattern. Broad pink spiral bands, or with wide zigzag dark purplish to greenish brown axial bands, so merged that the shell appears uniformly dark, except for a row of ovoid light patches at the periphery, and others towards the termination of the body whorl, are the extremes in pattern in the series. The holotype has the diffused dark purplish to greenish brown pattern with a few ovoid light patches near the outer lip and five moderately broad pink spiral bands beneath, two on the upper part of the whorls, one at the periphery and two on the base. These bands show as pink, only where they coincide with an occasional light patch, otherwise they appear as dark red brown under the prevailing dark purplish to greenish-brown. Columella and broad crescentic area surrounding it creamy-buff. There is a slight umbilical cleft above a crescentic depression bordering the columella. Shell turbinate, slightly more depressed than *turneri*, but otherwise closer to that species with its small rounded aperture, than to either *decepta* or the subantarctic *antipoda*. Whorls 4. Smooth and polished except for a few subobsolete basal spirals. Constantly smaller than *turneri*, but evidently adult, judging from the columellar callus.

- Height, 5 mm.; diameter, 5.5 mm. (Holotype).
- Height, 4.75 mm.; diameter, 5.75 mm. *decepta* (Kakanui).

*Holotype and paratypes:* In Auckland Museum.

*Locality:* Sealers' Beach, near Puysegur Point, S.W. Otago. Coll. A.W.B.P., Nov., 1934. On seaweed in rock pools near low water.

From *turneri* this species differs in being slightly more depressed, having an umbilical cleft, different colour pattern, and being constantly of smaller size.

## CALLIOSTOMATIDAE.

Genus MAUREA Oliver 1926.

Type (orig. desig.): *Trochus tigris* Martyn.

Subgenus MUCRINOPS Finlay 1926.

Type: *Zizyphinus spectabilis* A. Adams.

The Calliostomids of the *punctulata* series are a puzzling group. I have already (Powell 1926, p. 591) referred to a North Island form from muddy locations, which has numerous equally developed spiral granular ridges, instead of the normal arrangement of 7 primaries and 5 interstitial riblets. Later (1926), both Finlay and Oliver clashed in the description of a Stewart Island form, more squat than the typical species, and with 12 equi-developed spirals, as in the form from North Island mudflats. After collecting a large series from Stewart Island, another form appeared in extra large elevated shells, with from 9 to 12 equi-developed spirals. This same form also occurs along with typical *punctulatum* at Paekakariki, Wellington Province, and at the Chatham Islands.

As the two Stewart Island forms cannot be reconciled under the one subspecific name, I propose to separate the larger one as new.

The distribution of the *punctulata* series now appears as follows:—

(1) *punctulata punctulata*: North Island (North Cape to Wellington).

(2) *punctulata urbanior*: Stewart Island, Otago, Westport and ?Kawhia.

(3) *punctulata ampla*: Stewart Island, Chatham Islands, Kai-koura and Paekakariki (North Island).

### **Maurea (Mucrinops) punctulata ampla** n. subsp. Pl. 50, fig. 6.

Spire tall, conic, outlines lightly convex, one and a third times height of aperture. Upper spire whorls with 6 beaded spiral cords, and a plain thread in each interspace, antepenultimate with 9 beaded cords and two plain threads, one at upper suture and the other between cords 2 and 3, penultimate with 12 beaded cords, the additions being plain threads of the earlier whorl, plus one other which have become beaded.

Colour light orange brown with serial reddish brown dots on the spiral cords between the beads.

Height, 43 mm.; diameter, 38.75 mm. (holotype).

*Holotype*: In Auckland Museum.

*Locality*: Mason's Bay, Stewart Island (holotype).

---

FOOTNOTE.—I note that Thiele 1931 Handbuch der Systematischen Weichtierkunde, p. 49, provided the new name *Calotropis* for *Calliotropis* Oliver, type *Trochus cunninghami* Gray (non *Calliotropis Seguenza*). However, the group hardly needs separation from *Maurea* s. str.

## LIOTHIDAE.

Genus *ZALIPAIIS* Iredale 1915.

Type (orig. desig.): *Delphinoidea lissa* Suter.

***Zalipais turneri* n. sp.** Pl. 49, fig. 11.

Shell minute, depressed turbinate, thin, semi-transparent, smooth, umbilicated. Colour dull white. Suture deeply impressed. Protoconch of one smooth whorl, moderately large, as a convex blob. Whorls two, rapidly increasing, rounded, with a downward trend towards the aperture. The periphery is low at the level of the suture. Aperture subcircular, almost "D" shaped. Peristome continuous, sharp, straight across parietal wall. Outer lip advanced above, incurved and slightly notched at the suture. Spire about one-third height of aperture. Umbilicus deep, open, about one eighth the major diameter. Operculum horny, circular, concentric, nucleus central.

Height, 0.75 mm.; diameter, 1.05 mm. (holotype).

*Holotype*: In Auckland Museum.

*Locality*: Ocean Beach, Stewart Island (seaweed washings).

The species differs from *lissa* in being more turbinate in shape and in lacking the fine radial riblets. Finlay's *parva* (1924) is very much smaller and planorbid, while my *benthicola* (1927) has a wide open umbilicus.

## LITTORINIDAE.

Genus *ZELAXITAS* Finlay 1926.

Type (orig. desig.): *Laevilitorina cystophora* Finlay.

