FLANNEL FORMED OF INFUSORIA AND CONFERVÆ.

On the 17th of October last, Professor Ehrenberg laid before the Academy of Sciences of Berlin, a foot and a half square of natural wadding or flannel, consisting of *Infusoria* and *Confervæ*, which was found to the extent of several hundred square feet near Sabor in Silesia, after an inundation. We have already had occasion in preceding numbers of this Journal, to lay before our readers Professor Ehrenberg's notice respecting the animal and vegetable nature of the meteoric paper of 1686, (See Annals, vol. iii. pp. 185 and 320,) and also the communication of Ehrenberg and Kersten respecting the natural leather of Freiberg, to which the present substance is analogous, but far more surprising from its occurrence in such an immense mass. The flannel is chiefly formed of unramified branches of *Conferva rivularis* interwoven with fifteen species of *Infusoria* and some shells of the water-flea (*Daphnia*). Of the *Infusoria* eleven belong to the family of the *Baccillariæ*, and of these six to siliceous-loricated genera; several *Closterinæ*, &c. Predominating are the *Fragillaria*, *Navicula viridis*, and *Cryptomonas lenticularis*? All the forms are known species.—*Berichte der Akademie*, Oct. 17, 1839.
