

Additional weights of Venezuelan birds

by Betsy Trent Thomas

Received 3 August 1989

Body weight, or mass, of birds is considered the most stable avian measurement (Smith *et al.* 1986), and the best measure of body size (Mueller 1986). Dunning (1984) points out that mean body weight has been applied to studies of avian physiology, ecology, morphology, community structure and theoretical modelling. Many museum specimens lack weight data because large collections were made before the importance of weight was known and prior to convenient equipment for taking field measurements. While most recent specimens in museums do contain mass data, collecting has slowed greatly (Parkes 1985). Thus one certain way that researchers can obtain weight data is through live bird captures.

This paper supplements a previous report on Venezuelan bird weights (Thomas 1982). Since then various publications have given many other weights of Neotropical birds: most tanager weights are given in Isler & Isler (1987); Faaborg (1985) gives data for 129 spp.; Moermond & Denslow (1985) for 82 spp.; Parker *et al.* (1985) for 35 spp.; Remsen (1985) for 92 spp.; Robbins *et al.* (1985) for 193 spp.; and Wiedenfeld *et al.* (1985) for 91 spp.; and Bates *et al.* (1989) for 189 species.

This paper gives 1156 weights of 123 spp. All measurements were taken between 1982 and 1985 in Venezuela from mist-netted birds. Birds were weighed, usually within 15 min of capture, on Pesola spring balances of 10, 50, 100 and 300 g and recorded to the nearest tenth of a gram for those <100 g, and to the nearest 5 g for those >100 g. Colour notes of soft parts were recorded and are available on request from the author. When samples exceed 7, the number, range, mean and standard deviations are given. Order and nomenclature follows Meyer de Schauensee & Phelps (1978).

Most birds were netted at Fundo Pecuario Masaguaral, Estado Guárico ($08^{\circ}31'N$, $67^{\circ}35'W$ —63 m a.s.l.). Other birds were from Los Anaucos, Estado Miranda ($10^{\circ}20'N$, $66^{\circ}50'W$) at 550 m. Small numbers of birds were netted in 3 other Venezuelan states; at the War Memorial of 1817, Estado Apure ($07^{\circ}50'N$, $68^{\circ}45'W$) at c. 50 m; at Km 118 on the Sta Elena road, Estado Bolívar ($06^{\circ}01'N$, $61^{\circ}25'W$) at c. 1500 m; and at Rancho Grande in Henri Pittier Park, Estado Aragua ($10^{\circ}24'N$, $67^{\circ}43'W$) at 1090 m.

Weights are from Masaguaral unless otherwise identified; others are from Los Anaucos (LA), Estado Apure (A), Estado Bolívar (B) and Henri Pittier Park (HP). All weights are in grams. *North American migrants, **Austral migrants.

Eurypyga helias: unsexed 188.0

Jacana jacana: 12 unsexed 89.5–137.0 (113.96 ± 16.50)

Vanellus chilensis: 9 unsexed 225.0–284.0 (264.44 ± 19.21)

Acknowledgements

Work on Masaguaral was made possible by the owner Tomas Blohm. Partial funding was given by John B. Trent, the Wetmore Fund of the AOU and the Smithsonian Institution.

Charles Collins, Marshall Howe and Nancy Wicker helped me in the field. Wesley Lanyon sexed a few of the birds.

A new species of weaver from Tanzania

by N. E. & E. M. Baker

Received 11 August 1989

During December 1986 a visit was made to the town of Ifakara ($08^{\circ}08'S$, $36^{\circ}40'E$) in Morogoro Region east central Tanzania. Although primarily a field trip for the Tanzanian Bird Atlas, attention had been drawn by Dr Eric Burnier to a species of weaver that was reasonably common in the area, but which he could not identify. Situated on the northern bank of the