***Zelaxitas rissoaformis* n. sp.** Pl. 49, fig. 5.

Shell small, thin, vitreus, smooth, *Rissoa*-like, with tall spire, one and a third times height of aperture. Whorls  $4\frac{1}{2}$ , moderately convex. Sutures rather deeply impressed. Peristome thin and sharp, continued across parietal wall as a defined callus. Aperture ovate-pyriform. Operculum typical, ovate-pyriform, concentric with the nucleus median, near to the inner margin. Colour light brown, fading out on the lower part of the base.

Height, 2.55 mm.; diameter, 1.5 mm.

*Holotype*: In Auckland Museum.

*Locality*: Ocean Beach, Stewart Island (on seaweeds at low tide, A.W.B.P., Nov., 1934).

## RISSOIDAE.

Genus SUBONOBA Iredale 1915.

Type (orig. desig.) : *Rissoa fumata* Suter.

**Subonoba edita** n. sp. Pl. 49, fig. 6.

Shell small dull white, thin, attenuate. Spire twice height of aperture. Whorls 6, lightly convex. Sculpture consisting of numerous fine and close spiral lirae, 10 on antepenultimate, 11 on penultimate, 12 on body whorl plus 7 on the base. Protoconch papillate of  $1\frac{1}{2}$  smooth whorls. Peristome continuous, sharp. Aperture subovate.

Height, 3 mm.; diameter, 1.3 mm.

*Holotype*: In Auckland Museum.

*Locality*: Rosa Island, Port Pegasus, Stewart Island (in shell-sand. Mrs. R. H. Harrison).

The species is close to *fumata* Suter, but is constantly larger, yet relatively more slender.

Genus MERELINA Iredale 1915.

Type (orig. desig.) : *Rissoa cheilostoma* Ten.-Woods.

Two of the species here described occur at Stewart Island, but the third is a northern species, the description of which is included herein for convenience.

**Merelina harrisonae** n. sp. Pl. 49, fig. 2.

Shell large for the genus, solid, clathrate, spirals more prominent than the axials. Related to *lyalliana*, but larger, with fewer and weaker axials, keels more prominent and equal in development, and colour uniformly buff, without colour bands. The axials are fold-like, so that they have the effect of producing the spiral keels into laterally compressed nodules at the points of intersection, without being noticeable in the interspaces of the keels, thus not enclosing distinct rectangular spaces. Spire whorls with two strong keels, body whorl with two, plus a prominent smooth sutural keel, and two others on the base.

Height, 3.4 mm.; diameter, 1.55 mm.

*Holotype*: In Auckland Museum Collection.

*Locality*: Ringaringa (type) and Mason Bay, Stewart Island. Coll. Mrs. R. H. Harrison.

**Merelina maoriana** n. sp. Pl. 49, fig. 1.

1873. *Rissoa plicata* Hutton (non Deshayes 1838) Cat. Mar. Moll. N.Z., p. 29.

This is the Forsterian, Cookian, and Moriorian representative of the Rossian *plaga* Finlay 1926. It differs from that species in slightly smaller size, finer sculpture, and the addition of a third spiral keel on the body-whorl; this, the uppermost spiral, is weakest.

The axials are more closely spaced (16 on the body whorl as against 12 in *plaga*), the enclosed interspaces being square instead of slightly oblong.

The sculpture is crisp, but not strong, and is not rendered gemmate at the points of intersection of the spirals and axials. Colour uniformly dull white, without colour bands.

Height, 3 mm.; diameter, 1.3 mm.

*Holotype*: In Dr. H. J. Finlay Collection, Auckland Museum.

*Localities*: Dunedin Harbour, 3 fathoms (type); Cuvier Island, 38 fathoms; Mason Bay, Stewart Island; off Cape Saunders, 40-50 fathoms; Waitangi, Chatham Islands.

### **Merelina taupoensis n. sp. Pl. 49, fig. 3.**

Shell small, solid, clathrate. Protoconch typical ( $1\frac{1}{2}$  whorls sculptured, with about 12 spiral striae). Whorls 6. Suture narrowly margined above and below. Spire whorls with three equispaced spiral keels (median strongest, lowest almost as strong, uppermost weak), gemmate at points of intersection with axials. Body whorl with addition of a fourth smooth sutural keel and three more on base. Labial varix rather weak. Colour buff, with a faint brown band below suture and between third and sixth spirals on base. Related to *M. superba* Powell 1927.

Height, 2.8 mm.; diameter, 1.2 mm.

*Holotype*: In Dr. H. J. Finlay Collection, Auckland Museum.

*Localities*: Taupo Bay, Whangaroa (type); St. Helier's Bay, and Motutapu Island, Auckland; Doubtless Bay, 12 fathoms; Tom Bowling Bay.

## **KEY TO N.Z. SPECIES OF MERELINA.**

**MERELINA.** Protoconch of smooth spirals—base spirally sculptured.

**A. Protoconch with 3 spiral lirae.**

(a) Body whorl spirals all one series, continued over base.

1. *gemmata*. Whorls  $5\frac{1}{2}$  clathrate (gemmate). Spire whorls 3 keels. Body whorl 6 keels (3 basal).

**B. Protoconch with more than 3 spiral lirae.**

2. *compacta*. Whorls 4 clathrate (gemmate). Spire whorls 2 keels. Body whorl 6 keels (4 basal).

(b) Body whorl spirals in two series (body-whorl and basal).

(aa) Sculpture crisp, not gemmate, at axial and spiral intersection.

3. *plaga*. Whorls  $5\frac{1}{2}$  clathrate (spirals and axials equal). Spire whorls 2 keels. Body whorl 2 keels + 3 basal.

4. *maoriana*. Whorls  $5\frac{1}{2}$  clathrate (spirals and axials equal). Spire whorls 2 keels. Body whorl 3 keels (uppermost weak) + 3 basal.

