

NOTE XXV.

ON AN APPARENTLY UNDESCRIBED GENUS
OF WRENS FROM TIMOR.

BY

R. BOWDLER SHARPE,*F. L. S., F. Z. S. etc. Department of Zoology, British Museum.*

In the Leyden Museum are some specimens of a bird from Timor, bearing the label «*Orthotomus subulatus*, Müll. Verh.», a name which I cannot find to have been published anywhere, and as far as I am aware the species has never been described under any other name.

Generically this Wren comes very close to *Pnoepyga*, and has no rictal bristles and the front aspect of the tarsus entire. It has, however, a much longer bill, thinner, and more compressed, the culmen exceeding the hind toe and claw in length. I propose to separate it generically as *Orthnocichla*. The type will be

Orthnocichla subulata.

Orthotomus subulatus, Müll. MSS. in Mus. Lugd.

Adult male. General colour above light rufous brown, slightly more fulvescent on the rump and upper tail-coverts; wing-coverts like the back; quills dusky brown, externally light rufous, the inner secondaries entirely of the latter colour; tail-feathers light rufous; head like the back, a very distinct eyebrow of buffy white extending from the base of the nostrils to above the ear-coverts;

Notes from the Leyden Museum, Vol. VI.

feathers round the eye and ear-coverts whitish, the upper edge of the ear-coverts rufous brown; cheeks and under surface white, the sides of the breast ashy, the lower flanks fulvous brown; thighs brown; under tail-coverts white washed with fulvous; under wing-coverts yellowish white; quills dusky below, ashy fulvous along the edge of the inner web; bill yellowish white, pale brown on the upper mandible; feet yellowish white. Total length 3.5 inches, culmen 0.55, wing 2.1, tail 1.05, tarsus 0.8.

Hab. Timor.

Sharpe, Richard Bowdler. 1884. "Note XXV. On an apparently undescribed genus of wrens from Timor." *Notes from the Leyden Museum* 6, 179–180.
