**A Type Catalog of Fossil Invertebrates
(Arthropoda: Crustacea) in the Yale
Peabody Museum**

Russell D. White

(Received 8 May 1996)

Abstract

Type material for 83 nominal species of fossil crustaceans are in the Invertebrate Paleontology Collections of Yale University's Peabody Museum of Natural History. Primary types for 41 nominal species include 21 holotypes, 4 lectotypes and 76 syntypes (representing 15 nominal species). Secondary types for 17 nominal species include 29 paratypes and 3 paralectotypes. Tertiary types of 47 nominal species include 200 hypotypes. Most types are from Mazon Creek (Illinois) and New York State, and have been described by C.E. Beecher, J.M. Berdan, H.K. Brooks, James Hall, M.J. Rathbun, H.B. Roberts, P.E. Raymond, C.E. Resser and E.O. Ulrich.

Introduction

This catalog lists all known fossil crustacean types in the Invertebrate Paleontology Collections housed in Yale University's Peabody Museum of Natural History. This is the second in a series of type catalogs of fossil invertebrates and is a product of an ongoing computerization project to improve the accessibility of the type collections.

Eleven type specimens are missing and cannot be located. The collections have been thoroughly searched by the curatorial staff in the 1960s and 1980s and it is believed that these specimens are permanently lost. The missing status of each specimen is footnoted after each record, respectively. Any information on the whereabouts of these specimens would be greatly appreciated.

Organization

Specimens are listed under the originally described binomen; genera and species within genera are indexed alphabetically. Each entry includes the catalog number used by the Division of Invertebrate Paleontology prefixed with the abbreviation YPM and the type status of the original designation, followed by all known references to that name. Any subsequent designations are listed under the original designation and are cross-referenced in the body of the text. Locality descriptions follow each entry or set of entries for each binomen. Errors and inconsistencies are footnoted at the bottom of each binomen.

The type designations used are holotype, syntype, and lectotype for name bearers; paratype and paralectotype for secondary types; hypotype is used for all tertiary types. Name bearers and secondary types are defined as used in the *International Code of Zoological Nomenclature* (1985). Tertiary types or hypotypes are treated here as any described, figured or measured specimen used in a publication to augment the knowledge of a previously defined species, or any referred specimen that can not be placed unequivocally in a known species (e.g. *Berounella* sp.).

Locality descriptions follow each entry or set of entries with identical locality data. The locality information includes the stratigraphy, geography, collector and date. Stratigraphy has been standardized using *Stratigraphic Nomenclature Databases for the United States, its Possessions and Territories* (MacLachlan et al., 1992).