5. *manawatawhia*. Whorls  $5\frac{1}{2}$  clathrate (axials slightly stronger). Spire whorls 3 keels. Body whorl 3 keels + 4 basal.

6. *paupereques*. Whorls  $4\frac{3}{4}$  clathrate (equal). Spire whorls 2 keels. Body whorl 2 keels + 2 basal keels + 2 weak threads.  
(bb) Sculpture gemmate at axial and spiral intersection.
7. *lyalliana*. Whorls  $5\frac{1}{2}$  clathrate (spirals more prominent). Spire whorls 2 keels (upper more prominent). Body whorl 2 keels + 3 basal.
8. *harrisonae*. Whorls  $6\frac{1}{2}$  clathrate (spirals more prominent). Spire whorls 2 keels (equal). Body whorl 2 keels + 3 basal.
9. *taupoensis*. Whorls 6 clathrate (equal). Spire whorls 3 keels (No. 2 strongest, 3 next, 1 weakest). Body whorl 3 keels + 4 basal.
10. *superba*. Whorls  $6\frac{1}{2}$  clathrate (equal). Spire whorls 3-4 keels. Body whorl 4 keels + 3 basal.
11. *waitangiensis*. Whorls  $6\frac{1}{2}$  clathrate (spirals more prominent). Spire whorls 4-5 keels. Body whorl 5 keels + 4 basal.  
(cc) Sculpture with axials dominant.
12. *cochleata*. Whorls 5. Spire whorls 2 threads. Body whorl 2 threads + 3 basal keels.
13. *crispulata*. Whorls 5. Spire whorls 3 threads. Body whorl 4 threads + 3 basal keels.  
(dd) Sculpture extra heavy.
14. *crassissima*. Whorls 4, clathrate (equal). Spire whorls 2 keels. Body whorl 3 keels + 3 basal.

#### LOCALITY RANGE OF SPECIES.

- Merelina gemmata* Powell 1927—Maro Tiri, Chicken Is. (type); Tom Bowling Bay.
- compacta* Powell 1927—Mangonui 6-10 fath. (type); Tryphena, Great Barrier Island, 6 fath.; Tom Bowling Bay.
- plaga* Finlay 1926—Snares Is. 50 fath. (type); Faith Harbour, Auckland Is., off Auckland Is. 95 fath.; Bounty Is. 50 fath.
- maoriana* Powell n. sp.—Dunedin Harbour 3 fath. (type); Cuvier Id. 38 fath.; Mason Bay, Stewart Id.; off Cape Saunders 40-50 fath. Dusky Sound 30 fath.
- manawatawhia* Powell 1937—Off Three Kings Is. 260 metres (type).
- paupereques* Powell 1937—Off Three Kings Is. 260 metres (type); off Poor Knights Is. 60 fath.
- lyalliana* (Suter 1898)—Lyall Bay (type); Whangaroa; Tom Bowling Bay.
- harrisonae* Powell n. sp.—Ringaringa, Stewart Id. (type); Mason Bay, Stewart Id.
- taupoensis* Powell n. sp.—Taupo Bay, Whangaroa (type); St. Helier's Bay, Auckland; Motutapu Id., Auckland; Doubtless Bay, 12 fath.; Tom Bowling Bay.
- superba* Powell 1927—Maro Tiri, Chicken Is. (type); Tryphena, Great Barrier Id. 6 fath.; Tom Bowling Bay; Foveaux Strait (oyster dredge); Open Bay Is., Westland.
- waitangiensis* Powell 1933—Waitangi, Chatham Is. (type).
- cochleata* Powell 1937—Off Three Kings Is. 260 metres (type).
- crispulata* Powell 1937—Off Three Kings Is. 260 metres (type).
- crassissima* Powell 1937—Off Three Kings Is. 92 metres (type).

#### Genus SCROBS Watson 1886.

Type: *Rissoa (Scrobs) badia* Watson = *Rissoia jacksoni* Brazier.

**Scrobs trailli** n. sp. Pl. 49, fig. 4.

Similar to *S. ovata* Powell 1927 in general shape, but much larger, and with more convex whorls. The details of the peristome differ noticeably in that there is an inner rim duplicated on the outside by a heavy callus that fills the usual parietal cleft, although it is still separated from the parietal wall by a narrow groove. The outer lip callus does not bridge across to the body

wall, as in *ovata* and in the *hedleyi* series generally, but is deeply incised instead. Whorls  $3\frac{1}{2}$ . Spire  $1\frac{1}{2}$  times height of aperture. Protoconch typical, of  $1\frac{1}{2}$  finely stippled globose whorls. Surface smooth. Colour dark reddish brown except the peristome and the base, which are white.

Height, 1.5 mm.; diameter, 0.8 mm.

*Holotype*: In author's collection, Auckland Museum.

*Locality*: Mason's Bay, Stewart Island (in shell-sand; one specimen).

Named after Mr. Roy Traill, of Stewart Island.

### EULIMIDAE.

#### VENUSTILIFER n. gen.

Type: *Hypermastus bountyensis* Powell 1933.

In 1933 (Proc. Malac. Soc., vol. 20, pt. 5, p. 235) I described a then unique specimen from 170 fathoms, off the Bounty Islands, as *Hypermastus bountyensis*, noting that it was much more globular than the New South Wales genotype. The finding of further material at Mason's Beach, Stewart Island, shows that this globular shape is constant throughout all growth stages. In fact, the species is virtually a *Stilifer*, but with an elevated two-whorled parallel sided, blunt tipped, projecting protoconch set obliquely and partly immersed. *Hypermastus coxi* Pilsbry, the genotype, has a somewhat similar apex, but it is erect, and the adult shell is decidedly Eulimoid. I now have no hesitation in providing the above new generic name for the New Zealand species.

### STRUTHIOLARIIDAE.

#### Genus STRUTHIOLARIA Lamarck.

Type (monotypy): *S. nodulosa* Lamk (= *Buccinum papulosum* Martyn).

*Struthiolaria papulosa* varies with locality, so that certainly two forms, and possibly a third, are recognisable. The differences are not great, but are such that Stewart Island and North Island shells are readily separable, the former being larger than northern examples, having the nodules almost suppressed, the spiral sulcations deeper, and the colour pattern of broader axial streaks. These differences are even more marked in juveniles. Specimens from the vicinity of Wellington are similar to Auckland examples except that the spiral sulcations are a trifle more pronounced and the colour pattern is so diffused that the shell appears almost uniformly reddish brown. Martyn's figure (1874 Universal Conchologist, f. 54) is just such a shell.

For the time being two forms should be recognised, *papulosa* (typical) North Island (Wellington here designated as type locality) and the Stewart Island form, which may bear the name *Struthiolaria papulosa gigas* Sowerby 1842. Thes. Conch. 1, Pl. 5, f. 17. (See Pl. 50, figs. 1-5.)

*S. sulcata* Jonas 1839 may have priority, but without seeing the type I cannot decide. It is evidently a freak specimen in which the nodules are entirely absent. I have seen such specimens both from Stewart Island and North Auckland.

### PYRENIDAE.

Genus AOTEATILIA n. gen.

Type: *Daphnella substriata* Suter 1899.

A new genus is necessary for the reception of four undoubtedly con-generic species that had previously been placed for want of better locations in the genera *Daphnella* and *Mitromorpha* respectively. I propose removing them from the *Turridae* to the *Pyrenidae* and placing them near to *Zemitrella*.

The new genus is characterised by having a  $1\frac{1}{2}$  whorled papillate protoconch, smooth except for minute pitting; post nuclear sculpture in the form of close spiral lirae continued over the neck of the canal without differentiation, not with a heavier basal spiral series, as in most species of *Zemitrella*. The oblique plait (at the base of the pillar), so characteristic of *Zemitrella*, is well shown; also there is a very slight sinuosity on the shoulder of the outer lip, a factor that has been influential in the reference of the species to the *Turridae*. A similar weak sinus is found in some species of *Zemitrella* and *Liratilia*, notably *Z. sulcata* (Hutton) and *Z. pseudomarginata* (Suter).

Four species fall naturally into the new genus, and a fifth from Awanui, in 10 fathoms, awaits description.

The described species are *Daphnella substriata* Suter 1899, *D. acicula* Suter 1908, *D. psila* Suter 1908, and *D. tenuistriata* Suter 1908.

The protoconch in three of the species (I have not seen specimens of *psila*) is tinged with pink to purple.

My *Antimitrella* (1937, p. 214) is another related genus differing mainly in nuclear sculpture, which is in the form of faint axial striations on an otherwise smooth and glossy surface; also the downward sagging whorls make *laxa* the genotype, not unlike *Aoteatilia acicula* in shape.

### TURRIDAE.

Genus MAORIMORPHA n. gen.

Type: *Mitromorpha suteri* Murdoch 1905.

The above new genus is provided for a species described originally as a *Mitromorpha* by Murdoch (1905), removed to *Alcira* in the *Pyrenidae* by Suter (1913), and more recently referred back to the *Turridae* by Finlay (1926). The relationships of the genus are not obvious, but it is undoubtedly a Turrid, although there is superficial resemblance to the spirally lirate Pyrenids.

The generic characters are: Protoconch large, smooth, papillate, rather straight-sided, apex oblique but hardly lateral; post-nuclear sculpture of moderately strong spiral lirations continuous over all whorls and the neck of the canal; labial sinus sub-

sutural, broad, shallow, but distinct; canal short, broad and open, lip thin, not denticulate.

The genus so far as I know is monotypic.

The type of *suteri* is from Whangaroa Harbour, but the species occurs also at Stewart Island (dredged off Half Moon Bay) and Foveaux Strait (Bluff oyster scrapings).

#### Genus NEOGURALEUS n. gen.

Type: *Drillia sinclairi* Gillies 1882.

A considerable amount of work on the New Zealand Turrids has been done by Dr. H. J. Finlay, but only a few of his conclusions have been published. The Finlay collection was acquired by the Auckland Museum in 1937, and with it Dr. Finlay generously donated his manuscript of the Turrids. This work is incomplete owing to the difficulty he had in securing examples of foreign genotypes. However, by using a system of symbols he has allocated and keyed a large number of New Zealand Recent and fossil species. One group dealt with is that typified by *Drillia sinclairi*, for which I now provide the above new name.

The group seems to be confined to New Zealand, occurring Recent and not lower than the Waitotaran (Lower Pliocene). It resembles the Australian genus *Guraleus* in shape, size, sculpture and subsutural sinus, but has a very different protoconch. In *picta* Adams and Angas, the genotype of *Guraleus*, the protoconch is polygyrate, dome-shaped and smooth. In *Neoguraleus* it is polygyrate also, but only the tip, one to one and a-half whorls, is smooth, the remaining embryonic whorl being fenestrated—heavy spiral keels and weak, closely spaced axials.

The genus includes besides the genotype and a number of new species:—

*Pleurotoma (Mangilia) goodingi* Smith 1884, *Mangilia huttoni* Smith 1915, *Mangilia subaustralis* Suter 1899, *Asperdaphne murdochii* Finlay 1924 (n.n. for *Clathurella corrugata* Murdoch 1900), *Drillia lyallensis* Murdoch 1905, *Guraleus tenebrosus* Powell 1926, *Drillia amoena* Smith 1884, and probably *Mangilia cophinodes* Suter 1908. In addition to these Recent species (*murdochii* type from the Upper Pliocene occurs Recent also) there are the following Tertiary representatives: *Daphnella protensa* Hutton 1885, *Mangilia morgani* Marwick 1924, and *Guraleus ngatuturaensis* Bartrum and Powell 1928.

Three of the above species were collected at Stewart Island: *sinclairi*, *murdochii*, and *lyallensis*; and Suter 1913 recorded *amoena* under the name of *Mangilia protensa* Hutton.

#### SIPHONARIIDAE.

Genus KERGUELENIA Rochebrune and Mabille 1889.

Type: *Siphonaria redimiculum* Reeve.

The finding of a new species of *Kerguelenia* common on the high-tidal rocks at Akers Point, Stewart Island, opens up the question of the nomenclatural status of the New Zealand species.

Suter (1913 Man. N.Z. Moll., pp. 601-602) records the Magellanic *lateralis* Gould (including as synonyms *redimiculum* Reeve and *tristensis* Leach). The description is obviously composite, for the localities listed are Antipodes Islands; Auckland and Disappointment Islands; Campbell Island; Macquarie Island; Tasmania; Kerguelen Island; Patagonia; Straits of Magellan; and Falkland Islands. Details of the radula are cited from Hutton's (1883, Trans. N.Z. Inst., vol. 15, p. 143) observations on an Auckland Island specimen. In 1915, Iredale (T.N.Z.I., vol. 47, p. 478) proposed the name *Kerguelenia innominata* for this Neozelanic *Siphonaria lateralis* of Suter 1913, but without nominating a type, stating a type locality, or even providing a diagnosis. As there is more than one Neozelanic Subantarctic *Kerguelenia*, this name must be treated as indeterminable. Hedley in 1916 (Moll. Austr. Ant. Expl. Rep., vol. 4, pt. 1, pp. 61-62) ascribed the Macquarie Island *Kerguelenia* to *redimiculum* Reeve, noting that the form is "smoother than Reeve's figure and has the apex within the margin."

These are important differences, so the Macquarie Island shell represented by specimens collected in 1894 by the late Mr. A. Hamilton is described below as a new species.

Iredale's *innominata* cannot possibly be applied, for there is a second Subantarctic species as represented by a single specimen in my collection from the Bounty Islands. This has the apex within the margin, as in the Macquarie shells, but in a more median position, resulting in a regularly ovate outline. The ribbing also is more distant. Description is withheld until a series of specimens is available.

The Stewart Island species is quite distinct from both Subantarctic species in having the apex marginal at all stages of growth, and particularly in having coarse radial sculpture. The persistent marginal and even projecting position of the apex separates it from all the known species.

***Kerguelenia stewartiana* n. sp.** Pl. 49, figs. 6 and 7.

Shell obliquely ovate-pyriform, reminiscent of *Crepidula*. Apex posterior, narrowly pointed, bent to the left and projecting well beyond the margin. This feature is constant during all growth stages. Sculptured with distinct, flattened, flexuous, rather broad radials, most of which are bifurcated over the latter half of the shell by an intermediate groove.

There are about 22 primary ribs, some being indistinct towards the posterior end, and most of the anterior ones are bifurcated. Colour of exterior pale greenish grey to olive; irregularly blotched with dark brown, apex dark purplish brown. Interior dark reddish brown, paler at margin, the linear interstices of the external ribs showing through as dark brown lines. Siphonal groove shallow, not conspicuous.

Diameter, 9.25 mm.; length, 13.75 mm.; height, 4.25 mm.

*Holotype*: In Auckland Museum.

*Locality:* Aker's Point, Stewart Island. Common on seaweed covered rocks towards high water mark. First located by Mrs. R. H. Harrison.

**Kerguelenia macquariensis n. sp. Pl. 49, figs. 9 and 10.**

Shell elongate, ovate-quadrata. Apex within the margin near the posterior left. Surface smooth except for sub-obsolete radials, about ten along the posterior margin, being the only distinct ones. Colour dull light reddish-brown, interior darker brown in the apical area. Siphonal groove broad and shallow, well defined.

Diameter, 10 mm.; length, 15 mm.; height, 5 mm.

*Holotype:* In Dr. H. J. Finlay Collection, Auckland Museum.

*Locality:* Macquarie Island.

**FLAMMULINIDAE.**

Genus *FECTOLA* Iredale 1915.

Type (orig. desig.) : *Helix infecta* Reeve.

Subgenus *SUBFECTOLA* n. subgen.

Type: *Helix caputspinulae* Reeve.

Iredale (1915 Trans. N.Z. Inst., Vol. 47, p. 482) placed *caputspinulae* in his *Fectola*, but the species lacks the sinused lip of that genus, although it has the characteristic radially ribbed protoconch. This sinus is so well marked a feature of *Fectola*, rendering the ribbing at all stages strongly retractive to the suture that *caputspinulae* and *rakiura* cannot be accommodated in that genus naturally. A new subgenus is therefore here proposed for these *Charopa*-like shells having a radially ribbed protoconch as in *Fectola*, but evenly arcuate radial ribbing without the subsutural sinus.

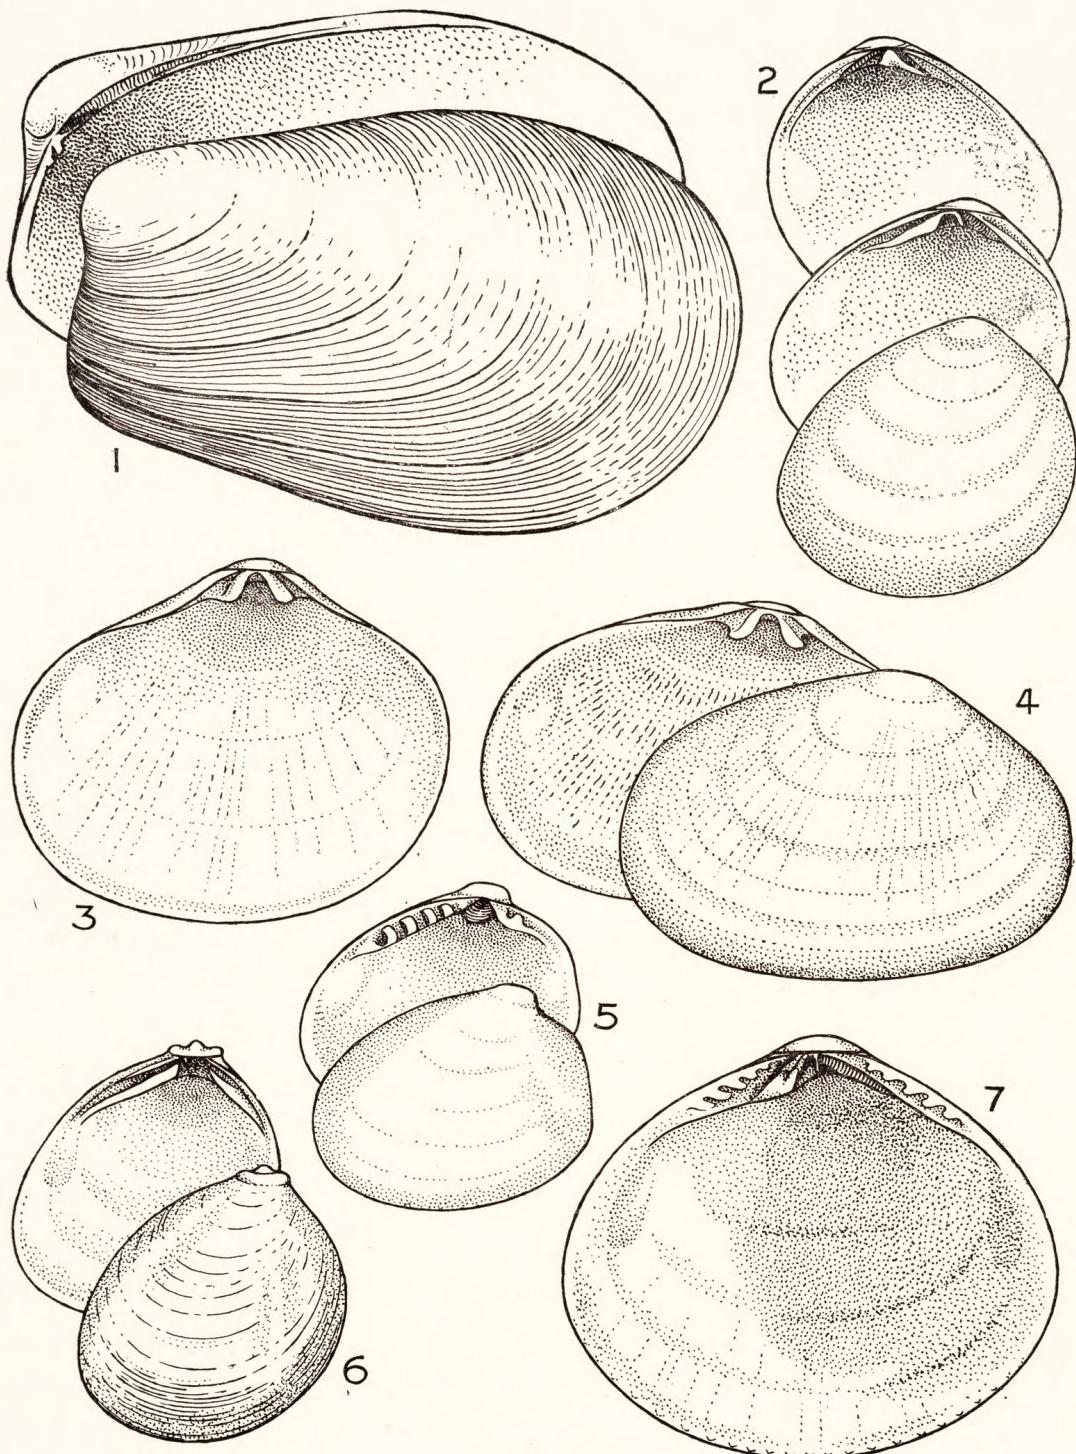

***Fectola (Subfectola) rakiura* n. sp. Text figures a, b, c (p. 224).**

Related to *caputspinulae*, but much more finely and closely ribbed, and with a narrower umbilicus. In coiling and in sculpture it resembles *Mocella corniculum*, but the ribbing is closer and the umbilicus narrower. Colour white. Sculpture of exceedingly fine and close radials, about 34 per millimeter, and dense spiral striations: ribs very slightly flexuous, but not retractive at suture. Umbilicus about one quarter the major diameter of the base. Outer lip evenly arcuate, but not sinused at the suture. Spire little raised, one-third height of aperture. Whorls four, including a one-whorled protoconch of close radial ribs.

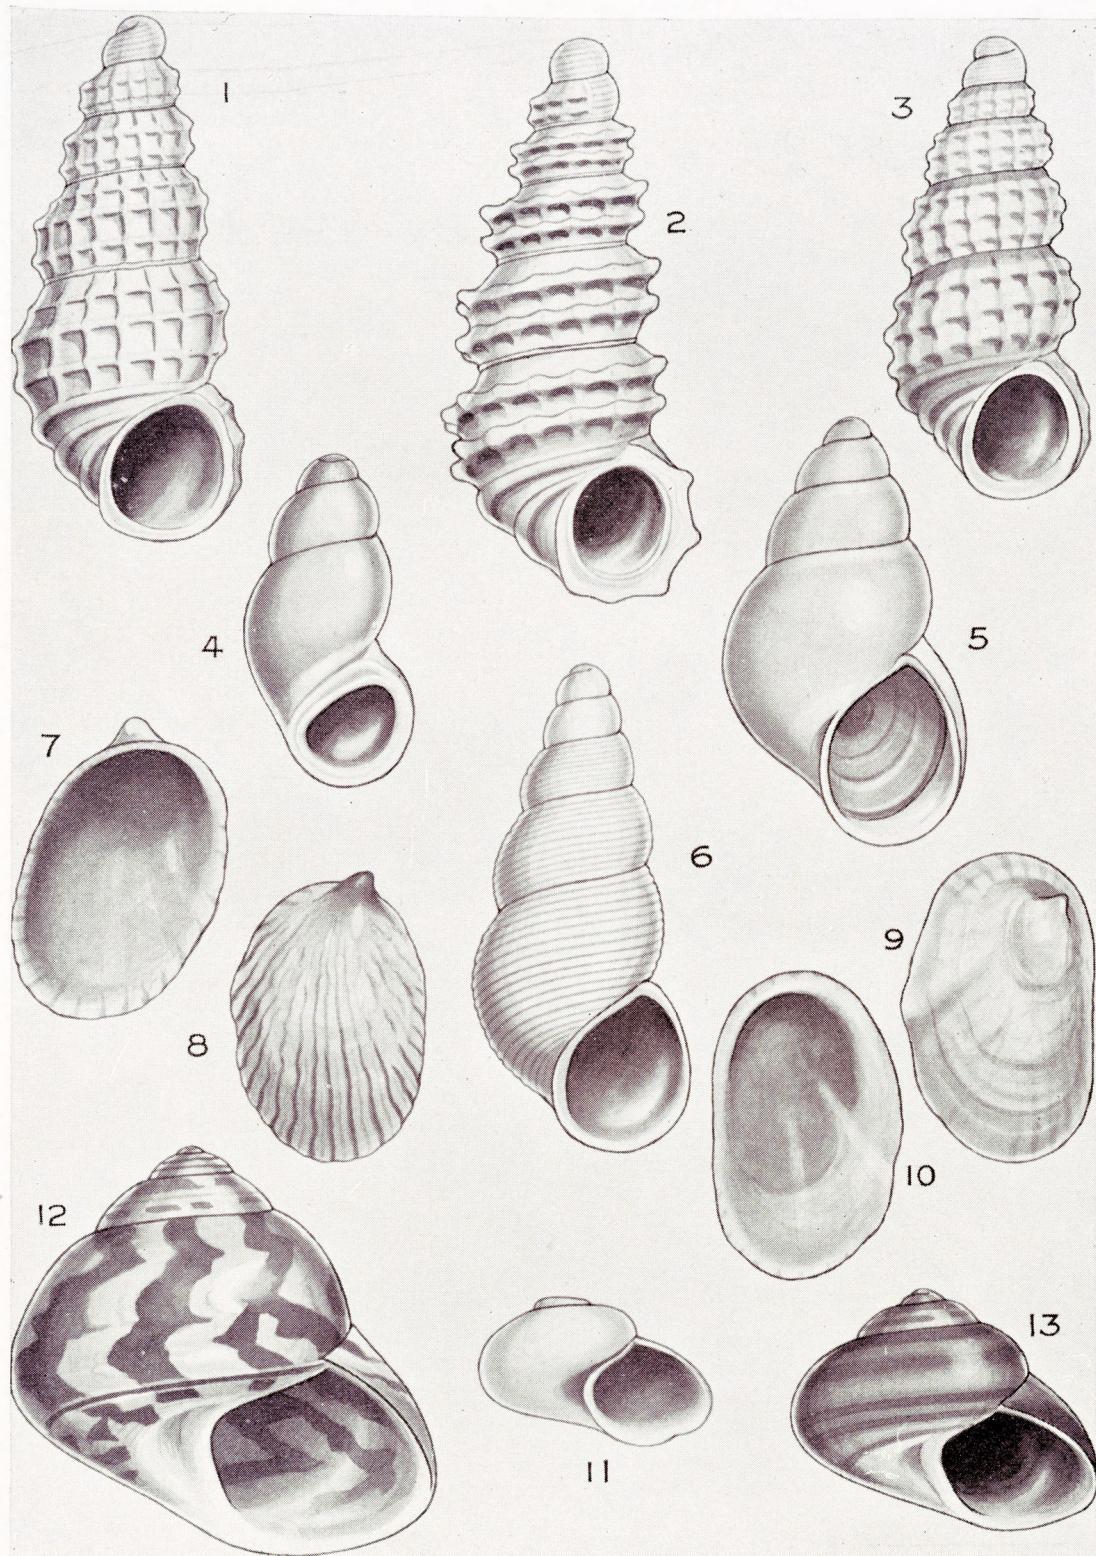

Diameter, 1.65 mm.; height, 0.8 mm.

*Holotype:* In Auckland Museum.

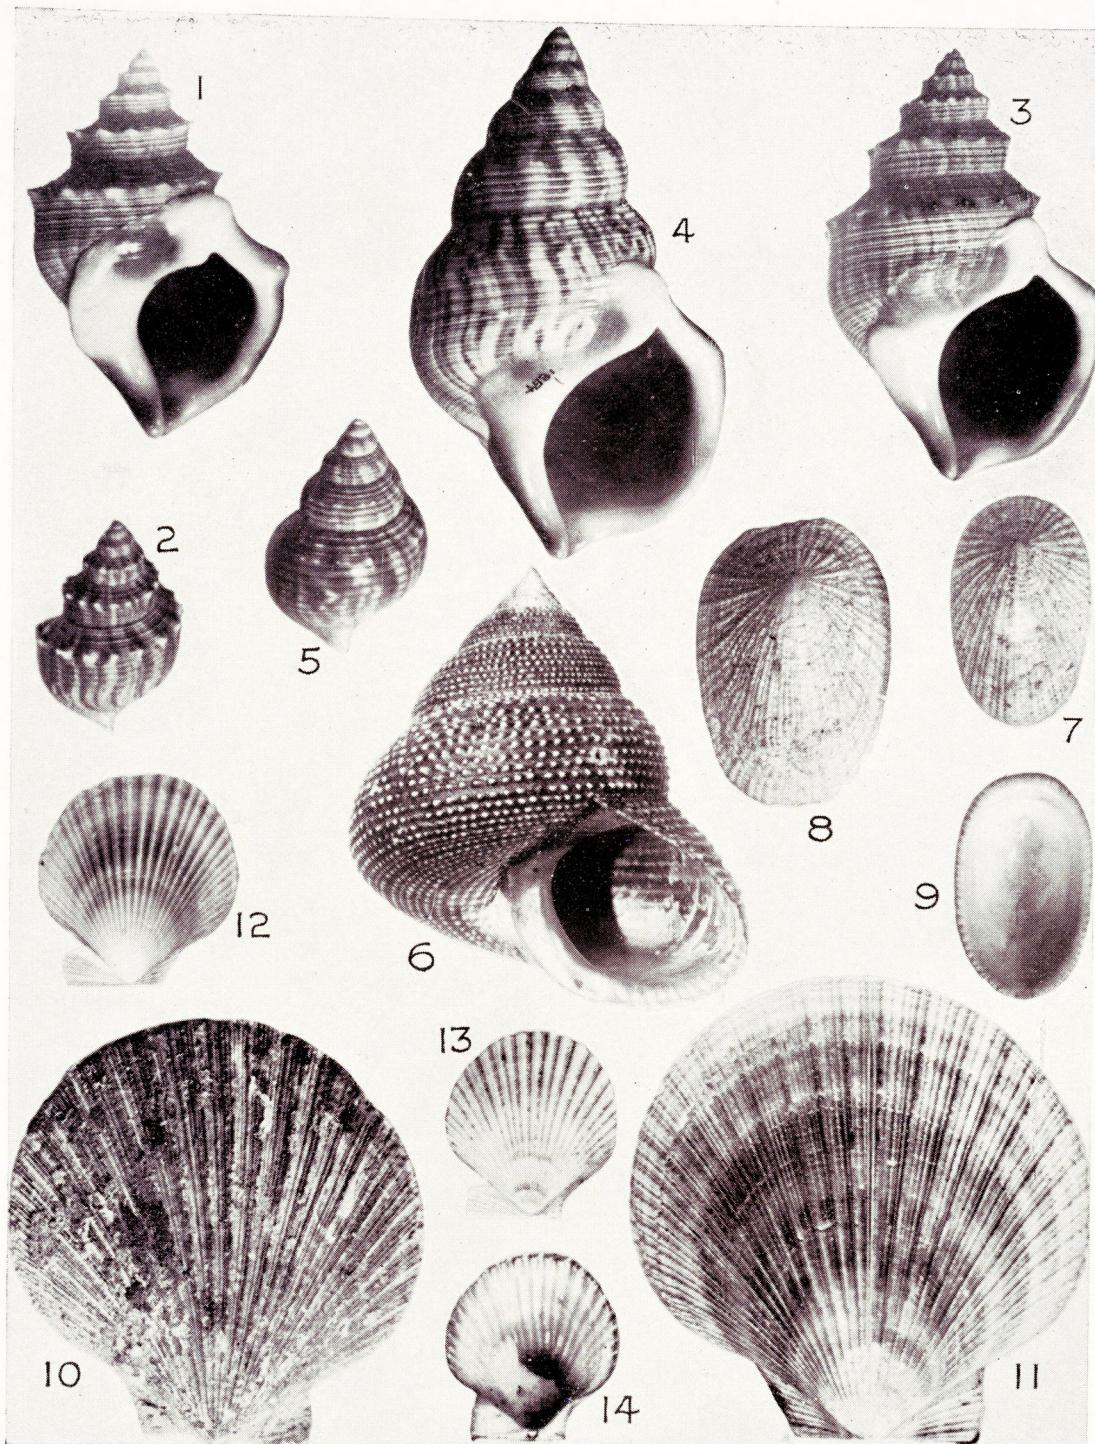

*Locality:* The Neck, Paterson Inlet, Stewart Island (under sides of leaves along bush track. Coll. A.W.B.P., Nov., 1934).
